# **1. INTRODUCTION**

SLR Consulting (SLR) was retained by 2809354 Ontario Inc. to conduct an environmental noise assessment for the proposed development at 3996 Innes Road in Orleans, Ontario. The Environmental Noise Assessment is used to support the Zoning Bylaw Amendment (ZBA) and Site Plan Application (SPA) for the proposed development and supports the planning requirements for the City of Ottawa.

## **1.1 FOCUS OF REPORT**

In keeping with the City of Ottawa and the Ontario Ministry of the Environment, Conservation and Parks requirements, this report examines the potential for:

- Impacts of the environment on the proposed development;
- Impacts of the proposed development on itself; and
- Impacts of the proposed development on the surrounding environment.

## **1.2 NATURE OF THE SUBJECT LANDS**

The proposed development is located at 3996 and 3998 Innes Road, to the south of Innes Road. The site is currently occupied by a single-storey semi-detached residential home, which will be demolished as part of the proposed development.

The proposed development will consist of a single 5-story mixed use building containing 20 units and a ground floor medical facility with basement garage and additional parking at grade. A private outdoor living area is proposed on Level 5 of the building.

A copy of the site plan and floor plans are included in **Appendix A**.

## **1.3 NATURE OF THE SURROUNDINGS**

Immediately surrounding the site are low-rise commercial developments and their parking lots to the east, west and south of the site. Few more low-rise commercial developments are located to the north-east of the site across Innes Road and low-rise residential homes are located to the north of the site. Beyond the immediate surroundings there are low-rise commercial buildings to the east, west and south of the site and mostly low-rise residential buildings to the north of the site.

The topography of the immediate surrounding area is considered to be essentially flat with no significant variations.

A context plan is shown in **Figure 1**.

---

## PART 1: IMPACTS OF THE ENVIRONMENT ON THE DEVELOPMENT

In assessing potential impacts of the environment on the proposed development, the focus of this report is to assess the potential for:

- Roadway noise impacts on the development;
- Stationary noise impacts from the surrounding commercial and industries lands; and
- Stationary noise impacts from the proposed development mechanical equipment on the proposed development itself and surrounding sensitive receptors

There are no railway lines within 1000 m from the proposed development, therefore, there are no concerns related to railway noise or vibration, and further assessments of these sources are not required.

There are no existing significant industrial vibration sources within 75 m of the Project, such as large stamping presses or forges. Under applicable MECP guidelines, a detailed vibration assessment is not required.

There are no airports in the immediate vicinity of the proposed development, and an assessment of aircraft noise impacts is not required.

## 2. TRANSPORTATION NOISE IMPACTS

### 2.1 TRANSPORTATION NOISE SOURCES

Transportation sources of interest with the potential to produce noise at the proposed development are roadway noise from Innes Road and Mer-Bleue Road.

The level of noise from these sources has been predicted, and this information has been used to identify façade, ventilation, and warning clause requirements.

### 2.2 SURFACE TRANSPORTATION NOISE CRITERIA

#### 2.2.1 MINISTRY OF ENVIRONMENT PUBLICATION NPC-300

##### Noise Sensitive Developments

Ministry of the Environment, Conservation and Parks (MECP) Publication NPC-300 provides sound level criteria for noise sensitive developments. The applicable portions of NPC-300 are Part C – Land Use Planning and the associated definitions outlined in Part A – Background. **Tables 1 to 4** below summarizes the applicable surface transportation (road and rail) criteria limits.

##### Location Specific Criteria

**Table 1** summarizes criteria in terms of energy equivalent sound exposure ( $L_{eq}$ ) levels for specific noise-sensitive locations. Both outdoor and indoor locations are identified, with the focus of outdoor areas being amenity spaces. Indoor criteria vary with sensitivity of the space. As a result, sleep areas have more stringent criteria than Living / Dining room space.

## Outdoor Amenity Areas

**Table 2** summarizes the noise mitigation requirements for communal outdoor amenity areas (“Outdoor Living Areas” or “OLAs”).

For the assessment of outdoor sound levels, the surface transportation noise impact is determined by combining road and rail traffic sound levels. Whistle noise due to railway trains is not included in the determination of levels.

