1.0 INTRODUCTION

1.1 General

In 2022, J.L. Richards & Associates Limited (JLR) was retained by Minto Communities Inc. (Minto) to prepare the detailed design of municipal infrastructure for Site Plan Approval (SPA) of Arcadia Stage 6. This Site Servicing Report (SSR) presents the servicing constraints and strategies for water, wastewater, stormwater servicing, and stormwater management in accordance with the City of Ottawa Design Guidelines, the associated technical bulletins and relevant design excerpts. This SSR also includes strategies for implementing erosion and sedimentation control measures throughout the construction phase of the project.

1.2 Site Description

Minto's Arcadia Stage 6 is located within the City of Ottawa's Official Plan boundary and consists of a ±5.58 ha parcel bounded by Campeau Drive and Arcadia Stage 3 to the north, Campeau Drive SWMF and Donum Lane to the east, Country Glen Way to the west and by the Light Rail Transit (LRT) / Feedmill Creek to the south (refer to Figure 1-1). The legal description of the subject property is Part of Block 2, Registered Plan 4M-1563 and Part of Lot 3, Concession 1 (Geographic Township of March), City of Ottawa (refer to Appendix A1 for the Legal Plan)

A topographical survey was completed by Stantec Inc. in May 2022 (Appendix A1). The survey indicates that the existing ground surface contains fill piles and generally slopes downwards in a northeasterly direction towards Donum Lane.

1.3 Proposed Development

The proposed development will consist of 368 residential units and one public parkette (0.56 ha). Overall, the site will feature 11 Executive Towns, 80 Avenue Towns, 13 Urban Towns and 264 Metro Towns. The Concept Plan for Arcadia Stage 6 is attached to Appendix A1.

1.4 Proposed Connections to Existing Infrastructure

A review of existing services was completed along both frontages of the subject property to identify existing sewers and watermains to service the development. The proposed connections to the existing infrastructure consists of the following (refer to Appendix A3 for a copy of the background drawings):

Watermain

- East: Connection to existing 305 mm diameter PVC watermain along Donum Lane.
- West: Connection to existing 305 mm diameter PVC watermain along Country Glen Way.

Sanitary

- East: Removal and relocation of existing maintenance hole on Donum Lane and connection using 375 mm pipe.

Storm

- East: Removal and relocation of existing maintenance hole on Donum Lane and connection using 1500 mm pipe.
- West: Connection to existing maintenance hole on Country Glen Way using 900 mm pipe. The existing 600 mm pipe initially intended to service the proposed development will be removed.

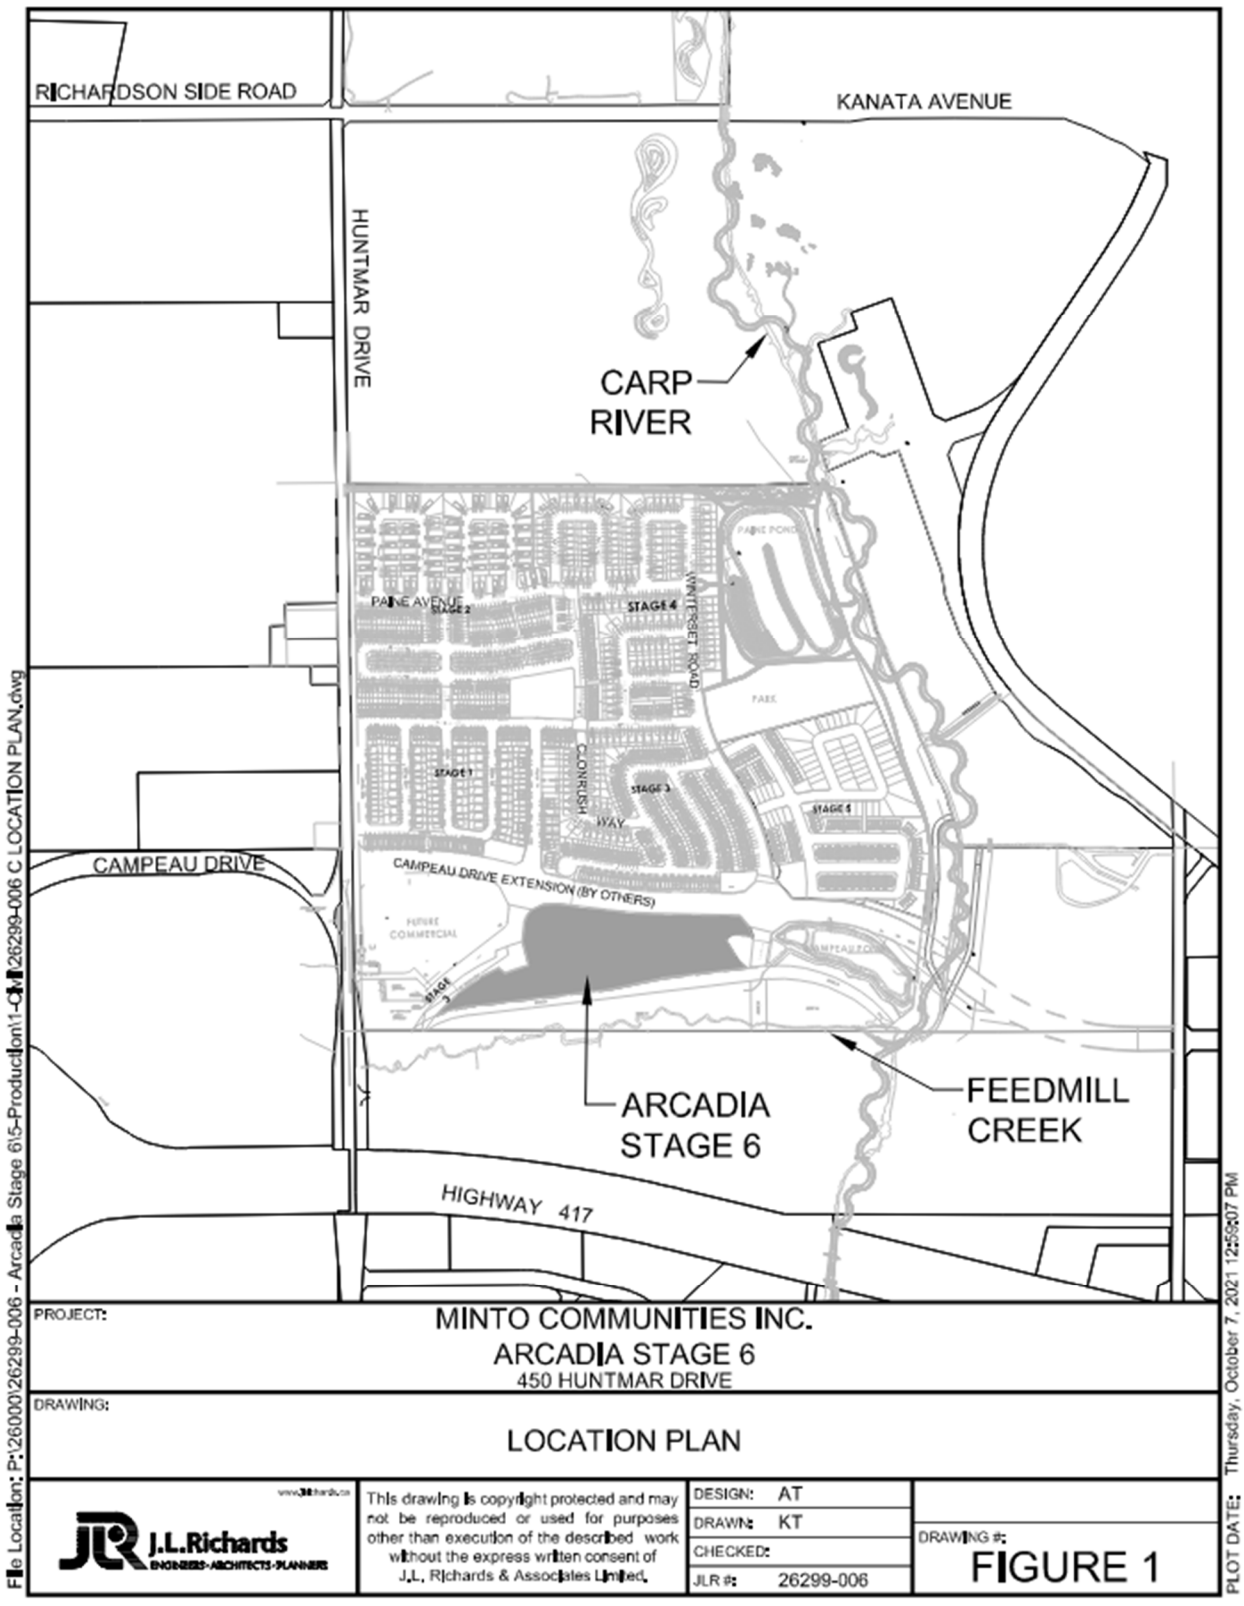
The existing watermain, storm and sanitary stubs on Donum Lane will be removed.

1.5 Consultation and Permits

A pre-consultation meeting was held on September 2, 2021, to discuss the planning process, design criteria, and servicing constraints. A copy of the pre-consultation meeting notes has been provided in Appendix A2.

As stated during the pre-consultation meeting, Stage 6 will be a Site Plan Control Application to the City of Ottawa. Existing structures are in place at the East and West side of the property line. These structures will be removed and/or relocated. As noted in the Servicing Drawings (S1 and S2), Stage 6 will have two storm, one sanitary and two watermain connections. An Environmental Compliance Approval (ECA) will be necessary to meet the Ministry of Environment, Conservation and Parks (MECP) requirements. In addition, a Servicing Study Checklist has been included in Appendix A4 of this report. The checklist provides all the details associated with this development as well as the approval and permit requirements.

Figure 1-1: Location Plan



2.0 WATER SERVICING

2.1 Water Supply Design Criteria

A Hydraulic Network Analysis (HNA) was carried out to confirm the site's watermain sizing and to demonstrate its compliance to the Ottawa Design Guidelines for Water Distribution (July 2010) and Technical Bulletins ISDTB-2014-02, ISTB-2018-02 and ISTB-2021-03. These documents are herein referred to as the Design Guidelines and TB-2014-02, TB-2018-02, and TB-2021-03, respectively.

Section 4.2.2 of the Design Guidelines states the following criteria for development additions to the public water distribution system:

- Under maximum hourly demand conditions (peak hour), the residual pressures shall not be less than 276 kPa (40 psi);
- During periods of maximum day and fire flow demand, the residual pressure at any point in the distribution system shall not be less than 140 kPa (20 psi);
- In accordance with the Ontario Building Code (OBC) in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi);
- The maximum pressure at any point in the distribution system in unoccupied areas shall not exceed 689 kPa (100 psi); and
- Feedermains, which have been provided primarily for the purpose of redundancy, shall meet, at a minimum, the basic day plus fire flow demand.

2.2 Domestic Water Demands

The estimated domestic water demands presented in this section are based on the site layout and unit count proposed in the Concept Plan (Appendix A1). Since receiving the boundary conditions from the City (Appendix B2), the number of units has been reduced from 409 to 368. The proposed development now consists of 104 townhouses (11 Executive Towns, 80 Avenue Towns and 13 Rear Lane Towns) and 264 duplexes (Metro Towns). Additionally, a public parkette with a water service is proposed for this development.

The residential consumption rate for average day demand was set in accordance with the City's TB-2021-03. To represent water usage from the Public Parkette, a demand of 4.0 L/s was applied to junction node J-33 for all three (3) demand scenarios (average day demand, maximum day demand and peak hour demand). Table 2-1 summarizes the water consumption rates and total estimated water demands used in the HNA. Calculated in accordance with Section 4.2.8 of the Design Guidelines, the detailed water demand distribution is presented in Appendix B1.

Table 2-1: Water Demands

Demand Scenario	Water Consumption or Peaking Factor	Total Demands (L/s)
Average Day Demand	280 L/c/d	6.88
Maximum Day Demand	2.5 x Avg Day	11.20
Peak Hour Demand	2.2 x Max Day	19.83

2.3 Fire Flow Requirements

The City has specified that the Fire Underwriters Survey (FUS) method shall be used for any public or private site where new fire hydrants are being designed. Specifically, the required fire flow (RFF) for each structure was calculated in accordance with TB-2018-02. Several firewalls were specified throughout the development to limit the maximum RFF to 15,000 L/min (250 L/s) in accordance with the boundary conditions received from the City of Ottawa. Critical fire areas for Arcadia Stage 6 are presented in Table 2-2.

Table 2-2: Fire Flow Requirements

Location	Block Number	Calculated Fire Flow L/min (L/s)
Critical Fire Area 1	Block 26	15,000 (250)
Critical Fire Area 2	Block 27	15,000 (250)
Critical Fire Area 3	Block MT-05	15,000 (250)
Critical Fire Area 4	Block MT-11	15,000 (250)
Critical Fire Area 5	Block MT-01	10,000 (167)
Critical Fire Area 6	Block MT-02	14,000 (233)

Refer to Appendix B1 for the detailed RFF calculations for the critical fire areas.

