1 INTRODUCTION

1.1 Scope

WSP Canada Inc. was retained by 2772133 Ontario inc. to conduct a stormwater management study in support of proposals to develop nine-storey and three-storey residential buildings with a connecting underground parking garage.

1.2 Site Location

The site is located at 1131-1151 Teron Road, Ottawa, Ontario. The location of the proposed development is illustrated in **Figure 1**.

Figure 1: Site Location

1.3 Stormwater Management Plan Objectives

The objectives of the stormwater management (SWM) study are as follows:

- Collect and review background information.
 - Confirm applicable SWM design criteria with City of Ottawa staff.
 - Evaluate various SWM practices that meet the stormwater management requirements and recommend a preferred strategy—specifically related to the applicable quantity and quality control criteria.
-

1.4 Design Criteria

Design criteria were confirmed through pre-consultation with the City of Ottawa held on January 14, 2021 (Meeting minutes included in **Appendix A**). Criteria amended through email correspondence on January 25, 2022. Revised criteria for 1131-1151 Teron Road are as follows:

Water Quantity Control and Discharge Criteria

- Stormwater directed to March Road ditch must be controlled to pre-development conditions up to the 100-year event.
- The entire site can be assumed to drain to March Road ditch under pre-development conditions to establish target release rates.
- No stormwater may be directed to the Teron Road storm sewer.
- Allowable Runoff coefficient (C): C = the lesser of the existing pre-development conditions to a maximum of 0.5
- Time of concentration (Tc): Tc = pre-development (Calculated); maximum Tc = 10 min

Water Quality Criteria

- MVCA requires enhanced water quality protection (80% TSS removal) be provided on-site

2 PRE-DEVELOPMENT CONDITIONS

2.1 General

Currently the land proposed for the new development is a greenfield site (1151 Teron Road) and contains a single-family home (1131 Teron Road). The site is primarily covered in grasses and small trees/bushes. The total site area is 1.48 ha. A large part of the site along March Road remains untouched in proposed conditions and has been excluded from the analysis, making the total study area 0.88 ha.

2.2 Rainfall Information

The rainfall intensity is calculated in accordance with Section 5.4.2 of the Ottawa Sewer Design Guidelines (October 2012):

$$i = \left[\frac{A}{(T_d + C)^B} \right]$$

Where;

- A, B, C = regression constants for each return period (defined in section 5.4.2)
 - i = rainfall intensity (mm/hour)
 - T_d = storm duration (minutes)
 - The IDF parameters/regression constants are included in **Appendix B**.
-

2.3 Allowable Flow Rates

As noted in **Section 1.4**, post-development drainage to the March Road ditch (0.88 ha), must not exceed the pre-development runoff up to the 100-year event, calculated using a runoff coefficient being the lesser of 0.50 or existing conditions. In this instance existing conditions are represented by a runoff coefficient of 0.23, therefore this value has been used to calculate the allowable release rate. The entire site is assumed to drain to the March Road ditch under pre-development conditions, as directed by the City.

The calculated peak flow rates for the site in the pre-development condition are summarized below in Table 2-1.

Table 2-1: Pre-Development Peak Flow Rate Calculations ($T_c=10$ min)

Return Period	Rainfall Intensity	March Rd Ditch Peak Flow Rate (L/s)	Target Release Rate (L/s)
years	mm/hour	C = 0.23, $T_c = 10$ min	
2	76.8	43	43
5	104.2	58	58
10	122.1	68	68
25	144.7	89	89
50	161.5	109	109
100	178.6	125	125

3 POST-DEVELOPMENT CONDITIONS

3.1 General

The site will be developed with a nine-storey residential building with a rear surface parking lot, as well as a three-storey residential building connected by an underground parking garage. Bioswales will be used to control the flow from the parking lot, and roof storage will be used to control the flow from the building. Quality control will be provided by the bioswales and an OGS unit.

Note that this report should be read in conjunction with the proposed site servicing drawing package—specifically drawings C02 (Grading Plan), C03 (Servicing Plan), and C04 (Drainage Area Plan).

3.2 Water Quantity

As noted in **Section 2.3**, the target allowable discharge rate discharging to the March Road ditch during the 100-year event is 125 L/s. This is equivalent to the peak runoff rate under pre-development conditions during a 100-year design storm event with a runoff coefficient of 0.23. Compliance with the 100-yr target offsite discharge rate will be achieved through use of bioswales in the central parking lot island, with inlet control prior to discharge into the proposed sewer to the March Road ditch, and roof storage on both buildings. Storage calculations are included in Appendix E.

