EXECUTIVE SUMMARY

Assessment

A Phase II ESA was conducted for the commercial and residential properties addressed 320 McRae Avenue, 1976 Scott Street, 311 and 315 Tweedsmuir Avenue, in the City of Ottawa, Ontario. The purpose of the Phase II ESA was to address the areas of potential environmental concern (APECs) identified during the Phase I ESA. The APECs included the former landfill in the area of the subject site, the former and continued use of the eastern portion of the subject site as various automotive service garages and autobody shops, as well as, the former use of the northern portion of the subject site as a retail fuel outlet.

During a previous investigation in 2008, petroleum hydrocarbon (PHC) fraction F3, barium, cadmium, lead, mercury and zinc impacted fill was identified on the east side of the commercial building and impacted groundwater (benzene, chloroform, toluene, xylenes and PHC (F1)) was identified in BH6, on the north side of the commercial building. Field observations indicated the presence of impacted groundwater in BH4, in the former pump island area. This well was not found at the time of the current assessment and could not be assessed.

A 2014 subsurface investigation at the subject site was conducted on October 8 and 9, 2014 and consisted of the drilling of three (3) boreholes and the installation of three (3) groundwater monitoring wells.

An arsenic concentration in BH1 and a petroleum hydrocarbon (PHC) fraction 1 (F1) concentration in BH3 were identified in excess of the selected MOECC Table 7 standards. Metals impacted fill in BH1 was visually identified at depths of 0.91 and 2.44 m, while in BH3 a thin layer of PHC impacted fill was identified between 3.28 and 3.38 m below ground surface, immediately on top of bedrock surface.

Groundwater samples were obtained from the monitoring wells at BH1 and BH2, and submitted for analysis of PHCs and volatile organic compounds (VOCs). None of the analytical parameters were found to exceed the selected MOECC Table 7 standards.

The current investigation included the placement of eight (8) boreholes, three (3) of which were instrumented with groundwater monitoring wells. Metals in excess of the MOECC Table 7 standards were identified in the fill material at BH15 and BH16. One PAH parameter was also identified in excess of the MOECC Table 7 standard in borehole BH16.

All groundwater was found to be in compliance with the MOECC Table 7 standards with the exception of the groundwater from BH9, where the F1 fraction petroleum hydrocarbon, benzene, ethylbenzene, and xylenes were identified above the MOECC Table 7 standard. The groundwater from BH6 was analysed again and all hydrocarbon and BTEX parameters were in compliance with the site standards.

Recommendations

Soil

Metal, PAH, and PHC concentrations in some soils are present at the subject site in concentrations in excess of the selected MOECC Table 7 standards. The presence of metals impacted fill beneath the commercial building and petroleum impacts in the former tank nest area are not considered to represent an immediate risk to the current use of the subject site. It is understood that, the site is being considered for redevelopment.

Any impacted soil removed from the site during redevelopment will require disposal at an approved waste disposal facility. Prior to disposal, a toxicity characteristic leaching procedure analysis will be required on a representative soil sample. It is recommended that Paterson personnel be present onsite during the soil excavation program to direct excavation activities in the areas where impacted material has been identified or is expected to exist. Additional testing may be required to effectively identify and delineate the impacted fill on the subject site.

If any soil is to remain on-site, it is recommended that confirmatory soil samples be collected upon completion of the soil remediation program to ensure that the site is in compliance with the MOECC Table 7 Standards.

Groundwater

Groundwater in the vicinity of the former pump island, located at the northern end of the property, appears to have been impacted with the F1 PHC fraction, as well as benzene, ethylbenzene, and xylenes.

Depending upon the volume of impacted groundwater encountered during future site development, and the depth of the future site works, several options may be available to treat the groundwater. The removal of impacted groundwater from the site by a licensed pumping contractor would be a feasible option for smaller volumes, while an on-site treatment system would likely be more economical for larger volumes over a longer period of time. An on-site treatment system would discharge to the City of Ottawa sewer system.

Prior to discharging treated groundwater to the municipal sewer system, a Sanitary Sewer Agreement will be required from the City of Ottawa's Sewer Use Program. Additional groundwater monitoring wells may be required following the completion of the site remediation program to ensure that the site meets the MOECC Table 7 Standards.

If site development does not occur in the near future, it is recommended that the groundwater from BH9 be retested to confirm the quality of the groundwater and the need for any remediation.

1.0 INTRODUCTION

At the request of the Estate of Carson Unsworth, Paterson Group (Paterson) conducted a Phase II Environmental Site Assessment of the properties addressed 320 McRae Avenue, 1976 Scott Street, 311 and 315 Tweedsmuir Avenue, in the City of Ottawa, Ontario. The purpose of this Phase II ESA was to address concerns identified in the Phase I ESA and to delineate previously identified contamination.

1.1 Site Description

| | |
|----------------------------------|--|
| Address: | 1976 Scott Street, 320 McRae Avenue, 311 and 315 Tweedsmuir Avenue, Ottawa, Ontario, hereafter referred to as 320 McRae Avenue. |
| Legal Description: | Lots 12 to 19, Registered Plan 273 and Lots 23, 24 and 25, Registered Plan 263. Part of Lot 31 and 32, Concession 1, Nepean Township, Ottawa Front. |
| Property Identification Numbers: | 04021-0013, 04021-0014, 04021-0015, 04021-0021, 04021-0022, 04021-0023, 04021-0024, 04021-0025, 04021-0026. |
| Location: | The subject site is located west of McRae Avenue, south of Scott Street and east of Tweedsmuir Avenue, in the City of Ottawa, Ontario. The subject site is shown on Figure 1 - Key Plan following the body of this report. |
| Latitude and Longitude: | 45° 23' 45" N, 75° 45' 02" W. |
| Configuration: | Irregular. |
| Site Area: | 0.51 hectares (approximate). |

1.2 Property Ownership

The subject property is currently owned by the Estate of Carson Unsworth. Paterson was retained to complete this Phase II ESA by Ms. Carol Morris-Unsworth.

1.3 Current and Proposed Future Uses

The southeast portion of the subject site is occupied by a commercial complex with two (2) garages, two (2) units used for office space, two (2) garage bays used for storage of landscaping equipment and self-storage space. The northwest portion of the subject site (311 and 315 Tweedsmuir Avenue) is occupied by two 2 storey residential dwellings. The northern portion of the subject site is utilized as a parking lot.

It is our understanding that the redevelopment of the property into a residential condominium complex is being considered.

1.4 Applicable Site Condition Standard

The site condition standards for the property were obtained from Table 7 of the document entitled "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act", prepared by the Ontario Ministry of the Environment (MOECC), April 2011. The MOECC Table 7 Standards are based on the following considerations:

- Coarse-grained soil conditions
- Shallow bedrock conditions
- Non-potable groundwater conditions
- Residential land use

2.0 BACKGROUND INFORMATION

2.1 Physical Setting

The subject site is located south of Scott Street, between McRae Avenue and Tweedsmuir Avenue, in the City of Ottawa. The site is occupied by two, 2 storey residential buildings on the west side of the subject site, a commercial building with a partial second storey on the east side of the subject site and a vacant kiosk on the north side of the subject site. The commercial building is currently being utilized as two (2) automotive service garages, a landscaper's storage garage, a self storage complex and two (2) units are being used for office space. The ground cover in the area of the residences and to the north of the residences towards Scott Street, consists of grass and trees. The remainder of the subject site is asphaltic concrete parking, with two gravel patches from former retail fuel outlet decommissioning work.

No drinking water wells or private sewage systems were observed on the subject property, nor are any expected to be present, as the site is located in a municipally-serviced area. No evidence of current or former railway or spur lines on the subject property was observed, at the time of the site inspection. There were no unidentified substances observed on the subject site.

