#### LIMITATIONS STATEMENT

WSP Canada Inc. (WSP) prepared this report solely for the use of the intended recipient, OTTAWA CATHOLIC SCHOOL BOARD, in accordance with the professional services agreement between the parties. In the event a contract has not been executed, the parties agree that the WSP General Terms for Consultant shall govern their business relationship which was provided to you prior to the preparation of this report.

The report is intended to be used in its entirety. No excerpts may be taken to be representative of the findings in the assessment.

The conclusions presented in this report are based on work performed by trained, professional and technical staff, in accordance with their reasonable interpretation of current and accepted engineering and scientific practices at the time the work was performed.

The content and opinions contained in the present report are based on the observations and/or information available to WSP at the time of preparation, using investigation techniques and engineering analysis methods consistent with those ordinarily exercised by WSP and other engineering/scientific practitioners working under similar conditions, and subject to the same time, financial and physical constraints applicable to this project.

WSP disclaims any obligation to update this report if, after the date of this report, any conditions appear to differ significantly from those presented in this report; however, WSP reserves the right to amend or supplement this report based on additional information, documentation or evidence.

WSP makes no other representations whatsoever concerning the legal significance of its findings.

The intended recipient is solely responsible for the disclosure of any information contained in this report. If a third party makes use of, relies on, or makes decisions in accordance with this report, said third party is solely responsible for such use, reliance or decisions. WSP does not accept responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken by said third party based on this report.

WSP has provided services to the intended recipient in accordance with the professional services agreement between the parties and in a manner consistent with that degree of care, skill and diligence normally provided by members of the same profession performing the same or comparable services in respect of projects of a similar nature in similar circumstances. It is understood and agreed by WSP and the recipient of this report that WSP provides no warranty, express or implied, of any kind. Without limiting the generality of the foregoing, it is agreed and understood by WSP and the recipient of this report that WSP makes no representation or warranty whatsoever as to the sufficiency of its scope of work for the purpose sought by the recipient of this report.

In preparing this report, WSP has relied in good faith on information provided by others, as noted in the report. WSP has reasonably assumed that the information provided is correct and WSP is not responsible for the accuracy or completeness of such information.

Benchmark and elevations used in this report are primarily to establish relative elevation differences between the specific testing and/or sampling locations and should not be used for other purposes, such as grading, excavating, construction, planning, development, etc.

The original of this digital file will be kept by WSP for a period of not less than 10 years. As the digital file transmitted to the intended recipient is no longer under the control of WSP, its integrity cannot be assured. As such, WSP does not guarantee any modifications made to this digital file subsequent to its transmission to the intended recipient.

This limitations statement is considered an integral part of this report.

#### EXECUTIVE SUMMARY

WSP Canada Inc. was retained by Ottawa Catholic School Board (OCSB) to complete an Environmental Noise Impact Study in support of an application for Site Plan Control Application (SPA) for the proposed OCSB Riverside South Elementary School development to be located at the corner of Brain Good Avenue and Solarium Avenue in Ottawa, Ontario (the Site). The Site consists of a main one-storey building and separate classroom portables, a play structure area, a sports field, and parking lot.

The purpose of the study is to assess the potential noise effects of the environment onto the Site and assess the potential noise impact of the proposed stationary noise sources at the Site on surrounding noise-sensitive areas. This report is based on the Site Plan, prepared by Pye & Richards – Temprano & Young Architects Inc., dated July 4, 2022 ("Issued for Client Review").

The assessment was conducted in accordance with the City of Ottawa and the Ministry of Environment, Parks and Conservation (MECP) noise guidelines.

The significant sources of noise in the vicinity of the proposed development are transportation noise sources, mainly road traffic on Brain Good Avenue and Solarium Avenue, which are classified as urban collector roads. The significant stationary sources of noise at the Site are rooftop HVAC equipment.

Based on the predicted sound levels at the proposed development due to road traffic noise sources, exterior wall, door, and window construction meeting the Ontario Building Code (OBC) minimum requirements will be adequate to meet the indoor sound level limits to comply with the City of Ottawa and the MECP noise guidelines. Stationary sources at the Site are predicted to comply with the City of Ottawa and the MECP noise guidelines without additional noise control measures.

#### 1 INTRODUCTION

WSP Canada Inc. (WSP) was retained by Ottawa Catholic School Board (OCSB) to complete an Environmental Noise Impact Study for the proposed Riverside South Elementary School development to be located at the corner of Brain Good Avenue and Solarium Avenue in Ottawa, Ontario (the Site). This report was prepared in support of the Site Plan Approval application submission.

This assessment investigates both the potential for noise impacts of the environment onto the Site from the nearby transportation sources (i.e., Brain Good Avenue and Solarium Avenue) and proposed stationary sources at the Site onto surrounding noise-sensitive areas.

The purpose of the study is to assess the potential noise effects of the environment onto the Site and proposed stationary sources at the Site onto surrounding noise-sensitive areas. The findings and recommendations needed to comply with the applicable noise guidelines are included herein.

#### 1.1 THE SITE AND SURROUNDING AREA

The Site is bounded by:

- To the east, Brain Good Avenue;
- To the south, Solarium Avenue;
- To the west, residential homes; and,
- To the north, an open space.

The Site is proposed to be surrounded by mostly residential lots. The location of the Site is shown in **Figure 1**. A zoning map showing the land use surrounding the proposed development obtained from the City of Ottawa is provided in **Figure 2**. The Site is zoned "I1E H(15)" Minor Institutional and the immediate surrounding area of the proposed development includes residential, institutional, and open space land uses.

#### 1.2 THE PROPOSED DEVELOPMENT

This report was based on the Site Plan, prepared by Pye & Richards – Temprano & Young Architects Inc., dated July 4, 2022, and included as **Appendix A**. The Site consists of a main one-storey building, north of the main building there are three (3) portable 6-pack classrooms, to the northwest a play structure area, a sports field, and a parking lot directly west.

#### 2 NOISE IMPACT ASSESSMENT

#### 2.1 NOISE SOURCES

The City's *Environmental Noise Control Guidelines* (ENCG) stipulates that a noise study shall be prepared when a new development is proposed within distances as follows:

- 100 metres from the right-of-way of an existing or proposed road; arterial, major collector, light rail transit, bus rapid transit or transit priority corridor;
- 250 metres from the right-of-way of an existing or proposed highway;
- 300 metres from the right-of-way of a proposed or existing rail corridor or secondary main railway line;
- 500 metres from the right-of-way of a freeway or 400-series provincial highway or principal main railway line;
   or
- Defined area from the Noise Exposure Forecast (NEF) noise contour of airport / aircraft noise

#### SURFACE TRANSPORTATION NOISE SOURCES

The significant sources of noise in the vicinity of the proposed development are transportation noise sources. The road types were identified as collectors using the City's "Official Plan – Schedule E Urban Road Network" as provided in **Appendix B**. The road within 100 metres of the site are Solarium Avenue and Brain Good Avenue. Other roads, light rail transit, bus rapid transit, and transit priority corridor, are over 100 metres away from the Site and are not expected to have a significant impact.

Proposed and existing highways are further than 250 m away from the proposed school. Proposed or existing rail corridor or main railway lines are further than 300 m. Freeway and 400-series or principal railway line are further than 500 m. Therefore, these transportation noise sources are not included or significant to this assessment.

#### STATIONARY NOISE SOURCES

There are stationary noise sources originating from the proposed school building development which is surrounded by existing and future residential buildings. Therefore, stationary noise has been included in the study to assess the potential noise impacts of the proposed development on the surrounding noise sensitive land uses.

#### AIRCRAFT SOURCES

The proposed development is located outside the City of Ottawa's International Airport's (Macdonald-Cartier International Airport) Vicinity Development Zone and outside the Airport Operating Influencing Zone (AOIZ). Therefore, aircraft noise has not been considered in the assessment. **Figure 3** shows the Site location in relation to the airport's NEF/NEP contour map. The NEF/NEP contour map is included in **Appendix C**.

#### 2.2 NOISE GUIDELINES AND ASSESSMENT CRITERIA

Noise is recognized as a pollutant in the Environmental Protection Act, as uncontrolled noise can affect human activities. Ontario provincial noise control guidelines require that noise concerns are addressed in the planning of any new development.

In land use planning, although elimination or control of the source of pollution is usually a primary objective, there are general limits as to what is practical and technically possible. The City's ENCG follows the MECP's Publication NPC-300, *Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning* for acceptable levels of road and air traffic noise impacting noise-sensitive institutional developments and stationary

noise on surrounding noise-sensitive residential areas. These limits are discussed in Section "Part C – Land Use Planning" of NPC-300 as well as Section 2 and 4 of the ENCG.