It is noted that a portion of the developed area (gravel walkway within U-1, B-101, B-102) will not drain to the proposed bioswales or be controlled by roof storage. Post-development runoff calculations have accounted for uncontrolled runoff from these areas, and the following results report on the cumulative release rates from the study area (controlled plus uncontrolled). The pervious area along March Road remains untouched in proposed conditions, so is not included in the analysis. There are no external areas draining to the site.

Table 3-1: Drainage Area Summary

Area ID	Area (ha)	C	Storage	Treatment
A-101	0.19	0.75	Bioswale 1	Bioswale/OGS
A-102	0.12	0.78	Bioswale 2	Bioswale/OGS
A-103	0.18	0.74	Bioswale 3	Bioswale/OGS
B-BLDG1	0.15	0.90	BLDG1 Roof	OGS
B-BLDG2	0.05	0.90	BLDG2 Roof	OGS
B-101	0.16	0.65	Uncontrolled	OGS

Area ID	Area (ha)	C	Storage	Treatment
B-102	0.01	0.90	Uncontrolled	OGS
Gravel Path	0.01	0.70	Uncontrolled	None

A HydroCAD model of the project was created and includes:

- Three bioswales (total storage volume 91 m³, 50 m³, 60 m³), with outlet controlled using HYDROVEX vortex valves to detain 0.49 ha of the new development (C = 0.75, 0.78, 0.74 +25% for 100-year as per OSDG 5.4.5)
- Rooftop flow control drains (WATTS Adjustable Accutrol Weir; See drawing C04A for details) to utilize roof storage on both buildings, to control 0.20 ha of new development. Roof drains on BLDG-1 ½ open, roof drains on BLDG-2 ¼ open.
- Uncontrolled runoff from gravel path area (0.01 ha, C = 0.70), B-101 (0.16 ha, C = 0.65), and B-102 (0.013 ha, C = 0.90), with C +25% for 100-year as per OSDG 5.4.5.

HydroCAD has been used for the modelling exercise, and the model has informed the maximum storage volume used in each bioswale and on each roof based on the proposed flow. The peak flow rate generated from the uncontrolled drainage area within the project site and controlled flow from the bioswales and roofs is 108 L/s which meets the allowable 100-year release rate of 125 L/s. Modelling results are summarized in Table 3-2 and shown in **Appendix D**.

Note that results provided below describe performance of the proposed system at several different storm durations, which have been solved iteratively within HydroCAD to represent critical conditions (i.e. maximum storage utilized within storage features, and peak release rate at the system discharge point). Peak flow rates at control points and peak uncontrolled flow have been reported, however these do not occur at the same time so do not sum to the overall peak flow leaving the system. The results demonstrate that the target allowable 100-year release rate is satisfied at all durations. The proposed system was also verified to meet target peak flow rates for all events from the 2-year through 100-year event.

Table 3-2: Summary of Modelling Results

Return Period (Years)	T _d (min)	Storage ID	Required Storage (m³)	Available Storage (m³)	Ponding Level / Depth^ (m)	Peak Flow Rate at control (L/s)	Peak Uncontrolled Flow Rate (m³/s)	Peak Flow to Ditch (L/s)	Allowable Flow Rate (L/s)

		Sum	231.6	268.5					

*Total Flow Leaving Site' includes all developed area draining to the March road ditch from the study area. ^Depth indicated for roof ponding on Bldg1 and Bldg2.

3.3 Water Quality

As noted in section 1.4, quality control is required to provide enhanced water quality treatment of the site (80% TSS removal).

For the parking lot area, quality treatment is provided within the bioswale. The bioswale outlet catch basins are offset by 100 mm to promote flow through the bioswale media and enhance water quality. Due to high groundwater and low permeability soils, the bioswales are not designed to promote infiltration (see Geotechnical Investigation Report, April 1, 2020). However, as indicated in the City of Ottawa Low Impact Development Technical Guidance Report (February 2021), treatment can still be provided through evapotranspiration, LID filtration, and sedimentation. A subdrain wrapped in geotextile drains the bioswale once water has filtered through the media. The design guidance for filters has been used from section 4.6.7 of the MOE SWM Planning and Design Manual. The following equation calculates the required filter surface area. The surface area provided is 149 m², which meets the requirement.

$$A = \frac{1000Vd}{k(h + d)t} = \frac{1000(19m^3)(0.15m)}{0.45mm/hr(0.88m + 0.15m)48hr} = 128 m^2$$

Figure 2: Bioswale cross-section

An OGS is also used to provide treatment downstream of the bioswales. This OGS treats the roof, B-101, and B-102, and well as water from the bioswales, to ensure an adequate level of quality treatment is reached prior to discharge into the March Road ditch. OGS sizing is provided in **Appendix D**.