2.4 Proposed Water Servicing, Boundary Conditions and Water Model

2.4.1 Proposed Water Servicing

The proposed water servicing for Arcadia Stage 6 includes a private 203 mm watermain loop connected to the following existing watermains:

- Connection-1: the existing 305 mm watermain south of the intersection of Donum Lane and Campeau Drive; and
- Connection-2: the existing 305 mm watermain ±150 m south of the intersection of Country Glen Way and Campeau Drive.

The water demands will be supplied by local 200 mm PVC watermains. A 50 mm PEX water service will be extended from the mainline to provide domestic water service to units which are not fronting the 200 mm watermains. All units will be provided with an individual 19 mm PEX water service from the front except for the duplex blocks with underground

parking, which will be provided with a shared water service into the mechanical room for each complex. The water service for the public parkette is proposed as a 50 mm copper pipe. Refer to Drawing S1 and S2 for the water servicing layout.

The construction will be carried out in phases. Phase 1 will consist of constructing and servicing MT-08, MT-10, MT-11, MT-12, MT-13 and MT-14, including the east underground parking structure. The proposed watermain along Feedmill Private and Creekway Private (north and east sides) will be constructed in Phase 1 to service these buildings. The full RFF can be achieved at every phase of construction for each building within that phase.

2.4.2 Boundary Conditions

Hydraulic boundary conditions were provided by the City at the two proposed connection locations (Connection-1 and Connection-2) listed in Section 2.4.1 above. Tables 2-3 summarizes the hydraulic boundary conditions received (refer to Appendix B2 for a copy of the City correspondence).

Table 2-3: Hydraulic Boundary Conditions

Demand Scenarios	Connection-1 Head (m)	Connection-2 Head (m)
Maximum HGL	161.3	161.3
Peak Hour	156.3	156.3
Max Day plus Fire 1 (167 L/s)	153.8	151.5
Max Day plus Fire 2 (250 L/s)	150.5	145.5

2.4.3 Water Model

A hydraulic water model within the WaterCAD® software platform was used to carry out the HNA (refer to the overall schematics presented in Appendix B3). The water demands from Table 2-1 and the boundary conditions from Table 2-3 were input into the model for each demand scenario. Table 2-4 summarizes the watermain diameters and roughness coefficients used in the model, based on Sections 4.2.12 and 4.3.5 of the Design Guidelines.

Table 2-4: Watermain Internal Diameters and C-Factors

Nominal Diameter	Inside Diameter	C-Factor
50 mm	41 mm (PEX) 50 mm (Copper)	100
150 mm	155 mm	100
200 mm	204 mm	110
300 mm	297 mm	120

2.5 Simulation Results

The HNA was carried out under steady-state peak hour, maximum day plus fire flow, and maximum pressure conditions to confirm that the proposed water servicing can meet the design criteria outlined in Section 2.1.

2.5.1 Peak Hour

The simulation results found the minimum pressure at the site during the peak hour condition to be 523 kPa (75.8psi) (refer to Appendix B4), which exceeds the minimum pressure criterion of 276 kPa (40 psi) per the Design Guidelines.

2.5.2 Maximum Day Plus Fire Flow

Fire water supply will be provided by hydrants located along the 203 mm watermains. Hydrant spacing was carried out in accordance with the Design Guidelines.

To ensure adequate fire protection, the maximum day demand shown in Table 2-1 was analyzed simultaneously with the fire flow requirements. The fire flow simulation was carried out by allowing WaterCAD® to calculate the maximum fire flow that can be drawn from each hydrant without allowing any part of the system to experience pressures less than 140 kPa (20 psi). Except for hydrant H-12, it is expected that the targeted fire flow of 15,000 L/min (250 L/s) can be provided throughout the site (refer to Appendix B5). As shown in Appendix B2, contributing fire hydrants were assessed for each structure within the site to confirm that adequate water supply is available per Appendix I of TB-2018-02.

As hydrant H-12 was only able to provide an available fire flow of 242 L/s, fire flow demands of 63 L/s were manually applied to the nearby hydrants (H-11, H-12, H-13 and H-14) to confirm that the hydrants could provide the RFF (250 L/s) while achieving the minimum pressure requirement of 140 kPa (20 psi). The results indicated that the hydrants were able to provide the RFF for Block MT-05 while maintaining the minimum pressure requirement throughout the site.

2.5.3 Maximum Pressure

Based on a zero (0 L/s) demand condition, the simulation results found the pressures at the site during the maximum pressure condition to range between 605 kPa (87.7 psi) and 649 kPa (94.1 psi) (refer to Appendix B6). Since these values exceed the maximum pressure constraint of 552 kPa (80 psi) per the Design Guidelines, all units within Arcadia Stage 6 will require pressure reducing valves (PRVs).

2.6 Summary and Conclusions

Based on the water simulation results, the proposed development can be serviced by a 203 mm watermain loop, 203 mm local watermains and 50 mm water service extensions as shown on Drawing S1 and S2. Simulation results under peak hour demand and maximum pressure conditions showed that the design criteria can be achieved with the installation of PRVs for all of the units within the site. Furthermore, adequate fire water supply can be achieved with the proposed servicing.

3.0 WASTEWATER SERVICING

3.1 Background

In accordance with the Kanata West Master Servicing Study (KWMSS), wastewater servicing in Arcadia Stage 6 is designed to outlet to the existing 675 mm diameter gravity sanitary sewer on Campeau Drive. Sanitary sewage will then be conveyed by gravity to the Signature Ridge Pump Station (SRPS) which, in turn, will eventually outlet to the Robert O. Pickard Environmental Centre where wastewater is processed and treated prior to discharge into the Ottawa River.

3.2 Design Criteria

The sanitary sewer system within Arcadia Stage 6 is designed in accordance with the Ottawa Sewer Design Guidelines and subsequent technical bulletins. The design parameters are applied under two scenarios as per ISTB Technical Bulletin 2018-01. In addition to the typical design values, annual values are used for the simulation of the system with failure of the pump station and operation of the overflows. The simulation of the pump station failure should show that the HGL of the sanitary system remains below the underside of footings due to the operation of the overflows. The key design parameters have been summarized in Table 3-1.

Table 3-1: Wastewater Key Design Parameters

Design Parameter	Design Value	Annual Value
Duplex[1] Population Density	2.3 ppu	Same as design
Row Townhouse[2] Population Density	2.7 ppu	Same as design
Residential Average Flow	280 L/Cap/Day	200 L/cap/day
Residential Peaking Factor	Harmon's Formula	Same as design
Harmon's Correction Factor (K)	0.8	0.6
Infiltration Allowance	0.33 L/s/ha	0.3
Manning's Roughness Coefficient (n)	0.013	0.013
Allowable Slopes	Varies (Refer to Section 6.1.2.2 of ODSG)	-
Allowable Velocities	0.6 m/s – 3.0 m/s	-
Allowable Freeboard	-	> 0 m

(1) The product "Metro Towns" are duplex units.
(2) The products "Rear Lane (or Urban) Towns", "Executive Towns", and "Avenue Towns" are row townhouse units.

3.3 Proposed Sanitary Servicing and Design Flows

Wastewater generated from Arcadia Stage 6 will be conveyed via a local 200 mm diameter sanitary sewer system that will discharge into the existing 375 mm sewer on Donum Lane as shown in the Servicing Drawings (S1-S2).

Wastewater flows from the proposed development are presented in the Arcadia Stage 6 Sanitary Design Sheet (refer to Appendix C1). Based on the design criteria (Table 3-1) and the site

constraints, a total design peak flow of 11.19 L/s is calculated for the development. Table 3-2 summarizes the results from the sanitary design sheet.

Table 3-2: Sanitary Design Flow Summary

Unit Type	Site Area	Unit Count	Unit Density	Average Flow	Res. Peak Flow	Infilt. Flow	Total Flow
Duplex	5.42 ha	264	2.3 ppu	280 L/cap/day	9.40 L/s	1.79 L/s	11.19 L/s
Row Townhouse		104	2.7 ppu				

The peak wastewater flow calculated for the proposed Arcadia Stage 6 development is 11.19 L/s as shown in Table 3-2. This is based on a total population of 888 people. The sanitary design spreadsheet prepared by IBI (Appendix C2) shows that a flow of 4.80 L/s was allocated for the western portion of Stage 6 and a flow of 20.06 L/s was allocated for a 24.3 ha land parcel which included the eastern portion of Stage 6. This amounts to a pro-rated flow allocation of 1.75 L/s for the eastern portion. Thus, the total flow allocation for the entire Stage 6 development is 6.55 L/s (4.80 L/s + 1.75 L/s).

It is noted that previously, the sanitary flows from this site were to be split between the western portion discharging to Country Glen Way and the eastern portion discharging to Donum Lane. Though two outlets were identified for this site, the flows were anticipated to quickly converge along Campeau Drive into the same sewer located northeast of the site at the Donum Lane/Winterset Road/Campeau Drive intersection (i.e., at ex. MH 307A). Although the calculated peak flow for Arcadia Stage 6 is 11.19 L/s which is greater than the original combined allocated flow of 6.55 L/s the following points discuss the downstream capacities:

1) The Donum Lane detailed design sheets completed as part of Arcadia Stage 3 & 4, show that there is sufficient residual downstream capacity to accept the 11.19 L/s from Arcadia Stage 6 on Donum Lane.

2) The design sheets from the KWMSS for Campeau Drive (Appendix C2) indicate that there is sufficient residual capacity in the downstream system up to the signature ridge pumping station to accommodate the increase in flow.

Given there is sufficient residual capacity in the sewer system, it is proposed to adopt the sanitary servicing strategy described in this section.

3.4 Overflow and Sanitary Hydraulic Grade Line Analysis

Protection against basement flooding within the existing Arcadia Stages 1 to 4 is currently provided by an existing overflow that outlets to the Paine Pond stormwater management facility along with other overflows in the wastewater sewer network. No new overflows are proposed for additional basement protection for Stage 6.

The hydraulic grade line (HGL) analysis carried out for the detailed design of Stage 4 (latest analysis dated February 2020) demonstrated that the design criterion for freeboard was met within the system for Arcadia Stages 1 to 4, including a flow allowance from Stage 6. An updated HGL analysis has been carried out to confirm the HGL within the Stage 6 development.

The HGL analysis was completed using the PCSWMM software platform. The HGL analysis was based on the Signature Ridge HGL analysis completed by IBI in September 2014 with the following revisions:

- Peak wastewater flows were calculated in accordance with the parameters prescribed in Technical Bulletin ISTB-2018-01 and based on residential unit counts and land uses per the current proposed Arcadia Development (Appendix 'A1').
- The local sanitary sewers in Stage 6 were added to the model.
- Land use and residential unit counts were updated using design documents from Arcadia Stages 1, 2 and the Arcadia Retail Development. Appendix C references all applicable documents. Allocations are shown on Drawing OSAN.
- Populations and land uses on the eastern side of the Carp River were maintained as per the 2014 HGL analysis; however, wastewater flows were recalculated based on the parameters in the Technical Bulletin ISTB-2018-01.
- Existing overflows in the model on the East side of the Carp River were maintained in the model although all sanitary sewers were updated as per the GeoOttawa information.
- As per the recent constructed works implemented in Stage 4, an emergency sanitary sewer overflow was included at the Paine SWMF at the 1:25 year design elevation of 93.37 m.

The revisions to the sewer shed areas are shown in the marked-up Figures from the September 2014 report (Appendix C8) along with the revised Sanitary Design Sheets for the Dry Weather Flow and Wet Weather Flow with the Annual Parameters. Table 3-4 summarize the wet and dry weather flows for Arcadia Stage 6 under the annual event.

The resulting flows at the overflows are listed in Table 3-3 below using the Annual Parameters for the Dry Weather Flow condition and the Wet Weather Flow Condition. The values can be summed to give the equivalent flow to the SRPS when the pump is operating.

Table 3-3: Sanitary Annual Flows at Overflow Locations

Overflow Location	Overflow Elevation (m)	Dry Weather Flow (l/s)	Wet Weather Flow (l/s)
Paine SWMF	93.37	29	42
SRPS Emergency Overflow	93.70	97	244
Richardson Ridge Overflow	94.10	6	34
Total Flow	-	132	319

The simulated HGL elevations were then compared to underside of footing (USF) elevations of Stage 4 and Stage 3. It should be noted that the USF used in this HGL analysis are generally

lower than those assumed as part of the 2013 IBI HGL analysis due to changes in the development criteria of the site during the design phases.