**Table 1: MECP Publication NPC-300 Sound Level Criteria for Road and Rail Noise**

Type of Space	Time Period	Equivalent Sound Exposure Level - L <sub>eq</sub> (dBA)		Assessment Location
		Road	Rail <sup>[1]</sup>	
Outdoor Living Area (OLA)	Daytime (0700-2300h)	55	55	Outdoors <sup>[2]</sup>
Living / Dining Room	Daytime (0700-2300h)	45	40	Indoors <sup>[4]</sup>
	Night-time (2300-0700h)	45	40	Indoors <sup>[4]</sup>
Sleeping Quarters	Daytime (0700-2300h)	45	40	Indoors <sup>[4]</sup>
	Night-time (2300-0700h)	40	35	Indoors <sup>[4]</sup>

**Notes:** [1] Whistle noise is excluded for OLA noise assessments, and included for Living / Dining Room and Sleeping Quarter assessments.

[2] Road and Rail noise impacts are to be combined for assessment of OLA impacts.

[3] An assessment of indoor noise levels is required only if the criteria in **Table 4** are exceeded.

**Table 2: MECP Publication NPC-300 Outdoor Living Area Mitigation Requirements**

Time Period	Equivalent Sound Level in Outdoor Living Area (dBA)	Ventilation Requirements
Daytime (0700-2300h)	≤ 55	<ul style="list-style-type: none"> <li>None</li> </ul>
	55 to 60 incl.	<ul style="list-style-type: none"> <li>Noise barrier <b>OR</b> Warning Clause A</li> </ul>
	> 60	<ul style="list-style-type: none"> <li>Noise barrier to reduce noise to 55 dBA <b>OR</b></li> <li>Noise barrier to reduce noise to 60 dBA and Warning Clause B</li> </ul>

## Ventilation and Warning Clauses

**Table 3** summarizes requirements for ventilation where windows potentially would have to remain closed as a means of noise control. Despite implementation of ventilation measures where required, if sound exposure levels exceed the guideline limits in **Tables 1**, warning clauses advising future occupants of the potential excesses are required. Warning clauses also apply to OLAs.

## Building Shell Requirements

**Table 4** provides sound level thresholds which if exceeded, require the building shell and components (i.e., wall, windows) to be designed and selected accordingly to ensure that the **Table 3 and 4** indoor sound criteria are met.

**Table 3: MECP Publication NPC-300 Ventilation & Warning Clause Requirements**

Assessment Location	Time Period	Energy Equivalent Sound Exposure Level - L <sub>eq</sub> (dBA)		Ventilation and Warning Clause Requirements [2]
		Road	Rail [1]	
Outdoor Living Area	Daytime (0700-2300h)	56 to 60 incl.		Type A Warning Clause
Plane of Window	Daytime (0700-2300h)	$\leq 55$		None
		56 to 65 incl.		Forced Air Heating /provision to add air conditioning + Type C Warning Clause
		$> 65$		Central Air Conditioning + Type D Warning Clause
	Night-time (2300-0700h)	51 to 60 incl.		Forced Air Heating/ provision to add air conditioning + Type C Warning Clause
		$> 60$		Central Air Conditioning + Type D Warning Clause

**Notes:** [1] Rail whistle noise is excluded.

[2] Road and Rail noise is combined for determining Ventilation and Warning Clause requirements.

**Table 4: MECP Publication NPC-300 Building Component Requirements**

Assessment Location	Time Period	Energy Equivalent Sound Exposure Level - L <sub>eq</sub> (dBA))		Component Requirements
		Road	Rail [1]	
Plane of Window	Daytime (0700-2300h)	$> 65$	$> 60$	Designed/ Selected to Meet Indoor Requirements [2]
	Night-time (2300-0700h)	$> 60$	$> 55$	

**Notes:** [1] Including whistle noise.

[2] Building component requirements are assessed separately for Road and Railway noise. The resultant sound isolation parameter is required to be combined to determine and overall acoustic parameter.

## 2.3 TRAFFIC DATA

### 2.3.1 ROADWAY TRAFFIC DATA

Road traffic data for Innes Road and Mer-Bleue Road were obtained from The City of Ottawa's Environmental Noise Control Guideline [ENCG]. The ENCG document provides the mature state (Ultimate) traffic volumes, day/night traffic split and commercial truck breakdown % of various roadway types.

Relevant sections of the ENCG document and calculations can be found in **Appendix B**. The following table summarizes the road traffic volumes used in the analysis.