4 CONCLUSIONS

A stormwater management plan has been prepared to support the site plan application for the 1131 – 1151 Teron Road development in the City of Ottawa. The key points are summarized below.

WATER QUANTITY

Runoff from the parking lot catchments will be directed to bioswales in the median of the parking area and will provide a storage volume of 200 m³. Roof runoff will be detained using rooftop flow control drains before joining runoff from areas B-101 and B-102. The peak 100-year discharge from the site is 108 L/s, which meets the allowable release rate of 125 L/s.

WATER QUALITY

Water treatment is provided by bioswales in the parking lot median, and by an OGS which treats roof and runoff from areas B-101 and B-102, as well as discharge from the bioswales.

This report demonstrates that the proposed SWM strategy will address stormwater management related impacts from this project and meet the requirements of the City of Ottawa.

Subject: 1131 - 1151 Teron Road SPC Discussion

Hi Winston and Ben,

See the following bullet-point summary of our discussion from earlier today.

- SWM quantity criteria to reflect previous requirements:
 - Areas discharging to March Road ditch - post-development flows up to the 100-yr controlled to corresponding pre-development flows.
 - Areas discharging to Teron Road storm sewer - post-development flows up to the 100-yr controlled to the pre-development 5-yr with a C-value of existing or 0.5, whichever is less, and a calculated time of concentration no less than 10 min).
- SWM quality criteria to be confirmed by the MVCA, however 80% TSS removal was previously required and should be assumed for the site unless MVCA indicates otherwise. MVCA to confirm if treatment is required for rooftop portion of site discharging to the Teron Road storm sewer. Matt Craig mcraig@mvc.on.ca was included as an MVCA contact in previous comments letter.
- There is no sanitary sewer fronting the site in Teron Road or March Road. A connection to the private sanitary sewer within Weeping Willow Lane was previously proposed. A letter of agreement must be provided from the owner of the private sanitary sewer to allow for the connection / easement / works on private property. An easement & or a Joint Use & Maintenance Agreement with the owner of the sewer will be needed. An assessment of available capacity will also need to be performed.
- Water service connections to the 610mm feedermain within Teron Road are not permitted. As such, a local watermain extension must be made from Steacie Drive and extended along Teron Road to the development site in order to service the development. A **second** connection to the existing hydrant lateral (fed by the 610mm feedermain) would be accepted, assuming a **first** connection to the local watermain off Steacie Drive is provided. If the 610mm feedermain is taken offline, there must be another watermain feed to service the development.

Feel free to contact me should you have any more questions.

Justin

During this period of uncertainty surrounding COVID-19, we are following best practices recommended to minimize the risk of exposure, while ensuring that service to our clients remains as uninterrupted as possible. I am working from home and will respond to emails at my earliest opportunity. Should there be delays due to internet connectivity, I thank your understanding and patience.

Subject: Re: Re: Teron Road SWM comments

Hi Winston,

The City's Water Resource SWM group has now had a chance to look at this situation in more detail with the topographic information you had provided. Unfortunately, regardless of existing topography for this site, the 300mm sewer in Teron Road is at capacity during the 5-year storm event and cannot receive the flows proposed from this development. It was only designed to receive roadway drainage. The SWM group's Senior Engineer has confirmed this and has indicated that all post-development flows from this development should be sent to the March Road ditch.

Regards,

Justin

Subject: RE: Re: Teron Road SWM comments

Hi Winston and Kathryn,

I had taken over this file from a previous City PM and was not involved in the review of the initial DSEL submission. The correspondence Winston has provided in his previous e-mail was the result of a meeting held prior to a WSP submission for this site, and therefore prior to my review of any detailed submission. In that e-mail I confirmed that the previous direction provided could still be considered valid (i.e., that pre-development drainage outlets could be maintained post-development). The drainage area split between the two outlets still needed proper justification at the time of actual site plan submission.