Table 3-4 displays the freeboard under dry and wet weather flows. Results in Table 3-4 indicate that a minimum freeboard greater 0.01m will be achieved throughout Stage 6. HGL levels for conceptual future stages can be found in Appendix 'C8'.

Table 3-4: Freeboard from Sanitary HGL under Pumping Station Failure

3.5 Summary and Conclusions

Wastewater servicing for Arcadia Stage 6 will be designed in accordance with the City of Ottawa Sewer Design Guidelines, the associated technical bulletins, and various background documents as highlighted throughout this section. The proposed collection and conveyance of wastewater will consist of a local 200 mm diameter sewer which will outlet into Donum Lane as shown on Drawings S1 and S2. It is recommended that this wastewater servicing plan be implemented in order to provide adequate sanitary servicing for the proposed development.

4.0 STORM SERVICING AND STORMWATER MANAGEMENT

4.1 Background

Similar to Arcadia Stages 1 to 4 stormwater management requirements for this development were originally set by the 2006 Kanata West Master Servicing Study (KWMSS), which identified a single stormwater management facility (referred as a Pond One) to service the area of the then proposed Arcadia developments. In 2018, after development of Stages 1 and 2, JLR evaluated various storm servicing strategies for the remainder of the Arcadia Development as part of the document entitled "Stormwater Management Strategy Report - Arcadia Residential Stages 3, 4 and Commercial Stage 2, JLR, May 2018". The 2018 report identified that the preferred solution for the remainder of the Arcadia development was to incorporate a second stormwater management facility (SWM facility) on the south side of Campeau Drive which would improve HGL issues, allow for the immediate servicing of Campeau Drive extension and Light Rail Transit (LRT) and reduce submergence along the minor system when compared to a single pond servicing strategy. The two-pond concept was accepted by the City of Ottawa. The second SWM facility referred to as the Campeau Drive SWMF is the dedicated storm outlet for Stage 3, which included part of the Stage 6 lands.

Storm flows from the west side of Arcadia Stage 6 discharge to existing stubs on Country Glen Road that were included as part of the design for the commercial development on the west side of Country Glen Road. Discharges to the minor system on Country Glen Road flow via the existing minor system through Stages 1, 2 and 4 of Arcadia development and outlet to the Paine Pond, which provides water quantity and quality control for discharges to Carp River. Release rates to Country Glen Road were set in the Arcadia Commercial 370 Huntmar Drive Design Brief by IBI Group, October 2014.

Storm flows from the east side of Arcadia Stage 6 discharge to an existing storm sewer on Donum Lane, which discharges into Campeau Drive SWMF. This facility provides water quantity and quality controls prior to releasing controlled flows into the Carp River. Allowable release rates from the east side of Arcadia Stage 6 were set out in the JLR 2018 report and confirmed in the design of Arcadia Stage 3.

4.2 Design Criteria

Storm and stormwater management servicing for the Arcadia Stage 6 was developed in accordance with the City of Ottawa 2012 Sewer Design Guidelines (OSDG) and the more recent Technical Bulletin PIEDTB-2016-01 (September 6, 2016). These two documents are herein referred to as the Design Guidelines in this section. A summary of the key storm and stormwater management criteria follows:

- Control minor system flows to the allowable release rates at existing stubs at Country Glen Road and Donum Lane;
- Storm sewers are designed to capture the 1:5 year storm event as a minimum using the Rational Method and using the regressions derived from Intensity-Duration-Frequency (IDF) equations as per the Design Guidelines;
- Provide a freeboard in the sewer network to the underside of footing (USF) of 300 mm during the 1:100-year storm where weeping tile connections are present;

- The runoff coefficients (C-factors) for the residential development were based on the maximum lot coverage permitted by the proposed zoning, as per the Design Guidelines. C-factors for non-residential land uses to be calculated based on the ratio of pervious and impervious surfaces depicted on proposed site plans;
- Minimum roadway profile grades at 0.5%;
- Roadway cross-fall of 3% was used for all streets;
- Minimum roadway slope of 0.1% from crest-to-crest for overland flow route;
- Minimum rear yard slope in the absence of perforated pipe system of 1.5% along with swale side slopes of 3 horizontal to 1 vertical;
- Maximum street ponding depth of 350 mm (static and dynamic) as per the Design Guidelines and maximum depth of rear yard flow to be 300 mm;
- Minimum vertical clearance of 0.15 m between the spill elevation on the street and the finished grade (garage elevation);
- Minimum vertical clearance of 0.30 m between the rear yard spill elevation and the ground elevation at the building in the rear yards;
- During the Climate Change event, the street ponding is not to reach the lowest building opening while the storm HGL must remain at or below the USF;
- The product of the velocity and depth of major system flows on streets during the 1:100-year design storm event is not to exceed 0.60 m^2/s; and,
- Major system flows up to and including the 1:100-year design storm event are contained within the site and internally are self-contained within the park and amenity blocks.

4.3 Proposed Stormwater Management Approach

It is proposed to utilize both the west and east connection points to the existing minor storm sewers on Country Glen Road and Donum Lane respectively. The Country Glen Road sewer will utilize the two existing stubs located approximately 70 m (MH201, Ext 1) and 130 m (MH205, Ext 2) upstream of the intersection with Campeau Drive, while the Donum Lane sewer will have one connection point at the existing stub to the east of the proposed development. The stormwater management approach will require that the discharges to these locations are controlled to the allowable release rates identified in the design of Phase 1 and Stage 3 of the Arcadia site. These allowable release rates are identified in Table 4-1.

Table 4-1: Allowable Release Rates

Outlet	Allowable Release Rate (m^3/s)	Set By
West – Country Glen Road (MH201, Ext 1)	0.148	Arcadia Commercial 370 Huntmar Drive Design Brief by IBI Group, October 2014
West – Country Glen Road (MH205, Ext 2)	0.492	Arcadia Commercial 370 Huntmar Drive Design Brief by IBI Group, October 2014 (Prorated by Contributing Area)
East – Donum Lane	0.567	Stormwater Management Strategy report- Arcadia Residential Stages 3, 4 and Commercial Stage 2, JLR, May 2018

The release rate to MH205 identified in the Arcadia Commercial 370 Huntmar Drive Design Brief (IBI Group, October 2014) design sheets, 520 L/s, was based on an upstream contributing area of 2.82 ha with a runoff coefficient of 0.70. However it is now intended to split the lands to this inlet stub and therefore the release rate will be prorated to each contributing area. Arcadia Stage 6 will contribute runoff from an area of 2.67 ha. At the same runoff coefficient, 0.70, and time of concentration, 12 minutes, the smaller area will have an allowable release rate of 492 L/s, which is shown in Table 4-1. The remaining area of 0.15 ha will remain undeveloped and subject to future site plans. The combined allowable release rate for lands covering the Stage 6 development to the Country Glen Road storm sewer is 640 L/s.

In order to achieve the allowable release rates, the stormwater management of the site will include online detention of the stormwater runoff in underground oversized sewers and allowing increased headwater depths in sewer sections with no weeping tile connections. Where weeping tile connections are proposed at houses with basements, the 1:5-year free flow capacity of the pipe network will be maintained, the 1:100-year HGL will remain 300mm below the underside of footing of connected units and the climate change event HGL will remain below the underside of footing of connected units.

4.4 Proposed Minor System Servicing

4.4.1 Runoff Coefficient

Runoff coefficients (C-Factors) were calculated for Arcadia Stage 6 based on the weighted product between the percentage of the pervious area at a C-Factor of 0.2 and the percentage of the impervious area at a C-Factor of 0.9. GIS Mapping of the impervious and pervious surfaces was used in the PCSWMM software spatial weighting tool to develop an overall weighted C-Factor for the site, excluding the park and amenity site. Due to consistency and density of the site, this approach provides a conservative C-Factor to be used across the site. C-Factors are provided in Table 4-2.

Table 4-2: C-Factors

Area	C-Factor
Site Development Area	0.78
Parkland (Public)	0.4
Amenity Space (Private)	0.58

One of the amenity spaces, which will remain private, has runoff from residential area and the C value for this subcatchment has been calculated separately based on an area weighting between 0.78 and 0.4 areas. A similar approach was used for three subcatchment areas with predominant open space and a reduced C-Factor of 0.58 was used.

4.4.2 Minor System Servicing

The proposed storm sewers of Arcadia Stage 6 were sized using the Rational Method based on the C-Factors presented in Table 4-2. Appropriate rainfall intensities were used in the Rational Method based on the rainfall regression

equations presented in Section 5.4.2 of the OSDG along with an inlet time of ten (10) minutes at the upstream end of the system. The Rational Method Storm Sewer Design Sheet is included in Appendix 'D1', while the Storm Drainage Plans included in the drawing set provide details associated with the storm drainage areas.

The storm drainage design sheet includes sewer sections which are used to control upstream flows through a restricted size. The restricted sewer sections operate under pressure in the minor system design event to control flows downstream and so show as operating beyond capacity in the design sheet, however these sewers are accounted for in the modelling HGL analysis.

4.4.3 Inlet Control Devices

Storm servicing for Arcadia Stage 6 was developed to limit all flows transmitted to the storm sewers and meet the 0.35 m criterion as the maximum street ponding depth requirement. To achieve this criterion, servicing was developed using ICDs at inlets to the minor system.

The response under the 1:5-year rational method calculation was used to determine the minimum ICD targeted flow for Arcadia Stage 6. The ICDs were selected based on the dynamic model head differential between the maximum HGL at the grate and the higher of the geodetic elevation of the centroid of the ICD or the downstream HGL, in each catch basin lead. Therefore, each ICD was sized to transmit the targeted peak flow based on the calculated water level depth at the top of grate. When water rises above the top of grate in the roadway sag, flows transmitted to the storm sewers will marginally increase due to the increase in the hydraulic head. Based on the range of flows and hydraulic heads at each catch basin, the following types of ICDs are proposed in Stage 6:

- IPEX Tempest Type A;
- IPEX Tempest Type B; and
- IPEX Tempest Type C;

Comprehensive ICD Tables referred to as the Catch Basin Table were prepared and are included in Appendix 'E2'. The Catch Basin Tables show specific information including top of grate elevation, pipe size and invert, the restricted capture rate and ICD type. The information shown on the Catch Basin Tables was extracted and shown on Drawing D1.

4.4.4 Water Quality

The storm discharge criterion for the subdivision is based on the enhanced protection level of 80% TSS removal. As described in JLR design briefs for Stormwater Management Facilities for Campeau and Paine Ponds, the 80 % of TSS removal was used as a design criterion to complete the detailed design of aforementioned facilities to provide water quality treatment for Arcadia Stage 6 development. Campeau Drive Pond services flows coming from eastern portion of

development while Paine Pond services flows from western portion of development.

The comparison of the design values used and the proposed values are shown in Table 4-3 and demonstrate that the ponds have the required water quality treatment capacity.

Table 4-3: Water Quality Capacity Analysis

	Stage 6 Area	Stage 6 C Factor	Stage 6 AxC
Campeau Pond Allocated	2.45	0.80	1.96
Campeau Pond Proposed	2.15	0.78	1.67
Paine Pond Allocated	3.55	0.70	2.48
Paine Pond Proposed	3.33	0.70	2.31

In Table 4-3 the allocated values to Campeau Pond are from the Arcadia Stage 3 Campeau Drive Pond Stormwater Management Facility Design Brief and the Stormwater Drainage Plan is contained in Appendix E. The allocated values to Paine Pond are from the design sheet in the Arcadia Commercial 370 Huntmar Drive Design Brief by IBI Group, October 2014 (also copied in Appendix E). Since the design sheet does not have any GIS mapping associated with it the split between Campeau Pond and Paine Pond is not specifically mapped, however the allocations were made in the modelling and the areas calculated now are consistent with the latest boundaries and GIS spatial mapping.

Table 4-3 shows that the overall AxC value proposed going to each pond is less than that originally allocated under the previous modelling which was used to size the pond permanent pool and extended detention volumes and therefore there is sufficient water quality control capacity in the downstream facilities. It is also recognized that the overall C-Factor of 0.78 used for the areas going to Campeau Pond is conservative as it does not reflect the park or amenity areas within the site boundaries, despite these areas being included in the area calculation.

4.5 Stormwater Management Modelling Approach

4.5.1 Dual Drainage Model

The analysis of both major and minor drainage systems was carried out to demonstrate their compliance with respect to the design criteria described in Section 4.2. The performance of the major overland system and minor storm sewer system was analyzed with PCSWMM. This software is a dynamic model which allows both hydrologic and hydraulic components to be simulated in the same platform and also allows the simulation of the interaction between the major and minor systems. The PCSWMM software platform was used to:

- Generate the surface runoff hydrograph for each sub-area under various recurrences.