2.2 Past Investigations

The following reports were available for review:

- ☐ "Soil Testing During Retail Gas Station Decommissioning, 1976 Scott Street, Ottawa, ON", prepared by SEACOR Environmental Inc. (SEACOR), dated September 2003.
- ☐ "Phase I-II - Environmental Site Assessment, 319 & 320 McRae Avenue, Ottawa, Ontario", prepared by Paterson, dated November 2008.
- ☐ Phase I – Environmental Site Assessment, Commercial and Residential Properties, 320 McRae Avenue, 1976 Scott Street and 311 Tweedsmuir Avenue, Ottawa, Ontario", prepared by Paterson, dated November 3, 2014.
- ☐ Phase II – Environmental Site Assessment, Commercial and Residential Properties, 320 McRae Avenue, 1976 Scott Street, 311 and 315 Tweedsmuir Avenue, Ottawa, Ontario", prepared by Paterson, dated January 28, 2016.

The 2014 Phase I-ESA report, incorporated information from the previous two (2) reports and identified three (3) on-site potentially contaminating activities (PCAs) that are considered to represent areas of potential environmental concern (APECs) for the subject site. These on-site PCAs are as follows:

- The former use of the northern portion of the subject site (1976 Scott Street) as a retail fuel outlet, between 1971 and 2002.
- The former and continued use of various units within the commercial building on the southeast portion of the subject site, as various automotive service garages and autobody shops, since the 1940's.
- Possible importation of fill of unknown quality during the former landfilling activities in the area of the subject site, prior to 1928.

Soil and groundwater analyses from previous subsurface investigations, including data from boreholes and groundwater monitoring wells, will be used to supplement the current Phase II-ESA.

3.0 SCOPE OF INVESTIGATION

3.1 Overview of Site Investigation

The current subsurface investigation conducted as a component of this Phase II ESA consisted of drilling eight (8) boreholes, three of which were instrumented with groundwater monitoring wells. Boreholes were advanced to a maximum depth of 6.96 m below grade, some boreholes terminating within bedrock.

3.2 Media Investigated

During the subsurface investigation, soil samples and groundwater samples were obtained and submitted for laboratory analysis. The rationale for sampling and analyzing these media is based on the Contaminants of Potential Concern identified in the Phase I ESA and observations made in the field.

3.3 Phase I Conceptual Site Model

Geological and Hydrogeological Setting

Based on information from the Geological Survey of Canada mapping and the current and previous subsurface investigations, drift thickness in the area of the subject site is between 1.01 and 3.10 m. Overburden soils consist primarily of fill and silty sand. Bedrock in the area of the subject site is considered to be interbedded limestone and dolostone of the Gull River Formation.

Groundwater in the monitoring wells onsite was encountered within the bedrock. Groundwater levels ranged from 2.02 to 2.54 m below grade.

Contaminants of Potential Concern

The following CPCs were identified with respect to the subject site:

- Petroleum Hydrocarbons Fractions 1 through 4 (PHCs F1-F4) – this suite of parameters encompasses gasoline (Fraction 1), diesel and fuel oil (Fraction 2), and heavy oils (Fractions 3 and 4). PHCs F1-F4 were selected as CPCs for the Phase I property based on the historical use of three (3) underground storage tanks at the former retail fuel outlet, and the historical and present use of new and waste oil ASTs, as well as, various mechanical activities at the automotive service garages. Heavy oils may be present in the form of lubricants and transmission or hydraulic fluids. PHCs may be present in the soil matrix, sorbed to soil particles, as well as in free or dissolved phase in the groundwater system. PHCs are generally considered to be LNAPLs – light non-aqueous phase liquids, indicating that when present in sufficient concentrations above the solubility limit, they will partition into a separate phase above the water table, due to their lower density.
- Metals – this suite of parameters encompasses various metals for which MOECC standards exist. Metals may be present in the soil matrix or dissolved in site groundwater. Metals were selected as CPCs for the Phase I property based on the reported historical presence of a landfill in the area of the subject site and the former and current use of the subject site as various automotive service garages.
- Volatile Organic Compounds (VOCs) – this suite of parameters includes chlorinated solvents (Tetrachloroethylene, Trichloroethylene, Dichloroethylenes, and Vinyl Chloride) associated with de-greasing and dry cleaning, as well as benzene, toluene, ethylbenzene, and xylenes (BTEX), associated with gasoline. These parameters were selected as CPCs for the Phase I study area based on the use of the eastern portion of the subject site as various automotive service garages and commercial autobody shops, as well as, the former use of the northern portion of the subject site as a retail fuel outlet. VOCs may be present in the soil matrix as well as in the dissolved phase in the groundwater system.
- Polycyclic Aromatic Hydrocarbons (PAHs) - this suite of parameters encompasses various complex hydrocarbons, commonly associated with coal, combustion, and/or heavy-fraction hydrocarbons such as hydraulic, transmission or crankcase oil.

PAHs may be present in the soil matrix or dissolved in site groundwater. PAHs were selected as CPCs for the RSC Property based on the use of the property as an automotive garage, as well as the historical presence of nearby landfilling activities.

The mechanisms of contaminant transport within the site soils include physical transportation and leaching. Physical transport is not anticipated to be an issue at the subject site, given the developed nature of the site. Leaching is anticipated to play a lesser role in the contaminant transportation, given the presence of an asphaltic concrete parking lot surface.

The mechanisms of contaminant transport within the groundwater system include advection, dispersion, and diffusion. Diffusion and advection will likely dominate in the fill where lower hydraulic conductivity is likely to be present.

Existing Buildings and Structures

The site is occupied by residential dwellings at 311 and 315 Tweedsmuir Avenue, by a vacant kiosk at 1976 Scott Street and the commercial building (occupied two (2) automotive service garages, Westboro Self-storage, a landscaper for equipment storage and two (2) office units.) at 320 McRae Avenue.

Water Bodies

No water bodies are present within the Phase I study area. The closest body of water is the Ottawa River, located to the north and west of the subject site.

Areas of Natural Significance

No areas of natural significance were identified on the site or in the Phase I study area.

Drinking Water Wells

Based on the availability of municipal water within the Phase I ESA study area, drinking water wells are not expected to be located on the subject property or neighbouring properties within the study area.

Neighbouring Land Use

Neighbouring land use in the Phase I study area is a mixture of residential, commercial and industrial properties.

Potentially Contaminating Activities and Areas of Potential Environmental Concern

Various PCAs were identified with regard to the current and former use of properties within the Phase I study area, however, only the PCAs identified on the subject site were considered to represent APECs on the subject site. As discussed in detail in the Phase I-ESA report and in Section 2.2 of this report, these PCAs are associated with the potential former landfilling activities in the area of the subject site, the former use of the northern portion of the subject site as a retail fuel outlet and the previous and continued use of the commercial structure on the southeast portion of the property as various automotive service garages and autobody shops.

Assessment of Uncertainty and/or Absence of Information

The information available for review as part of the preparation of the Phase I ESA is considered to be sufficient to conclude that there are areas of potential environmental concern on the subject site which have the potential to have impacted the subject site. The exact footprint of the reported former landfill site in the area of the subject site could not be confirmed. The presence of potentially contaminating activities was confirmed by a variety of independent sources, and as such, the conclusions of this report are not affected by uncertainty which may be present with respect to the individual sources.

3.4 Deviations from Sampling and Analysis Plan

The Sampling and Analysis Plan for this project is included in Appendix 1 of this report. No significant deviations from the sampling and analysis plan were noted.

3.5 Impediments

The presence of various utilities on the east and north sides of the property restricted borehole placement in these areas. General use of the subject site (automotive service garage; shuffling of vehicles and equipment) resulted in restricted locations for drilling, with several delays and interruptions.

No other physical impediments or denial of access were encountered during the Phase II Environmental Site Assessment.

4.0 INVESTIGATION METHOD

4.1 Subsurface Investigation

The recent subsurface investigation was conducted on March 29 and 30, 2017 and consisted of the drilling of eight (8) boreholes, three (3) of which were instrumented with groundwater monitoring wells. The boreholes were drilled by George Downing Estate Drilling Ltd. under full-time supervision of Paterson staff. Boreholes were also drilled on the property in 2014, and 2008. Three (3) previous groundwater monitoring wells remain on site from those investigations. Borehole locations are shown on Drawing No. PE3391-4 and PE3391-5, appended to this report.