As noted in Comment B7 in our last comment response letter, the City's Water Resources Group has indicated that, following review of their Streambuilder model for the site area, the 300mm storm sewer in Teron Road does not receive any runoff from the site under current conditions. They also indicated that the 300mm Teron Road storm sewer was only designed to receive roadway runoff and is already at capacity and unable to receive any additional flows.

Based on the Water Resource Group's analysis of existing drainage boundaries, they have confirmed that the SWM approach for the entire site should be post-pre to the March Road ditch, however, as mentioned to Winston during our conversation earlier today, I will circulate them the topographic justification he provided in his previous e-mail for their review. I will follow up with you both once I receive a response.

Regards,

Justin

Subject: Re: Teron Road SWM comments

Hi Justin,

At the beginning of this project, we have already agreed for the SWM drainage areas split as per the existing survey topographic information.

Please see attached pre-consultation meeting minutes and the survey plan for your reference and coordination.

Yours truly,

Ding Bang (Winston) Yang, P.Eng.

Subject:

SWM CALCULATIONS- Pre-Development Peak Flow March Rd Ditch

Calculation of existing runoff rate is undertaken using the Rational Method:

$$Q = 2.78CiA$$

Where: Q = peak flow rate (litres/second)

C = runoff coefficient

i = rainfall intensity (mm/hour)

A = catchment area (hectares)

Site Area, A	8,766	m ²
Site Area, A	0.88	hectares
Runoff Coefficient, C	0.23	

Rainfall intensity calculated in accordance with City of Ottawa Sewer Design Guidelines (section 5.4.2):

$$i = \left[\frac{A}{(Td + C)^B} \right]$$

Where: A, B, C = regression constants for each return period (defined in section 5.4.2)

i = rainfall intensity (mm/hour)

Td = storm duration (minutes) 10 minutes

Return Period (Years)	2	5	10	25	50	100*
A	733.0	998.1	1,174.2	1,402.9	1,569.6	1,735.7
B	0.810	0.814	0.816	0.819	0.820	0.820
C	6.199	6.053	6.014	6.018	6.014	6.014
T (mins)	10	10	10	10	10	10
I (mm/hr)	76.8	104.2	122.1	144.7	161.5	178.6
Runoff Coefficient C	0.23	0.23	0.23	0.23	0.23	0.23
C Multiplier (OSDG Table 5.7)	1.00	1.00	1.00	1.10	1.20	1.25
Revised Runoff Coefficient C	0.23	0.23	0.23	0.25	0.28	0.29
Q (litres/sec)	43	58	68	89	109	125
Q (m3/sec)	0.04	0.06	0.07	0.09	0.11	0.13

Hydrograph

APPENDIX

C-2

100-Year Analysis (Peak Discharge, $T_c = 16$ min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately

APPENDIX

C-3

100-Year Analysis (Peak Storage Bioswale 1, $T_c = 72$ min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately

APPENDIX

C-4 100-Year Analysis (Peak Storage Bioswale 2, $T_c = 48$ min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately

APPENDIX

C-5

100-Year Analysis (Peak Storage Bioswale 3, $T_c = 36$ min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately

APPENDIX

C-6

100-Year Analysis (Peak Building 1 Rooftop Storage, $T_c = 36$ Min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately.

Link 2L: Ditch

APPENDIX

C-7

100-Year Analysis (Peak Building 2 Rooftop Storage, $T_c = 29$ Min)

The storm system for the site is governed by the 100-year storm. Peak storage in each storage unit and peak discharge may occur at separate times of concentration and are therefore reported separately.

 Water Quality Runoff Volume Capture (%): **> 90**

Stormceptor® EF Sizing Report

THIRD-PARTY TESTING AND VERIFICATION

► **Stormceptor® EF and Stormceptor® EFO** are the latest evolutions in the Stormceptor® oil-grit separator (OGS) technology series, and are designed to remove a wide variety of pollutants from stormwater and snowmelt runoff. These technologies have been third-party tested in accordance with the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** and performance has been third-party verified in accordance with the **ISO 14034 Environmental Technology Verification (ETV)** protocol.