- Subdivide each inflow hydrograph into its minor and major system components based on the proposed inlet capture rates and roadway sag storage.
- Assess cascading, if any, and carry out dynamic routing of storm flows to determine flow depths along the roadways. As previously stated, the maximum major overland flow depths along the subdivision's roadways are to be limited to 350 mm or less, as per Technical Bulletin PIEDTB-2016-01.
- Demonstrate that the HGL along the storm sewers during the 1:100-year event without sedimentation is 300 mm below the basement's USFs.

PCSWMM was set-up to evaluate the proposed servicing as detailed on Drawings G1 (Grading), Drawings SWM1 (Ponding Plan), Drawings DST, ODST (Drainage) and Drawings S1-S2 & OS (Servicing). As per Drawings DST, the Arcadia Stage 6 lands were discretized into more refined sub-catchments for the immediate drainage area of Stage 6 and lumped sub-catchments for the entire modelled extents. To demonstrate the model schematic, Figure E1-1 and Figure E1-2 (Appendix E1) were prepared and depict the major and minor system elements of the model along with the subcatchments.

4.5.2 Integration with the Carp River Modelling and Boundary Conditions

In order to evaluate the design of the Paine and Campeau Stormwater Management Facilities and the impact on the Carp River, a sub-model of the City of Ottawa PCSWMM Carp River model was extracted to act as the downstream receiver for the stormwater management facilities. The inflow hydrograph at the upstream end of the sub-section of the Carp and the downstream stage hydrograph were both extracted from the overall Carp River model and used as inputs for the respective storm events in the Arcadia Detailed Design model.

Details of the detailed design model and the control of flows released to the Carp River were provided in the Paine Stormwater Management Facility Design Brief, JLR February 2020 for Arcadia Stage 4 and the Stormwater Management Facility Design Brief, Campeau Drive SWMF, JLR May 2019 for Arcadia Stage 3.

Both reports demonstrated that the use of the sub-model was a representation of the flows in the Carp River from the full model and that the stormwater management ponds provided sufficient controls to achieve no impact to the peak flows or maximum water levels in the Carp River.

Since the Arcadia Stage 6 development is internal to the detailed model used in these two reports and discharges to the two ponds, the Arcadia Stage 6 model will use the detailed sub-model to demonstrate that flows to the ponds can be maintained under the proposed Stage 6 stormwater management strategy and therefore there will be no impact on the Carp River.

4.5.3 Simulation of Street Segments

Flow directed to a street segment is split at the major system node; flows are broken down into minor and major system components using an outlet rating curve

representing the ICD capture and assigning the minor system flow directly into the minor conduit while maintaining the major system flows on the surface conduit. Flow through the outlet link is calculated based on the HGL above the elevation of the ICD and its rated capacity under various water surface elevations. The ICD rating curves are those provided by the manufacturer.

The storage in roadway sag is included in the model as being inherent within the major system conduits. The dynamic capability of PCSWMM means that the static and any dynamic flow is calculated in the model to provide one depth value at each sag location. The low points and high points in the street conduits are taken from the Civil 3D surface.

The subdivision's grading was developed with roadway static storage depths to maximize detention and attenuation of major overland flows while those of lesser volume sags were designed to maximize the conveyance capability of the dynamic section of the cross-section during events where cascading occurs.

4.5.4 Adjoining Existing Areas

The western half of Campeau Drive, from Huntmar Drive to 160 metres east of the roundabout with Country Glen Road, was included in the SWMHYMO modelling for Arcadia Phase I, which included flows from Campeau Drive, residential facing Campeau Drive, Country Glen Road and minor flows from the commercial areas. The minor system flows were extracted from the approved SWMHYMO modelling and imported into the PCSWMM modelling. The IBI design allowed for some major overland flow to continue down Campeau Drive to the low point at the junction with Donum Lane and this hydrograph was also extracted from the SWMHYMO model and imported into the PCSWMM model.

It should be noted that the previous modelling for Arcadia Phase I included Stage 6 as commercial with all major overland flows retained on site, however, due to the change to residential and some of the properties facing Campeau Drive, the grading means that there is some runoff contributing directly to Campeau Drive flows. In order to capture the change in major system flow and small changes in drainage areas as a result of Stage 4, the hydrographs along Campeau Drive from the Phase I model were removed and replaced with subcatchments, inlet links and weirs representing the runoff and conveyance included in the SWMHYMO model.

The hydrologic parameters used are consistent with the Phase I modelling and the flows in the model are consistent with those in the Phase I modelling. A comparison of the flows is provided in Table 4-4.

Table 4-4: Major Overland Flow Comparison along Campeau Drive

Section of Major Overland Flow along Campeau Drive	SWMHYMO 1:100 year 3-hour Chicago flow (m^3/s)	PCSWMM 1:100 year 3-hour Chicago flow (m^3/s)
MH300 to MH301 at commercial access on Campeau Drive	0.221	0.221
MH301 to MH302	0.267	0.263
MH302 to Country Glen Road roundabout	0.319	0.306
Country Glen Road roundabout to MH304	0.357	0.354
MH304 to Donum Lane roundabout	0.430	0.430

In addition, the total inflow to the low points on Campeau Drive at the Donum Lane roundabout were simulated in the Stage 4 model. The inlet capture defined in the Stage 4 model was set at the 1:10-year rate at each of the low point inlets. Additional flows to the low points at the Donum Lane roundabout included the immediate catchments in the model. In a change to the Stage 4 model, the actual impervious surface coverage was used to refine the imperviousness values used in the hydrology for the Campeau Drive catchment. The imperviousness reduced from 85.7% to 72.0% reflecting the front yards facing the north side of Campeau Drive covered by the catchment area. A comparison of the incoming flow for the 1:10-year and 1:100-year 3-hour Chicago storms at the north and south low points is provided in Table 4-5.

Table 4-5: Incoming Flow to the North and South Low Points – 3-hour Chicago Storm

Low Point	Stage 4 Model 1:10-year incoming flow (m^3/s)	Stage 4 Model 1:100-year incoming flow (m^3/s)	Stage 6 Model 1:10-year incoming flow (m^3/s)	Stage 6 Model 1:100-year incoming flow (m^3/s)	Stage 4 Modelled Minor System Inlet Capture Rate (m^3/s)
North	0.198	0.517	0.174	0.480	0.2
South	0.156	0.452	0.159	0.457	0.16

The comparison with the flows in the SWMHYMO model with those in the Stage 4 modelling shows that the changes to the drainage areas have negligible impact on the hydraulics of Campeau Drive. The flows from upstream are consistent with the previous modelling and the inclusion of the runoff from Stage 6 front yards, along with refinement of the imperviousness values for Campeau Drive, means that the 1:10-year flow rate remains below, or at, the modelled inlet capture rate and the 1:100-year event flows are no greater, or at, previously simulated flow rates.

4.6 Modelling Parameters

4.6.1 Hydrological Parameters

The following parameters were used in the hydrologic component of PCSWMM:

- **Areas and Imperviousness**: Catchment ID and drainage areas used by PCSWMM match those shown on either Drawing DST or Figure E-1 (Appendix E1). In regard to the imperviousness of subcatchments, C-Factors reported in Section 4.4.1 were used to estimate PCSWMM's imperviousness.

- **Catchment Width**: The catchment width is approximately twice the length of the street segment through the subcatchment, in accordance with the OSDG for the majority of catchments where there is an even split on the road. In some cases the catchment width is the length of the road section if the catchment is all to one side of the road.

- **Manning's Roughness Coefficient**: Manning's Roughness Coefficients of 0.013 and 0.25 were used for the impervious and pervious surfaces, respectively within the Stage 6 area, which are consistent with the OSDG. Historically other values have been used for the pervious component in other stages and these have been maintained.

- **CN Infiltration parameters**: For consistency with the City of Ottawa Carp River Model the CN infiltration approach was used. The CN value of 75 for pervious land cover was maintained from the Carp River Model.

  Since PCSWMM is based on the Nonlinear Reservoir Routing Method (SWMM 5 engine) to generate runoff from subcatchments, the infiltration and depression storage are accounted for separately. The formulation of the SCS Loss Method incorporated into SWMM does not include the Initial Abstraction term. CN is used in SWMM to compute infiltration losses only, not total hydrologic losses as in the original SCS methodology. Therefore, the CN value is used and not a modified CN (CN*) as this alters for term to account for the difference in Initial Abstraction.

- **Initial Abstraction**: Initial abstraction of 4.67 mm and 1.57 mm was used for the pervious and impervious surfaces respectively, consistent with the OSDG and Carp River Model.

Note that for catchments that were previously modelled in SWMHYMO for Arcadia Phase I maintained the catchment parameters as per the SWMHYMO model to maintain consistency with previous work.

4.6.2 Simulation of Storm Distributions

The City of Ottawa requires that the performance of the minor and major systems be investigated under the 3-hour Chicago design storm. As such, 1:2-year, 1:5-year, 1:10-year, 1:25-year, 1:50-year, and 1:100-year 3-hour Chicago storms were

evaluated. In addition, the critical storm distribution for the Carp River is the 12-hour SCS storm and so this distribution was also assessed by the model for the same durations, in addition to the standard 24-hour SCS storm distribution for the same durations. The 12-hour SCS storm was found to be critical for the minor system HGL while the Chicago 3-hour storm for the major overland flow system.

It should be noted that the 12-hour SCS storm used in the modeling was labelled as the MTO 12-hour SCS storm in the Carp River modelling and the nomenclature has been maintained to differentiate it from the storms for Arcadia derived from the City of Ottawa IDF and OSDG.

The Climate Change stress test event was run for all three storm distributions used. As per the requirements of the Ottawa Sewer Design Guidelines, historical storms were also assessed, including the July 1, 1979 storm, the August 4, 1988 storm and the August 8, 1996 storm.

4.6.3 Simulation of Park and Amenity Blocks

For the park and amenity blocks the model includes a storage node with an outlet link to restrict flow to the minor system to the 1:5-year runoff rate for the blocks. In events greater than the 1:5-year return period then the storage node detains runoff over and above the release rate for the block. The 1:5-year release rates for the blocks are shown in Table 4-6.

Table 4-6: Release Rates for the Park and Amenity Area

Block	Area (ha)	Imperviousness (%)	Runoff Coefficient	1:5-year Release Rate (m^3/s)	Storage Requirement (m^3)
Park Block	0.50	28.57	0.40	0.058	50
Amenity Block	0.12	54.29	0.58	0.021	11

4.6.4 Simulation of Garage Access Ramps

Two of the units within the Stage 6 development have depressed garage access ramps. One of these will be able to drain via gravity to the storm sewer system while the other to the east of the site will require to be pumped to the minor system. A maximum pump rate of 9 L/s, approximately equivalent to a 1:10 year event. Where the gravity connection is provided the drain is above the underside of footing for the unit and 300mm freeboard should be maintained below the grate elevation.

4.7 Simulation Results

This section of the Report presents the results of the simulation of Stage 6 as part of the detailed model for the Arcadia site as a whole, incorporating Stages 1 to 4 and the Paine Pond and Campeau Drive stormwater management facilities. The modelling includes the future Stage 5 at a conceptual level with the same parameters as used in the Stage 3 and 4 models.

The objective of this section is to assess the performance of the following systems under the build-out condition:

- The major overland system under extreme storm events (i.e., 1:100 year and climate change events) as per the OSDG; and
- The major overland system during the 1:2-year storm event and determine whether surface ponding is to occur.
- Appendices E4 and E5 provide Storm HGL analyses and Street Ponding Analyses respectively for a range of historical storms and interim conditions.

4.7.1 Low Point Ponding Analysis

The results at each of the low points, as generated by a 3-hour Chicago storm distribution, are set out in Table 4-7 and in The simulation results compiled in Table 4-7 above shows ponding depths at the locations where the catchbasin manhole structures were utilized to convey the surface flow into storm sewer. At these locations the modelling is such that surface flow head is required to be present to drive the flow through grate opening into the minor system. Ponding hydrographs for the 1:2 year and 1:5 year event showed that surface ponding is only present for the peak of the event to create the head in the model. The depths in the 1:2 year and 1:5 year events are only from the grate and are not as a result of any downstream ICD.

Table 4-8. Low points correspond to Area IDs from the ponding plan Drawing SWM1.

Table 4-7: Catchbasin Ponding Depths (3-hour Chicago Event)

Low Point ID	Top of Grate (m)	Maximum Static Depth	1:2 year Depth (mm)	1:5 year Depth (mm)	1:100 year Depth (mm)	Climate Change Depth (mm)
2	97.3	300	10	10	10	20
3	97.25	300	20	30	50	70
10	96.67	180	-	10	210	310
20	95.8	150	20	20	40	50
21	96.3	100	20	30	60	80
24	96.22	230	60	70	150	220
25	96.2	300	-	-	90	130

The simulation results compiled in Table 4-7 above shows ponding depths at the locations where the catchbasin manhole structures were utilized to convey the surface flow into storm sewer. At these locations the modelling is such that surface flow head is required to be present to drive the flow through grate opening into the minor system. Ponding hydrographs for the 1:2 year and 1:5 year event showed that surface ponding is only present for the peak of the event to create the head in

the model. The depths in the 1:2 year and 1:5 year events are only from the grate and are not as a result of any downstream ICD.