#### 2.2.1 ROAD SOURCES ASSESSMENT CRITERIA

Table 2-1 summarizes sound level limits for road traffic applicable for the proposed institutional development.

Table 2-1 ENCG & NPC-300 Road Traffic Indoor Sound Level Criteria for Schools

AREA	TIME PERIOD	Leq (dBA) [1] -ROAD	REFERENCE
Indoor Living/Dining Areas of Schools, Daycares	Daytime (0700 – 2300h)	45	NPC-300 Table C-2 ENCG Table 2.2b

**Notes**: [1] Daytime:  $L_{EQ 16HR}$ ; Nighttime:  $L_{EQ 8-HR}$ .

The NPC-300 and ENCG provide sound level limits in terms of energy equivalent (average) sound levels [L<sub>EQ</sub>] in units of A-weighted decibels (dBA) at a specific noise-sensitive location. Outdoor areas are not considered noise-sensitive for institutional developments. Therefore, only indoor locations are identified and only during the daytime period.

The building envelope, such as walls, windows and doors where applicable, should be designed so that the indoor sound levels comply with the sound level limits summarized in **Table 2-1** above.

#### **BUILDING COMPONENT REQUIREMENTS**

To comply with the indoor sound level criteria listed in **Table 2-1**, the ENCG and NPC-300 provides guidelines based on predicted sound level at the façade/plane of window. If the predicted sound level at the plane of window exceeds, additional considerations such as the type of windows, exterior walls, and doors that can provide noise attenuation must be selected.

Table 2-2 summarizes requirements for type of building façade construction for institutional purpose buildings.

Table 2-2 Building Requirements for Indoor Spaces

AREA	TIME PERIOD	$LEQ (dBA)^{[2]}$	BUILDING COMPONENT REQUIREMENTS
		≤ 55	Building components compliant with Ontario Building Code (OBC)
Plane of Window [1]	Daytime (0700 – 2300h)	> 55 and ≤ 65	Building components compliant with OBC
		> 65	Building components designed/selected to meet Indoor Requirements

Notes: [1] Plane of Window of an institutional purpose building leading to a noise sensitive room, such as teacher's lounge, classrooms, etc. [2] Daytime: L<sub>EO 16HR</sub>.

#### 2.2.2 STATIONARY SOURCES ASSESSMENT CRITERIA

For stationary sources, the MECP NPC-300 and ENCG Section 3 provides criteria based on one-hour equivalent sound level. In order to comply with the noise impact from stationary sources, the predicted sound level must comply with the noise guidelines stipulated in NPC-300 and ENCG. Two locations are typically considered: an outdoor location and the plane of window.

DITT DING COMPONENT

Both guidelines provide sound level limits for noise-sensitive receptors based on the acoustical environment of the area. NPC-300 categorizes the acoustical environment into four classes: Class 1 (urban), Class 2 (semi-urban), Class 3 (rural), or Class 4 (special cases). Based on a review of the area using aerial imagery, the general area is currently under construction and thus, can be considered as Class 1 once fully developed. Given that the school only operates during the daytime, **Table 2-3** summarizes the MECP's daytime sound level limit for a Class 1 Area and was used as the applicable sound level limit for the development.

Table 2-3 MECP's Exclusion Limits in dBA

	CLASS 1			
PERIOD	PLANE OF WINDOW <sup>1</sup>	OUTDOOR POR <sup>2</sup>		
Daytime (07:00 – 19:00)	50	50		

#### Notes:

- 1 Plane of window means a point in space corresponding with the location of the centre of a window of a noise sensitive space
- 2 PoR means point of reception; representing a point in a receptor location.

#### 2.3 ROAD SOURCES

#### 231 ROAD TRAFFIC DATA

Road traffic data were obtained from the ENCG **Appendix B** for Brian Good Avenue and Solarium Avenue. The data obtained from the ENCG provides future traffic volume, day/night split, commercial vehicle percentages, and posted speed limits for various roadways based on roadway class and number of lanes. The ENCG data represents the future traffic volume and corresponding to a "mature state of development", in the City's Official Plan.

The traffic and road parameters used for sound level predictions are shown in **Table 2-4**. The surrounding topography is generally flat and assessed as such.

Table 2-4 Summary of Road Traffic Data Used in the Transportation Noise Analysis

ROAD	ROAD CLASSIFICATION	TRAFFIC VOLUMES (AADT)	DAY/NIGHT SPLIT (%)	MEDIUM TRUCKS (%)	HEAVY TRUCKS (%)	POSTED SPEED LIMIT (KPH)
Brian Good Avenue	2-Lane Urban Collector	8,000	92/8	7%	5%	40
Solarium Avenue	2-Lane Urban Collector	8,000	92/8	7%	5%	40

#### 2.3.2 ANALYSIS METHOD

The MECP updated their guidance requiring the use of up-to-date noise prediction methods and software for determining the impacts of noise from roads and railways (Publication NPC-306 "Methods to Determine Sound Levels Due to Road and Rail Traffic" December 2021). The Publication NPC-306 replaces Publication NPC-206 "Sound Levels Due to Road Traffic", dated October 1995, which referenced the use of ORNAMENT calculation procedures. Previous noise prediction methods using STAMSON, and MECP prediction software implementation of ORNAMENT, were based on a 1995 DOS program which is a modification of the U.S. Federal Highway Administration (FHWA) FHWA-RD-77-108 algorithm to simplify calculations with inherent limitations. Based on the MECP's draft guidance, the new methods will lead to more accurate noise predictions, effective control measures and based on current science.

Although Publication NPC-306 is in circulation for comments as draft, further clarifications from the MECP to Noise Practitioners and Stakeholders suggests that the methods and software will not change. This assessment therefore uses the updated guidance set out in NPC-306 to account for complex features of the development and provide more accurate noise predictions. This is also in line with recent trends in industry best practices.

Road traffic sound levels at the proposed development were predicted using Cadna/A, a commercially available noise propagation modelling software. The following parameters were taken into consideration in the model:

- Road and rail alignments and gradients;
- Traffic volumes and design speeds;
- Commercial vehicle percentages for roads;
- Shielding provided by intervening buildings, barriers and/or topographical features; and
- Special details such as barrier and receptor locations, elevations, and heights.

The software's Building Evaluation feature was used to predict the sound levels on every façade of the proposed school and portables. The software generates an array of receivers along each building facade producing a comprehensive analysis of where the highest sound levels from road noise will be located on the building.

Solarium Avenue and Brain Good Avenue were modelled as road source using the U.S. FHWA Traffic Noise Model (TNM) noise emission and calculation method implemented by Cadna/A. The TNM predictions were validated at the closest east façade of the one-storey building facing Brian Good Avenue and closest south façade facing solarium Avenue and are equivalent to those made using the MECP prediction software STAMSON, which is an implementation of the ORNAMENT calculation methods.

The STAMSON validation files are included in **Appendix D**.

The analysis method in the NRC document, BPN56 "Controlling Sound Transmissions into Buildings", dated September 1985, were used to estimate the acoustical requirements for the building components.

#### 2.3.3 RESULTS

Based on the road traffic data, sound levels were predicted at the proposed school. The Site's location with respect to these roads is shown in **Figure 4.** The predicted sound levels were used to investigate building construction requirements. The highest sound levels on the façades of proposed development is summarized in **Table 2-5**.

Table 2-5 Summary of Predicted Façade Sound Levels due to Road Traffic

STRUCTURE	LOCATION DESCRIPTION	APPROXIMATE HEIGHT (M)	DAYTIME HIGHEST SOUND LEVEL LEQ (dBA)
Main School Building	Southeast corner, on east façade	2	63
Portables	Northeast corner, on east façade	2	61

#### 2.3.4 RECOMMENDATIONS

As shown in **Table 2-5**, the sound levels at the plane of window are below 65 dBA during the daytime hours. Thus, wall, door and window glazing assemblies meeting the minimum non-acoustical requirements of the Ontario Building Code (OBC) will be sufficient to meet the applicable indoor sound level limits.

#### 2.4 STATIONARY SOURCES

Stationary source is defined in MECP publication NPC-300 as source of sound or combination of sources of sound that are included and normally operated within the property lines of a facility. The ENCG states new stationary sources of noise (noise generating) are defined by proximity to existing or approved noise-sensitive developments.