PERFORMANCE

► **Stormceptor® EF and EFO** remove stormwater pollutants through gravity separation and floatation, and feature a patent-pending design that generates positive removal of total suspended solids (TSS) throughout each storm event, including high-intensity storms. Captured pollutants include sediment, free oils, and sediment-bound pollutants such as nutrients, heavy metals, and petroleum hydrocarbons. Stormceptor is sized to remove a high level of TSS from the frequent rainfall events that contribute the vast majority of annual runoff volume and pollutant load. The technology incorporates an internal bypass to convey excessive stormwater flows from high-intensity storms through the device without resuspension and washout (scour) of previously captured pollutants. Proper routine maintenance ensures high pollutant removal performance and protection of downstream waterways.

PARTICLE SIZE DISTRIBUTION (PSD)

► The **Canadian ETV PSD** shown in the table below was used, or in part, for this sizing. This is the identical PSD that is referenced in the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators** for both sediment removal testing and scour testing. The Canadian ETV PSD contains a wide range of particle sizes in the sand and silt fractions, and is considered reasonably representative of the particle size fractions found in typical urban stormwater runoff.

Particle Size (µm)	Percent Less Than	Particle Size Fraction (µm)	Percent
1000	100	500-1000	5
500	95	250-500	5

SCOUR PREVENTION AND ONLINE CONFIGURATION

► **Stormceptor® EF and EFO** feature an internal bypass and superior scour prevention technology that have been demonstrated in third-party testing according to the scour testing provisions of the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators**, and the exceptional scour test performance has been third-party verified in accordance with the ISO 14034 ETV protocol. As a result, Stormceptor EF and EFO are approved for online installation, eliminating the need for costly additional bypass structures, piping, and installation expense.

DESIGN FLEXIBILITY

► **Stormceptor® EF and EFO** offers design flexibility in one simplified platform, accepting stormwater flow from a single inlet pipe or multiple inlet pipes, and/or surface runoff through an inlet grate. The device can also serve as a junction structure, accommodate a 90-degree inlet-to-outlet bend angle, and can be modified to ensure performance in submerged conditions.

OIL CAPTURE AND RETENTION

► While Stormceptor® EF will capture and retain oil from dry weather spills and low intensity runoff, **Stormceptor® EFO** has demonstrated superior oil capture and greater than 99% oil retention in third-party testing according to the light liquid re-entrainment testing provisions of the Canadian ETV **Procedure for Laboratory Testing of Oil-Grit Separators**. Stormceptor EFO is recommended for sites where oil capture and retention is a requirement.

Stormceptor® EF Sizing Report

INLET-TO-OUTLET DROP

Elevation differential between inlet and outlet pipe inverts is dictated by the angle at which the inlet pipe(s) enters the unit.

0° - 45° : The inlet pipe is 1-inch (25mm) higher than the outlet pipe.

45° - 90° : The inlet pipe is 2-inches (50mm) higher than the outlet pipe.

HEAD LOSS

The head loss through Stormceptor EF is similar to that of a 60-degree bend structure. The applicable K value for calculating minor losses through the unit is 1.1.

For submerged conditions the applicable K value is 3.0.

Pollutant Capacity

Stormceptor®EF Sizing Report

STANDARD PERFORMANCE SPECIFICATION FOR “OIL GRIT SEPARATOR” (OGS) STORMWATER QUALITY TREATMENT DEVICE

PART 1 – GENERAL

1.1 WORK INCLUDED

This section specifies requirements for selecting, sizing, and designing an underground Oil Grit Separator (OGS) device for stormwater quality treatment, with third-party testing results and a Statement of Verification in accordance with ISO 14034 Environmental Management – Environmental Technology Verification (ETV).

1.2 REFERENCE STANDARDS & PROCEDURES

ISO 14034:2016 Environmental management – Environmental technology verification (ETV)

Canadian Environmental Technology Verification (ETV) Program’s **Procedure for Laboratory Testing of Oil-Grit Separators**

1.3 SUBMITTALS

1.3.1 All submittals, including sizing reports & shop drawings, shall be submitted upon request with each order to the contractor then forwarded to the Engineer of Record for review and acceptance. Shop drawings shall detail all OGS components, elevations, and sequence of construction.

1.3.2 Alternative devices shall have features identical to or greater than the specified device, including: treatment chamber diameter, treatment chamber wet volume, sediment storage volume, and oil storage volume.

