TABLE OF CONTENTS

1.0 INTRODUCTION

The subject site is located on the west side of Cleopatra Drive (#64), at the west end of Caesar Avenue in the City of Ottawa. The site currently has an existing two (2) storey industrial/office building and an asphalt parking lot. The existing building is to remain and shall be expanded with a proposed one (1) storey addition of approximately 4,185sq.ft. The existing asphalt parking lot (i.e. along the east and south sides of the existing building) will be reconfigured; therefore, increasing the landscaped area which in return reduces the imperviousness of the site. The north side of the existing building (i.e. gravel parking lot / storage area), will be removed to accommodate the new building addition. The overall site has an area of 0.28ha, however only 0.066ha is being redeveloped.

The existing building is serviced from a 10 inch (250mm) diameter sanitary sewer along Cleopatra Drive. As for water, the site is currently serviced by an on-site well. Approximately half the site drains overland to the existing hydro easement along the west side of the site, where as the other half of the site drains overland easterly ultimately draining to catchbasins along Cleopatra Drive.

A site investigation was undertaken to verify the existing site conditions and to establish the impact the new building expansion would have on the site. The City of Ottawa was contacted to verify existing civil infrastructure services along Cleopatra Drive and information on the servicing requirements for this project.

2.0 WATER SERVICE

As mentioned above, the building is currently serviced by an on-site water well. The intent is to decommission the existing water well and connect to the existing 12 inch (300mm) diameter watermain along Cleopatra Drive. Using the City of Ottawa guideline of 35 cu.m/ha.d for light industrial use, the anticipated average daily demand for the site has been calculated at 9.8cu.m/day or 0.116L/s. Therefore, the anticipated peak hourly rate shall be in the magnitude of 0.21L/s, which is minimal. No fire sprinklers are anticipated at this time.

The anticipated fire flow (based on the Fire Underwriters Survey) was calculated to be 7,000 L/min or **116.7 L/s.** A detailed calculation can be seen in Appendix B.

The following are boundary conditions provided by the City (i.e. Justin Armstrong on May 30, 2019 – correspondence attached in Appendix B):

Minimum HGL = 126.5m
Maximum HGL = 134.0m
Max Day + Fire Flow = 126.0m

Based on a ground elevation of 90.15m:

Minimum HGL = 51.7 psi
Maximum HGL = 62.4 psi
Max Day + Fire Flow = 51.0 psi

Ainley has reviewed the results of the City of Ottawa hydraulic analysis and find that they meet the requirements set out by the ODG for water distribution, as seen below:

- Normal operating pressure ranges between 50 psi and 80 psi under a condition of maximum daily flow.
- Under maximum hourly demand conditions, the pressures are not less than 40 psi.
- During periods of maximum day and fire flow demand, the residual pressure at any point in the distribution system shall not be less than 20 psi.
- The maximum pressure at any point in the distribution system in occupied areas outside of the public right-of-way shall not exceed 80 psi.
- The maximum pressure at any point in the distribution system in unoccupied areas shall not exceed 100 psi.

We also provide a Fire Hydrant Coverage Plan and Hydrant Spacing/Capacity Table for your reference in Appendix B.

With regards to the existing well, we note that the UTM coordinates from the well record don't seem to line up correctly with the property; however, does state that the well is in fact on the property (please see attached Well Record in Appendix C). Decommissioning must be done by a licensed well contractor in accordance with Wells Regulation (R.R.O 1990 Regulation 903) as per Ontario Water Resource Act.

3.0 SANITARY SEWER SERVICE

As mentioned above, the site is currently serviced from a 10 inch (250mm) diameter sanitary sewer along Cleopatra Drive. Under City of Ottawa policy, secondary sanitary service connections to a property are not generally permitted. The intent is to provide a new sanitary service (decommissioning and/or removing the old service), and branching off a secondary line (on-site) towards the new building addition at a proposed Sanitary MH. The secondary line to the new building addition is intended to service the floor drains only, therefore no additional flows are expected.