Table 4-8: Low Point Major System Ponding (3-hour Chicago Event)

Low Point ID	Top of Grate (m)	Maximum Static Depth	1:2 year Depth (mm)	1:5 year Depth (mm)	1:100 year Depth (mm)	Climate Change Depth (mm)
4	97.15	300	-	-	100	120

13	96	250	-	-	150	180
13	96	250	-	-	20	130
14	95.6	150	-	-	160	200
14	95.6	150	-	-	-	10
15	95.6	200	-	-	150	250
22	95.71	140	-	-	180	190
23	95.9	150	-	-	90	130
26	96.15	200	-	-	110	160
27	96.57	150	-	-	150	190
28	96.77	250	-	-	120	160
29	96.87	240	-	-	160	260

Low Point ID	Top of Grate (m)	Maximum Static Depth	1:2 year Depth (mm)	1:5 year Depth (mm)	1:100 year Depth (mm)	Climate Change Depth (mm)
30	97.07	130	-	-	-	-
31	97.22	130	-	-	-	50
32	97.02	200	-	-	160	210
33	97.17	130	-	-	-	50
34	97.07	220	-	-	60	100
36	97.25	300	-	-	150	200
36	97.3	200	-	-	-	30

The simulation results compiled in Table 4-8 shows that:

- No ponding nor dynamic flow will occur in the 1:2-year or 1:5 year events within the site; and,
- Maximum ponding depth of 210 mm during the 1:100-year event;
- In the climate change event, the peak ponding depth is below 350mm

4.7.2 Major System Flow

The major system overland flow route simulation results for the 3-hour Chicago storm are summarized in Table 4-11 showing the values for Velocity x Depth design criteria where overland flow is present. A full list of all locations is included in Appendix E.

Table 4-9: Major System Overland Flow Routes Analysis – Velocity x Depth (3hr Chicago)

J7_LP_ST6_J16	J7	LP_ST6_J16	0	0	0.02	0.02

Cascading flow only occurs through the street network in the events greater than the 1:5 year. In rainfall events where cascading flow does occur the velocity x depth of each of these major overland flow routes are under the allowable maximum of 0.6 m^2/s and meeting design criteria for the events up to the 1:100 year design storm event.

4.7.3 Storm Sewer HGL Analysis

The storm sewer HGL under the ultimate servicing scenario is shown at each of the manhole nodes in Table 4-10. Where there is no Underside of Footing (USF) associated with the manhole a dash is shown in the table.

Table 4-10: HGL Analysis (12-hour SCS Storm)

The simulation results compiled in Table 4-10 shows that:

- All nodes achieve HGLs with 300 mm freeboard to the underside of footing in the 1:100-year event with the smallest freeboard being 300 mm; and,
- All nodes maintain a clearance to the underside of footing in the climate change stress test event.

4.7.4 Storm Sewer HGL Analysis for Existing Arcadia Stages

The storm sewer HGL under the ultimate servicing scenario is shown at each of the existing Arcadia Stages 1 and 2 manhole nodes in Table 4-11. Where there is no Underside of Footing (USF) associated with the manhole, a dash is shown in the table.

Table 4-11: Storm HGL Analysis Arcadia Stage 1 and 2 (12-hour SCS)

MH540	95.11	94.46	94.13	-	0.98
(1) If the HGL in ultimate buildout condition is greater than the HGL of the Stage 1 Interim buildout, then the difference in HGL levels is provided.					

The simulation results compiled in Table 4-12 shows that:

- The HGL levels for the ultimate buildout condition are lower than the HGL levels in Arcadia Stages 1 and 2 interim buildout conditions, except in Stage 1 at MH205, MH206, MH207, and MH208.
- A minimum freeboard of 0.3m is provided at all manhole nodes in the existing Arcadia Stages.

The storm sewer HGL under the ultimate servicing scenario is shown at each of the existing Arcadia Stages 3 manhole nodes in Table 4-12. Where there is no Underside of Footing (USF) associated with the manhole, a dash is shown in the table.

Table 4-12: Storm HGL Analysis Arcadia Stage 3 (12-hour SCS)

MH ID	USF (m)	Stage 1 or 2 Interim Buildout HGL (m)	Ultimate Buildout HGL (m)	Difference between Stage 3 & Stage 6 Ultimate HGL (m)(1)	Freeboard
MH100	-	93.65	93.65	-	-

Table 4-12 shows that there is no impact on Donham Lane HGLs from the Stage 6 development.

4.7.5 System Release Rates and Downstream HGLs

The allowable release rates for the system to Donum Lane and Country Glen Road were identified in Section 4.3. The results of the modelling for the 1:100-year event for the three storm distributions are shown in Table 4-13

Table 4-13: System Release Rates Comparison

Event	Stage 6 to Donum Lane (m^3/s)	Allowable to Donum Lane (m^3/s)	Stage 6 to Country Glen Road (m^3/s)	Allowable Release Rate to Country Glen Road (m^3/s)
3-hour Chicago	0.563	0.567	0.640	0.640
12-hour SCS	0.500	0.567	0.616	0.640
24-hour SCS	0.497	0.567	0.603	0.640

Table 4-13 shows that the system meets the allowable release rate in each of the storm distributions for events up to the 1:100-year event. Since the allowable release rates are achieved the operations of the Paine Pond and Campeau Drive SWMF will be maintained as per the Design Briefs for the facilities and there will be no impact on the downstream Carp River.

4.8 Summary and Conclusions

The stormwater servicing and management concept is proposed to provide stormwater servicing for Arcadia Stage 6, as shown on the Servicing Plan (Drawing S1 and S2).

5.0 Erosion and Sedimentation Control

Erosion and sediment control measures, as outlined in the Ontario Ministry of Natural Resources (MNR) Guidelines on Erosion and Sediment Control for Urban Construction Sites, will be implemented to trap sediment on site. The following erosion and sediment control measures can be implemented during construction as shown on the Erosion and Sediment Control Plan (Drawing ESC):

- Supply and installation of a silt fence barrier, as per OPSD 219.110.
- Supply and installation of siltsack or sentinel CB inserts between the frame and cover of catch basins and maintenance holes adjacent to the project area during construction, to prevent sediment from entering the sewer system.
- Stockpiling of material during construction is to be located along flat areas away from drainage paths. For material placed on sloped areas, stockpiles are to be enclosed with a silt fence to protect watercourses.
- All catch basins are to be equipped with sumps, inspected frequently, and cleaned as required.
- Temporary ICDs are to be placed blocking part of the sewer pipe in the connecting storm maintenance holes to eliminate construction debris from entering the existing storm sewer system. The ICDs are to be removed after the proposed storm sewers have been fully cleaned.
- A mud mat is to be built at each of the site entranceways to prevent the transport of sediment onto paved surfaces. The mud mat shall be:
  - Minimum of 20 m in length for the full width of the entrance way (10 m wide minimum).
  - Minimum of 400 mm thick underlain with a geotextile (or graded aggregate filter); and
  - Constructed with 50 mm diameter clear stone for the first 10 m (extending from the paved street) and the remainder of the length with 150 mm diameter clear stone.

The proposed removal and reinstatement measures as well as the erosion control measures shall conform to the following documents:

- "Guidelines on Erosion and Sediment Control for Urban Construction Sites" published by Ontario Ministries of Natural Resources, Environment, Municipal Affairs, and Transportation & Communication, Association of Construction Authorities of Ontario and Urban Development Institute, Ontario, May 1987.
- "MTO Drainage Manual", Chapter F: "Erosion of Materials and Sediment Control", Ministry of Transportation & Communications, 1985.
- "Erosion and Sediment Control" Training Manual by Ministry of Environment, Spring 1998.
- Applicable Regulations and Guidelines of the Ministry of Natural Resources.

6.0 CONCLUSIONS

Servicing of Minto's Arcadia Stage 6 development, as depicted on the detailed design drawings, has been accounted for in previous studies completed for the subject area. In General, the lands will be serviced as follows:

- Water servicing will be provided by connections to existing watermains on Country Glen Way and Donum Lane, and to the existing feedermain located on Campeau Drive.

- Wastewater servicing will be provided by a local sanitary sewer system that will outlet to existing sanitary sewers on Campeau Drive.

- Storm servicing is to be provided on-site by means of local sewers that outlet to the existing storm sewers on Donum Land and Country Glen way.

- Flows in excess of the prescribed allowable peak flow are to be detained by means of on-site storage methods; either above ground or underground or a combination of both.

This report has been prepared by J.L. Richards & Associates Limited for Minto Communities Inc.'s exclusive use. Its discussions and conclusions are summary in nature and cannot properly be used, interpreted or extended to other purposes without a detailed understanding and discussions with the client as to its mandated purpose, scope and limitations. This report is based on information, drawings, data, or reports provided by the named client, its agents, and certain other suppliers or third parties, as applicable, and relies upon the accuracy and completeness of such information. Any inaccuracy or omissions in information provided, or changes to applications, designs, or materials may have a significant impact on the accuracy, reliability, findings, or conclusions of this report.

Mike Giampa – Project Manager (Transportation), City of Ottawa
Matthew Hayley – Planner (Environmental), City of Ottawa

APPLICANT COMMENTS:

1. Two separate developments are proposed:

    a. Stage 5 will be a Plan of Subdivision application and a Zoning By-law Amendment application:

        - Stage 5 is located east of Arcadia Stages 1-4; it is the last piece north of Campeau Drive;
        - Existing infrastructure extends to the boundaries of the site and two accesses off of Winterset Road are proposed;
        - A total of 225 low-rise units are proposed in the form of singles, townhouses and back-to-back townhouses; and,

- The site is designated as General Urban Area in the Official Plan; the Carp River Restoration Policy Area Overlay applies; and the site is zoned Development Reserve (DR).

b. Stage 6 will be a Site Plan Control application and a Zoning By-law Amendment application:

- Stage 6 lands are located south of Campeau Drive, the parcel closest to the intersection of Huntmar Drive and Campeau Drive was sold by Minto to a hotel developer;
- The site is designated as Mixed-Use Centre in the Official Plan, the Kanata West Concept Plan identifies this area as a community core, and the site is zoned Development Reserve;
- Land dedications have been made for the proposed future Campeau Station LRT Station;
- Two accesses, one off of Campeau Drive is proposed and one off of Country Glen Way, are proposed;
- Infrastructure connections are proposed to be made from Country Glen Way and Donum Lane;
- A total of 480 units are proposed in the form of stacked townhouses (please note that the submitted plans reference a higher unit count); and,
- 2 communal amenity spaces are proposed.

2. The separate applications for both developments are expected to be submitted in September 2021 (Stage 5) and October 2021 (Stage 6).

STAFF COMMENTS:

Planning

Stage 5

1. A Major Zoning By-law Amendment application will be required for the Stage 5 lands to permit the proposed development. Urban Exception 1932 can removed through this application as the Holding Symbol has now been lifted.
2. A new Plan of Subdivision application will be required to permit the proposed development, as Stage was not included in the previous draft approval.
3. Please note that there is a 30cm reserve along Winterset Road that will need to be lifted.
4. Staff are generally satisfied with the current layout.

5. Please consider adding another pedestrian connection between Street 1 and 6; please consider providing a pedestrian plan with the application submissions.
6. Please submit a streetscape plan with your application. The location of trees and sidewalks should be considered early in the design process.

Stage 6

7. A Major Zoning By-law Amendment application will be required to permit the proposed development on the Stage 6 lands.
8. The Phase 6 lands previously received draft approval through a previous plan of subdivision application (File No. D07-16-16-0025).
9. It is understood that the applicant currently intends to allow the draft approval to lapse and pursue Site Plan Control and Plan of Condominium applications to permit the proposed development.
    a. The proposed development requires a Complex (Manager Approval, Public Consultation) Site Plan Control Application.
10. Please note that there are 30cm reserves along Country Glen Way, Campeau, and Donum Lane.
11. It is understood that the applicant is interested in straightening the jagged section of the Country Glen Way right-of-way. Staff have reach out to the City's Corporate Real Estate Office (CREO) to discuss the possibility of a land swap, and will provide more information once a response is received.
12. Please ensure that adequate bicycle parking is provided both in and outside the proposed storage building.
13. Please review the City's Urban Design Guidelines for Transit Oriented Development to ensure that proposed development conforms to the guidelines

General

14. Fees and forms for the above mentioned applications can be found here; please note that each planning application fee will be reduced by 10 per cent if two or more applications are submitted at the same time and for the same lands.
15. Please ensure that each submission considers the Official Plan policies that are applicable at the time of the submission of the application
    a. If a complete application is received by no later than the day before the new Official Plan is adopted (October 2021), it will be processed on the basis of existing Official Plan policy provided it is consistent with the 2020 Provincial Policy Statement.

b. Applications received after the day before the new Official Plan is adopted (October 2021), will be reviewed and evaluated on the basis of the policies of the new Official Plan, which is consistent with the 2020 Provincial Policy Statement.