4.2 Soil Sampling

A total of 22 soil samples were obtained from the boreholes by means of auger flight sampling and split spoon sampling. Split spoon samples were taken at approximate 0.6 m intervals. The depths at which split spoon and auger flight samples were obtained from the boreholes are shown as “**SS**” and “**AU**” respectively on the Soil Profile and Test Data Sheets, appended to this report. A total of 3 rock core samples were also collected from each BH9, BH10 and BH11 during the coring. These are shown as “**RC**” on the Soil Profile and Test Data Sheets.

Soil samples and rock core samples were also collected during previous investigations in 2014 and 2008.

Site soils consist primarily of fill material (crushed stone over sandy material), with some silty sand, underlain by limestone bedrock. Glacial till was identified below fill material at the south end of the property. A concrete floor is present in the building. Gravel ground surface is present in the area of the former underground tank nest in the north-east side of the property.

Concrete encountered in BH1 and BH2 was 0.15 m thick, asphalt in other areas was approximately 0.05 m thick. Fill was present in all boreholes in thicknesses varying between 0.96 to 3.38 m. Fill material with traces of glass, plastic, slag and metal pieces), was identified in the upper fill layer at BH1, BH8 and BH16.

A hydrocarbon odour was noted in the rock core collected from BH9. During the previous investigation in 2014, a hydrocarbon odour was noted in a soil sample collected from BH3, however no such odours were noted in BH10, placed adjacent to BH3. Bedrock was confirmed at depths of 1.19 m to 3.30 m, and limestone bedrock (with calcite seams) was cored to a maximum depth of 7.87 m below grade.

4.3 Field Screening Measurements

Samples collected from site underwent a preliminary screening procedure which included visual screening for colour and evidence of deleterious substances. A MiniRae 2000 photoionization detector (PID) was used to determine the selection of samples to be submitted for analytical testing.

The soil vapours were measured by inserting the analyzer probe into the nominal headspace above the soil sample. Samples were then agitated and the peak readings recorded. The vapour readings ranged from 0.2 to 242 ppm. Vapour readings are noted on the Soil Profile and Test Data Sheets in Appendix 1.

Soil samples were selected for analysis based on visual appearance, location, and vapour readings.

4.4 Groundwater Monitoring Well Installation

Three (3) groundwater monitoring wells installed in 2014 (BH1, BH2 and BH3) by CoreTech Drilling Inc. of Ottawa, under full-time supervision by Paterson personnel. Two (2) groundwater monitoring wells (BH4 and BH6) were installed in 2008 by George Downing Estate Drilling Inc., and three (3) more in 2017 by the same contractor. The monitoring wells consisted of 32 mm diameter Schedule 40 threaded PVC risers and screens. A sand pack consisting of silica sand was placed around the screen, and a bentonite seal was placed above the screen to minimize cross-contamination. Monitoring well construction details are provided on the Soil Profile and Test Data Sheets in Appendix 1. A summary of monitoring well construction details is provided below in Table 1.

The groundwater monitoring wells were developed upon completion using a dedicated inertial lift pump. A minimum of three (3) well volumes were removed from the wells.

It should be noted that the monitoring wells installed at BH3 and BH4 have been destroyed.

| Table 1: Monitoring Well Construction Details | | | | | | |
|--|---------------------------------|----------------------------|----------------------------------|--------------------------|-------------------------------|--------------------|
| Well ID | Ground Surface Elevation | Total Depth (m BGS) | Screened Interval (m BGS) | Sand Pack (m BGS) | Bentonite Seal (m BGS) | Casing Type |
| BH4 (2008) <i>Destroyed</i> | 63.42 | 7.75 | 4.70 – 7.75 | 3.05 – 7.75 | 0.60 – 3.05 | Flushmount |
| BH6 (2008) | 63.16 | 7.87 | 4.82 – 7.87 | 3.05 – 7.87 | 0.60 – 3.05 | Flushmount |
| BH1 (2014) | 64.76 | 7.09 | 4.04 – 7.09 | 3.58 – 7.09 | 0.60 – 3.58 | Flushmount |
| BH2 (2014) | 63.04 | 7.01 | 3.96 – 7.01 | 3.35 – 7.01 | 0.60 – 3.35 | Flushmount |
| BH3 (2014) <i>Destroyed</i> | 63.17 | 3.38 | 1.86 – 3.38 | 1.55- 3.38 | 0.60 - 1.55 | Flushmount |
| BH9 (2017) | 63.44 | 5.48 | 2.30 – 5.48 | 2.21 – 5.48 | 0.3 – 2.21 | Flushmount |
| BH10 (2017) | 63.12 | 6.96 | 3.80 – 6.96 | 3.61 – 6.96 | 0.3 – 3.61 | Flushmount |
| BH11 (2017) | 63.42 | 5.77 | 2.65 – 5.77 | 2.44 – 5.77 | 0.3 – 2.44 | Flushmount |

4.5 Groundwater Sampling

Groundwater sampling protocols were followed using the MOECC document entitled “Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario”, dated May 1996.

Groundwater samples were obtained from each monitoring well, using dedicated sampling equipment. Standing water was purged from each well prior to sampling. Samples were stored in coolers to reduce analyte volatilization during transportation. Details of our standard operating procedure for groundwater sampling are provided in the Sampling and Analysis Plan in Appendix 1.

4.6 Analytical Testing

Based on the guidelines outlined in the Sampling and Analysis Plan appended to this report, the following soil and groundwater samples were submitted for analysis:

| Table 2: Soil Samples Submitted | | | | | | | |
|-------------------------------------|-------------------------------------|---------------------|-----|-----|------|--------------|--|
| Sample ID | Sample Depth/ Stratigraphic Unit | Parameters Analyzed | | | | | Rationale |
| | | Metals | PAH | VOC | BTEX | PHCs (F1-F4) | |
| Phase II-ESA Investigation, 2008 | | | | | | | |
| BH8-SS2 | 0.76-1.01 m; Fill | X | | | | X | Assessment of suspect fill material on the east side of the commercial building. |
| Phase II-ESA Investigation, 2014 | | | | | | | |

| BH11-GW1 | 2.65 – 5.65 m, Bedrock | X | X | X | | | Assessment of the groundwater in the vicinity of the former underground storage tank nest and pump island |

Paracel Laboratories (Paracel), of Ottawa, Ontario, performed the laboratory analysis on the samples submitted for analytical testing. Paracel is a member of the Standards Council of Canada/Canadian Association for Laboratory Accreditation (SCC/CALA). Paracel is accredited and certified by SCC/CALA for specific tests registered with the association.

4.7 Residue Management

Soil cuttings, purge water and fluids from equipment cleaning were retained on-site.

4.8 Elevation Surveying

Ground surface elevations at the borehole locations were determined by Paterson personnel based on the geodetic elevation of the top of spindle of a fire hydrant (64.44 m), which is no longer present, located on the west side of McRae Street, immediately south of Scott Street, and a municipal catch basin (63.13 m), located on the east side of Tweedsmuir Avenue, immediately south of Scott Street. The geodetic elevations are based on a Topographic Site Plan prepared by Stantec Geomatics Ltd. in 2008. The accuracy of the benchmark was not verified by Paterson.

4.9 Quality Assurance and Quality Control Measures

A summary of quality assurance and quality control (QA/QC) measures, including sampling containers, preservation, labelling, handling, and custody, equipment cleaning procedures, and field quality control measurements is provided in the Sampling and Analysis Plan in Appendix 1.