4.0 DRAINAGE & STORM WATER SYSTEM

The stormwater management facility for this development has been designed to attenuate the release of stormwater runoff from the redeveloped area of the site to a rate not greater than the 5 year pre-development runoff rate of 9.5 l/s, (i.e. see correspondence from the City of Ottawa in Appendix A confirming the quantity control criteria for the site).
We note that in pre-development conditions, the entire proposed redeveloped area drains towards the west side of the site (i.e. not towards the municipal right of way). Due to the existing topography, a small section of the proposed redeveloped area (drainage area A-3) will drain uncontrolled to the west side of the site. As well, a small section of the proposed redeveloped area (drainage area A-2) will drain uncontrolled to the east towards Cleopatra Drive. Therefore, over controlling drainage area A-1 (proposed building and grassed area to the north) will be required.

This has been achieved by installing an inlet control device (i.e. Vertical Hydrovex Valve – see Appendix C) in the ditch inlet catchbasin and by providing the appropriate ponding volume within the swale/ditch system, (refer to Detention Area Volume Calculations in Appendix C). We note that the emergency overland flow high point will be set at 0.18m below the finished floor elevation. Flows from A1 will be directed to the ditch storage via eavestrough. Due to the nature of the site (industrial area, no basement, overland flow not to right of way), there is limited opportunity for property damage to occur should this overland flow fail to convey the flow from this small area. Nonetheless, this overland flow highpoint elevation meets the requirements of the current City of Ottawa OSDG for the elevations of overland flow high points compared to finished floors.

Since the proposed redeveloped area is primarily building (which typically doesn't require stormwater quality treatment – considered clean water); that the proposed reconfiguration of the existing parking lot does not change the existing drainage pattern and increases the landscaped area which in return reduces the imperviousness of the site; and, that the existing industrial subdivision drains to an existing stormwater management pond/facility, we note that no stormwater quality requirements are required for this site (i.e. see correspondence from the RVCA in Appendix C).

Also, based on our pre-consultation with Ministry of the Environment (i.e. Charlie Primeau – Water Compliance Supervisor) on June 5, 2019 and subsequent correspondence with the City of Ottawa, an Industrial ECA (direct submission) will be required for this project. Correspondence from the MOE, City of Ottawa and a copy of the existing C of A for the downstream storm water pond received by the City of Ottawa has been included in the report for reference in Appendix C.

4.1 5 YEAR PRE-DEVELOPMENT FLOW

Q = R x A x I x N

Redeveloped Site Area	A =	0.066 hectares
Runoff Coefficient	R =	0.50 (gravel)
Time of Concentration	Tc =	10 min
Rainfall Intensity (5yr)	I =	104.19 mm/hr
5 year Pre-Dev. Flow:	Q =	0.50 x 0.066 x 104.19 x 2.778
	Q =	9.5 l/s

4.2 100 YEAR POST-DEVELOPMENT FLOW (AREA A1)

Q = R x A x I x N

Redeveloped Site Area	A =	0.054 hectares
Runoff Coefficient	R =	$\frac{(0.014 \times 0.20) + (0.039 \times 0.90)}{0.053}$
	R =	0.72
Time of Concentration	Tc =	10 min
Rainfall Intensity (100yr)	I =	178.56 mm/hr
100 year Post-Dev. Flow:	Q =	0.72 x 0.053 x 178.56 x 2.778
	Q =	18.9 l/s

4.3 100 YEAR POST-DEVELOPMENT FLOW (AREA A2)

Q = R x A x I x N

Redeveloped Site Area	A =	0.005 hectares
Runoff Coefficient	R =	$\frac{(0.003 \times 0.20) + (0.002 \times 0.90)}{0.005}$
	R =	0.43
Time of Concentration	Tc =	10 min
Rainfall Intensity (100yr)	I =	178.56 mm/hr
100 year Post-Dev. Flow:	Q =	0.43 x 0.005 x 178.56 x 2.778
	Q =	1.1 l/s

4.4 100 YEAR POST-DEVELOPMENT FLOW (AREA A3)

Q = R x A x I x N

Redeveloped Site Area	A =	0.008 hectares
Runoff Coefficient	R =	0.90 (asphalt)
Time of Concentration	Tc =	10 min
Rainfall Intensity (100yr)	I =	178.56 mm/hr

100 year Post-Dev. Flow: Q = 0.90 x 0.008 x 178.56 x 2.778
Q = 3.6 l/s

4.5 STORAGE REQUIREMENTS

As noted previously, the site has been designed to limit the rate of runoff (for the redeveloped portion of the site) to the 5 year pre-development release rate of 9.5 l/s for rainfall events up to and including the 100 year post-development event.