**Table 5: Summary of Road Traffic Data Used in the Transportation Analysis**

Roadway Link	2031 Traffic Volumes (AADT)	% Day/ Night Volume Split		Commercial Traffic Breakdown		Vehicle Speed (km/h)
		Daytime	Night-time	% Medium Trucks	% Heavy Trucks	
Innes Road (4 Lane UAD)	35000 <sup>[1]</sup>	92	8	7	5	60
Mer-Bleue Road (4 Lane UAD)	35000 <sup>[1]</sup>	92	8	7	5	60

**Notes:** [1] Based on traffic data obtained from the City of Ottawa ENCG, Road types assumed to be 4-lane urban arterial divided.

## 2.4 PROJECTED SOUND LEVELS

Road traffic sound levels at the proposed development were predicted using Cadna/A, a commercially available noise propagation modelling software. Roadways were modelled as line sources of sound, with sound emission rates calculated using the ORNAMENT algorithms, the road traffic noise model of the MECP. These predictions were validated and are equivalent to those made using the MECP's ORNAMENT or STAMSON v5.04 road traffic noise models. STAMSON validation files are included in **Appendix C**.

The ground in the study area corresponds mostly to asphalt. A reflective ground type has been assigned in the modelling.

Sound levels were predicted along the facades of the proposed development using the “building evaluation” feature of Cadna/A. This feature allows for noise levels to be predicted across the entire façade of a structure.

### 2.4.1 FAÇADE SOUND LEVELS

Predicted worst-case façade sound levels are presented in **Table 6**. The transportation façade sound levels of the development, showing the ranges of predicted daytime and night-time sound levels are shown in **Figure 2** and **Figure 3**.

**Table 6: Summary of Transportation Facade Sound Levels**

Levels	Façade <sup>[1]</sup>	Roadway Sound Levels <sup>[2]</sup>	
		L <sub>eq</sub> Day (dBA)	L <sub>eq</sub> Night (dBA)
Levels 1-4	North	73	65
	East	69	62
	South	60	52
	West	70	62
Level 5	North	72	64
	East	69	61
	South	61	53
	West	68	61

**Notes:** [1] Façade locations are shown in **Figure 2** and **Figure 3**.

[2] The sound levels presented are for the worst-case exposed façade, in which totals may not correspond to the same location.

The façade roadway sound levels are predicted to be above 65 dBA and 60 dBA during the daytime and nighttime periods at the northern, eastern and western facades respectively. Therefore, an assessment of building components is required for the development.

## 2.4.2 OUTDOOR LIVING AREAS

A private Outdoor Living Area (OLA) is also located on Level 5 of the development in the southern part of the building. The at grade outdoor amenity areas are considered to be publicly accessible spaces. Since these spaces are publicly accessible, they have not been included as amenity spaces in this assessment.

The predicted noise impacts from the surrounding roadways are shown in **Figure 4** and summarized in the following table:

**Table 7: Summary of Transportation Noise Impacts - OLA**

ID	Location	Transportation Impacts $L_{eq}$ Day (dBA)
OLA Level 5	Level 5 – Suite 502 Balcony	60 <sup>[1]</sup>

**Notes:** [1] Sound levels up to 60 dBA are allowed with the use of a **Type A** Warning Clause.

Sound level at the Level 5 OLA is predicted to be at or below 60 dBA.

## 2.5 FAÇADE ASSESSMENT

Based on the roadway levels shown in **Table 6**, façade sound levels were predicted to exceed the above criteria at multiple locations throughout the development. Therefore, an assessment of glazing requirements is necessary for meeting the indoor sound level requirements outlined in **Table 1**.

Indoor sound levels and required facade Sound Transmission Classes (STCs) were estimated using the procedures outlined in National Research Council Building Practice Note BPN-56.

### 2.5.1 GLAZING CALCULATION INPUTS

The glazing and floor areas were approximately calculated based on the floor plans provided. Non-glazing portion of the walls was assumed to have a rating of STC 43 for all locations.