5.0 REVIEW AND EVALUATION

5.1 Geology

Site soils primarily consist of sandy fill material, with some silty sand (and gravel at BH14 and BH15), atop predominantly limestone bedrock. The fill material consists of silty sand with gravel and some cobbles. Traces of plastic, slag and metal pieces were observed in BH1 at depths of 0.91 m and 2.44 m, BH8 between 0.30 and 1.10 m, and BH16 from below the asphalt surface and 1.37 m. Bedrock was cored in BH1, BH2, BH4, BH6, BH9, BH10 and BH11 to depths ranging from 7.09 and 7.87 m below grade.

Groundwater monitoring wells were installed at BH1, BH2, BH3, BH4, BH6, BH9, BH10 and BH11. In recent years, the groundwater monitoring wells at BH3 and BH4 have been destroyed and are no longer present. Site stratigraphy is shown on Drawings PE3391-6A - Cross-Section A-A' – Soil and PE3391-6B - Cross-Section A-A' - Groundwater.

5.2 Groundwater Elevations, Flow Direction, and Hydraulic Gradient

Groundwater levels were measured during the groundwater sampling event on April 5, 2017, using an electronic water level meter. Groundwater levels are summarized below in Table 4. All measurements are geodetic based on the topographic site plan prepared by Stantec Geomatics Ltd.

| Table 4: Groundwater Level Measurements | | | | |
|--|-------------------------------------|--|--------------------------------------|----------------------------|
| Borehole Location | Ground Surface Elevation (m) | Water Level Depth (m below grade) | Water Level Elevation (m ASL) | Date of Measurement |
| BH1 | 64.76 | 2.50 | 62.26 | April 5, 2017 |
| BH2 | 63.04 | 2.25 | 60.79 | April 5, 2017 |
| BH6 | 63.16 | 2.08 | 61.08 | April 5, 2017 |
| BH9 | 63.44 | 2.35 | 61.09 | April 5, 2017 |
| BH10 | 63.12 | 2.05 | 61.07 | April 5, 2017 |
| BH11 | 63.42 | 2.54 | 60.88 | April 5, 2017 |

Based on the groundwater levels collected during the April 5, 2017 groundwater sampling event, the groundwater flow at the subject property is considered to be in a northward direction, consistent with the anticipated regional groundwater flow direction towards the Ottawa River.

No free product was observed in the monitoring wells sampled at the subject site, however a hydrocarbon odour was noted within the groundwater samples collected from BH9.

5.3 Fine-Medium Soil Texture

Based on field soil observations, fine-grained soil standards are not applicable to the subject site.

5.4 Soil: Field Screening

Field screening of the soil samples collected during drilling resulted in organic vapour readings of 0.2 ppm to 242 ppm. Field screening results of each individual soil sample are provided on the Soil Profile and Test Data Sheets appended to this report.

The organic vapour readings obtained from field screening of soil samples identified the potential for PHC contamination in BH3-SS6 (242 ppm).

Higher-fraction hydrocarbons may not be as readily detectable by combustible gas or PID detectors.

Visually, pieces of slag were observed in some of the fill samples from BH1, and traces of plastic and glass were noted in fill samples from BH16.

5.5 Soil Quality

Five (5) soil samples from the current investigation were submitted for analysis of a combination of metals, PHCs, BTEX, VOCs and PAH. The results of the testing are presented below. Also provided are the previous analytical results from the 2008 and 2014 investigations. Laboratory certificates for the recent analytical testing are presented in Appendix A.

All metals parameter concentrations were found to be in compliance with the MOECC Table 7 standards with the exception of samples collected from BH15 and BH16.

Soil Sample BH15-SS2 was later submitted for barium analysis to confirm that the barium exceedance noted in Sample BH15-AU1 was limited to the upper fill material. Barium in that sample (Sample BH15-SS2) was in compliance with the MOECC Table 7 standard.

Barium, cadmium, lead, mercury and zinc were identified in Sample BH8-SS2 (from October, 2008) in excess of the selected MOECC Table 7 standards. Arsenic was identified in Sample BH1-SS3 in excess of the MOECC Table 7 standard. All other metals parameters were in compliance with the selected MOECC standards.

No VOC parameters were detected above the laboratory detection limits. All VOC concentrations are in compliance with the MOECC Table 7 standards.

A soil sample (BH1-SS4) was later analysed for the full VOC suite, based on the earlier BTEX results. All VOC parameters from Sample BH1-SS4 were non-detect, and in compliance with the MOECC Table 7 standards.

All other parameter concentrations were below laboratory detection limits.

5.6 Groundwater Quality

Groundwater samples were collected from the recent groundwater monitoring wells installed at BH9, BH10 and BH11. Samples were also collected from older wells installed at BH1, BH2 and BH6 during previous work and the current study.

The results of the analytical testing are presented below in Tables 12 - 17. The laboratory certificates of analysis are provided in Appendix 1.

5.7 Phase II Conceptual Site Model

The following section has been prepared in accordance with the requirements of O.Reg. 269/11 amending O.Reg. 153/04 - Record of Site Condition regulation, made under the Environmental Protection Act. Conclusions and recommendations are discussed in a subsequent section.

Site Description

Potentially Contaminating Activity and Areas of Potential Environmental Concern

As indicated in the Phase I-ESA report, potentially contaminating activities (PCAs) that are considered to represent areas of potential environmental concern (APECs) on the subject site consist of:

- ☐ The former use of the northern portion of the subject site (1976 Scott Street) as a retail fuel outlet, between 1971 and 2002.
- ☐ The former and continued use of various units within the commercial building on the southeast portion of the subject site as various automotive service garages and autobody shops, since the 1940's.
- ☐ Possible importation of fill of unknown quality during the former landfilling activities in the area of the subject site, prior to 1928.

These activities are all considered to have had the potential to have introduced contamination to the soil and/or groundwater under the subject site.

Subsurface Structures and Utilities

Public and private underground service locates were completed for a 5 m radius around each borehole location, prior to the subsurface investigation. Various underground utilities including sewers and private drainage lines were identified in the vicinity of the boreholes. No private potable water wells or septic systems are present on the subject site.

Physical Setting

Site Stratigraphy

The site stratigraphy, from ground surface to the deepest aquifer or aquitard investigated, is illustrated on Drawings PE3391-6A and PE3391-6B. Stratigraphy consists of:

- ❑ Concrete in BH1 and BH2 with a thickness of 0.15 m (interior of building). Asphalt in BH6, BH7 and BH8 with a thickness of 0.05 to 0.06 m.
- ❑ Fill, generally consisting of silty sand with gravel (with pieces of slag in BH1, metal pieces in BH8 and some glass in BH16), varying in thickness from 1.04 to 2.29 m, with deeper fill in the former underground storage tank nest location at BH3 (3.38 m). Groundwater was not observed in this stratigraphic unit.
- ❑ Silty sand with gravel, and cobbles was identified in BH7 with a thickness of 1.58 m. Gravel was also encountered in Boreholes BH14 and BH15.
- ❑ Limestone bedrock - this unit was confirmed in BH1, BH2, BH4, BH6, BH9, BH10 and BH11, where bedrock was cored to depths between 1.19 to 7.87 m below grade. Groundwater was observed in this stratigraphic unit. This is the deepest unit investigated.

Hydrogeological Characteristics

Groundwater was encountered in the limestone bedrock at the subject site. The upper bedrock unit is interpreted to function as a local aquifer at the subject site.

Water levels were measured at the subject site on April 5, 2017. Water levels are summarized above in Section 6.2 of this report and are shown on the attached drawings.

Based on measured groundwater levels, the groundwater flow direction at the subject property is in a northward direction, heading towards the Ottawa River.

Approximate Depth to Bedrock

Bedrock was confirmed in Boreholes BH1, BH2, BH4, BH6, BH9, BH10, and BH11 at depths of 1.19 to 3.30 m below grade.

Approximate Depth to Water Table

The depth to water table at the subject site varies between approximately 2.05 and 2.54 m below existing grade.

Sections 41 and 43.1 of the Regulation

Section 41 of the Regulation (Site Condition Standards, Environmentally Sensitive Areas) does not apply to the subject site.