Over controlling Area A1 to 4.8 l/s [9.5 l/s (pre-dev.) – 1.2 l/s (Area A2) – 3.4 (area A3)] ensures the 5 year pre-development release rate of 9.5 l/s is achieved.

Storage volume requirements were determined by applying the 5-year and 100-year rainfall intensity values at 10-minute intervals until a peak storage volume was attained.

Return Period	Time (min)	Intensity (mm/hr)	Flow Q (L/s)	Controlled Release	Net Runoff To Be Stored (L/s)	Storage Req'd m3
	10	104.19	11.00	4.8	6.2	3.7
5 Year	20	70.25	7.42	4.8	2.6	3.1
	30	53.93	5.69	4.8	0.9	1.6
	40	44.18	4.67	4.8	-0.1	-0.3
	50	37.65	3.98	4.8	-0.8	-2.5
	10	178.56	18.85	4.8	14.0	8.4
100 Year	20	119.95	12.66	4.8	7.9	**9.4**
	30	91.87	9.70	4.8	4.9	8.8
	40	75.15	7.93	4.8	3.1	7.5
	50	63.95	6.75	4.8	1.9	5.8

Therefore, the resulting 100-year release rate from the redeveloped portion of the site is less/equal to the allowable release rate of 9.5 l/s by providing 9.4 cu.m of storage within the swale/ditch system on the north side of the proposed building expansion.

5.0 EROSION AND SEDIMENT CONTROL

Erosion and sediment control measures shall be implemented during construction to minimize the migration of sediments from the proposed construction. To accomplish this task, items such as silt fences, and geo-textile membranes shall be installed to capture sediment before it leaves the construction areas. In addition, all stockpiles shall be covered and located away from waterways and exposed areas and shall be vegetated as soon as possible. During construction, all erosion control features shall be maintained and repaired as necessary and adjacent roadways kept free of debris and sediment as required. Drawing 19028 - SC1 shows detailed requirements for erosion and sediment control.

6.0 CONCLUSION

1. The intent is to decommission the existing water well and connect to the existing 300mm diameter watermain along Cleopatra Drive. The anticipated peak hourly rate has been calculated at 0.21 L/s. The fire flow water demand has been calculated at 116.7 L/s. No fire sprinklers are anticipated at this time.
2. No increase in sanitary flows is anticipated.
3. The redeveloped portion of the site has been designed to limit the rate of runoff to the 5 year pre-development release rate for rainfall events up to and including the 100 year post-development event.
4. Erosion and sediment control has been incorporated into the contract drawings.
5. An Industrial ECA (direction submission) will be required for this project and will be completed / submitted separately.

We trust that this report meets all of your requirements. Should you have any questions or require further clarification, please do not hesitate to contact our office.

Sincerely,

Good morning Guy,

I just want to let you know that the quantity control criteria that you used in your report for this site is the correct one (i.e. 5-year flow based on the lesser of C=0.5 or existing). This is related to comment #19 in the attached comment.

If you have any questions, please let me know.

Thanks,

Santhosh

It is understood that FUS calculations are required to determine the boundary conditions

64 Cleopatra Fire Flow

Step	Parameter	Value	Note
A	Type of Construction	Ordinary	Assumed Steel construction with combustible interior components
	Coefficient related to the type of construction	C = 1.0	
B	Ground Floor Area	N/A	Considering that some floors are of differing areas (mezzanine, attic storage of ex building), only the total floor area is given, as below
C	Height in Storeys	3 storeys in existing building, 1 storey plus Mezzanine in proposed building	
	Total floor area:	A = 924.4 m2	
D	Fire flow:	F = 220 C $A^{0.5}$ = 220 x 1.0 x $(924.4)^{0.5}$ = 6 688.87 L/min = 7 000 L/min	Flow rounded to the nearest 1000 L/min.
E	Occupancy class	Combustible	Given that this building will be used as a mechanical garage, and this use is not listed as either low or high hazard occupancy,
	Occupancy Charge	0%	
	Occupancy increase or decrease	7 000 L/min x 0% = 0 L/min	

