INTRODUCTION

1.1 PURPOSE OF REPORT

Stantec Consulting Ltd. has been retained by Robinson Village II Limited Partnership to prepare an environmental noise assessment for the proposed 4 storey building with a basement floor at 29 Robinson Avenue, located in the City of Ottawa. A site plan control application is being prepared and a Noise Assessment Study is required to address City policies regarding residential development adjacent to a 400-series highway.

The purpose of this report is to:

- outline the Ministry’s guidelines and criteria for noise levels and residential land use;
- apply the noise level standards of the Ontario Ministry of the Environment, Conservation and Parks NPC-300 to the site in conjunction with the City of Ottawa document “Environmental Noise Control Guidelines” dated January 2016;
- determine the extent to which noise level contours will be of concern to future residents/institutional users of the proposed development, using the computerized version (STAMSON 5.03) of the MECP’s noise model;
- outline recommendations for noise attenuation, as necessary, to achieve acceptable noise levels for future residents of the proposed development.

1.2 LOCATION

The proposed development consists of 46 units and the site is located along the northern section of Robinson Avenue, north of Hurdman Road. The proposed site is illustrated in Figure 1. This report will focus on the rooms with exposure to the Highway 417.

Surrounding land uses are as follows:

- north – existing park and residential;
- east – existing residential;
- south – existing residential;
- west – existing residential.

The main potential noise source that may impact the subject site is vehicular traffic along the Highway 417. The traffic volumes for these roadways are based on the City of Ottawa document “Environmental Noise Control Guidelines”.

August 26, 2019
Additional noise sources considered for assessment in this report were the Hurdman Bus Station, the Ottawa Train Station, and the City of Ottawa municipal work yard. It was found that the Hurdman Bus Station falls outside of the required 300m distance from the proposed site set out by the City of Ottawa Environmental Noise Control Guidelines and was not assessed in this report. The railway alignment for the Lees Train Station is within 300m from the site, however, the alignment at that point has an obstructive grade differential due to its crossing under the 417 highway (as well as obstruction by the Lees interchange crossing over the 417) and was therefore not considered as a potential noise source. Lastly, the Ottawa municipal work yard, despite falling within the required 300m distance, has an anticipated use that was not deemed to be a stationary noise concern due to lack of an existing noise ECA, and work yard development taking place after existing residential buildings in proximity to the site, implying no significant changes to anticipated noise levels beyond background urban hum (as well as being shielded by existing residences to the south).

Figure 1 29 Robinson Avenue Development
2.0 NOISE LEVEL CRITERIA

2.1 GUIDELINES

The Ontario Ministry of the Environment, Conservation and Parks (MECP) has produced guidelines for noise levels for use in noise assessment and land use planning. Noise level criteria for residential land use are summarized in Table 1 below. Noise levels in excess of the guidelines presented are acceptable under certain conditions and with certain provisions.

Table 1 Noise Criteria for Residential Land Use

3.0 OBSERVATIONS AND CALCULATIONS

3.1 NOISE LEVEL PREDICTIONS

Noise predictions in this report were completed using the computerized version (STAMSON 5.03) of the MECP noise model ORNAMENT to calculate noise levels from various sources. The program accepts variables related to noise sources and receivers, road traffic volumes, and the nature and extent of noise mitigation features, if required.

3.2 ROAD TRAFFIC VOLUMES

Traffic volume data for Highway 417 was provided by the City of Ottawa document “Environmental Noise Control Guidelines” dated January 2016. The document indicates that the average annual daily traffic volume for Highway 417 will be 18,333 vehicles per lane per day for a 4-lane eastbound and 4-lane westbound highway. Additional information regarding applicable assumptions and ratios for day/night traffic and car/truck traffic is summarized as follows:

- heavy truck traffic for this segment is estimated to be 5% of total traffic volume;
- medium truck traffic for this segment is estimated to be 7% of total traffic volume; the rest is assumed to be car traffic;
- daytime (7 am – 11 pm) traffic is assumed to be 92%, with the remaining 8% at night (11 pm – 7 am); and
- the speed limit for Highway 417 is 100 km/hr

Table 5 summarizes the traffic volumes used for calculations in this report.

3.3 PROJECTED NOISE LEVELS

Using the MECP noise model ORNAMENT, noise levels were calculated for daytime and nighttime conditions at the point representing the anticipated building location based on the site plan prepared by Figurr Architects. The resulting receiver sites are illustrated in Figure 2 and Figure 3.

The receiver heights for indoor, daytime, and nighttime noise level calculations for the proposed buildings were assessed at the mid-height of each floor. Building elevation drawings are provided in Appendix B as well as the floor plans indicating the receiver locations.

Upon assessing the developments noise exposure to the Highway 417 it was found that the embankment conceals the development from noise west of the Robinson Avenue overpass, and the Hurdman Yard garage and the greenspace along the Rideau River shield the development east of the river. However, such impacts were adjusted for the receiver on the third to fourth floors of the building based on the varying heights of the adjacent row of housing. The difference in the noise levels at each floor height is reflected in Table 7.