Section 43.1 of the Regulation does apply to the subject site in that the subject site is a Shallow Soil Property; bedrock is estimated at depths less than 2 m below grade across more than two thirds (2/3) of the entire site. It is not located within 30 m of a water body.

Fill Placement

Fill material was identified at the subject site. As addressed in the Phase I-ESA, potentially impacted fill deposition was considered to be a potentially contaminating activity, associated with the reported former landfilling activities in the area the subject site.

Proposed Buildings and Other Structures

It is Paterson's understanding that the subject site will be developed with three (3) mixed use (commercial/residential) buildings.

Existing Buildings and Structures

The subject site is currently occupied by two, 2-storey residential dwellings (311 and 315 Tweedsmuir Avenue), a small vacant kiosk (1976 Scott Street) and a commercial building with a partial second storey (320 McRae Avenue). No other buildings or structures are present on the subject site.

Water Bodies

The Ottawa River is the closest body of water to the subject site, located generally to the north of the subject site, with the closest point approximately 800 m west.

Areas of Natural Significance

No areas of natural significance are present on the subject site.

Environmental Condition

Areas Where Contaminants are Present

Areas where contaminants are present (identified as part of the current Phase II-ESA) include the parking area to the north of the building along McRae Avenue (metals, PAH), and a portion of the parking area to the south of the building (barium).

During previous investigations; contaminants were identified below the southern portion of the building (metals), within the former tank test (PHC), and in the space between the building and McRae Avenue (metals, PHC).

Groundwater impacts (PHC, BTEX) were identified in the monitoring well located within the former pump island area.

The areas where contaminants are present in concentrations greater than the MOECC Table 7 standards are shown on Drawing PE3391-4 and PE3391-5.

Types of Contaminants

Based on the recent analytical testing, contaminants found at concentrations greater than the MOECC Table 7 standards at the subject site consist of various metals, the F1 and F3 petroleum hydrocarbon fractions, and benzo[a]pyrene in soil. In groundwater, identified contaminants include the F1 petroleum hydrocarbon fraction, benzene, ethylbenzene, and xylenes.

Contaminated Media

Based on the results of the Phase II ESA, the contaminants of concern are present in the fill at various locations on the subject site, in the southeast part of the site around the commercial building.

Hydrocarbon and BTEX impacts were also detected in the groundwater at one groundwater well location, BH9.

What Is Known About Areas Where Contaminants Are Present

Contaminants are located in the vicinity of the commercial structure on the subject site, in the area of the former underground storage tank nest and pump island associated with the former retail fuel outlet. Based on the nature of the contaminants and their locations, the contaminants are suspected to be from imported poor quality fill, the operation of automotive services garages, autobody shops on the eastern portion of the property and the former operation of the retail fuel outlet on northeastern portion of the subject site.

Distribution of Contaminants

The horizontal distribution of contaminants is shown on Drawing PE3391-4 and PE3391-5.

Vertically, the soil contaminants were observed in the fill strata in BH1, BH3, BH8, BH15 and BH16. Suspect fill (traces of slag and metal pieces) was identified in BH1 and BH8, and trace amounts of glass and plastic were identified in BH16.

Groundwater contamination was identified in the monitoring well at BH9, and is considered to be localised to the area around the former pump island.

Discharge of Contaminants

The source of metal and PAH contaminants may be associated with the importation of poor quality fill material or activities associated with the past use of the commercial building on site. The presence of PHC and BTEX contamination in the soil and groundwater is considered to be associated with the use of the subject site as various automotive service garages and autobody shops, as well as, the former use of the northern portion of the property as a retail fuel outlet.

Migration of Contaminants

The migration of metals and PAH contaminants within the soil, or from the soil to groundwater, is expected to be limited due to the fact that the groundwater table was encountered primarily within the bedrock, and not within the fill above it. Furthermore, metals and PAHs were tested in the groundwater and all parameters were in compliance with the site standards.

PHC and BTEX impacts have a greater potential to migrate through the bedrock to the groundwater table and migrate with the groundwater flow. PHC and BTEX contaminants are typically light non-aqueous phase liquids (LNAPLs), which have a specific density less than water, which would mean they would sit atop the groundwater table.

The migration of contaminants within site groundwater is interpreted to be controlled primarily by groundwater flow at the subject site as well as seasonal fluctuations.

Climatic and Meteorological Conditions

In general, climatic and meteorological conditions have the potential to affect contaminant distribution. Two ways by which climatic and meteorological conditions may affect contaminant distribution include the downward leaching of contaminants by means of the infiltration of precipitation, and the migration of contaminants via groundwater levels and/or flow, which may fluctuate seasonally.

Based on analytical test results, downward leaching through the fill layer into the water table has not occurred, primarily due to the layer of asphalt covering most of the parking lot and the buildings covering the remainder of the property. Furthermore, metals are not known to readily dissolve in groundwater.

Potential for Vapour Intrusion

The potential for vapour intrusion into the existing buildings is considered to be negligible, and insignificant with respect to the vapours already present in the garage spaces due to the products typically used in auto garages. Furthermore, only metals were identified exceedance in the soil from the boreholes drilled inside the commercial building, and metals do not easily enter the vapour state.

6.0 CONCLUSIONS

Assessment

A Phase II ESA was conducted for the commercial and residential properties addressed 320 McRae Avenue, 1976 Scott Street, 311 and 315 Tweedsmuir Avenue, in the City of Ottawa, Ontario. The purpose of the Phase II ESA was to address the areas of potential environmental concern (APECs) identified during the Phase I ESA. The APECs included the former landfill in the area of the subject site, the former and continued use of the eastern portion of the subject site as various automotive service garages and autobody shops, as well as, the former use of the northern portion of the subject site as a retail fuel outlet.

During a previous investigation in 2008, petroleum hydrocarbon (PHC) fraction F3, barium, cadmium, lead, mercury and zinc impacted fill was identified on the east side of the commercial building and impacted groundwater (benzene, chloroform, toluene, xylenes and PHC (F1)) was identified in BH6, on the north side of the commercial building. Field observations indicated the presence of impacted groundwater in BH4, in the former pump island area. This well was not found at the time of the current assessment and could not be assessed.

A 2014 subsurface investigation at the subject site was conducted on October 8 and 9, 2014 and consisted of the drilling of three (3) boreholes and the installation of three (3) groundwater monitoring wells.

An arsenic concentration in BH1 and a petroleum hydrocarbon (PHC) fraction 1 (F1) concentration in BH3 were identified in excess of the selected MOECC Table 7 standards.

Metals impacted fill in BH1 was visually identified at depths of 0.91 and 2.44 m, while in BH3 a thin layer of PHC impacted fill was identified between 3.28 and 3.38 m below ground surface, immediately on top of bedrock surface.

Groundwater samples were obtained from the monitoring wells at BH1 and BH2, and submitted for analysis of PHCs and volatile organic compounds (VOCs). None of the analytical parameters were found to exceed the selected MOECC Table 7 standards.

The current investigation included the placement of eight (8) boreholes, three (3) of which were instrumented with groundwater monitoring wells.

Metals in excess of the MOECC Table 7 standards were identified in the fill material at BH15 and BH16. One PAH parameter was also identified in excess of the MOECC Table 7 standard in borehole BH16.

All groundwater was found to be in compliance with the MOECC Table 7 standards with the exception of the groundwater from BH9, where the F1 fraction petroleum hydrocarbon, benzene, ethylbenzene, and xylenes were identified above the MOECC Table 7 standard. The groundwater from BH6 was analysed again and all hydrocarbon and BTEX parameters were in compliance with the site standards.

Recommendations

Soil

Metal, PAH, and PHC concentrations in some soils are present at the subject site in concentrations in excess of the selected MOECC Table 7 standards. The presence of metals impacted fill beneath the commercial building and petroleum impacts in the former tank nest area are not considered to represent an immediate risk to the current use of the subject site. It is understood that, the site is being considered for redevelopment.