As detailed mechanical design is not available at the time of this report, the noise sources associated with the proposed development were based on a similar sized school. The significant stationary sources of noise are the rooftop HVAC units and a condenser. Insignificant sources or sources with negligible sound level contribution offsite include hot water heaters, small fans, and indoor equipment. No emergency generator is planned at the Site. Bus drop-off location is to be located along Brian Good Avenue and located outside the school's property boundary (offsite noise source). Therefore, noise associated with bus drop-off activities is not included in the assessment.

#### 2.4.1 ONSITE NOISE SOURCES

A total of six (6) rooftop HVAC units (RTUs) and two (2) condensers are planned on the main school building as shown in **Figure 5**. All six RTUs and both condensers were conservatively assumed to operate simultaneously for 60 minutes in a predictable worst-case hour during the day. The school operates only during the daytime between 0700h to 1900h and assessed as such.

Sound power levels for the RTUs were provided by the manufacturer (AAON) for both the exposed condenser section and exhaust fan outlet. The sound power levels for the VRF Condensers were taken from Daikin and Carrier model. The sound level data used in the assessment is summarized in **Table 2-6** and manufacturer's cutsheets are provided in **Appendix E**.

The source locations and receptors placed on the proposed development are provided in Figure 5.

In order to estimate the sound levels from stationary sources to the surrounding residential areas, a predictive analysis was completed using a commercially available software package CADNA/A, a computer implementation of the ISO Standard 9613-2 "Acoustics – Attenuation of Sound During Propagation Outdoors", which takes into account the following:

- Source sound power levels;
- Distance attenuation;
- Source-receptor geometry;
- Ground and air (atmospheric) attenuation; and,
- Temperature and humidity effects on noise propagation.

Key parameters used in the model and sample calculations are located in **Appendix F**.

Table 2-6 Stationary Source Sound Data for Proposed School

Notes:

[1] Refer Figure 5 for source locations; locations are referred using these IDs.

#### 2.4.2 RECEPTORS

Residential lots surround the site on east, south, and west sides. Adjacent to the site on the north is open space. Locations of the future residential buildings used in this analysis were based on the Site Plan. To the south the development plans were not available and therefore, lots and dwellings were assumed to have similar setback distance as the adjacent residential lots.

These buildings were analysed as receptors R01 to R09 at the second-floor plane of window (i.e., 4.5 m above ground) and are described in **Table 2-7**. Outdoor points of reception (receptors R01\_O to R02\_O) were assessed at standing height (i.e., 1.5 m above ground) representing the backyards. **Figure 5** shows the receptors in relation to onsite stationary noise sources.

#### 2.4.3 RESULTS

#### IMPACTS FROM THE PROPOSED DEVELOPMENT ON THE SURROUNDING ENVIRONMENT

The overall sound levels at receptors of existing and potential surrounding residential homes, generated using assumed predictable worst-case operations of the school, are summarized in Error! Reference source not found..

Table 2-7 Predicted Sound Levels from Onsite Stationary Sources

POR ID	POR DESCRIPTION	RECEPTOR HEIGHT (M)	PREDICTED SOUND LEVEL (dBA)	DAYTIME SOUND LEVEL LIMIT (dBA)	COMPLIANCE WITH LIMIT?
R01	2-storey Existing Residential Home to the West (Window)	4.5	40	50	Yes
R02	2-storey Existing Residential Home to the West (Window)	4.5	39	50	Yes
R01_O	2-storey Existing Residential Home to the West (Outdoor)	1.5	40	50	Yes
R02_O	2-storey Existing Residential Home to the West (Outdoor)	1.5	40	50	Yes
R03	2-storey Existing Residential Home to the West (Window)	4.5	44	50	Yes
R04	2-storey Existing Residential Home to the West (Window)	4.5	47	50	Yes
R05	2-storey Potential Residential Home to the South (Window)	4.5	47	50	Yes
R06	2-storey Potential Residential Home to the South (Window)	4.5	47	50	Yes
R07	2-storey Potential Residential Home to the South (Window)	4.5	47	50	Yes
R08	2-storey Potential Residential Home to the South (Window)	4.5	47	50	Yes
R09	2-storey Potential Residential Home to the South (Window)	4.5	44	50	Yes

As shown in **Table 2-7**, the predicted stationary source sound level of the proposed RTUs and condensers meet sound level limit at all receptors.

## 3 RECOMMENDATIONS AND CONCLUSIONS

#### 3.1 CONCLUSIONS

This report has been prepared to support the Site Plan Approval application. The assessment evaluated the potential for noise impact of transportation sources on the Site, and stationary sources associated with the Site on nearby residential uses and stationary sources associated with the nearby public school on the proposed development.

The predicted sound levels were assessed as per the MECP Publication NPC-300 and ENCG requirements. The assessment demonstrates that the Site will comply with the applicable noise guidelines without additional noise control measures.

#### 3.2 RECOMMENDATIONS

Table 3-1 summarizes the building recommendations for the schools proposed development.

Table 3-1 Summary of Building Requirements

BUILDING	BUILDING COMPONENTS (WALLS) STC	BUILDING COMPONENTS (WINDOWS & DOORS) STC	NOISE CONTROL MEASURES
1-Storey Main School Building	OBC <sup>1</sup>	OBC <sup>1</sup>	NA
Portables	OBC <sup>1</sup>	OBC <sup>1</sup>	NPC-216 <sup>2</sup>

Notes:

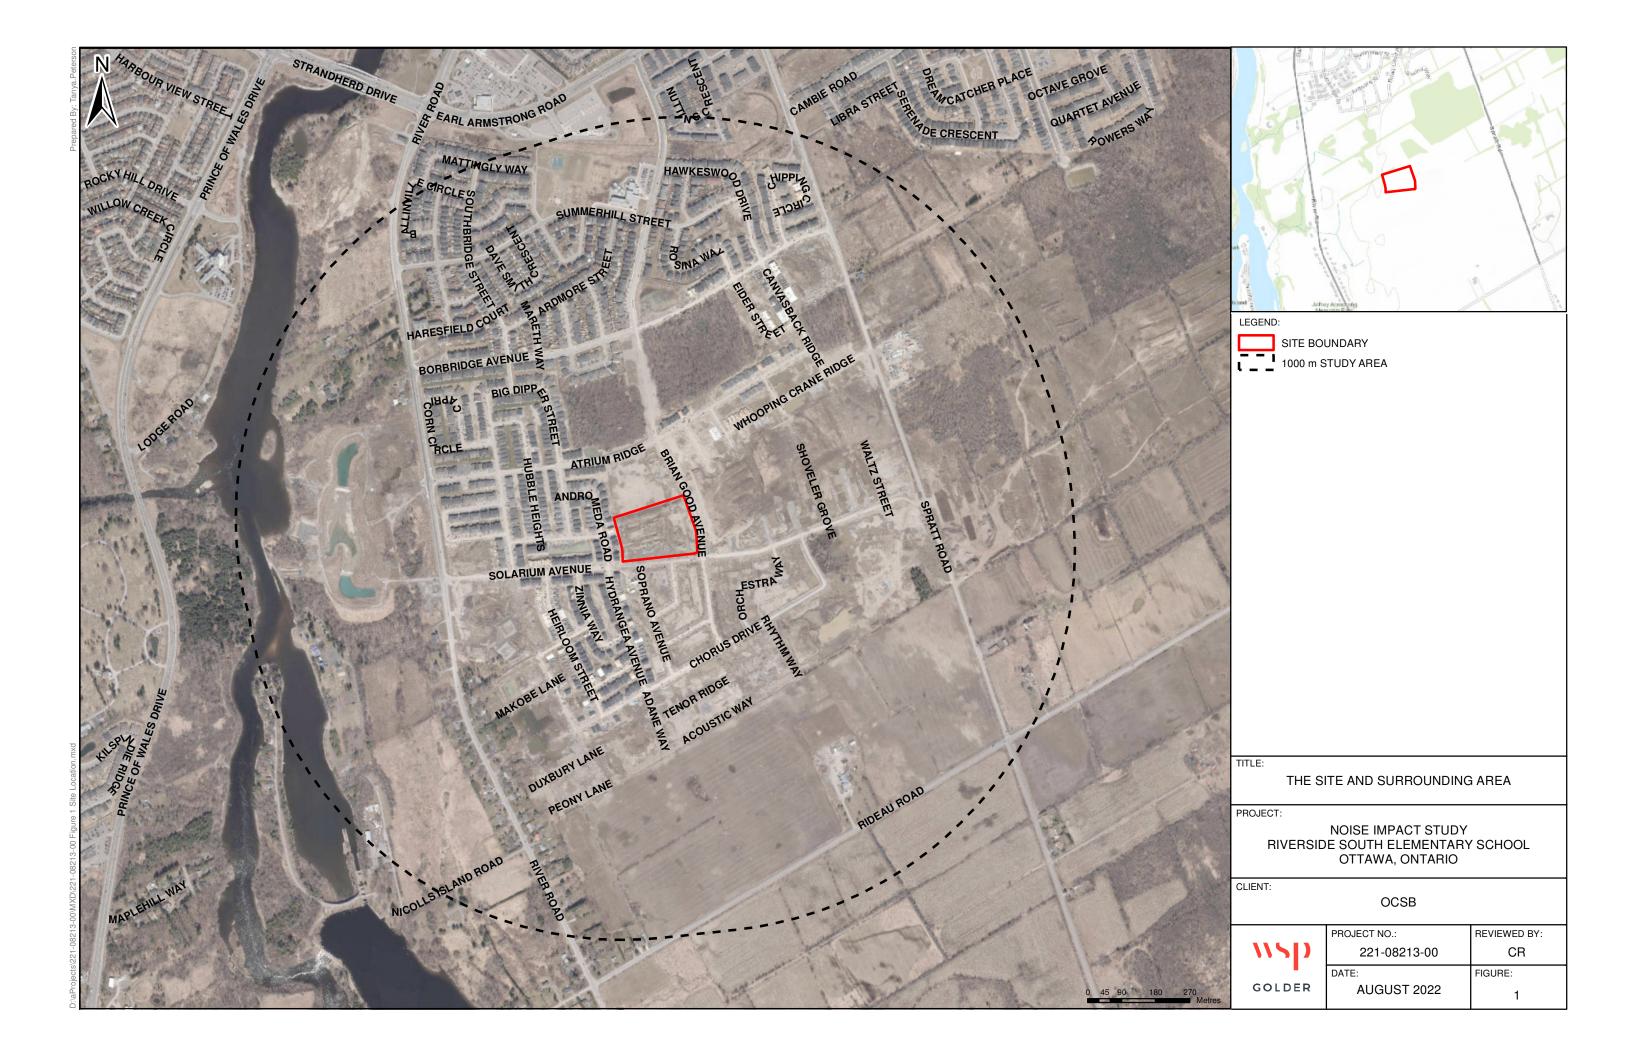

<sup>&</sup>lt;sup>1</sup> OBC – Meet or exceed the minimum non-acoustical requirement of Ontario Building Code (OBC).

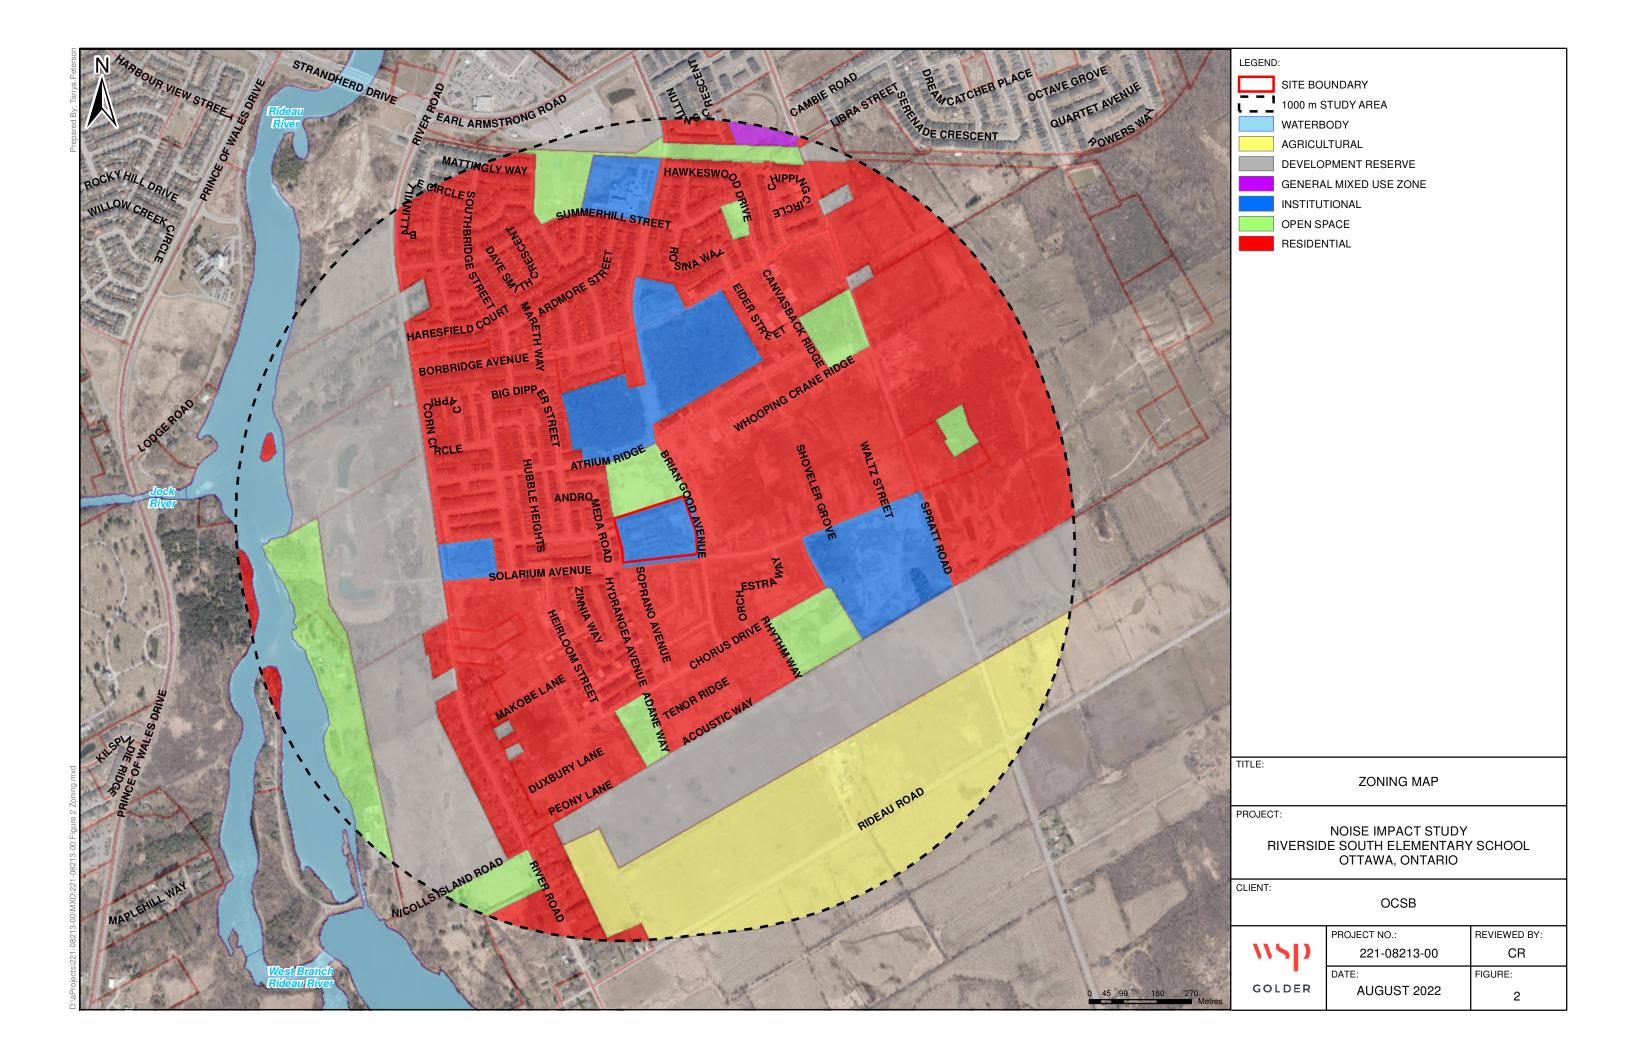

<sup>&</sup>lt;sup>2</sup> Where possible, select equipment to comply with noise criteria of MECP Publication NPC-216, Residential Air Conditioning Devices.

# Product Data

#### 09DE,DK Air-Cooled Condensers

15 to 90 Nominal Tons

Air-Cooled Condenser Units for Remote System Application

- 11 popular sizes
- performance proven in every building application
- · efficient direct-drive fans
- unit casings meet the ASTM B117 500-hour salt spray test requirements
- small footprints allow for installations in tight spaces

#### Features/Benefits

A family of ruggedly built condensers ideal for clinics, motels, schools, apartments, office buildings, and factories.