### 2.5.2 GLAZING REQUIREMENTS

The acoustical requirements are provided below in **Table 8**, which is the STC rating taking into consideration roadway noise and the assumptions listed in the previous section. Ontario Building Code (OBC) construction is considered to be sufficient for all living rooms and bedrooms in the proposed development. Any configuration meeting the minimum structural and safety requirements of the Ontario Building Code, which generally produces a minimum STC for glazed elements of STC 29. It should be noted that corner units are likely to require an increase of 3 STC points, as the space has noise contributions from two (2) exposed sides. Detailed Façade Calculations are included in **Appendix D**.

**Table 8: Façade Sound Transmission Class (STC) Requirements**

Levels	Façade	Non-Glazing Component	Glazing Requirements	
			Living Room	Bedroom
Levels 2-4	North	43	OBC	30
	East	43	OBC	OBC
	West	43	OBC	OBC
	South	43	OBC	OBC
Level 5	North	43	30	-
	East	43	OBC	OBC
	West	43	OBC	OBC
	South	43	OBC	OBC

**Notes:** OBC = Ontario Building Code, meeting a rating of STC 29.

The combined glazing and frame assembly must be designed to ensure the overall sound isolation performance for the entire window unit meets the sound isolation requirements. It is recommended window manufacturers test data be reviewed to confirm acoustical performance is met. As the design progresses, final acoustical requirements should be reviewed. It is recommended that window manufacturers test data be reviewed to confirm the acoustical performance is met.

## 2.6 VENTILATION AND WARNING CLAUSE REQUIREMENTS

### 2.6.1 RESIDENTIAL UNITS

The requirements regarding warning clauses are summarized in **Table 2**. Where required, the Warning Clauses should be included in agreements registered on Title for the residential units and included in all agreements of purchase and sale or lease, and all rental agreements. Warning Clauses are summarized in **Appendix E**.

Based on the predicted façade noise levels, forced air heating with provisions for future installation of central air conditioning, and an MECP **Type C** warning clause, is recommended for all affected units with façade sound levels from road traffic that are between 56 and 65 dBA during the daytime, or between 51 and 60 dBA during night-time hours. Central air conditioning, and an MECP **Type D** warning clause, is recommended for all affected units with façade sound levels from road and rail traffic that exceed 65 dBA during the daytime, or exceed 60 dBA during night-time hours. The most conservative warning clause is for Warning Clause **Type D** for all units of the proposed development.

### 2.6.2 OUTDOOR LIVING AREAS

As the outdoor amenity area level is predicted to be between 55 dBA and 60 dBA, an MECP **Type A** Warning Clause is recommended for Level 5 - Suite 502 OLA.

The **Type A** warning clause is included in **Appendix E**.

### **3. STATIONARY SOURCE NOISE IMPACTS**

A site visit was complete by SLR personnel on September 15, 2021, with observations made during all periods of the day. The site was found to be primarily surrounded by commercial buildings to the east, west and south and residential lands to the north. A context plan is shown in **Figure 1**.

Significant ambient roadway noise from Innes Road and Mer-Bleue Road dominate within the area. As the surrounding area is primarily commercial/retail lands, the inclusion of stationary noise sources was determined based on the MECP Guideline D-6 Potential Influence Areas. Commercial/retail lands are considered to be Class 1 Industries, in which a 70 m influence area was applied for the inclusion of stationary noise sources. The 70 m influence area from the property line is shown in **Figure 5**.

#### **3.1 STATIONARY NOISE MODELLING**

Based on the information obtained from the local industries and from our site visit, the significant sources of noise in the area of the project have been identified. Modelled noise sources include:

- Commercial buildings in the immediate surrounding rooftop HVAC units;
- KFC/Taco Bell rooftop HVAC units;
- Kingdom Hall of Jehovah's Witnesses HVAC units;
- Touchless Car Wash
  - Car vacuum cleaner;
  - Car wash dryer;
  - Cars idling and queuing; and
- Petrol station HVAC units.

Noise impacts from stationary sources were modelled using Cadna/A, a software implementation of the internationally recognized ISO-9613-2 environmental noise propagation algorithms. Cadna/A / ISO-9613 is the preferred noise model of the MECP. The ISO 9613 equations account for:

- Source to receiver geometry;
- Distance attenuation;
- Atmospheric absorption;
- Reflections off of the ground and ground absorption;
- Reflections off of vertical walls; and
- Screening effects of buildings, terrain, and purpose-built noise barriers (noise walls, berms, etc.).