Any impacted soil removed from the site during redevelopment will require disposal at an approved waste disposal facility. Prior to disposal, a toxicity characteristic leaching procedure analysis will be required on a representative soil sample. It is recommended that Paterson personnel be present onsite during the soil excavation program to direct excavation activities in the areas where impacted material has been identified or is expected to exist. Additional testing may be required to effectively identify and delineate the impacted fill on the subject site.

If any soil is to remain on-site, it is recommended that confirmatory soil samples be collected upon completion of the soil remediation program to ensure that the site is in compliance with the MOECC Table 7 Standards.

Groundwater

Groundwater in the vicinity of the former pump island, located at the northern end of the property, appears to have been impacted with the F1 PHC fraction, as well as benzene, ethylbenzene, and xylenes.

Depending upon the volume of impacted groundwater encountered during future site development, and the depth of the future site works, several options may be available to treat the groundwater. The removal of impacted groundwater from the site by a licensed pumping contractor would be a feasible option for smaller volumes, while an on-site treatment system would likely be more economical for larger volumes over a longer period of time. An on-site treatment system would discharge to the City of Ottawa sewer system. Prior to discharging treated groundwater to the municipal sewer system, a Sanitary Sewer Agreement will be required from the City of Ottawa's Sewer Use Program. Additional groundwater monitoring wells may be required following the completion of the site remediation program to ensure that the site meets the MOECC Table 7 Standards.

If site development does not occur in the near future, it is recommended that the groundwater from BH9 be retested to confirm the quality of the groundwater and the need for any remediation.

7.0 STATEMENT OF LIMITATIONS

This Phase II - Environmental Site Assessment report has been prepared in general accordance with O.Reg. 153/04 as amended by O.Reg. 269/11, and meets the requirements of CSA Z769-00. The conclusions presented herein are based on information gathered from a limited sampling and testing program. The test results represent conditions at specific test locations at the time of the field program.

The client should be aware that any information pertaining to soils and all test hole logs are furnished as a matter of general information only and test hole descriptions or logs are not to be interpreted as descriptive of conditions at locations other than those of the test holes themselves.

Should any conditions be encountered at the subject site and/or historical information that differ from our findings, we request that we be notified immediately in order to allow for a reassessment.

This report was prepared for the sole use of the Estate of Carson Unsworth. Permission and notification from the Estate of Carson Unsworth and Paterson will be required to release this report to any other party.

1.0 SAMPLING PROGRAM

Paterson Group Inc. (Paterson) was commissioned by the Estate of Carson Unsworth to conduct a Phase II Environmental Site Assessment (ESA) for the property located at 320 McRae Avenue, 1976 Scott Street and 311 Tweedsmuir Avenue, in the City of Ottawa, Ontario. Based on the results of a 2008 Phase II ESA and the 2014 Phase II ESA completed by Paterson for the subject property, a subsurface investigation program, consisting of borehole drilling, was developed. The summary of the sampling program is provided below in Table 1.

| Table 1: Sampling Program Summary | | |
|--|--|---|
| Borehole | Location & Rationale | Proposed Depth & Rationale |
| BH9 | Drill to assess the former pump island | Drilled to intercept water table for monitoring well installation. Coring bedrock will likely be necessary. |
| BH10 | Drill to assess potential BTEX and PHC impacts in the former underground storage tank nest on 1976 Scott Street. | Drilled to intercept water table for monitoring well installation. Coring bedrock will likely be necessary. |
| BH11 | Drill to assess the groundwater in the vicinity of the former underground storage tank nest and pump island | Drilled to intercept water table for monitoring well installation. Coring bedrock will likely be necessary. |
| BH12 | Drill to assess potential placement of fill and for general coverage. | Drill to bedrock. Well installation not anticipated. |
| BH13 | Drill to assess potential placement of fill and the former retail fuel outlet. | Drill to bedrock. Well installation not anticipated. |
| BH14 | Drill to assess fill material, and soils in vicinity of garage | Drill to bedrock. Well installation not anticipated. |
| BH15 | Drill to assess fill material, and soils in vicinity of garage | Drill to bedrock. Well installation not anticipated. |
| BH16 | Drill to assess fill material, and soils in vicinity of garage | Drill to bedrock. Well installation not anticipated. |

All boreholes are considered to be assessing the subject site for the potential presence of deleterious fill, to address the area of potential environmental concern associated with the reported former land-filling activities in the area of the subject site. Borehole locations are shown on the Test Hole Location Plan appended to the main report.

At each borehole, auger and split-spoon samples of overburden soils will be obtained at 0.6 m (2') intervals until approximately 2.0 m below the groundwater

level, to intercept groundwater with monitoring wells. All soil samples will be retained, and samples will be selected for submission following a preliminary screening analysis.

Following borehole drilling, monitoring wells will be installed in selected boreholes (as above) for the measurement of water levels and the collection of groundwater samples.

2.0 ANALYTICAL TESTING PROGRAM

The analytical testing program for soil at the subject site is based on the following general considerations:

- At least one sample from each borehole should be submitted, in order to delineate the horizontal extent of contamination across the site.
- At least one sample from each stratigraphic unit should be submitted, in order to delineate the vertical extent of contamination at the site.
- In boreholes where there is visual or olfactory evidence of contamination, or where organic vapour meter or photoionization detector readings indicate the presence of contamination, the 'worst-case' sample from each borehole should be submitted for comparison with MOE site condition standards.
- In boreholes with evidence of contamination as described above, a sample should be submitted from the stratigraphic unit below the 'worst-case' sample to determine whether the contaminant(s) have migrated downward.
- Parameters analyzed should be consistent with the Contaminants of Potential Concern identified in the Phase I ESA.

The analytical testing program for groundwater at the subject site is based on the following general considerations:

- Groundwater monitoring wells should be installed in all boreholes with visual or olfactory evidence of soil contamination, in stratigraphic units where soil contamination was encountered, where those stratigraphic units are at or below the water table (i.e. a water sample can be obtained).
- Groundwater monitoring well screens should straddle the water table at sites where the contaminants of concern are suspected to be LNAPLs.

- At least one groundwater monitoring well should be installed in a stratigraphic unit below the suspected contamination, where said stratigraphic unit is water-bearing.
- Parameters analyzed should be consistent with the Contaminants of Concern identified in the Phase I ESA and with the contaminants identified in the soil samples.

3.0 STANDARD OPERATING PROCEDURES

3.1 Environmental Drilling Procedure

Purpose

The purpose of environmental boreholes is to identify and/or delineate contamination within the soil and/or to install groundwater monitoring wells in order to identify contamination within the groundwater.

Equipment

The following is a list of equipment that is in addition to regular drilling equipment stated in the geotechnical drilling SOP:

- Glass soil sample jars
- two buckets
- cleaning brush (toilet brush works well)
- dish detergent
- methyl hydrate
- water (if not available on site - water jugs available in trailer)
- latex or nitrile gloves (depending on suspected contaminant)
- RKI Eagle organic vapour meter or MiniRae photoionization detector (depending on contamination suspected)

Determining Borehole Locations

If conditions on site are not as suspected, and planned borehole locations cannot be drilled, **call the office to discuss**. Alternative borehole locations will be determined in conversation with the field technician and supervising engineer.

After drilling is completed a plan with the borehole locations must be provided. Distances and orientations of boreholes with respect to site features (buildings, roadways, etc.) must be provided. Distances should be measured using a measuring tape or wheel rather than paced off. Ground surface elevations at each borehole should be surveyed relative to a geodetic benchmark, if one is available, or a temporary site benchmark which can be tied in at a later date if necessary.