#### Greater system economy

Subcooling offers more cooling capacity. A specially designed liquid refrigerant circuit provides subcooling for increased capacity without additional power consumption. Subcooling liquid refrigerant also expands condenser applications by permitting condenser installation below the evaporator without subjecting the refrigerant to flashing before the expansion valve.

All units are UL (Underwriters' Laboratories) and UL, Canada approved.

#### Quieter, more efficient operation

Improved fan design — direct drive fans move air efficiently, yet quietly, at low power input. Bell-mouthed fan openings offer increased airflow, improved fan efficiency, and quiet operation.

#### Multi-circuit, multi-refrigerant capability

Choose the multi-circuit 09DE or 09DK and realize separate cooling system economy on each circuit. Save space and satisfy installation needs without the expense of smaller condensers with single circuitry. Models can be used with Refrigerants 12, 22, 500, 502 or 134a to meet individual system capacity requirements. A different refrigerant can be used with each cooling circuit.

#### Individual unit qualities

**09DE016 condenser** with 15-ton capacity uses a wraparound coil design (with integral subcooling) that may be used as single system or split into 2 systems. Unit with vertical air discharge contains a control box, 2 direct-drive fans, motors, and motor mounts. The U-shaped coil has a large face area to maximize heat transfer.

**09DK020-044 condensers** are available in 17.5-, 20-, 25-, 30-, 40-ton sizes. Models 09DK020, 024, and 028 have 2 direct drive fans, 2 motors and motor mounts. Models 09DK034 and 044 have 3 direct drive fans, 3 motors and motor mounts. Fan motors are 3-phase, TEAO (Totally Enclosed, Air Over). All units are equipped with a junction box and 2 condenser coils with integral subcooling circuits. Each circuit may be used as a separate condenser for a single system.

09DK054-094 condensers are available in 50-, 60-, 70-, 80-, and 90-ton sizes. Models 09DK054 and 064 have 4 direct-drive fans, 4 motors and motor mounts. Models 09DK074-094 have 6 direct-drive fans, 6 motors and motor mounts. All fan motors are 3-phase and are protected against single phasing conditions. Fans 1 and 2 use open drip-proof motors that are compatible with the Motormaster® V accessory. On 208-230/460 volt units, the remaining fan motors are totally enclosed. All 380/415 v and 575 v units have open drip-proof fan motors. All fan motors have permanently lubricated sealed bearings. Fans 3 and 4 on 09DK054 and 064 and fans 3, 4, 5, and 6 on 09DK074-094 models are controlled separately for efficient unit control.

These units are equipped with a hinged access door, which allows for easy entrance into the control box. Four condenser coils with integral subcooling circuits are available to create a variety of capacity split combinations. A tubing package is supplied with the unit for 100%, 50/50%, and 67/33% (09DK044-084 only) coil circuiting applications to facilitate field installations and maximize unit flexibility.

#### Coil split versatility

Model 09DE and 09DK coils can be split into 2 or more condensing circuits. Each circuit may handle a separate cooling system, using a different refrigerant if desired. Each circuit has a refrigerant subcooling circuit. Depending on condenser size, one to 6 condenser coil circuiting applications can be used as shown below. This saves space and provides installation flexibility.

#### **Options and accessories**

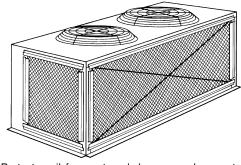

OPTION/ACCESSORY	FOR USE WITH	OPTION	ACCESSORY
EnviroShield™ Condenser Coil	09DE,09DK	Χ	
Motormaster® I Head Pressure Control	09DE016 09DK020-044		Х
Coil Grille	09DE016		X
Fan Cycling Control	09DE016 09DK020-044		Х
Fan Sound Reduction Kit	09DK054-094		Х
Security Grille Package	09DK054-094		Х
Control Transformer	09DK054-094		Х
Condenser Coil Hail Guard	09DK054-094		X
Motormaster V Head Pressure Control	09DK054-094		X

#### SECURITY GRILLE (09DK054-094: 09DK074,084 SHOWN)

The security grilles protect the condenser coils from debris or vandalism after the unit has been installed. Upper condenser coil grilles are available to protect vertical coils. Lower end and side grilles are available to protect the area beneath the coils.

#### COIL GRILLE (09DE016)

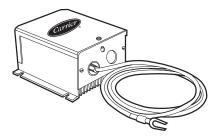

Protects coil from external damage and prevents leaves and other debris from entering fins (available for field installation on 09DE016 only).

#### **FAN CYCLING CONTROL**

During intermediate seasons, proper condensing temperature is controlled by fan control packages which permit shutoff of one or 2 condenser fans. These packages are also required when using the Motormaster head pressure control (09DE016, 09DK020-044 units).

#### MOTORMASTER I HEAD PRESSURE CONTROL (09DE, 09DK020-044)

This exclusive solid-state device automatically modulates fan speed from full to zero rpm to maintain proper condensing temperature at low ambient temperature conditions to -20 F

#### MOTORMASTER V HEAD PRESSURE CONTROL (09DK054-094)

The Motormaster V head pressure control is used to permit low ambient operation down to -20~F by modulating the fan speed on each of the primary fans (1 and 2). The standard factory-installed motors are compatible with the Motormaster V control.

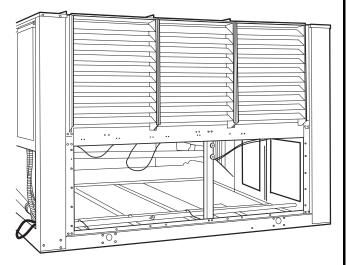

#### FAN SOUND REDUCTION KIT (09DK054-094)

# ACOUSTIC ENCLOSURES ACCESSORY HAIL GUARD'

#### \*Hail guard not required.

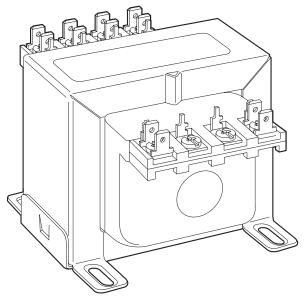

The fan sound reduction kit consists of a specially designed system of fans and acoustic enclosures for reducing sound levels without compromising unit performance. A fan motor change is not required and the fan system is compatible with Motormaster® V device. Two kits are required for the 09DK054,064 units and three kits are required for the 09DK074-094 units.

#### **CONDENSER COIL HAIL GUARD** (09DK054-094)

This accessory protects the coils against damage from hail and other flying debris. Two packages are required for 09DK054 and 064 and three packages required for 09DK074-094.

#### CONTROL TRANSFORMER (09DK054-094)

The control transformer is used to convert 200-208/230/460 v to 115 v for use on 115-v control systems, utilizing power from the main unit power connection.

*Enviro-Shield*™ condenser options — Several options are available to match coil protection to site conditions for optimum durability. See table below and refer to the Application Data for selection guidance. Consult your Carrier representative for further information.

END

#### NOTES:

The approximate operating weight of the unit is:

09DK-054 — 1695 lb [ 769 kg]

09DK-054C — 1983 lb [ 900 kg]

09DK-064 — 1845 lb [ 837 kg]

09DK-064C — 2278 lb [1033 kg]

Unit must have clearances for airflow as follows:

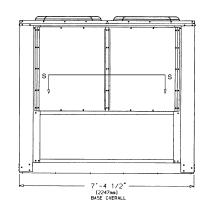

Top — Do not restrict in any way Ends — 5 ft [1524 mm] Sides — 6 ft [1829 mm]

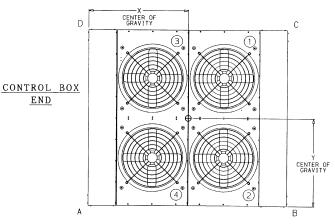

All units are shipped with a capacity split tubing kit. This kit may be used by the field to obtain 100%, 50/50% and 66/34% capacity splits. To obtain a 34/34/32% capacity split, coils must be manifolded by the field. Coils are factory circuited for a 34/34/16/16% capacity split.

#### NOTES:

- 1. The approximate operating weight of the unit is:
  09DK-094 2850 lb [1293 kg]
  09DK-094C 3560 lb [1615 kg]
  2. Unit must have clearances for airflow as follows:

Top- Do not restrict in any way

Ends — 5 ft [1524 mm] Sides — 6 ft [1829 mm]

- Mounting holes may be used to mount unit to concrete pad. They are not recommended for mounting unit to spring isolators. If spring isolators are used, a perimeter support channel between the unit and the isolators is recommended.
- The letter C after model size refers to copper tube/copper fin coils.

#### **Selection procedure (with example)**

I Select minimum or maximum charge ratings.