1.3.3 Unless directed otherwise by the Engineer of Record, OGS stormwater quality treatment product substitutions or alternatives submitted within ten days prior to project bid shall not be accepted. All alternatives or substitutions submitted shall be signed and sealed by a local registered Professional Engineer, based on the exact same criteria detailed in Section 3, in entirety, subject to review and approval by the Engineer of Record.

PART 2 – PRODUCTS

2.1 OGS POLLUTANT STORAGE

The OGS device shall include a sump for sediment storage, and a protected volume for the capture and storage of petroleum hydrocarbons and buoyant gross pollutants. The minimum sediment & petroleum hydrocarbon storage capacity shall be as follows:

2.1.1	4 ft (1219 mm) Diameter OGS Units:	1.19 m ³ sediment / 265 L oil
	6 ft (1829 mm) Diameter OGS Units:	3.48 m ³ sediment / 609 L oil
	8 ft (2438 mm) Diameter OGS Units:	8.78 m ³ sediment / 1,071 L oil
	10 ft (3048 mm) Diameter OGS Units:	17.78 m ³ sediment / 1,673 L oil
	12 ft (3657 mm) Diameter OGS Units:	31.23 m ³ sediment / 2,476 L oil

PART 3 – PERFORMANCE & DESIGN

3.1 GENERAL

The OGS stormwater quality treatment device shall be verified in accordance with ISO 14034:2016 Environmental management – Environmental technology verification (ETV). The OGS stormwater quality treatment device shall

Stormceptor®EF Sizing Report

remove oil, sediment and gross pollutants from stormwater runoff during frequent wet weather events, and retain these pollutants during less frequent high flow wet weather events below the insert within the OGS for later removal during maintenance. The Manufacturer shall have at least ten (10) years of local experience, history and success in engineering design, manufacturing and production and supply of OGS stormwater quality treatment device systems, acceptable to the Engineer of Record.

3.2 SIZING METHODOLOGY

The OGS device shall be engineered, designed and sized to provide stormwater quality treatment based on treating a minimum of 90 percent of the average annual runoff volume and a minimum removal of an annual average 60% of the sediment (TSS) load based on the Particle Size Distribution (PSD) specified in the sizing report for the specified device. Sizing of the OGS shall be determined by use of a minimum ten (10) years of local historical rainfall data provided by Environment Canada, and only rainfall intensities greater than 0.5 mm/hr shall be included in sizing calculations. Sizing shall also be determined by use of the sediment removal performance data derived from the ISO 14034 ETV third-party verified laboratory testing data from testing conducted in accordance with the Canadian ETV protocol Procedure for Laboratory Testing of Oil-Grit Separators, as follows:

3.2.1 Sediment removal efficiency for a given surface loading rate and its associated flow rate shall be based on sediment removal efficiency demonstrated at the seven (7) tested surface loading rates specified in the protocol, ranging 40 L/min/m² to 1400 L/min/m², and as stated in the ISO 14034 ETV Verification Statement for the OGS device.

3.2.2 Sediment removal efficiency for surface loading rates between 40 L/min/m² and 1400 L/min/m² shall be based on linear interpolation of data between consecutive tested surface loading rates.

3.2.3 Sediment removal efficiency for surface loading rates less than the lowest tested surface loading rate of 40 L/min/m² shall be assumed to be identical to the sediment removal efficiency at 40 L/min/m². No extrapolation shall be allowed that results in a sediment removal efficiency that is greater than that demonstrated at 40 L/min/m².

3.2.4 Sediment removal efficiency for surface loading rates greater than the highest tested surface loading rate of 1400 L/min/m² shall assume zero sediment removal for the portion of flow that exceeds 1400 L/min/m², and shall be calculated using a simple proportioning formula, with 1400 L/min/m² in the numerator and the higher surface loading rate in the denominator, and multiplying the resulting fraction times the sediment removal efficiency at 1400 L/min/m².

The OGS device shall also have sufficient annual sediment storage capacity as specified and calculated in Section 2.1.

3.3 CANADIAN ETV or ISO 14034 ETV VERIFICATION OF SCOUR TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of third-party scour testing conducted in accordance with the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators**.

3.3.1 To be acceptable for on-line installation, the OGS device must demonstrate an average scour test effluent concentration less than 10 mg/L at each surface loading rate tested, up to and including 2600 L/min/m².