	Fire Flow	F = 11 000 L/min + - 0 L/min F = 7 000 L/min	No rounding applied.
F	Sprinkler Protection	Not Included	It is understood that this building will not be equipped with a sprinkler system.
	Sprinkler credit	0%	
	Sprinkler FF reduction	7 000 x 0% = 0 L/min	
G	West side exposure:	Exposing wall: Ordinary type construction Distance: over 45 m	No exposed wall within 45 meters of the proposed structure
	West side exposure charge:	0%	
	North side exposure:	Exposing wall: Ordinary type construction Distance: over 45 m	No exposed wall within 45 meters of the proposed structure
	North side exposure charge:	0%	
	East side exposure:	Exposing wall: Ordinary type construction Distance: 36.9 m	Exposed wall of Ordinary construction
	East side exposure charge:	5%	
	South Side Exposure:	Exposing wall: Ordinary type construction Distance: over 45 m	No exposed wall within 45 meters of the proposed structure
	South side exposure charge:	0%	
	Total exposure charge:	= 0% + 0% + 5% + 0% = 5%	The total exposure charge is below the maximum value of 75%.
	Increase for exposures:	= 7 000 L/min x 5% = 350 L/min	
H	Fire flow	F = 7 000 L/min + 350 L/min F = 7 350 L/min = 7 000 L/min = 116.7 L/s	Flow rounded to nearest 1000 L/min.

Thus, to conclude;

- Fire Flow for the proposed building (considering the existing building and proposed building as a single fire area) will be **116.7 L/s**.

Attachments: 64 Cleopatra May 2019.pdf

Hi Paul,

Please see boundary conditions below as well as assumed connection point in attached PDF.

The following are boundary conditions, HGL, for hydraulic analysis at 64 Cleopatra (zone 2C) assumed to be connected the 305mm on Cleopatra (see attached PDF for location).

Minimum HGL = 126.5m

Maximum HGL = 134.0m

MaxDay + FireFlow (117 L/s) = 126.0m

These are for current conditions and are based on computer model simulation.

Disclaimer: The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation.

Subject: RE: D07-12-16-0029 64 Cleopatra Drive - Water Boundary card request

Hi Justin;

Thank you for responding to our request. I have included the information requested below;

- An image of the site indicating the location of the site's proposed water connection to the City main.
  See attached servicing drawing snapshot
- Average daily demand
  0.116 L/s
- Maximum daily demand
  0.175 L/s
- Peak hour demand
  0.210 L/s
- Required fire flow based on the FUS method (see attached Technical Bulletin ISTB-2018-02 which outlines the FUS method in detail)
  116.67 L/s - See attached memorandum for calculations

Cheers,

Paul Le Blanc, EIT

Sent: May 31, 2021 4:05 PM
To: Guy Ste-Croix; Eric Lalande
Subject: RE: 64 Cleopatra Drive

Good Afternoon Guy,

The only thing I would add is that no additional water quality control is required because the repaved area is within the same footprint, with no new infrastructure proposed and is currently sheet drained to an existing grassed area at the rear of the property which currently provides some water quality treatment.

Subject: RE: 64 Cleopatra Drive

Hi Jamie,

Per our meeting earlier today, we summarize the following:

- The building addition / expansion area at 64 Cleopatra Drive in Ottawa is considered ‘clean water’ (i.e. primarily building / roof and grass area); therefore, no stormwater quality is required.
- With regards to the reconfiguration of the existing parking lot, we note that a small section will be repaved and other sections of asphalt will be removed all together. The proposed reconfiguration of the existing parking lot does not change the existing drainage pattern and increases the landscaped area which in return reduces the imperviousness of the site; therefore, no stormwater quality is required.

We ask that you please acknowledge receipt and confirmation of the above noted statements, so this can be included in our SWM report.