Drilling Procedure

The actual drilling procedure for environmental boreholes is the same as geotechnical boreholes (see SOP for drilling and sampling) with a few exceptions as follows:

- Continuous split spoon samples (every 0.6 m or 2') or semi-continuous (every 0.76 m or 2'6") are required.
- Make sure samples are well sealed in plastic bags with no holes prior to screening and are kept cool but unfrozen.
- If sampling for VOCs, BTEX, or PHCs F1, a soil core from each soil sample which may be analyzed must be taken and placed in the laboratory-provided methanol vial.
- Note all and any odours or discolouration of samples.
- Split spoon samplers must be washed between samples.
- If obvious contamination is encountered, continue sampling until vertical extent of contamination is delineated.
- As a general rule, environmental boreholes should be deep enough to intercept the groundwater table (unless this is impossible/impractical - call project manager to discuss).
- If at all possible, soil samples should be submitted to a preliminary screening procedure on site, either using a RKI Eagle, PID, etc. depending on type of suspected contamination.

Spoon Washing Procedure

All sampling equipment (spilt spoons, etc.) must be washed between samples in order to prevent cross contamination of soil samples.

-
- Obtain two buckets of water (preferably hot if available)
 - Add a small amount of dish soap to one bucket
 - Scrub spoons with brush in soapy water, inside and out, including tip
 - Rinse in clean water
 - Apply a small amount of methyl hydrate to the inside of the spoon. (A spray bottle or water bottle with a small hole in the cap works well)
 - Allow to dry (takes seconds)
 - Rinse with distilled water, a spray bottle works well.

The methyl hydrate eliminates any soap residue that may be on the spoon, and is especially important when dealing with suspected VOCs.

Screening Procedure

The RKI Eagle is used to screen most soil samples, particularly where petroleum hydrocarbon contamination is suspected. The MiniRae is used when VOCs are suspected, however it also can be useful for detecting petroleum. These tools are for screening purposes only and cannot be used in place of laboratory testing. Vapour results obtained from the RKI Eagle and the PID are relative and must be interpreted.

Screening equipment should be calibrated on an approximately monthly basis, more frequently if heavily used.

- Samples should be brought to room temperature; this is specifically important in colder weather. Soil must not be frozen.
- Turn instrument on and allow to come to zero - calibrate if necessary
- If using RKI Eagle, ensure instrument is in methane elimination mode unless otherwise directed.
- Ensure measurement units are ppm (parts per million) initially. RKI Eagle will automatically switch to %LEL (lower explosive limit) if higher concentrations are encountered.
- Break up large lumps of soil in the sample bag, taking care not to puncture bag.

- Insert probe into soil bag, creating a seal with your hand around the opening.
- Gently manipulate soil in bag while observing instrument readings.
- Record the highest value obtained in the first 15 to 25 seconds
- Make sure to indicate scale (ppm or LEL); also note which instrument was used (RKI Eagle 1 or 2, or MiniRae).
- Jar samples and refrigerate as per Sampling and Analysis Plan.

3.2 Monitoring Well Installation Procedure

Equipment

- 5' x 2" [1.52 m x 50 mm] threaded sections of Schedule 40 PVC slotted well screen (5' x 1¼" [1.52 m x 32 mm] if installing in cored hole in bedrock)
- 5' x 2" [1.52 m x 50 mm] threaded sections of Schedule 40 PVC riser pipe (5' x 1¼" [1.52 m x 32 mm] if installing in cored hole in bedrock)
- Threaded end-cap
- Slip-cap or J-plug
- Asphalt cold patch or concrete
- Silica Sand
- Bentonite chips (Holeplug)
- Steel flushmount casing

Procedure

- Drill borehole to required depth, using drilling and sampling procedures described above.
- If borehole is deeper than required monitoring well, backfill with bentonite chips to required depth. This should only be done on wells where contamination is not suspected, in order to prevent downward migration of contamination.

- Only one monitoring well should be installed per borehole.
- Monitoring wells should not be screened across more than one stratigraphic unit to prevent potential migration of contaminants between units.
- Where LNAPLs are the suspected contaminants of concern, monitoring wells should be screened straddling the water table in order to capture any free product floating on top of the water table.
- Thread the end cap onto a section of screen. Thread second section of screen if required. Thread risers onto screen. Lower into borehole to required depth. Ensure slip-cap or J-plug is inserted to prevent backfill materials entering well.
- As drillers remove augers, backfill borehole annulus with silica sand until the level of sand is approximately 0.3 m above the top of the screen.
- Backfill with holeplug until at least 0.3 m of holeplug is present above the top of the silica sand.
- Backfill remainder of borehole with holeplug or with auger cuttings (if contamination is not suspected).
- Install flushmount casing. Seal space between flushmount and borehole annulus with concrete, cold patch, or holeplug to match surrounding ground surface.

3.3 Monitoring Well Sampling Procedure

Equipment

- Water level metre or interface probe on hydrocarbon/LNAPL sites
- Spray bottles containing water and methanol to clean water level tape or interface probe
- Peristaltic pump
- Polyethylene tubing for peristaltic pump
- Flexible tubing for peristaltic pump
- Latex or nitrile gloves (depending on suspected contaminant)

- Allen keys and/or 9/16" socket wrench to remove well caps
- Graduated bucket with volume measurements
- pH/Temperature/Conductivity combo pen
- Laboratory-supplied sample bottles

Sampling Procedure

- Locate well and use socket wrench or Allan key to open metal flush mount protector cap. Remove plastic well cap.
- Measure water level, with respect to existing ground surface, using water level meter or interface probe. If using interface probe on suspected NAPL site, measure the thickness of free product.
- Measure total depth of well.
- Clean water level tape or interface probe using methanol and water. Change gloves between wells.
- Calculate volume of standing water within well and record.
- Insert polyethylene tubing into well and attach to peristaltic pump. Turn on peristaltic pump and purge into graduated bucket. Purge at least three well volumes of water from the well. Measure and record field chemistry. Continue to purge, measuring field chemistry after every well volume purged, until appearance or field chemistry stabilizes.
- Note appearance of purge water, including colour, opacity (clear, cloudy, silty), sheen, presence of LNAPL, and odour. Note any other unusual features (particulate matter, effervescence (bubbling) of dissolved gas, etc.).
- Fill required sample bottles. If sampling for metals, attach 75-micron filter to discharge tube and filter metals sample. If sampling for VOCs, use low flow rate to ensure continuous stream of non-turbulent flow into sample bottles. Ensure no headspace is present in VOC vials.
- Replace well cap and flushmount casing cap.

4.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

The QA/QC program for this Phase II ESA is as follows:

- All non-dedicated sampling equipment (split spoons) will be decontaminated according to the SOPs listed above.
- All groundwater sampling equipment is dedicated (polyethylene and flexible peristaltic tubing is replaced for each well).
- Where groundwater samples are to be analyzed for VOCs, one laboratory-provided trip blank will be submitted for analysis with every laboratory submission.
- Approximately one (1) field duplicate will be submitted for every ten (10) samples submitted for laboratory analysis. A minimum of one (1) field duplicate per project will be submitted. Field duplicates will be submitted for soil and groundwater samples
- Where combo pens are used to measure field chemistry, they will be calibrated on an approximately monthly basis, according to frequency of use.

5.0 DATA QUALITY OBJECTIVES

The purpose of setting data quality objectives (DQOs) is to ensure that the level of uncertainty in data collected during the Phase II ESA is low enough that decision-making is not affected, and that the overall objectives of the investigation are met.

The quality of data is assessed by comparing field duplicates with original samples. If the relative percent difference (RPD) between the duplicate and the sample is within 20%, the data are considered to be of sufficient quality so as not to affect decision-making. The RPD is calculated as follows:

$$RPD = \left| \frac{x_1 - x_2}{(x_1 + x_2)/2} \right| \times 100\%$$

Where x_1 is the concentration of a given parameter in an original sample and x_2 is the concentration of that same parameter in the field duplicate sample.

For the purpose of calculating the RPD, it is desirable to select field duplicates from samples for which parameters are present in concentrations above laboratory detection limits, i.e. samples which are expected to be contaminated.

If parameters are below laboratory detection limits for selected samples or duplicates, the RPD may be calculated using a concentration equal to one half ($0.5 \times$) the laboratory detection limit.