Please contact the Planner, Colette Gorni, at Colette.Gorni@ottawa.ca if you have any questions or require additional information relating to the comments above.

Urban Design

Stage 5

1. A design brief is required. A terms of reference is attached.
2. Please ensure the pathway connections to the Carp River Open Space Lands are accessible. This may require co-locating the two blocks in the vicinity of Lot 25 and Block 8 to provide additional length for these blocks.
3. Please consider locations for sidewalks and trees at the time of submission, as it relates to utilities and clay soils.
4. Orientation of units to minimize the need for noise walls on Winterset Road should be considered.
5. A pathway connection should be provided within Block 43 – Dry Pond to provide access to Winterset Road.

Stage 6

6. A design brief is required. A terms of reference is attached.
7. The subject lands are located within a design priority area. A high-quality site and building design are expected, suitable for a mixed use centre.
8. Consideration should be given to providing more than one product/dwelling type for this site.
9. Options to eliminate the need for a single loaded private street abutting Campeau Drive should be explored.
10. The current access on Campeau should be considered for a more urban treatment vs. a pork chop island.
11. The units abutting Campeau Drive in the Western Block, should be oriented to be in alignment with Campeau Drive vs. being offset.
12. The treatment of built form abutting Country Glen Way should be reviewed. Opportunities to regularize this property line should also be explored if possible.
13. Connectivity to the MUP along Feedmill Creek should be strengthened at key locations.

14. Consideration should be given to allowing for live/work arrangements at grade.

15. Consideration should be given to allowing for a mix of uses on-site.

Please contact Urban Design Planner Mark Young at Mark.Young@ottawa.ca if you have any questions or require additional information relating to the comments above.

Engineering

1. The Servicing Study Guidelines for Development Applications are available at the following address: http://ottawa.ca/en/development-application-review-process-0/servicing-study-guidelines-development-applications

2. Servicing and site works shall be in accordance with the following documents:

   - ⇨ Ottawa Sewer Design Guidelines (October 2012)
   - ⇨ Ottawa Design Guidelines – Water Distribution (2010)
   - ⇨ Geotechnical Investigation and Reporting Guidelines for Development Applications in the City of Ottawa (2007)
   - ⇨ City of Ottawa Slope Stability Guidelines for Development Applications (revised 2012)
   - ⇨ City of Ottawa Environmental Noise Control Guidelines (January, 2016)
   - ⇨ City of Ottawa Park and Pathway Development Manual (2012)
   - ⇨ City of Ottawa Accessibility Design Standards (2012)
   - ⇨ Ottawa Standard Tender Documents (latest version)
   - ⇨ Ontario Provincial Standards for Roads & Public Works (2013)

3. Record drawings and utility plans are also available for purchase from the City (Contact the City's Information Centre by email at InformationCentre@ottawa.ca or by phone at (613) 580-2424 x.44455).

4. The Stormwater Management Criteria, for the subject site, is to be based on the criteria outlined in the KWMSS. Understanding that deviations have been made to the KWMSS in previous phases and that Phases 5 & 6 are the final two phases in the Arcadia subdivision area, and that infrastructure and stormwater management facilities surrounding the sites have been constructed as part of previous phases of development, it will be important to demonstrate that the surrounding infrastructure has been designed with enough capacity to support the proposed developments.

Deviations from previous design assumption shall be justified in the plans and reports.

5. As was mentioned in the pre-consultation meeting, Phases 5 & 6 are the final two phases in the Arcadia subdivision area, and the surrounding infrastructure intended to provide servicing for Phases 5 & 6 has been constructed as part of previous Phases. The plans and reports that are to be submitted in support of Phase 5 & 6 will need to demonstrate that the surrounding/downstream infrastructure has been designed with enough capacity to support the proposed developments and that any works required by the KWMSS to support the proposed developments have been completed. Any deviations within Phase 5 & 6 from previous design assumptions will need to be clearly justified.

6. Preference for servicing of Phase 5 would be entirely internal to Phase 5 (i.e., individual building service connections to Winterset to be avoided) in order to eliminate any potential service disruptions to existing residents.

7. Water Boundary condition requests must include the location of the service and the expected loads required by the proposed development. Please provide the following information:

    i. Location of service

    ii. Type of development and the amount of fire flow required (as per FUS, 1999).

    iii. Average daily demand: ___ l/s.

    iv. Maximum daily demand: ___l/s.

    v. Maximum hourly daily demand: ___ l/s.

8. As mentioned in the pre-consultation meeting, soil and geotechnical conditions are of potential concern for these sites. Sufficient justification should be provided to support the feasibility of Phase 5 and 6 proposals from a geotechnical perspective. For these proposals, where sensitive marine clays exist, the following information must be provided to the City:

    - A map that shows:

        i. Location and depth of sensitive soils

        ii. Location of utilities

iii. Location of proposed landscaping

9. MOECC ECA Requirements

   It is anticipated that an MECP Environmental Compliance Approval(s) (ECA) will be needed (or existing will need to be amended) for sewers as well as for any deviation from previous ECA approvals.

10. Phase 1 ESAs and Phase 2 ESAs must conform to clause 4.8.4 of the Official Plan that requires that development applications conform to Ontario Regulation 153/04.

Please contact Infrastructure Project Manager Justin Armstrong at Justin.Armstrong@ottawa.ca if you have any questions or require additional information relating to the comments above.

Transportation

1. A TIA is warranted- proceed to scoping.
2. The application will not be deemed complete until the submission of the draft step 1-4, including the functional draft RMA package (if applicable) and/or monitoring report (if applicable). Although a full review of the TIA Strategy report (Step 4) is not required prior to an application, it is strongly recommended.
3. Synchro files are required with Step 4.
4. ROW protection on Campeau is 37.5m.
5. Geometric Road Design (GRD) drawings will be required with the first submission of underground infrastructure and grading drawings.
6. These drawings should include such items as, but is not limited to:
   a. Road Signage and Pavement Marking for the subdivision;
   b. Intersection control measure at new internal intersections; and
   c. Location of depressed curbs and TWSIs;
   d. Include traffic calming measures on roads within the limits of their subdivision to limit vehicular speed to 30 kph and improve pedestrian safety. These measures may include either vertical or horizontal features.
7. Site triangles at the following locations on the final plan will be required:
   a. Local Road to Local Road: 3 metre x 3 metres
   b. Local Road to Collector Road: 5 metre x 5 metres
   c. Collector Road to Collector Road: 5 metre x 5 metres

d. Collector Road to Arterial Road: 5 metre x 5 metres

8. A Road Noise Impact Study is required.

9. Please note that all new applications (pre-consultation meetings dated after March 3, 2021) must use the NEW TRANS Trip Generation Manual when forecasting site generated trips using this manual. The TRANS committee (a joint transportation planning committee serving the National Capital region) finalized a new manual early in March 2021. The document will be available in French and English on the TRANS website http://www.ncr-trans-rcn.ca/surveys/2009-trip-generation. The new manual has simplified the conversion from vehicle trips to person trips and then trips by modal share.

10. Any Development Charge road work may be front ended by the applicant, so long as the work is listed in the affordable network. Repayment will be based on warrants, as determined solely by the Transportation Services Department. A Front Ending application is required.

Please contact Transportation Project Manager Mike Giampa at Mike.Giampa@ottawa.ca if you have any questions or require additional information relating to the comments above.

Parks

1. Staff understand that the applicant intends to provide cash-in-lieu rather than dedicate land for parkland for both Stages 5 and 6.

2. Please confirm lands that are to be dedicated to the City (e.g., corner park blocks, dry ponds, open space blocks, etc.) in each application..

3. Please provide more information on pedestrian pathways to the adjacent park and open space blocks for Stage 5.

4. Please reach out to Councillor Sudds to discuss the cash-in-lieu of parkland proposal.

Please contact Parks Planner Mike Russett at Mike.Russett@ottawa.ca if you have any questions or require additional information relating to the comments above.

Environment

1. Up-dated EIS, should focus on the transition from the developed lands to the natural area/watercourse blocks.

2. Implementing all recommendations from older EIS if still applicable.

Please contact Environmental Planner Matthew Hayley at Matthew.Hayley@ottawa.ca if you have any questions or require additional information relating to the comments above.

Forestry

TCR requirements:

1. A Tree Conservation Report (TCR) must be supplied for review along with the suite of other plans/reports required by the City
    a. An approved TCR is a requirement of Site Plan approval.
    b. The TCR may be combined with eh LP provided all information is supplied
2. As of January 1 2021, any removal of privately-owned trees 10cm or larger in diameter, or publicly (City) owned trees of any diameter requires a tree permit issued under the Tree Protection Bylaw (Bylaw 2020 – 340); the permit will be based on an approved TCR and made available at or near plan approval.
3. The Planning Forester from Planning and Growth Management as well as foresters from Forestry Services will review the submitted TCR
    a. If tree removal is required, both municipal and privately-owned trees will be addressed in a single permit issued through the Planning Forester
    b. Compensation may be required for city owned trees – if so, it will need to be paid prior to the release of the tree permit
4. The TCR must list all trees on site, as well as off-site trees if the CRZ extends into the developed area, by species, diameter and health condition
5. Please identify trees by ownership – private onsite, private on adjoining site, city owned, co-owned (trees on a property line)
6. the TCR must list all trees on adjacent sites if they have a critical root zone that extends onto the development site
7. If trees are to be removed, the TCR must clearly show where they are, and document the reason they cannot be retained
8. All retained trees must be shown and all retained trees within the area impacted by the development process must be protected as per City guidelines available at Tree Protection Specification or by searching Ottawa.ca
        a. The location of tree protection fencing must be shown on a plan;
        b. Show the critical root zone of the retained trees; and,
        c. If excavation will occur within the critical root zone, please show the limits of excavation .

9. The City encourages the retention of healthy trees; if possible, please seek opportunities for retention of trees that will contribute to the design/function of the site.

For more information on the process or help with tree retention options, contact Mark Richardson mark.richardson@ottawa.ca or on City of Ottawa

Landscape Plan Tree Planting requirements:

10. Minimum Setbacks

    a. Maintain 1.5m from sidewalk or MUP/cycle track.

    b. Maintain 2.5m from curb

    c. Coniferous species require a minimum 4.5m setback from curb, sidewalk or MUP/cycle track/pathway.

    d. Maintain 7.5m between large growing trees, and 4m between small growing trees. Park or open space planting should consider 10m spacing.

    e. Adhere to Ottawa Hydro's planting guidelines (species and setbacks) when planting around overhead primary conductors.

11. Tree specifications

    a. Minimum stock size: 50mm tree caliper for deciduous, 200cm height for coniferous.

    b. Maximize the use of large deciduous species wherever possible to maximize future canopy coverage

    c. Tree planting on city property shall be in accordance with the City of Ottawa's Tree Planting Specification; and include watering and warranty as described in the specification (can be provided by Forestry Services).

    d. Plant native trees whenever possible

    e. No root barriers, dead-man anchor systems, or planters are permitted.

    f. No tree stakes unless necessary (and only 1 on the prevailing winds side of the tree)

12. Hard surface planting

    a. Curb style planter is highly recommended

    b. No grates are to be used and if guards are required, City of Ottawa standard (which can be provided) shall be used.

c. Trees are to be planted at grade

13. Soil Volume

a. Please ensure adequate soil volumes are met:

Tree Type/Size	Single Tree Soil Volume (m3)	Multiple Tree Soil Volume (m3/tree)
Ornamental	15	9
Columnar	15	9
Small	20	12
Medium	25	15
Large	30	18
Conifer	25	15

**Please note that these soil volumes are not applicable in cases with Sensitive Marine Clay.

14. Sensitive Marine Clay

a. Please follow the City's 2017 Tree Planting in Sensitive Marine Clay guidelines.

Please contact Adam Palmer at adam.palmer@Ottawa.ca if you have any questions or require additional information relating to the landscape plan tree planting requirements.

MVCA

1. MVCA staff have recently reviewed permit applications and related documents required as part of the Lifting of a Holding Symbol application for the Stage 5 lands.
2. Please ensure that the Campeau pond setbacks and LRT alignment are considered as the site designs for both applications are further refined.
3. Please note that the MVCA will be conducting a floodplain mapping update by the end of the year.
4. Please refer to MVCA comments provided for previous stages of the Arcadia subdivision.

Please contact the MVCA's Planning Manager, Matt Craig, at MCraig@mvc.on.ca if you have any questions or require additional information relating to the comments above.