Subject: 64 Cleopatra Drive

Hi Eric,

We are working on a building expansion at 64 Cleopatra Drive in Ottawa. The site currently has an existing two (2) storey industrial/office building and an asphalt parking lot. The existing building is to remain and shall be expanded with a proposed one (1) storey addition of approximately 4,200sq.ft. The existing asphalt parking lot (i.e. along the east and south sides of the existing building) will be reconfigured; therefore, increasing the landscaped area which in return reduces the imperviousness of the site. The north side of the existing building (i.e. gravel parking lot / storage area), will be removed to accommodate the new building addition. The overall site has an area of 0.28ha, however only 0.066ha is being redeveloped. The redeveloped portion of the site will be controlled to the 5-year pre-development level. Since the proposed redeveloped area is primarily building (which typically doesn't require storm water quality treatment) and that the existing industrial subdivision drains to an existing stormwater management pond/facility, we note that it's our interpretation that no stormwater quality requirements will be required for this site. That being said, with regards to water quality control, the City of Ottawa has requested: *"Please confirm what the Rideau Valley Conservation Authority (RVCA) has identified as the quality control criteria for this site."* We ask that you please confirm by email so we can include RVCA correspondence in our report as requested by the City.

Attachments: FW: 64 Cleopatra Drive, D07-12-16-0029, Zoning-IG, - Construction of an additional building to an existing site

Hi Guy,

You will have to apply for an Industrial ECA and it will be a direct submission. Please see attached email for the reason.

Thanks,

Santhosh

From: Kuruvilla, Santhosh
Sent: May 14, 2021 12:26 PM
To: Guy Ste-Croix <stecroix@ainleygroup.com>
Subject: RE: D07-12-16-0029 - 64 Cleopatra Drive

Hi Guy,

I forwarded your information to our senior engineer and she requested the following additional information from you.

Hi Santhosh,

Please ask the applicant to answer each of these questions. Charles will send the request to Aziz once this is provided.

1) Applicants name and address:

2) The site name and location:

3) Who will own the sewer works:

4) Description of the proposed sewage works:

5) Confirmation that outside of the fact the proposed sewage works will remain privately owned, the works meet all the requirements of items 1) and 2) of schedule A of the City's ToR agreement:

Thanks,

Santosh

To: Kuruvilla, Santhosh <Santhosh.Kuruvilla@ottawa.ca>
Subject: D07-12-16-0029 - 64 Cleopatra Drive

Hi Santhosh,

Further to our discussion re. an ECA possibly not being required for the building expansion project at 64 Cleopatra Drive within the City of Ottawa, we provide the following description of what the building will be used for: **The building will be operated by a Civil contractor and will be used for storage space (with a small amount of office space) and garage for heavy Civil equipment.** We note that the redeveloped area is primarily roof which typically doesn't require stormwater quality treatment. Also, the building will not have a storm sewer connection. The building (Area A1 – see below) will be directed to the ditch storage area via eavestroughing. A catchbasin with an inlet control device will be installed in the grassed / ditched area to control post-development flows to pre-development levels. Therefore, it appears (based on our interpretation) that the expected stormwater effluent from the proposed building expansion area is non-industrial.

Subject: FW: D07-12-16-0029 64 Cleopatra Drive - 170 Cleopatra Pond ECA

Hi Charlie;

Thanks for your call this past Friday; I appreciate the assistance in keeping this project moving.

I've attached the existing C of A for the downstream storm water pond received from the City of Ottawa; please let me know if this is sufficient for the purpose of identifying the pond and any associated requirements regarding our project. The address is also in the attached email.

I've also confirmed that the building is operated by a civil contractor, and that it will be used for storage space and garage for heavy equipment.

As discussed, I'm also clarifying that the receiving storm water on-site storage area will only be receiving water from the proposed roof and the grass area adjacent to the proposed addition.

Please let me know if you require anything further to complete our pre-consultation meeting.