The following additional parameters were used in the modelling, which are consistent with providing a conservative (worst-case assessment of noise levels):

- Temperature: 10°C;
- Relative Humidity: 70%;
- Ground Absorption G: G=0.0 (reflective) as default global parameter;
- Reflection: An order of reflection of 1 was used (accounts for noise reflecting from walls);
- Wall Absorption Coefficients: Set to 0.37 (37 % of energy is absorbed, 63% reflected); and
- Terrain: Relatively flat near the Project site.

Generic SLR historical sound level data was applied in the stationary noise modelling. A summary of the sound levels used in the analysis and equipment operating conditions is included in **Appendix F**. All stationary sources modelled are shown in **Figure 5**.

## 3.2 STATIONARY NOISE CRITERIA

### 3.2.1 MECP NPC-300 GUIDELINES FOR STATIONARY NOISE SOURCES

MECP noise guidelines for stationary source noise impacting residential developments are given in MECP publication NPC-300. The applicable portions of NPC-300 are Part C – Land Use Planning and the associated definitions outlined in Part A Background.

The acoustic environment surrounding the proposed development is dominated by the roadway noise. Therefore, the proposed development is considered to be located in a Class 1 area.

The sound level limit for steady sound sources are expressed as a 1-hr equivalent sound level ( $L_{eq}$  (1 hr) values, in dBA) and is the higher of the NPC-300 exclusionary limits and the existing background sound level. The NPC-300 stationary source noise requirements in a Class 1 Area are summarized in Table 9 steady sound sources.

**Table 9: NPC-300 Class 1 Continuous Sound Noise Requirements**

Receiver Category	Time Period	Exclusionary Sound Level Limits, $L_{eq}$ (1 hr), dBA [1]
Outdoor	0700 – 1900h	50
	1900 – 2300h	50
	2300 – 0700h	-
Plane of Window [2]	0700 – 1900h	50
	1900 – 2300h	50
	2300 – 0700h	45

**Notes:** [1] or minimum hourly  $L_{eq}$  of background noise, whichever is higher.

[2] Applicable for “Noise Sensitive Spaces”, as defined in NPC-300

Since the ambient sound levels were anticipated to exceed the NPC-300 exclusionary limits, sound exposures from roadway noise were assessed and the corresponding applicable guideline limits were determined.

**Table 10** summarizes 2019 road traffic volumes applied in the ambient noise modelling.

**Table 10: Summary of Road Traffic Data Used in the Ambient Noise Analysis**

Roadway Link	Traffic Volumes (AADT)	% Day/ Night Volume Split [1]		Commercial Traffic Breakdown [1]		Vehicle Speed (km/h)
		Daytime	Night-time	% Medium Trucks	% Heavy Trucks	
Innes Road (4 Lane UAD)	30382 <sup>[1]</sup>	92	8	7	5	60
Mer-Bleue Road (4 Lane UAD)	19773 <sup>[1]</sup>	92	8	7	5	60

**Notes:** [1] Based on traffic data obtained from the City of Ottawa Transportation Intersection Volumes 2019 dataset published on <http://open.ottawa.ca>.

As with the Transportation assessment, ambient roadway noise was modelled as line sources of sound using the Cadna/A computer model. The minimum hourly  $L_{eq}$  for the ambient sound levels were found to exceed the NPC-300 default guideline limits during all periods of the day.

As a conservative assessment of stationary impacts, the daytime/evening operations were considered to be the same and were assessed against the stricter evening criteria.

Surrounding facility noise impacts were assessed against the higher of the modelled ambient noise levels and the exclusionary limits in **Table 9**.

### 3.2.2 PREDICTED FAÇADE LEVELS

The “building evaluation” feature of the Cadna/A was used to assess noise impacts on the residential portions of the towers, podium and townhouse blocks. This feature allows for noise levels to be predicted across the entire façade of a structure.

A summary of the predicted noise impacts on each façade are shown in **Table 11**, and **Figures 6** and **7** for daytime/evening and night-time periods, respectively. The difference between the existing ambient sound levels and the surrounding stationary noise impacts are shown in **Figures 8** and **9** for daytime/evening and night-time periods, respectively.

The stationary noise impacts were found to be at or below established limit for all facades, during all periods of the day. Therefore, the applicable guideline limits are met on all facades of the proposed development.