List the refrigerant, total heat rejection (THR), suction and discharge temperatures as determined from compressor data.

- II Determine condensing temperature (saturated discharge temperature minus discharge line loss).
- III Determine temperature difference (condensing temperature minus entering-air temperature).
- IV Enter Condenser Ratings table (minimum or maximum charge as determined in Step 1) at selected refrigerant and established temperature difference (TD).

Read across to total heat rejection equal to or greater than required. Interpolate if necessary. Read unit size.

EXAMPLE: (Maximum Charge)

Given:

R-22, Maximum Charge	
THR (including subcooling)29	9.4 Tons
Saturated Discharge Temperature	123.8 F
Saturated Suction Temperature	40 F
Entering-Air Temperature	95 F
Discharge Line Loss	2 F

Cond Temp = 123.8 F - 2 F = 121.8 FTD = 121.8 F - 95 F = 26.8 F

Interpolate in Condenser Ratings table (maximum charge) and obtain capacity of 09DK028 as 29.8 tons and 09DK024 as 23.1 tons. Select the 09DK028.

EXAMPLE: (Minimum Charge)

Given:

R-22, Minimum Charge
THR
Saturated Discharge Temperature122 F
Saturated Suction Temperature40 F
Entering-Air Temperature95 F
Discharge Line Loss
Cond Temp = 122 F -2 F = 120 F

TD = 120 F - 95 F = 25 F

Enter Condenser Ratings table (minimum charge) and select 09DE016 with 15.9 tons THR.

<sup>\*</sup>TD (Temperature Difference) = Saturated Condensing Temperature (entering) — Entering-Air Temperature.

- Minimum charge gives higher heat rejection, since entire surface of condenser and subcooling circuit is used for condensing only. Minimum charge ratings, however, do not represent greatest potential system capacity. They are comparable to competitive ratings without subcooling.
- 2. Use maximum charge when compressor, condenser, and evaporator are selected as a package and the components balanced to secure maximum benefits of 15 F subcooling (for example, in selecting 09DK condensers with Carrier compressor rated at 15 F
- subcooling). Maximum charge activates the subcooling circuit, resulting in higher system capacity at slightly higher head pressure and corresponding condensing temperature. Liquid refrigerant leaves the system subcooled to a stable condition to allow greater length of refrigerant run or lift. See Application Data section, page 27, for available liquid lift information.

  Condenser subcooling = Saturated condensing temperature of refrigerant Actual temperature of refrigerant leaving the coil.

#### 09DK CONDENSER WITH SINGLE COMPRESSOR SEE NOTE I 09DK028 UNIT (LOCATED ABOVE OTHER COMPONENTS) HOT GAS PRESSURE RELIEF DEVICE \* MUFFLER SHUTOFF VALVE\* COMPRESSOR VALVE LIQUID LINE SEE NOTE 2 FILTER-DRIER\* MOISTURE INDICATOR\* SEE NOTE 3

\*Field supplied.

#### NOTES:

- Hot gas lines should rise above refrigerant level in condenser circuit. Double riser may be required; check compressor minimum capacity. Trap should be installed on hot gas lines to pre-
- vent condenser oil and refrigerant vapor migration from accumulating on compressor heads during off cycle.
- Refer to Carrier System Design Manual, part 3, or the Carrier E20-II® Software Refrigerant Piping program, for proper piping sizes and design.
- Pitch all horizontal lines downward in the direction of refrigerant flow.
- For piping lengths greater than 50 ft, provide support to liquid and gas lines near the connections to the coil.
- Single-phase motors (09DE016) require one field-supplied contactor to start all fans. Fieldsupplied contactors are not required when accessory fan cycling control package is furnished.
- Wiring and piping shown are general points-of-connection guides only and do not include details required for specific installations.
- All wiring must comply with applicable national and local codes.
- All piping must follow standard refrigerant piping practices.
- For pressure relief requirements, see latest revision of ASHRAE (American Society of Heating, Refrigeration, and Air Conditioning Engineers) Standard 15, Safety Code for Mechanical Refrigeration.
- 11. All 09DK units have factory-installed contactors.

#### 09DK CONDENSER WITH DUAL SPLIT SYSTEM

#### **Application data**

Ductwork added to equipment installed indoors results in added external static pressure, which affects fan performance and condenser capacity. The table below lists performance comparisons for operating with free air discharge and various external static pressures.

#### PERFORMANCE COMPARISONS — FREE AIR DISCHARGE VS STATIC PRESSURES

EXTERNAL STATIC (in. wg)	% CFM DECREASE	% THR DECREASE	APPROX % SYSTEM DECREASE		
0.1	8.5	5.2	2.6		
0.2	14.2	8.9	4.9		
0.3	19.8	12.2	6.1		
0.4	24.9	16.1	8.1		
0.5	29.9	19.1	9.6		

THR — Total Heat Rejection

#### Liquid lift

The amount of liquid lift available before refrigerant flashing occurs depends on the amount of liquid subcooling in the system.

All 09DE and 09DK condensers have positive subcooling when applied with an optimum charge. With subcooling, it is possible to overcome an appreciable friction drop and/or static head (due to the elevation of the liquid metering device above the condenser).

When 09DE and 09DK condensers are applied with a minimum charge, minimal subcooling in the condenser is realized; therefore, if subcooling is required it must be obtained by external means such as a liquid suction interchanger.

The average amount of liquid lift available from the 09DE and 09DK condensers is shown in the accompanying table.

#### AVAILABLE LIQUID LIFT (ft)\*

REF	REFRIGERANT		-22	R-S	502	R-134a			
	Unit	Temperature Difference (F)†							
	Unit		30	20	30	20	30		
09DE	016	75	71	75	70	_	_		
	020,024 028 034 044	77 78 80 75	67 68 70 65	77 78 80 75	61 62 64 60	_	_		
09DK	054 064 074 084 094	60 41 44 51 41	50 31 34 41 31	60 41 44 51 41	44 25 28 35 25	29 20 18 22 18	26 6 7 10 1		

<sup>\*</sup>Allows 7 psi drop for liquid line accessories and 2° F liquid line loss with maximum charge. †Saturated Condensing Temperature (entering) – Entering Air Temperature (dry bulb) °F.

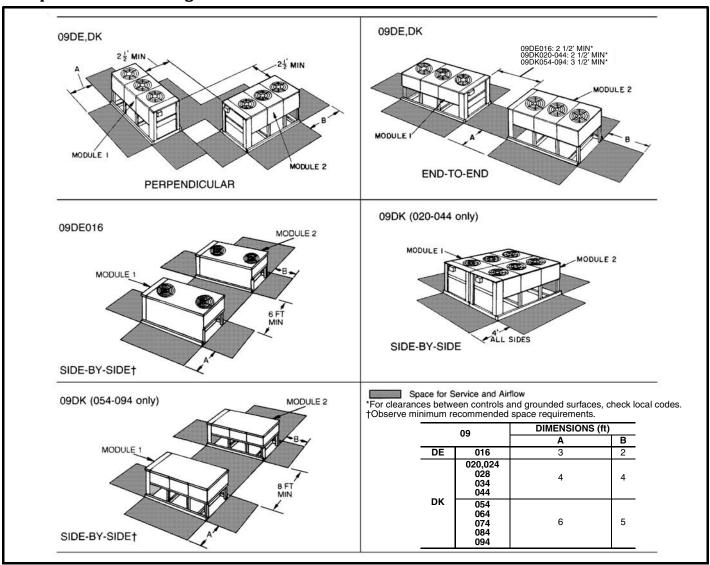

#### NOTES

- 1. Data based on 15 F subcooling, and unit circuiting of 100% for the 09DE units, and 50/50% or 53/47% for the 09DK units.
- 2. Available subcooling is greatly reduced when R-12 or R-500 is used in these units. It is recommended that the evaporator is at the same level as the condenser, or lower.
- 3. Subcooling = Saturated condensing temperature of refrigerant Actual temperature of refrigerant leaving the coil.

#### **Application data (cont)**

#### Multiple condenser arrangements

#### Head pressure control

**General** — Efficient operation of the evaporator thermostatic expansion valves requires a 90 F minimum saturated condensing temperature when compressors are operating at 100% capacity, 80 F for 75% compressor capacity, and 70 F for 50 and 25% compressor capacity.

A drop in entering outdoor-air temperature results in a lower saturated condensing temperature. When the outdoor-air temperature drops below the minimum temperatures listed in the Minimum Outdoor-Air Operating Temperature table on page 30, head pressure control is required.