Cheers,

NOTES: GENERAL

1. CONTRACTOR TO VERIFY ALL BUILDING AND SITE LAYOUT DIMENSIONS WITH THE ARCHITECT'S LATEST DRAWINGS PRIOR TO COMMENCEMENT OF CONSTRUCTION LAYOUT. ALL CONSTRUCTION LAYOUT SHALL BE CONFIRMED BY THE ARCHITECT PRIOR TO CONSTRUCTION.
2. ALL ELEVATIONS ARE SHOWN AS METRIC AND GEODETIC.
3. CONSTRUCTION LAYOUT SHALL BE DONE BY THE CONTRACTOR.
4. CONTRACTOR IS RESPONSIBLE FOR THE PROTECTION OF ANY EXISTING SERVICES AND FACILITIES THAT MAY BE DAMAGED DURING CONSTRUCTION. CONTRACTOR TO LOCATE ALL EXISTING UNDERGROUND SERVICES PRIOR TO ANY EXCAVATION.
5. CONTRACTOR IS RESPONSIBLE FOR THE REPAIR AND/OR REPLACEMENT OF ANY DAMAGED UNDERGROUND UTILITIES, SEWERS OR SERVICES AT NO ADDITIONAL COST TO THE OWNER. ALL FEES, INSPECTION, PERMITS AND COORDINATION WILL BE AT THE CONTRACTOR'S EXPENSE.
6. CONTRACTOR TO VERIFY ALL SURFACE AND SUBSURFACE CONDITIONS PRIOR TO CONSTRUCTION BY REVIEWING THE GEOTECHNICAL REPORT. IF A GEOTECHNICAL REPORT IS NOT AVAILABLE, THE CONTRACTOR IS RESPONSIBLE TO MAKE THEIR OWN INDEPENDENT ASSESSMENT OF THE SUBSURFACE CONDITIONS BY WHATEVER MEANS POSSIBLE, AT NO ADDITIONAL COST TO THE OWNER. THE CONTRACTOR SHALL NOT MAKE ANY CLAIMS FOR ADDITIONAL COMPENSATION AS A RESULT OF UNSUITABLE CONDITIONS.
7. CONTRACTOR TO COORDINATE ALL PERMITS, FEES, INSPECTIONS AND APPROVALS AS REQUIRED BY THE CITY, AT NO ADDITIONAL COST TO THE OWNER.
8. CONTRACTOR IS RESPONSIBLE FOR ALL DEWATERING, SUPPORT AND PROTECTION OF EXCAVATIONS. DISCHARGE OF WATER SHALL BE IN AN APPROVED MANNER AND CONSISTENT WITH THE MINISTRY OF THE ENVIRONMENT AND THE CITY OF OTTAWA.
9. ANY AND ALL CHANGES MUST BE APPROVED IN WRITING FROM THE ENGINEER PRIOR TO IMPLEMENTATION.
10. ALL UNSUITABLE OR EXCESS MATERIAL SHALL BE REMOVED, HAULED AND DUMPED AT A LOCATION APPROVED BY THE OWNER. THIS WORK WILL BE COMPLETED AT NO ADDITIONAL COST TO THE CONTRACT.
11. ALL DISTURBED AREAS SHALL BE REINSTATED TO EQUAL OR BETTER CONDITION TO THE SATISFACTION OF THE ENGINEER AND THE CITY OF OTTAWA.
12. ASPHALT WEAR COURSE SHALL NOT BE PLACED UNTIL FINAL VIDEO INSPECTION OF THE SEWERS HAVE BEEN COMPLETED AND APPROVED BY THE ENGINEER AND/OR CITY.
13. ALL UNSUITABLE MATERIAL SHALL BE EXCAVATED AND BACKFILLED WITH GRANULAR 'B'. COMPACTION TO CONFORM WITH CITY STANDARDS.
14. CITY OF OTTAWA STANDARD CONSTRUCTION & MATERIAL SPECIFICATIONS, THE ONTARIO PROVINCIAL STANDARD SPECIFICATIONS (OPSS) AND THE ONTARIO PROVINCIAL STANDARD DRAWINGS (OPSD), ALONG WITH THESE DRAWINGS SHALL FORM PART OF THE CONTRACT DOCUMENTS AND SHALL APPLY TO ALL CONSTRUCTION ACTIVITIES.
15. THE CONTRACTOR IS RESPONSIBLE FOR THE INSTALLATION AND CONSTRUCTION OF ALL SEDIMENT AND EROSION CONTROL MEASURES TO ENSURE THAT SEDIMENT DOES NOT MIGRATE FROM THE CONSTRUCTION SITE. SEDIMENTS SHALL BE CONTAINED AND DISPOSED OF IN A MANNER CONSISTENT WITH THE CITY OF OTTAWA SPECIFICATIONS.
16. THE CONTRACTOR SHALL VERIFY ALL SURFACE AND SUBSURFACE CONDITIONS PRIOR TO COMMENCING CONSTRUCTION BY REVIEWING THE GEOTECHNICAL INVESTIGATION REPORT PG3498-LET.01 PREPARED BY PATERSON GROUP, DATED FEBRUARY 12, 2016.
17. ALL ASPHALT REMOVAL AREAS SHALL BE SAW CUT TO FORM A CLEAN STRAIGHT EDGE PRIOR TO PLACEMENT OF NEW ASPHALT.
18. CONTRACTOR TO PROVIDE 'AS-BUILT' INFORMATION (SEWER INVERTS, SERVICE LATERAL INVERTS & LOCATION, ASPHALT & TOP OF CURB GRADES, ETC.) TO THE ENGINEER IN IN A FORMAT CONSISTENT WITH CITY STANDARDS.
19. CURBS SHALL CONFORM TO CITY OF OTTAWA STD. SC1.1 (BARRIER CURB).
20. ALL EXISTING PAVEMENT, CURBS, SIDEWALKS, DRIVEWAYS AND BOULEVARD AREAS DISTURBED BY THE CONSTRUCTION MUST BE REINSTATED TO EXISTING CONDITION OR BETTER.