**Table 11: Summary of Stationary Façade Sound Levels**

Building Level	Façade <sup>[1]</sup>	Stationary Sound Levels <sup>[2]</sup>		Ambient Levels	
		L <sub>eq</sub> Day /Eve (dBA)	L <sub>eq</sub> Night (dBA)	L <sub>eq</sub> Day /Eve (dBA)	L <sub>eq</sub> Night (dBA)
Levels 1-4	North	45	39	≤ 71	≤ 61
	East	51	44	≤ 68	≤ 58
	South	50	43	≤ 58	≤ 48
	West	51	44	≤ 69	≤ 59
Level 5	North	45	39	≤ 70	≤ 60
	East	51	43	≤ 68	≤ 57
	South	50	43	≤ 58	≤ 48
	West	51	43	≤ 67	≤ 57

Notes: [1] Façade locations are identified on **Figures 6** and **7**.

[2] Sound levels shown represent the worst-case impact along the identified facade.

### 3.2.3 PREDICTED OLA LEVELS

The predicted worst-case noise impacts from the stationary sources are shown in **Figure 10**. The Level 5 OLA levels are predicted to be below the ambient background levels for outdoor amenity spaces. Therefore, noise mitigation is not required.

---

## PART 2: IMPACTS OF THE DEVELOPMENT ON ITSELF

At the time of this assessment, the proposed development's mechanical systems have not been sufficiently designed.

If common mechanical systems will be implemented as part of the proposed development, the impacts from all equipment should comply with the MECP Publication NPC-300 guideline limits. The mechanical equipment is to be included with proposed development, the potential impacts should be assessed as part of the final building design. The criteria can be met at all surrounding and on-site receptors by the appropriate selection of mechanical equipment, by locating equipment with sufficient setback from noise sensitive locations, and by incorporating control measures (e.g., silencers) into the design. This can be confirmed at either the site plan approval or building permit approval stages.

If individual air conditioning systems are to be implemented for each residential unit for the proposed site, the sound levels from each unit should meet MECP Publication NPC-216.

---

## PART 3: IMPACTS OF THE DEVELOPMENT ON THE SURROUNDING AREA

The building mechanical systems have not been designed at this time.

If common mechanical systems will be implemented as part of the proposed development, such equipment has the potential to result in noise impacts on residential spaces within the development. This equipment is required to meet MECP Publication NPC 300 requirements at the facades of the noise sensitive spaces within the development. Therefore, the potential impacts should be assessed as part of the final building design. The criteria are expected to be met at all on-site receptors with the appropriate selection of mechanical equipment, by locating equipment to minimize noise impacts within the development, and by incorporating control measures (e.g., silencers) into the design.

If individual air conditioning systems are to be implemented for each residential unit for the proposed site, there will be very little chance of offsite impacts as compliance is required to be met onsite.

It is recommended the mechanical systems be reviewed by an acoustical professional prior to final selection of equipment.

---

## 4. CONCLUSION AND RECOMMENDATIONS

The potential for noise impacts on and from the proposed development have been assessed. Impacts of the environment on the development, the development on itself, and the development on the surrounding area have been considered. Based on the results of our studies, the following conclusions have been reached:

### 4.1 TRANSPORTATION NOISE

- An assessment of transportation noise impacts from surrounding roadways has been completed.
- Based on transportation façade sound levels upgraded glazing may not be required within the development, as outlined in outlined in **Section 2.5.2**.
- Noise impacts within the Level 5 outdoor amenity area are predicted to be within acceptable levels, as outlined in **Section 2.4.2**.
- As required by MECP Publication NPC-300, **Type A** and **Type D** Warning Clauses (outlined in **Section 2.6**) should be included in agreements registered on Title for the residential units, and included in agreements of purchase and sale. Warning Clauses are summarized in **Appendix E**.

### 4.2 STATIONARY NOISE

- “Stationary” noise from the surrounding commercial facilities were assessed on the proposed development, as outlined in **Section 3**.
- Stationary noise impacts from the surrounding commercial noise are predicted to meet NPC-300 Class 1 guideline limits on all façades, and the outdoor living area without noise control measures.

### 4.3 OVERALL ASSESSMENT

- Impacts of the environment on the proposed development can be adequately controlled with proper glazing and the inclusion of ventilation and warning clause requirements.