NEXT STEPS:

Please refer to the links to Guide to preparing studies and plans and fees for further information. Additional information is available related to building permits, development charges, and the Accessibility Design Standards. Be aware that other fees and permits may be required, outside of the development review process. You may obtain background drawings by contacting informationcentre@ottawa.ca.

These pre-con comments are valid for one year. If you submit a development application(s) after this time, you may be required to meet for another pre-consultation meeting and/or the submission requirements may change. You are as well encouraged to contact us for a follow-up meeting if the plan/concept will be further refined.

Please do not hesitate to Colette Gorni, at Colette.Gorni@ottawa.ca, if you have any questions.

Plan Number ____________________

DRAWING NOTES

1.0 GENERAL

1.1 CONTRACTOR TO VERIFY ALL DIMENSIONS PRIOR TO CONSTRUCTION.

1.2 DO NOT SCALE DRAWINGS.

1.3 CONTRACTOR TO REPORT ALL DISCOVERIES OF ERRORS, OMISSIONS OR DISCREPANCIES TO THE ARCHITECT OR DESIGN ENGINEER AS APPLICABLE.

1.4 USE ONLY THE LATEST REVISED DRAWINGS OR THOSE THAT ARE MARKED "ISSUED FOR CONSTRUCTION".

1.5 ALL CONSTRUCTION SHALL COMPLY WITH CURRENT CITY OF OTTAWA STANDARDS AND SPECIFICATIONS.

1.6 THIS DRAWING SHALL BE READ IN CONJUNCTION WITH ALL RELEVANT DRAWINGS AND SPECIFICATIONS.

1.7 FOR LEGAL SURVEY INFORMATION REFER TO REGISTERED PLAN.

1.8 REFER TO SITE PLAN BY PELLOW + ASSOCIATES ARCHITECTS INC.FOR SITE PLAN LAYOUT.

1.9 REFER TO LANDSCAPE ARCHITECTURAL DRAWINGS FOR SURFACE FEATURES DETAILS.

1.10 CONTRACTOR TO IMPLEMENT EROSION AND SEDIMENT CONTROL MEASURES AS IDENTIFIED IN THE EROSION AND SEDIMENT CONTROL PLAN TO THE SATISFACTION OF THE CITY OF OTTAWA, PRIOR TO UNDERTAKING ANY SITE ALTERATIONS (FILLING, GRADING, REMOVAL OF VEGETATION, ETC.). DURING ALL PHASES OF THE SITE PREPARATION AND CONSTRUCTION THE MEASURES ARE TO BE MAINTAINED TO THE SATISFACTION OF THE ENGINEER AND CITY OF OTTAWA IN ACCORDANCE WITH THE BEST MANAGEMENT PRACTICES FOR EROSION AND SEDIMENT CONTROL. SHOULD ANY ADDITIONAL MEASURES BE REQUIRED TO ADDRESS FIELD CONDITIONS THEY SHALL BE INSTALLED AS DIRECTED BY THE ENGINEER OR THE CITY OF OTTAWA. SUCH ADDITIONAL MEASURES MAY INCLUDE BUT NOT BE LIMITED TO INSTALLATION OF FILTER CLOTHS ACROSS MANHOLE AND CATCHBASIN LIDS TO PREVENT SEDIMENT FROM ENTERING THE STRUCTURE AND INSTALLATION AND MAINTENANCE OF A LIGHT DUTY SILT FENCE BARRIER AS REQUIRED.

1.11 ALL IRON WORK ELEVATIONS SHOWN ARE APPROXIMATE AND ARE SUBJECT TO MINOR ADJUSTMENTS AS DETERMINED BY THE ENGINEER.

1.12 ALL CONCRETE CURBS AND SIDEWALKS TO CONFORM TO O.P.S. AND CONSTRUCTED TO CITY STANDARDS. ALL ONSITE CURBS TO BE BARRIER TYPE, WITH DEPRESSIONS AS NOTED.

1.13 ALL CONCRETE SHALL BE "NORMAL PORTLAND CEMENT" IN ACCORDANCE WITH O.P.S.S. 1350 AND SHALL ACHIEVE A MINIMUM STRENGTH OF 30MPa AT 28 DAYS.

1.14 ALL CONSTRUCTION TRAFFIC TO ACCESS SITE FROM CAMPEAU DRIVE.

1.15 FOR DETAILS OF TEST PITS SEE GEOTECHNICAL REPORT.

1.16 CONTRACTOR TO PROTECT EXISTING INFRASTRUCTURE AND PROPERTY SUCH AS TREES, PARKING METERS, SIDEWALKS, CURBS, ASPHALT, AND STREET SIGNS FROM DAMAGE DURING CONSTRUCTION. CONTRACTOR TO PAY THE COST TO REINSTATE OR REPLACE ANY DAMAGED INFRASTRUCTURE OR PROPERTY TO THE SATISFACTION OF THE CITY.

1.17 THE POSITION OF POLE LINES, CONDUITS, WATERMAIN, SEWERS, AND OTHER UNDERGROUND AND ABOVEGROUND UTILITIES AND STRUCTURES ARE NOT NECESSARILY SHOWN ON THE CONTRACT DRAWINGS, AND WHERE SHOWN, THE ACCURACY OF THE POSITION OF SUCH UTILITIES AND STRUCTURES IS NOT GUARANTEED. BEFORE STARTING WORK THE CONTRACTOR SHALL INFORM ITSELF OF THE EXACT LOCATION OF ALL SUCH UTILITIES AND STRUCTURES, SHALL PROTECT ALL UTILITIES AND STRUCTURES, AND SHALL ASSUME ALL LIABILITY FOR DAMAGE TO THEM.

1.18 CONTRACTOR TO SUPPLY SUITABLE FILL MATERIAL WHERE REQUIRED TO ROUGH GRADE THE SITE. ALL IMPORTED FILL MATERIAL TO BE CERTIFIED AS ACCEPTABLE BY THE GEOTECHNICAL ENGINEER.

1.19 CONTRACTOR TO HAUL EXCESS MATERIAL OFFSITE AS NECESSARY TO GRADE SITE TO MEET THE PROPOSED GRADES. ALL EXCESS MATERIAL TO BE HAULED OFFSITE AND DISPOSED OF AT AN APPROVED DUMP SITE. SHOULD THE CONTRACTOR DISCOVER ANY HAZARDOUS MATERIAL, CONTRACTOR IS TO NOTIFY ENGINEER. ENGINEER TO DETERMINE APPROPRIATE DISPOSAL METHOD/LOCATION.

1.20 FILL MATERIAL WITHIN THE PARKING LOT AND BUILDING PAD AREAS, AND SUPPORTING BUILDING FOUNDATIONS SHALL BE COMPACTED TO 98% STANDARD MODIFIED PROCTOR DENSITY AND TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER.

1.21 ALL COMPACTION METHODS TO BE PERFORMED TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER TO INCLUDE BUT NOT BE LIMITED TO THE THICKNESS OF LIFTS, AND COMPACTION EQUIPMENT USED.

1.22 ALL DISTURBED BOULEVARDS TO BE REINSTATED WITH SOD ON 100mm TOPSOIL.

1.23 UTILITY DUCTS TO BE INSTALLED PRIOR TO ROAD BASE CONSTRUCTION.

1.24 CLAY DIKES TO BE INSTALLED WHERE INDICATED ON THE DRAWINGS OR AS APPROVED AND DIRECTED BY THE GEOTECHNICAL ENGINEER ALL IN ACCORDANCE WITH CITY OF OTTAWA STANDARDS AND SPECIFICATIONS.

1.25 ALL PIPE BEDDING TO BE OPSS GRANULAR 'A' PLACED A MINIMUM OF 300mm BELOW SEWER AND WATER PIPES AND COMPACTED TO SPRING LINE. BEDDING AND COVER MATERIAL AS PER RECOMMENDATIONS FROM GEOTECHNICAL ENGINEER.

2.0 SANITARY

2.1 ALL SANITARY SEWER MAINS TO BE CSA CERTIFIED, BELL AND SPIGOT TYPE. ONLY FACTORY FITTINGS TO BE USED. SEWER TO BE INSTALLED AS PER OSPD 1005.01. SANITARY SEWER MATERIALS TO BE:
250mmØ AND SMALLER - PVC DR 28
300mmØ AND LARGER - CONC. CL. 140-D

2.2 ALL SANITARY MAINTENANCE HOLES TO BE 1.2m DIAMETER AS PER CITY OF OTTAWA STANDARDS COMPLETE WITH BENCHING, RUNGS, FRAME AND COVER, DROP PIPES AND LANDINGS WHERE NEEDED.

2.3 SANITARY MANHOLE COVERS TO BE CITY OF OTTAWA STD. S25 (MOD. OPSD. 401.020). SANITARY MANHOLE COVER TO BE CLOSED COVER TYPE, AS PER CITY STANDARD S24.

2.4 SANITARY SEWER LEAKAGE TEST AND CCTV INSPECTION SHALL BE COMPLETED AS PER CITY SPECIFICATIONS PRIOR TO INSTALLATION OF BASE COURSE ASPHALT.

2.5 ANY SANITARY SEWER WITH LESS THAN 2.0m COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

2.6 CONNECTION TO THE EXISTING SANITARY SEWER TO BE INCLUDED IN THE COST FOR SANITARY SEWER INSTALLATION. THIS INCLUDES REINSTATEMENT OF ROAD CUTS TO CITY STANDARDS.

3.0 STORM

3.1 ALL STORM SEWERS TO BE CSA CERTIFIED, BELL AND SPIGOT TYPE. ALL STORM SEWERS TO BE INSTALLED PER MANUFACTURER'S INSTRUCTIONS. ONLY FACTORY FITTINGS TO BE USED. STORM SEWER MATERIALS TO BE : 375mmØ AND SMALLER - PVC DR 35
450mmØ AND LARGER - CONC. CL. 100-D

3.2 ALL STORM MAINTENANCE HOLES TO BE SIZED IN ACCORDANCE WITH THE PLANS AND AS PER CITY OF OTTAWA STANDARDS COMPLETE WITH BENCHING, RUNGS, AND FRAME AND COVER.

3.3 STORM MH COVERS TO BE OPEN TYPE, AS PER CITY STANDARD S24, FRAMES TO BE PER CITY OF OTTAWA STD. S25.. CONTRACTOR TO INSTALL FILTER FABRIC UNDER STORM MH COVER UNTIL SODDING IS COMPLETE.

3.4 STORM MAINTENANCE HOLES AND CBMH'S TO BE OPSD, SIZE AS SPECIFIED, TAPER TOP FOR MH AND FLAT TOP FOR CBMH, UNLESS OTHERWISE NOTED.

3.5 ALL CATCH BASINS TO BE AS PER OPSD 705.010, FRAME & FISH TYPE GRATE AS PER CITY OF OTTAWA STD. S19.1, ALL CB LEAD PIPES TO BE 250mm DIAMETER PVC DR 35 @ 1.00% SLOPE WITH OUTLET INVERT AT 1.45m BELOW TOP OF GRATE, UNLESS OTHERWISE NOTED.

3.6 150mm DIAMETER SOCK-WRAPPED PERFORATED PVC SUBDRAINS TO BE INSTALLED AT ALL CB'S, EXTEND 3.0m FROM 4 SIDES OF CB. WHERE CB IS ADJACENT TO CURB EXTEND SUBDRAIN 3.0m IN EACH DIRECTION ALONG CURB.

3.7 ANY STORM SEWER WITH LESS THAN 2.0m COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

3.8 CONNECTION TO THE EXISTING STORM SEWER TO BE INCLUDED IN THE COST FOR STORM SEWER INSTALLATION. THIS INCLUDES REINSTATEMENT OF ROAD CUT TO CITY STANDARDS.

3.9 CONTRACTOR TO PROVIDE IPEX-TEMPEST ICD'S (OR EQUIVALENT)SHOP DRAWINGS BASED ON HEAD AND FLOW RATE SPECIFIED IN CB DATA TABLE, FOR ENGINEERS REVIEW PRIOR TO ORDERING ICD'S.

3.10 CONTRACTOR TO PROVIDE TRITON M-6 STORAGE CELL (OR EQUIVALENT) SHOP DRAWING BASED ON VOLUME SPECIFIED FOR ENGINEERS APPROVAL PRIOR TO ORDERING MATERIAL.

4.0 WATER

4.1 ALL WATERMAINS TO BE PVC DR 18, WITH MINIMUM COVER OF 2.4m AND INSTALLED PER CITY OF OTTAWA STANDARDS. ALL DOMESTIC WATER SERVICES ARE TO BE 200mmØ.

4.2 THRUST BLOCKS TO BE INSTALLED AT ALL BENDS, TEES, AND CAPS ALL AS PER OPSD 1103.01 AND 1103.02.

4.3 CONTRACTOR TO CONDUCT PRESSURE AND LEAKAGE TESTING OF ALL WATERMAINS AND DISINFECT AND CHLORINATE ALL WATERMAINS TO THE SATISFACTION OF M.O.E. AND THE CITY OF OTTAWA.