**Head pressure controls** — Head pressure on the 09DE016 and 09DK020-094 units may be controlled by fan cycling supplemented by Motormaster<sup>®</sup> control. Fan cycling control is available as an accessory on the 09DE and 09DK020-044 units. Motormaster I is also available on these units with fan cycling.

On 09DK054-094 condensers, fan cycling controls are standard (norminal 67/33%, 33/33/33%, 33/33/17/17%). Head pressure can also be controlled by fan cycling controls supplemented by the accessory Motormaster V solid-state head pressure controller. See accessory installation instructions for more information.

Fan cycling — The fan cycling control, used primarily during intermediate seasons, cycles one fan on the 09DE016 unit, one fan on 09DK020-028 units, 2 fans on 09DK034-064 units, and 4 fans on 09DK074-094 units.

Motormaster I head pressure control (09DE, 09DK020-044) — When outdoor temperatures are low enough to cause low condensing pressures, the Motormaster control modulates the motor speed of one condenser fan from full to zero rpm to maintain a constant saturated condensing temperature for full year-round head pressure control. The Motormaster I control can be used only with suitable motors. It may be used as the sole control on single-fan units but must be used in conjunction with fan cycling control on multiple-fan units. If condensers 09DK020-044 are applied to separate refrigeration cycles,

special problems arise when controlling head pressure from a single control point. For such applications, more positive system control can be ensured by using individual condensers and head pressure controls.

**Motormaster V head pressure control** — Available for 09DK054-094 units only, this head pressure control maintains the proper condensing temperature at low ambient temperature conditions to -20 F and is compatible with the standard factory-installed 3-phase motors (in positions 1 and 2).

#### **Process applications**

Process applications are defined as heat rejection loads that are not related to or significantly affected by outside ambient conditions. Process applications tend to have constant heat rejection requirements throughout the year. Consequently, these applications may require switching the set points on standard accessory fan cycle controls. Consult Application Engineering for assistance in designing and selecting process systems.

#### E-coated aluminum-fin and copper fin coils

**E-coated aluminum-fin coils** have a flexible and durable epoxy coating uniformly applied to all coil surfaces. Unlike brittle phenolic dip and bake coatings, E-coat provides superior protection with unmatched flexibility, edge coverage, metal adhesion, thermal performance, and most importantly, corrosion resistance.

E-coated coils provide this protection since all coil surfaces are completely encapsulated from environmental contamination. This coating is especially suitable in industrial environments.

**E-coated copper-fin coils** have the same flexible and durable epoxy coating as E-coated aluminum-fin coils. However, this option combines the natural salt and environmental resistance of all-copper construction with high levels of corrosion protection. This coating is recommended for harsh combinations of coastal and industrial environments.

#### **Application data (cont)**

Intermediate Season

Winter Season

ATS — Air Temperature Switch FCPS— Fan Cycling Pressure Switch

TD — Temperature Difference
= Saturated Condensing Temperature (Entering)

- Entering-Air Temperature

\*Interpolation permitted.

Additional FCPSs are needed for nominal 67/33, 33/33/33, and 33/33/17/17% capacity split applications.

#### NOTES:

- Fans on the 09DK054-094 units are controlled by an ATS or FCPS.
- Minimum outdoor temperatures are determined for indoor and outdoor unit combinations of the same capacity. However, for 09DK020 (17<sup>1</sup>/<sub>2</sub> ton) outdoor unit, the minimum outdoor temperatures shown are determined for combination with a 15-ton indoor unit.

#### Guide specifications — 09DE and 09DK020-044

#### **Air-Cooled Condensing Units**

#### **HVAC Guide Specifications**

Size Range: **15 to 40 Tons, Nominal** Carrier Model Numbers: **09DE, 09DK** 

#### Part 1 — General

#### 1.01 SYSTEM DESCRIPTION

Outdoor mounted, air-cooled condenser. Air shall discharge vertically.

#### 1.02 QUALITY ASSURANCE

Unit shall be rated using refrigerants 12, 22, 134a, 500, 502. Ratings shall be listed at minimum ( $5^{\circ}$  F subcooling) and maximum ( $15^{\circ}$  F subcooling) refrigerant charge.

Units shall be UL approved and coils shall be leak tested at 420 psig (480 psig on 09DK) air pressure.

#### 1.03 DELIVERY, STORAGE, AND HANDLING

Unit shall be stored and handled per manufacturer's instructions.

#### Part 2 — Products

#### 2.01 EQUIPMENT

#### A. General:

Outdoor mounted, packaged, air-cooled remote condenser. Unit shall be complete with cooling coils, fans, fan motors, and electrical controls.

#### B. Cabinet:

Cabinet shall be of welded steel frame construction with removable electrical control cover. Hinged panel allows access to electrical control box on 09DK units. Panels shall be of zinc-coated bonderized steel finished with baked enamel. Unit casing shall be capable of withstanding ASTM Standard B117 500-hour salt spray test.

#### C. Fan(s):

Fan(s) shall be of the propeller type, direct driven by weatherproof motors, and dynamically balanced. Fan(s) shall be arranged for vertical discharge with horizontal suction.

#### D. Coils:

Coils shall use copper tubes, aluminum plate fins (or optional copper tubes, copper fins) and galvanized steel tube sheets. Fins shall be bonded to tubes by mechanical expansion. Hot gas and liquid connections shall be made from the same end.

All coils shall be shipped with no refrigerant holding charge (dry air only).

09DE016 — each coil shall be capable of field connection for splits of 100% or 50/50%.

09DK — each coil shall be capable of field connection for splits of 100%, 50/50%, 67/33%, (020 and 024 size); 100%, 60/40%, 50/50%, 40/40/20% (028 and 034 sizes); and

100%, 73/27%, 67/33%, 60/40%, 53/47%, 40/34/13/13% (044 size).

#### E. Motors:

Motors shall be weatherproof and inherently protected to operate at the specified electrical characteristics. The 09DE fan motors are single phase. 09DK fan motors shall be 3-phase, TEAO (Totally Enclosed, Air Over).

#### F. Operating Characteristics:

Unit shall be capable of rejecting the required heat at the required cfm and be capable of operating at moderate ambient temperatures as standard, and down to -20 F with the head pressure controller.

#### G. Electrical Characteristics:

Unit shall be capable of operating on three-phase. Electrical characteristics shall be specified on the equipment schedule.

#### H. Special Features:

Certain standard features are replaced with features designated by \* are specified. See your local Carrier Sales Office for amending specifications.

#### \* 1. Fan Cycling Control:

Cycles one or two fans to maintain head pressure.

#### \* 2. Head Pressure Controller:

Modulates the speed of one fan in response to low outdoor temperature and provides operation down to -20 F when used with accessory fan cycling control.

#### 3. Condenser Coil Options:

#### a. Pre-Coated Aluminum-Fin Coils:

Shall have a durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments. Coating shall be applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube. Epoxy-phenolic barrier shall minimize galvanic action between dissimilar metals.

#### b. Copper-Fin Coils:

Shall be constructed of copper fins mechanically bonded to copper tubes and copper tube sheets. Galvanized steel tube sheets shall not be acceptable. All copper construction shall provide protection in moderate coastal applications.

A polymer strip shall prevent the coil assembly from contacting the sheet metal coil pan to minimize the potential for galvanic corrosion between the coil and the pan. All copper construction shall provide protection in moderate coastal environments.

# Guide specifications — 09DE and 09DK020-044 (cont)

#### c. E-Coated Aluminum-Fin Coils:

Shall be constructed of aluminum fins mechanically bonded to copper tubes. Coating process shall have a flexible epoxy polymer coating uniformly applied to all coil surfaced without material bridging between the fins. The coating process shall ensure complete coil encapsulation. Color shall be high-gloss black with gloss at  $60^{\circ}$  of 65%to 90% per ASTM D523-89. Uniform dry film thickness shall be 0.8 mil to 1.2 mil on all surfaces, including the fin edges. Superior hardness characteristics shall meet those requirements of 2H, per ASTM D3363-92A. Cross-hatch adhesion shall meet the requirements of 4B-5B, per ASTM D3359-93. Impact resistance shall be up to 160 in./lb, per ASTM D2794-93. Humidity resistance shall be up to a minimum of 1000 hours per ASTM D2247-92. Water immersion resistance shall be up to a minimum of 250 hours per ASTM D870-92. Durability shall be confirmed through testing to no less than 1000 hours of salt spray per ASTM B117-90.