It is also important to consider data quality in the overall context of the project. For example, if the DQOs are not met for a given sample, yet the concentrations of contaminants in both the sample and the duplicate exceed the MOE site remediation standards by a large margin, the decision-making usefulness of the sample may not be considered to be impaired. The proximity of other samples which meet the DQOs must also be considered in developing the Phase II Conceptual Site Model; often there are enough data available to produce a reliable Phase II Conceptual Site Model even if DQOs are not met for certain individual samples.

These considerations are discussed in the body of the report.

6.0 PHYSICAL IMPEDIMENTS TO SAMPLING & ANALYSIS PLAN

Physical impediments to the Sampling and Analysis plan may include:

- The location of underground utilities
- Poor recovery of split-spoon soil samples
- Insufficient groundwater volume for groundwater samples
- Breakage of sampling containers following sampling or while in transit to the laboratory
- Elevated detection limits due to matrix interference (generally related to soil colour or presence of organic material)
- Elevated detection limits due to high concentrations of certain parameters, necessitating dilution of samples in laboratory
- Drill rig breakdowns
- Winter conditions
- Other site-specific impediments

Site-specific impediments to the Sampling and Analysis plan are discussed in the body of the Phase II ESA report.

SYMBOLS AND TERMS

SOIL DESCRIPTION

Behavioural properties, such as structure and strength, take precedence over particle gradation in describing soils. Terminology describing soil structure are as follows:

| | | |
|------------------|---|--|
| Desiccated | - | having visible signs of weathering by oxidation of clay minerals, shrinkage cracks, etc. |
| Fissured | - | having cracks, and hence a blocky structure. |
| Varved | - | composed of regular alternating layers of silt and clay. |
| Stratified | - | composed of alternating layers of different soil types, e.g. silt and sand or silt and clay. |
| Well-Graded | - | Having wide range in grain sizes and substantial amounts of all intermediate particle sizes (see Grain Size Distribution). |
| Uniformly-Graded | - | Predominantly of one grain size (see Grain Size Distribution). |

The standard terminology to describe the strength of cohesionless soils is the relative density, usually inferred from the results of the Standard Penetration Test (SPT) 'N' value. The SPT N value is the number of blows of a 63.5 kg hammer, falling 760 mm, required to drive a 51 mm O.D. split spoon sampler 300 mm into the soil after an initial penetration of 150 mm.

| Relative Density | 'N' Value | Relative Density % |
|------------------|-----------|--------------------|
| Very Loose | <4 | <15 |
| Loose | 4-10 | 15-35 |
| Compact | 10-30 | 35-65 |
| Dense | 30-50 | 65-85 |
| Very Dense | >50 | >85 |

The standard terminology to describe the strength of cohesive soils is the consistency, which is based on the undisturbed undrained shear strength as measured by the in situ or laboratory vane tests, penetrometer tests, unconfined compression tests, or occasionally by Standard Penetration Tests.

| Consistency | Undrained Shear Strength (kPa) | 'N' Value |
|-------------|--------------------------------|-----------|
| Very Soft | <12 | <2 |
| Soft | 12-25 | 2-4 |
| Firm | 25-50 | 4-8 |
| Stiff | 50-100 | 8-15 |
| Very Stiff | 100-200 | 15-30 |
| Hard | >200 | >30 |

SYMBOLS AND TERMS (continued)

SOIL DESCRIPTION (continued)

Cohesive soils can also be classified according to their “sensitivity”. The sensitivity is the ratio between the undisturbed undrained shear strength and the remoulded undrained shear strength of the soil.

Terminology used for describing soil strata based upon texture, or the proportion of individual particle sizes present is provided on the Textural Soil Classification Chart at the end of this information package.

ROCK DESCRIPTION

The structural description of the bedrock mass is based on the Rock Quality Designation (RQD).

The RQD classification is based on a modified core recovery percentage in which all pieces of sound core over 100 mm long are counted as recovery. The smaller pieces are considered to be a result of closely-spaced discontinuities (resulting from shearing, jointing, faulting, or weathering) in the rock mass and are not counted. RQD is ideally determined from NXL size core. However, it can be used on smaller core sizes, such as BX, if the bulk of the fractures caused by drilling stresses (called “mechanical breaks”) are easily distinguishable from the normal in situ fractures.

| RQD % | ROCK QUALITY |
|--------------|--|
| 90-100 | Excellent, intact, very sound |
| 75-90 | Good, massive, moderately jointed or sound |
| 50-75 | Fair, blocky and seamy, fractured |
| 25-50 | Poor, shattered and very seamy or blocky, severely fractured |
| 0-25 | Very poor, crushed, very severely fractured |

SAMPLE TYPES

| | | |
|----|---|---|
| SS | - | Split spoon sample (obtained in conjunction with the performing of the Standard Penetration Test (SPT)) |
| TW | - | Thin wall tube or Shelby tube |
| PS | - | Piston sample |
| AU | - | Auger sample or bulk sample |
| WS | - | Wash sample |
| RC | - | Rock core sample (Core bit size AXT, BXL, etc.). Rock core samples are obtained with the use of standard diamond drilling bits. |

SYMBOLS AND TERMS (continued)

GRAIN SIZE DISTRIBUTION

| | | |
|-----|---|--|
| MC% | - | Natural moisture content or water content of sample, % |
| LL | - | Liquid Limit, % (water content above which soil behaves as a liquid) |
| PL | - | Plastic limit, % (water content above which soil behaves plastically) |
| PI | - | Plasticity index, % (difference between LL and PL) |
| Dxx | - | Grain size which xx% of the soil, by weight, is of finer grain sizes These grain size descriptions are not used below 0.075 mm grain size |
| D10 | - | Grain size at which 10% of the soil is finer (effective grain size) |
| D60 | - | Grain size at which 60% of the soil is finer |
| Cc | - | Concavity coefficient = $(D_{30})^2 / (D_{10} \times D_{60})$ |
| Cu | - | Uniformity coefficient = D_{60} / D_{10} |

Cc and Cu are used to assess the grading of sands and gravels:

Well-graded gravels have: $1 < Cc < 3$ and $Cu > 4$

Well-graded sands have: $1 < Cc < 3$ and $Cu > 6$

Sands and gravels not meeting the above requirements are poorly-graded or uniformly-graded.

Cc and Cu are not applicable for the description of soils with more than 10% silt and clay
(more than 10% finer than 0.075 mm or the #200 sieve)

CONSOLIDATION TEST

| | | |
|------------|---|--|
| p'_o | - | Present effective overburden pressure at sample depth |
| p'_c | - | Preconsolidation pressure of (maximum past pressure on) sample |
| Ccr | - | Recompression index (in effect at pressures below p'_c) |
| Cc | - | Compression index (in effect at pressures above p'_c) |
| OC Ratio | | Overconsolidation ratio = p'_c / p'_o |
| Void Ratio | | Initial sample void ratio = volume of voids / volume of solids |
| Wo | - | Initial water content (at start of consolidation test) |

PERMEABILITY TEST

| | | |
|---|---|--|
| k | - | Coefficient of permeability or hydraulic conductivity is a measure of the ability of water to flow through the sample. The value of k is measured at a specified unit weight for (remoulded) cohesionless soil samples, because its value will vary with the unit weight or density of the sample during the test. |

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 21672

Report Date: 05-Apr-2017

Order Date: 30-Mar-2017

Project Description: PE3391

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 21672

Report Date: 12-Apr-2017

Order Date: 6-Apr-2017

Project Description: PE3391

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 16609

Report Date: 18-Apr-2017

Order Date: 17-Apr-2017

Project Description: PE3391

Qualifier Notes:

None

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.

Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 21365

Report Date: 11-Apr-2017

Order Date: 5-Apr-2017

Project Description: PE3391

Qualifier Notes:***Sample Qualifiers :***

1 : This result exceeds the calibration range of the instrument. The result may be biased.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

Certificate of Analysis

Client: Paterson Group Consulting Engineers

Client PO: 21764

Report Date: 20-Mar-2017

Order Date: 14-Mar-2017

Project Description: PE3391

Qualifier Notes:

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA\QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