The unattenuated receiver noise levels have been summarized in Table 7, and noise level calculations are provided in Appendix A for sound levels at daytime and nighttime building face.

Conclusions and Recommendations
August 26, 2019

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 OUTDOOR NOISE IMPACTS

Predicted noise levels lie within City of Ottawa and MECP criteria at the outdoor living area for the potential building with exposure to Highway 417.

The predicted noise level for the outdoor ground floor amenity area located at the rear of the proposed building is 52.5 dBA. This falls within the accepted City of Ottawa and MECP criteria noise level standards and therefore there are no additional measures required for outdoor noise mitigation.

A sensitivity analysis was conducted for the rooftop amenity area with the intent to reduce the resulting noise levels to below the 55dBA threshold via noise walls with a minimum surface density of 20kg/m². The rooftop terrace would require noise barriers with heights above 2.5m to attenuate noise levels in the OLA to 55dBA, and reduction of noise levels to 60 dBA is unachievable at the 2.5m maximum wall height. Due to limitations in the STAMSON software which only allows one barrier to be modeled, the existing 5.0m noise barrier along Highway 417 was not included in this model scenario.

Three noise wall heights surrounding the terrace were modeled to compare the anticipated attenuated noise level. A summary of the attenuated noise generated can be found in Table 8. A noise barrier of 1.5 m is currently proposed to mitigate the outdoor noise levels on the rooftop to provide noise reduction beyond background levels.

4.2 INDOOR NOISE IMPACTS

Predicted noise levels are above City of Ottawa and MECP criteria at the daytime building face and the nighttime building face for potential units with exposure to the Highway 417.

The following summarizes the measures required by the City of Ottawa and MECP criteria for the development to occur within accepted standards:

- Based on the predicted noise levels proposed all units within 29 Robinson Avenue fall under the noise warning clause Generic Indoor Noise Mitigation (GI) that requires the provision for a central air conditioning system to be installed.

- On all offers of purchase for units with noise warning clause GI, the following information is required to be disclosed:
  
  - “Installation of central air conditioning will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the City of Ottawa and the Ministry of the Environment Conservation and Parks.”

Noise warning clauses are provided in Appendix C.
The consideration of these measures will allow the residential development to proceed in accordance with City of Ottawa’s planning approval process and form the basis for meeting the City of Ottawa’s and MECP criteria with respect to environmental noise.

Appendix C  NOISE WARNING CLAUSE
WARNING CLAUSES

The following warning clauses may be used individually or in combination:

Generic Mitigation of Indoor Area (GI):

Indoor environment - \( \text{Leq}(16) \) greater than 55 dBA and less than or equal to 65 dBA or \( \text{Leq}(8) \) greater than 50 dBA and less than or equal to 60 dBA

To help address the need for sound attenuation this development has been designed so as to provide an indoor environment that is within provincial guidelines. Measures for sound attenuation include:

- a setback of buildings from the noise source;
- the provision for adding central air conditioning at the occupant’s discretion.

To be included in all offers of purchase:

“Installation of central air conditioning will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the City of Ottawa and the Ministry of the Environment Conservation and Parks.”

Extensive Mitigation of Indoor Area (MI):

Indoor environment - \( \text{Leq}(16) \) greater than 65 dBA or \( \text{Leq}(8) \) greater than 60 dBA

To help address the need for sound attenuation this development has been designed so as to provide an indoor environment that is within provincial guidelines. Measures for sound attenuation include:

- multi-pane glass;
- exterior wall insulation;
- a forced central air conditioning system.

To ensure that provincial sound level limits are not exceeded, it is important to maintain these sound attenuation features.

To be included in all offers of purchase:

“This dwelling unit has been supplied with a forced central air conditioning system and other measures which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the City of Ottawa and the Ministry of the Environment Conservation and Parks.”
To be included in all offers of purchase:

**Generic Mitigation of Outdoor Amenity Area (GO):**

Outdoor amenity areas- $L_{eq}(16)$ in the OLA greater than 55 dBA and less than or equal to 60 dBA.

To help address the need for outdoor sound attenuation occupants are to be informed this development may potentially require the inclusion of:

- an acoustic barrier.

To be included in all offers of purchase:

“Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road traffic may, on occasion, interfere with some activities of the dwelling occupants in their outdoor amenity area as the sound levels exceed the sound level limits of the City of Ottawa and the Ministry of the Environment and Conservation and Parks.”

**Extensive Mitigation of Outdoor Amenity Area (MO):**

Outdoor amenity areas- $L_{eq}(16)$ in the OLA greater than 60 dBA.

To help address the need for outdoor sound attenuation this development is to includes outdoor noise attenuation with the use of:

- an acoustic barrier.

To be included in all offers of purchase:

“Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road traffic may, on occasion, interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the City of Ottawa and the Ministry of the Environment Conservation and Parks.”