---

## STATEMENT OF LIMITATIONS

This report has been prepared and the work referred to in this report has been undertaken by SLR Consulting (Canada) Ltd. (SLR) for 2809354 Ontario Inc., hereafter referred to as the "Client". It is intended for the sole and exclusive use of the Client. The report has been prepared in accordance with the Scope of Work and agreement between SLR and the Client. Other than by the Client and as set out herein, copying or distribution of this report or use of or reliance on the information contained herein, in whole or in part, is not permitted unless payment for the work has been made in full and express written permission has been obtained from SLR.

This report has been prepared in a manner generally accepted by professional consulting principles and practices for the same locality and under similar conditions. No other representations or warranties, expressed or implied, are made.

Opinions and recommendations contained in this report are based on conditions that existed at the time the services were performed and are intended only for the client, purposes, locations, time frames and project parameters as outlined in the Scope of Work and agreement between SLR and the Client. The data reported, findings, observations and conclusions expressed are limited by the Scope of Work. SLR is not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. SLR does not warranty the accuracy of information provided by third party sources.

**Note:**

- 1) This schedule forms part of the Official Plan of the City of Ottawa and must be read in conjunction with the text.
- 2) This schedule is intended as a framework for planning and design; consequently alignments of proposed roads are approximate and subject to detailed study.
- 3) An unidentified new facility from Highway 416 to Highway 417 East is not shown.

**Note:**

- 1) La présente annexe fait partie du Plan officiel de la Ville d'Ottawa et doit être consultée en se reportant au texte même du Plan officiel.
- 2) La présente annexe doit servir de guide en matière de planification et de conception; il s'ensuit que le tracé des routes proposées n'est qu'approximatif et donnera lieu à une étude plus approfondie.
- 3) Une nouvelle installation non identifiée et située entre l'autoroute 416 et l'autoroute 417E n'apparaît pas.

## Appendix B: Table of Traffic and Road Parameters To Be Used For Sound Level Predictions

**Table B1 Traffic And Road Parameters To Be Used For Sound Level Predictions**

Row Width (m)	Implied Roadway Class	AADT Vehicles/Day	Posted Speed Km/Hr	Day/Night Split %	Medium Trucks %	Heavy Trucks % <sup>1</sup>
NA <sup>2</sup>	Freeway, Queensway, Highway	18,333 per lane	100	92/8	7	5
37.5-44.5	6-Lane Urban Arterial-Divided (6 UAD)	50,000	50-80	92/8	7	5
34-37.5	4-Lane Urban Arterial-Divided (4-UAD)	35,000	50-80	92/8	7	5
23-34	4-Lane Urban Arterial-Undivided (4-UAU)	30,000	50-80	92/8	7	5
23-34	4-Lane Major Collector (4-UMCU)	24,000	40-60	92/8	7	5
30-35.5	2-Lane Rural Arterial (2-RAU)	15,000	50-80	92/8	7	5
20-30	2-Lane Urban Arterial (2-UAU)	15,000	50-80	92/8	7	5
20-30	2-Lane Major Collector (2-UMCU)	12,000	40-60	92/8	7	5
30-35.5	2-Lane Outer Rural Arterial (near the extremities of the City) (2-RAU)	10,000	50-80	92/8	7	5
20-30	2-Lane Urban Collector (2-UCU)	8,000	40-50	92/8	7	5

<sup>1</sup> The MOE Vehicle Classification definitions should be used to estimate automobiles, medium trucks and heavy trucks.

<sup>2</sup> The number of lanes is determined by the future mature state of the roadway.

### Required Warning Clauses

Environmental Noise Assessment

3996 Innes Road

SLR Project No.: 241.30290.00000

This page intentionally left blank  
for 2-sided printing purposes

## **SUMMARY OF MITIGATION MEASURES AND WARNING CLAUSES**

### **Warning Clauses**

Warning Clauses may be used individually or in combination. The following Warning Clauses should be included in agreements registered on Title for the residential units, and included in all agreements of purchase and sale or lease, and all rental agreements:

#### ***Transportation Sources (Road)***

##### ***MECP Type A Warning Clause – Level 5 – Unit 502 OLA***

“Purchasers/tenants are advised that sound levels due to increasing road traffic may occasionally interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment.”

##### ***MECP Type D Warning Clause – All units***

“This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment.”