3.4 LIGHT LIQUID RE-ENTRAINMENT SIMULATION TESTING

The OGS device shall have Canadian ETV or ISO 14034 ETV Verification of completed third-party Light Liquid Re-entrainment Simulation Testing in accordance with the Canadian ETV **Program's Procedure for Laboratory Testing of Oil-Grit Separators**, with results reported within the Canadian ETV or ISO 14034 ETV verification. This re-entrainment testing is conducted with the device pre-loaded with low density polyethylene (LDPE) plastic beads as a

Stormceptor®EF Sizing Report

surrogate for light liquids such as oil and fuel. Testing is conducted on the same OGS unit tested for sediment removal to assess whether light liquids captured after a spill are effectively retained at high flow rates.

3.4.1 For an OGS device to be an acceptable stormwater treatment device on a site where vehicular traffic occurs and the potential for an oil or fuel spill exists, the OGS device must have reported verified performance results of greater than 99% cumulative retention of LDPE plastic beads for the five specified surface loading rates (ranging 200 L/min/m² to 2600 L/min/m²) in accordance with the Light Liquid Re-entrainment Simulation Testing within the Canadian ETV Program's **Procedure for Laboratory Testing of Oil-Grit Separators**. However, an OGS device shall not be allowed if the Light Liquid Re-entrainment Simulation Testing was performed with screening components within the OGS device that are effective at retaining the LDPE plastic beads, but would not be expected to retain light liquids such as oil and fuel.

Product Specifications

Adjustable Accutrol Weir

Tag: _____

Adjustable Flow Control for Roof Drains

ADJUSTABLE ACCUTROL (for Large Sump Roof Drains only)

For more flexibility in controlling flow with heads deeper than 2", Watts Drainage offers the Adjustable Accutrol. The Adjustable Accutrol Weir is designed with a single parabolic opening that can be covered to restrict flow above 2" of head to less than 5 gpm per inch, up to 6" of head. To adjust the flow rate for depths over 2" of head, set the slot in the adjustable upper cone according to the flow rate required. Refer to Table 1 below.

Note: Flow rates are directly proportional to the amount of weir opening that is exposed.

EXAMPLE:

For example, if the adjustable upper cone is set to cover 1/2 of the weir opening, flow rates above 2" of head will be restricted to 2-1/2 gpm per inch of head.

Therefore, at 3" of head, the flow rate through the Accutrol Weir that has 1/2 the slot exposed will be:
[5 gpm (per inch of head) x 2 inches of head] + 2-1/2 gpm (for the third inch of head) = 12-1/2 gpm.

TABLE 1. Adjustable Accutrol Flow Rate Settings

Weir Opening Exposed	1"	2"	3"	4"	5"	6"

HYDROVEX[®] VHV / SVHV Vertical Vortex Flow Regulator

JOHN MEUNIER

HYDROVEX® VHV / SVHV VERTICAL VORTEX FLOW REGULATOR

APPLICATIONS

One of the major problems of urban wet weather flow management is the runoff generated after a heavy rainfall. During a storm, uncontrolled flows may overload the drainage system and cause flooding. Due to increased velocities, sewer pipe wear is increased dramatically and results in network deterioration. In a combined sewer system, the wastewater treatment plant may also experience significant increases in flows during storms, thereby losing its treatment efficiency.

A simple means of controlling excessive water runoff is by controlling excessive flows at their origin (manholes). **John Meunier Inc.** manufactures the **HYDROVEX® VHV / SVHV** line of vortex flow regulators to control stormwater flows in sewer networks, as well as manholes.

The vortex flow regulator design is based on the fluid mechanics principle of the forced vortex. This grants flow regulation without any moving parts, thus reducing maintenance. The operation of the regulator, depending on the upstream head and discharge, switches between orifice flow (gravity flow) and vortex flow. Although the concept is quite simple, over 12 years of research have been carried out in order to get a high performance.

The **HYDROVEX® VHV / SVHV** Vertical Vortex Flow Regulators (refer to **Figure 1**) are manufactured entirely of stainless steel, and consist of a hollow body (1) (in which flow control takes place) and an outlet orifice (7). Two rubber "O" rings (3) seal and retain the unit inside the outlet pipe. Two stainless steel retaining rings (4) are welded on the outlet sleeve to ensure that there is no shifting of the "O" rings during installation and use.