#### d. E-Coated Copper Fin Coils:

Shall be copper fins mechanically bonded to copper tubes with copper tube sheets. Coating process shall have a flexible epoxy polymer coating uniformly applied to all coil surfaces without a material bridging between the fins. The coating process shall ensure complete coil encapsulation. Shall be highgloss black with gloss at 60° of 65% to 90% per ASTM D523-89. Uniform dry film thickness shall be 0.8 mil to 1.2 mil on all surfaces, including the fin edges. Superior hardness characteristics shall meet those requirements of 2H, per ASTM D3363-92A. Cross-hatch adhesion shall meet the requirements of 4B-5B, per ASTM D3359-93. Impact resistance shall be up to 160 in./lb, per ASTM D2794-93. Humidity resistance shall be up to a minimum of 1000 hours per ASTM D2247-92. Water immersion resistance shall be up to a minimum of 250 hours per ASTM D870-92. Durability shall be confirmed through testing to no less than 1000 hours of salt spray per ASTM B117-90.

#### 4. Coil Grille (09DE only):

Protects condenser coil from damage. Shall be constructed from expanded aluminum (not intended as hail guard).

# Guide specifications — 09DK054-094

#### **HVAC Guide Specifications**

Size Range: 50 to 90 Tons, Nominal

Carrier Model Number: 09DK

#### Part 1 — General

#### 1.01 SYSTEM DESCRIPTION

Outdoor mounted, split system air-cooled condenser, utilizing electromechanical fan cycling controls. Air shall enter horizontally and vertically and discharge vertically.

#### 1.02 QUALITY ASSURANCE

- A. Unit shall be rated using refrigerants 12, 22, 134a, 500, and 502. Ratings shall be at minimum (5° F subcooling) and maximum (15° F subcooling) refrig-
- B. Unit construction shall be designed to conform to ASHRAE 15 latest revision safety standard and NEC.
- C. Units shall be UL and UL, Canada approved (208/ 230, 460, 575 v).
- D. Unit shall be manufactured according ISO 9001:2000 manufacturing quality standard.
- E. Unit operation shall be tested at the factory.

#### 1.03 DELIVERY, STORAGE, AND HANDLING

Unit shall be stored and handled according to manufacturer's instructions.

#### Part 2 — Products

#### 2.01 EQUIPMENT

#### A. General:

Outdoor mounted, packaged, air-cooled remote condenser unit shall be complete with coils, fans, fan motors, and electrical controls.

#### B. Unit Cabinet:

- 1. Frame shall be heavy-gage galvanized steel members.
- 2. Galvanized steel casing, zinc phosphated, with an electrostatically applied baked enamel finish.
- 3. Unit casing shall be capable of withstanding ASTM Standard B117 500-hour salt spray test.
- 4. Control box shall be equipped with a hinged access door.

#### C. Fans:

Condenser fans shall be direct-driven propeller type discharging air vertically upward and shall be equipped with the following features:

- 1. Permanently lubricated bearings.
- 2. PVC coated steel wire safety guards.
- 3. Inherent corrosion-resistant shafts.
- 4. Statically and dynamically balanced propeller fans.

#### D. Coils:

- 1. Coil shall be air-cooled with integral subcooler, constructed of aluminum fins mechanically bonded to seamless copper tubes which are then cleaned, dehydrated, and sealed. Copper tube/fin combination available as an option.
- 2. Coils shall be leak tested at 280 psig (1931 kPa) and pressure tested at 450 psig minimum (3103 kPa).
- 3. Hot gas and liquid connections shall be made from the same end.
- 4. Coil shall be capable of field connection for nominal splits of 100%, 50/50%, 67/33%, 33/33/33%, and 33/33/17/17% (50 to 80 ton units) or 100%, 50/50% (90 ton units).
- 5. All coils shall be shipped with dry air holding charge, not refrigerant.

#### E. Refrigeration Components:

A tubing package for headering shall be provided for 100%, 50/50%, and nominal 67/33% capacity split applications. The package shall include hot gas and liquid line piping 1/4-in. male flare fittings, valve cores, fan cycle pressure switches, and the necessary hardware for installation.

#### F. Motors:

Condenser-fan motors shall be 3-phase and shall be protected against single-phasing conditions. All motors shall have permanently lubricated sealed bearings. Fans 1 and 2 shall use open drip-proof motors that are compatible with the head pressure controller accessory. The remaining fan motors shall be totally enclosed fan-cooled (208-230/460-v units). All motors on 380-v and 575-v units shall be open drip-proof.

#### G. Operating Characteristics:

Unit shall be capable of rejecting the required heat at the required cfm and be capable of operating down to moderate ambient temperatures with standard factory-supplied fan cycling. Operation to -20 F shall be possible with the head pressure control accessory.

#### H. Electrical Characteristics:

- 1. A dual power supply of the correct voltage is required for each series unit; a 3-phase power circuit voltage and a single-phase control circuit voltage. The number of control circuits will depend on the capacity split application utilized. Power supplies for all units shall enter the control box through factory-punched entrance holes in the control box shelf. Terminal blocks shall be supplied for field wiring connections.
- 2. The units shall utilize electromechanical fan cycling head pressure controls to control each fan separately.

# Guide specifications — 09DK054-094 (cont)

#### I. Special Features:

Certain standard features are replaced when features designated by \* are specified. See your local Carrier Sales Office for amending specifications.

#### 1. Condenser Coil Options:

#### a. Pre-Coated Aluminum-Fin Coils:

Shall have a durable epoxy-phenolic coating to provide protection in mildly corrosive coastal environments. Coating shall be applied to the aluminum fin stock prior to the fin stamping process to create an inert barrier between the aluminum fin and copper tube. Epoxy-phenolic barrier shall minimize galvanic action between dissimilar metals.

#### b. Copper-Fin Coils:

Shall be constructed of copper fins mechanically bonded to copper tubes and copper tube sheets. Galvanized steel tube sheets shall not be acceptable. All copper construction shall provide protection in moderate coastal applications.

A polymer strip shall prevent the coil assembly from contacting the sheet metal coil pan to minimize the potential for galvanic corrosion between the coil and the pan. All copper construction shall provide protection in moderate coastal environments.

#### c. E-Coated Aluminum-Fin Coils:

Shall be constructed of aluminum fins mechanically bonded to copper tubes. Coating process shall have a flexible epoxy polymer coating uniformly applied to all coil surfaced without material bridging between the fins. The coating process shall ensure complete coil encapsulation. Color shall be high-gloss black with gloss at 60° of 65% to 90% per ASTM D523-89. Uniform dry film thickness shall be 0.8 mil to 1.2 mil on all surfaces, including the fin edges. Superior hardness characteristics shall meet those requirements of 2H, per ASTM D3363-92A. Cross-hatch adhesion shall meet the requirements of 4B-5B, per ASTM D3359-93. Impact resistance shall be up to 160 in./lb, per ASTM D2794-93. Humidity resistance shall be up to a minimum of 1000 hours per ASTM D2247-92. Water immersion resistance shall be up to a minimum of 250 hours per ASTM D870-92. Durability shall be confirmed through testing to no less than 1000 hours of salt spray per ASTM B117-90.

#### d. E-Coated Copper Fin Coils:

Shall be copper fins mechanically bonded to copper tubes with copper tube sheets. Coating process shall have a flexible epoxy polymer coating uniformly applied to all coil surfaces without a material bridging between the fins. The coating process shall ensure complete coil encapsulation. Shall be highgloss black with gloss at 60° of 65% to 90% per ASTM D523-89. Uniform dry film thickness shall be 0.8 mil to 1.2 mil on all surfaces, including the fin edges. Superior hardness characteristics shall meet those requirements of 2H, per ASTM D3363-92A. Cross-hatch adhesion shall meet the requirements of 4B-5B, per ASTM D3359-93. Impact resistance shall be up to 160 in./lb, per ASTM D2794-93. Humidity resistance shall be up to a minimum of 1000 hours per ASTM D2247-92. Water immersion resistance shall be up to a minimum of 250 hours per ASTM D870-92. Durability shall be confirmed through testing to no less than 1000 hours of salt spray per ASTM B117-90.

#### 2. Fan Sound Reduction Kit:

Fan sound reduction kits reduce system noise without compromising performance.

#### 3. Security Grilles:

The PVC-coated grilles protect the condenser coil from damage due to debris and vandalism.

#### 4. Control Transformer:

The transformer is used to convert 200/230/460 v to 115 v for use on 115-v control systems, utilizing power from the condenser main unit power connection.

#### 5. Head Pressure Controller:

This accessory allows the unit to operate at low ambient conditions to -20 F.

#### 6. Hail Guard:

Louver-type sheet metal hail guard design prevents damage to condenser coil due to hail and other flying debris.