NOTES: SERVICE LATERALS

1. THE FOUNDATION DRAIN OF THE PROPOSED ONE STOREY ADDITION IS TO BE CONNECTED TO THE EXISTING BUILDING FOUNDATION DRAIN (IF APPLICABLE).
2. DIRECT ROOF LEADER CONNECTIONS TO THE STORM SEWER SYSTEM WILL NOT BE PERMITTED. ROOF LEADERS SHALL DISCHARGE TO THE SURFACE.
3. CONNECTION OF FOUNDATION DRAINS TO THE SANITARY SEWER IS NOT PERMITTED.
4. SANITARY SEWER LATERALS SHALL BE CONSTRUCTED AT A GRADIENT OF AT LEAST 1.00%.
5. SANITARY SEWER LATERALS SHALL BE SDR-28 PIPE.
6. THE MINIMUM DIAMETER FOR SANITARY SEWER LATERALS IS 135mm.
26. SANITARY SEWER LATERALS SHALL HAVE A MINIMUM OF 2.0m COVER. THERMAL INSULATION IS TO BE INSTALLED WHERE REQUIRED.
7. SANITARY SEWER LATERALS SHALL BE CONSTRUCTED IN ACCORDANCE WITH CITY OF OTTAWA STANDARDS S11 AND S11.1.
8. WATER SERVICE TO BE 50mm COPPER, INSTALLED PER CITY OF OTTAWA STANDARD W33.
9. WATER SERVICE POST ASSEMBLY TO BE IN ACCORDANCE WITH STANDARD W35.
10. WATER SERVICE TO BE INSTALLED WITH A MINIMUM COVER OF 2.4m. THERMAL INSULATION IS TO BE INSTALLED WHERE REQUIRED.
11. WATER SERVICE INSTALLATION AT SEWER CROSSINGS PER STD. W38.
12. WATER SERVICE BEDDING SHALL BE CONSTRUCTED IN ACCORDANCE WITH CITY OF OTTAWA STANDARD W17.
13. INSTALLATION OF WATER METER AND REMOTE RECEPTACLE SHALL BE IN ACCORDANCE WITH CITY OF OTTAWA STANDARDS. (BY OTHERS).
14. CATHODIC PROTECTION IS REQUIRED FOR ALL IRON FITTINGS IN ACCORDANCE WITH CITY OF OTTAWA STANDARDS.
15. CONNECTION TO EXISTING WATERMAIN ALONG CLEOPATRA DRIVE SHALL BE COMPLETED BY CITY FORCES. EXCAVATION, BACKFILL AND REINSTATEMENT SHALL BE COMPLETED BY THE CONTRACTOR.
16. PROVIDE FOUNDATION DRAINAGE AS PER PATERSON GROUP GEOTECHNICAL REPORT PG3498-LET.01 DATED FEBRUARY 12, 2016 AND CONNECT TO EXISTING FOUNDATION DRAINAGE IF PRESENT.

RECOMENDED PAVEMENT DESIGN:

40mm HL3

50mm HL8

150mm OPSS GRANULAR 'A'

450mm OPSS GRANULAR 'B' TYPE II