FIGURE 1: HYDROVEX® VHV-SVHV VERTICAL VORTEX FLOW REGULATORS

ADVANTAGES

- The **HYDROVEX® VHV / SVHV** line of flow regulators are manufactured entirely of stainless steel, making them durable and corrosion resistant.
- Having no moving parts, they require minimal maintenance.
- The geometry of the **HYDROVEX® VHV / SVHV** flow regulators allows a control equal to an orifice plate, having a cross section area 4 to 6 times smaller. This decreases the chance of blockage of the regulator, due to sediments and debris found in stormwater flows. **Figure 2** illustrates the comparison between a regulator model 100 SVHV-2 and an equivalent orifice plate. One can see that for the same height of water, the regulator controls a flow approximately four times smaller than an equivalent orifice plate.
- Installation of the **HYDROVEX® VHV / SVHV** flow regulators is quick and straightforward and is performed after all civil works are completed.
- Installation requires no special tools or equipment and may be carried out by any contractor.
- Installation may be carried out in existing structures.

FIGURE 2: DISCHARGE CURVE SHOWING A HYDROVEX® FLOW REGULATOR VS AN ORIFICE PLATE

SELECTION

Selection of a **VHV** or **SVHV** regulator can be easily made using the selection charts found at the back of this brochure (see **Figure 3**). These charts are a graphical representation of the maximum upstream water pressure (head) and the maximum discharge at the manhole outlet. The maximum design head is the difference between the maximum upstream water level and the invert of the outlet pipe. All selections should be verified by John Meunier Inc. personnel prior to fabrication.

Example:

- ✓ Maximum design head 2m (6.56 ft.)
- ✓ Maximum discharge 6 L/s (0.2 cfs)
- ✓ Using **Figure 3** - VHV model required is a **75 VHV-1**

INSTALLATION REQUIREMENTS

All **HYDROVEX®** **VHV** / **SVHV** flow regulators can be installed in circular or square manholes. **Figure 4** gives the various minimum dimensions required for a given regulator. ***It is imperative to respect the minimum clearances shown to ensure easy installation and proper functioning of the regulator.***

SPECIFICATIONS

In order to specify a **HYDROVEX**[®] regulator, the following parameters must be defined:

- The model number (ex: 75-VHV-1)
- The diameter and type of outlet pipe (ex: 6" diam. SDR 35)
- The desired discharge (ex: 6 l/s or 0.21 CFS)
- The upstream head (ex: 2 m or 6.56 ft.) *
- The manhole diameter (ex: 36" diam.)
- The minimum clearance "H" (ex: 10 inches)
- The material type (ex: 304 s/s, 11 Ga. standard)

* *Upstream head is defined as the difference in elevation between the maximum upstream water level and the invert of the outlet pipe where the **HYDROVEX**[®] flow regulator is to be installed.*

PLEASE NOTE THAT WHEN REQUESTING A PROPOSAL, WE SIMPLY REQUIRE THAT YOU PROVIDE US WITH THE FOLLOWING:

- *project design flow rate*
- *pressure head*
- *chamber's outlet pipe diameter and type*

Typical VHV model in factory

OPTIONS

VHV-1-O (standard model with odour control inlet)

FV – SVHV (mounted on sliding plate)

FV – VHV-O (mounted on sliding plate with odour control inlet)

VHV with Gooseneck assembly in existing chamber without minimum release at the bottom

VHV with air vent for minimal slopes

350 SVHV-2	1000	40	1200	48	250	10	700	28

NOTE: *In the case of a square manhole, the outlet flow pipe must be centered on the wall to ensure enough clearance for the unit.*

INSTALLATION

The installation of a **HYDROVEX**[®] regulator may be undertaken once the manhole and piping is in place. Installation consists of simply fitting the regulator into the outlet pipe of the manhole. **John Meunier Inc.** recommends the use of a lubricant on the outlet pipe, in order to facilitate the insertion and orientation of the flow controller.

MAINTENANCE

HYDROVEX[®] regulators are manufactured in such a way as to be maintenance free; however, a periodic inspection (every 3-6 months) is suggested in order to ensure that neither the inlet nor the outlet has become blocked with debris. The manhole should undergo periodically, particularly after major storms, inspection and cleaning as established by the municipality

GUARANTY

The **HYDROVEX**[®] line of **VHV / SVHV** regulators are guaranteed against both design and manufacturing defects for a period of 5 years. Should a unit be defective, **John Meunier Inc.** is solely responsible for either modification or replacement of the unit.