4.4 TRACER WIRE TO BE INSTALLED ALONG THE FULL LENGTH OF WATERMAIN AND ATTACHED TO EACH MAIN STOP AS PER CITY OF OTTAWA STANDARDS.

4.5 ALL COMPONENTS OF THE WATER DISTRIBUTION SYSTEM SHALL BE CATHODICALLY PROTECTED AS PER CITY OF OTTAWA STANDARDS.

4.6 ALL VALVES & VALVE BOXES AND CHAMBERS, HYDRANTS, AND HYDRANT VALVES AND ASSEMBLIES SHALL BE INSTALLED AS PER CITY OF OTTAWA STANDARDS.

4.7 ANY WATERMAIN WITH LESS THAN 2.4m COVER REQUIRES THERMAL INSULATION AS PER CITY OF OTTAWA STANDARD W22, OR AS APPROVED BY THE ENGINEER.

4.8 CONTRACTOR IS RESPONSIBLE FOR ACQUIRING THE WATER PERMIT FROM THE CITY OF OTTAWA AND PAYMENT OF ANY FEES ASSOCIATED WITH SECURING THE WATER PERMIT. OWNER IS RESPONSIBLE FOR REIMBURSING THE CONTRACTOR FOR THE ACTUAL COST OF ACQUIRING THE WATER PERMIT.

4.9 CONNECTION TO EXISTING WATERMAIN TO BE INCLUDED IN THE COST FOR THE WATERMAIN INSTALLATION. THIS COST INCLUDES REINSTATEMENT OF ROAD CUTS TO CITY STANDARDS.

5.0 PARKING LOT AND WORK IN PUBLIC RIGHTS OF WAY

5.1 CONTRACTOR TO REINSTATE ROAD CUTS PER CITY OF OTTAWA STANDARD R-10.

5.2 THE CONTRACTOR SHALL PREPARE A TRAFFIC MANAGEMENT PLAN FOR REVIEW AND APPROVAL BY THE CITY OF OTTAWA. CONTRACTOR TO MAINTAIN TRAFFIC FLOW DURING THE ENTIRE CONSTRUCTION PERIOD. MAINTENANCE OF ROAD CUTS SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. PROVISION OF FLAGMEN, DETOURS AS NECESSARY, BARRICADES AND SIGNS TO THE FULL SATISFACTION OF THE ENGINEER AND ROAD AUTHORITY SHALL BE THE CONTRACTOR'S RESPONSIBILITY.

5.3 CONTRACTOR TO PREPARE SUBGRADE, INCLUDING PROOFROLLING, TO THE SATISFACTION OF THE GEOTECHNICAL ENGINEER PRIOR TO THE COMMENCEMENT OF PLACEMENT OF GRANULAR B MATERIAL.

5.4 FILL TO BE PLACED AND COMPACTED PER THE GEOTECHNICAL REPORT REQUIREMENTS.

5.5 CONTRACTOR TO SUPPLY, PLACE AND COMPACT GRANULAR B MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOETCHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF GRANULAR B MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE GRADATION REQUIREMENTS SPECIFIED IN THE GEOTECHNICAL REPORT.

5.6 GRANULAR A MATERIAL TO BE PLACED ONLY UPON APPROVAL BY THE GEOTECHNICAL ENGINEER OF GRANULAR B PLACEMENT.

5.7 CONTRACTOR TO SUPPLY, PLACE AND COMPACT GRANULAR A MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOETCHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF GRANULAR A MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE GRADATION REQUIREMENTS SPECIFIED IN THE GEOTECHNICAL REPORT.

5.8 ASPHALT MATERIAL TO BE PLACED ONLY UPON APPROVAL BY THE GEOTECHNICAL ENGINEER OF GRANULAR A PLACEMENT.

5.9 CONTRACTOR TO SUPPLY, PLACE AND COMPACT ASPHALT MATERIAL IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOTECHNICAL ENGINEER. CONTRACTOR TO PROVIDE ENGINEER WITH SAMPLES OF ASPHALT MATERIAL FOR TESTING AND CERTIFICATION FROM THE GEOTECHNICAL ENGINEER THAT THE MATERIAL MEETS THE REQUIREMENTS SPECIFIED IN THE GEOTECHNICAL REPORT.

5.10 CONTRACTOR IS RESPONSIBLE FOR ESTABLISHING LINE AND GRADE IN ACCORDANCE WITH THE PLANS, AND FOR PROVIDING THE ENGINEER WITH VERIFICATION PRIOR TO PLACEMENT.

5.11 ANY DITCHES DISTURBED DURING SERVICING AND GRADING OPERATIONS ARE TO BE REINSTATED TO THEIR ORIGINAL CONDITION AND FLOWLINE GRADES.

5.12 ALL RE GRADED AREAS IN EXISTING PUBLIC RIGHTS OF WAY AND ANY OTHER DISTURBED AREAS IN EXISTING PUBLIC RIGHTS OF WAY ARE TO BE FINISHED WITH SOD ON 100mm TOPSOIL.

5.13 ALL EXCESS MATERIAL TO BE HAULED OFFSITE AND DISPOSED OF AT AN APPROVED DUMP SITE. SHOULD THE CONTRACTOR DISCOVER ANY HAZARDOUS MATERIAL, CONTRACTOR IS TO NOTIFY ENGINEER. ENGINEER TO DETERMINE APPROPRIATE DISPOSAL METHOD/LOCATION.

5.14 PAVEMENT STRUCTURE (MATERIAL TYPES AND THICKNESSES) FOR HEAVY DUTY AND LIGHT DUTY AREAS TO BE AS SPECIFIED IN THE GEOTECHNICAL REPORT AND SHOWN ON THE PLANS.

Servicing Study Checklist

MINTO COMMUNITIES INC. ARCADIA STAGE 6

DEVELOPMENT SERVICING STUDY CHECKLIST

REFERENCED STUDIES AND REPORTS	REFERENCE
Site Servicing Report for Minto Communities Inc., Arcadia Stage 6 (J.L. Richards & Associates Limited, Revision 0 dated July 2022)	SSR
Geotechnical Investigation, Proposed Residential Development – Arcadia Stage 6, Campeau Drive - Ottawa, Ontario" Report Number PG5648-1, Revision 4 dated June 30, 2022	GR

4.1	GENERAL CONTENT	REFERENCE
☐	Executive Summary (for larger reports only).	N/A
☒	Date and revision number of the report.	SSR (Title Page)
☒	Location map and plan showing municipal address, boundary, and layout of proposed development.	SSR (Figure 1-1, Appendix 'A1')
☒	Plan showing the site and location of all existing services.	Site Servicing Plan (S1)
☒	Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.	SSR (Sect. 1.0)
☒	Summary of Pre-consultation Meetings with City and other approval agencies.	SSR (Appendix 'A2')
☒	Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.	SSR (Sect. 1.0)
☒	Statement of objectives and servicing criteria.	SSR (Sect. 2.1, 3.1, 3.2, 4.1, 4.2)
☒	Identification of existing and proposed infrastructure available in the immediate area.	SSR (Sect. 1.4) Site Servicing Plan (S1)
☒	Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	SSR (Sect. 3.1, 4.1)
☒	Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	GR Grading Plans (G1, G2) Ponding Plans (SWM1, SWM2)

☐	Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	N/A
☐	Proposed phasing of the development, if applicable.	N/A
☒	Reference to geotechnical studies and recommendations concerning servicing.	GR
☒	All preliminary and formal site plan submissions should have the following information: ▪ Metric scale ▪ North arrow (including construction North) ▪ Key plan ▪ Name and contact information of applicant and property owner ▪ Property limits, including bearings and dimensions ▪ Existing and proposed structures and parking areas ▪ Easements, road widening and rights-of-way ▪ Adjacent street names	All Drawings

4.2	DEVELOPMENT SERVICING REPORT: WATER	REFERENCE
☒	Confirm consistency with Master Servicing Study, if available.	SSR (Sect. 2)
☒	Availability of public infrastructure to service proposed development.	SSR (Sect. 1.4, 2.4) Site Servicing Plan (S1)
☒	Identification of system constraints.	SSR (Sect. 2.0)
☒	Identify boundary conditions.	SSR (Sect. 2.4)
☒	Confirmation of adequate domestic supply and pressure.	SSR (Sect. 2.5, Appendix B)
☒	Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	SSR (Sect. 2.3, 2.5, Appendix B)
☒	Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	SSR (Sect. 2.5)
☐	Definition of phasing constraints. Hydraulic modelling is required to confirm servicing for all defined phases of the project, including the ultimate design.	N/A
☒	Address reliability requirements, such as appropriate location of shutoff valves.	Site Servicing Plan (S1)
☐	Check on the necessity of a pressure zone boundary modification.	N/A

☒	Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range.	SSR (Sect. 2.0)
☒	Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants), including special metering provisions.	SSR (Sect. 2.0) Site Servicing Plan (S1)
☐	Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	N/A
☒	Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	SSR (Sect. 2.2)
☒	Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	SSR (Appendix B)

4.3	DEVELOPMENT SERVICING REPORT: WASTEWATER	REFERENCE
☒	Summary of proposed design criteria (Note: Wet weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	SSR (Sect. 3.2)
☒	Confirm consistency with Master Servicing Study and/or justifications for deviations.	SSR (Sect. 3)
☐	Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the Guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	N/A
☒	Description of existing sanitary sewer available for discharge of wastewater from proposed development.	SSR (Sect. 1.4, 3.1, Appendix C)
☒	Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable.)	SSR (Sect. 3.3)
☒	Calculations related to dry weather and wet weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	SSR (Appendix C)
☒	Description of proposed sewer network, including sewers, pumping stations and forcemains.	SSR (Sect. 3.4, Appendix C)

☒	Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	GR
☐	Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	N/A
☐	Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	N/A
☒	Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	SSR (Section 3.4)
☐	Special considerations, such as contamination, corrosive environment, etc.	N/A

4.4	DEVELOPMENT SERVICING REPORT: STORMWATER	REFERENCE
☒	Description of drainage outlets and downstream constraints, including legality of outlets (i.e., municipal drain, right-of-way, watercourse, or private property).	SSR (Sect. 1.6, 6.1, 6.2)
☒	Analysis of available capacity in existing public infrastructure.	SSR (Sect. 1.3)
☒	A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.	Drawing DST, ODST
☒	Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected sub watersheds, taking into account long-term cumulative effects.	SSR (Sect. 4.2, 4.3)
☒	Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	SSR (Sect. 4.3)
☒	Description of the stormwater management concept with facility locations and descriptions with references and supporting information.	SSR (Sect. 4, Drawing S1, DST, ODST)
☐	Setback from private sewage disposal systems.	N/A
☐	Watercourse and hazard lands setbacks.	N/A
☒	Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	Appendix A2

☒	Confirm consistency with subwatershed and Master Servicing Study, if applicable study exists.	SSR (Sect. 4)
☒	Storage requirements (complete with calculations) and conveyance capacity for minor events (1:2 year return period) and major events (1:100 year return period).	SSR (Sect. 4, Appendix E)
☐	Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	N/A
☒	Calculate pre- and post-development peak flow rates, including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	SSR (Sect. 4, Appendix E)
☐	Any proposed diversion of drainage catchment areas from one outlet to another.	N/A
☒	Proposed minor and major systems, including locations and sizes of stormwater trunk sewers, and stormwater management facilities.	Site Servicing Plan (S1) Plan and Profile Drawings Ponding Plans Appendix E
☐	If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100-year return period storm event.	N/A
☒	Identification of potential impacts to receiving watercourses.	SSR (Sect 4.3)
☐	Identification of municipal drains and related approval requirements.	N/A
☒	Description of how the conveyance and storage capacity will be achieved for the development.	SSR (Sect. 4.3)
☒	100 year flood levels and major flow routing to protect proposed development from flooding for establishing minimum building elevations (MBE) and overall grading.	SSR (Sect. 4.3) Site Servicing Plan (S1) Ponding Plans (SWM1 & SWM2) Appendix E
☒	Inclusion of hydraulic analysis, including hydraulic grade line elevations.	SSR (Sect. 4.3, Appendix E)
☒	Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	SSR (Sect. 5.0) Erosion & Sediment Control Plan (ESC)
☐	Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	N/A
☒	Identification of fill constraints related to floodplain and geotechnical investigation.	GR

4.5	APPROVAL AND PERMIT REQUIREMENTS	REFERENCE
The Servicing Study shall provide a list of applicable permits and regulatory approvals necessary for the proposed development, as well as the relevant issues affecting such approval. The approval and permitting shall include but not be limited to the following:		
☐	Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams, as defined in the Act.	N/A
☐	Application for Environmental Compliance Approval (ECA) under the Ontario Water Resources Act.	N/A
☐	Changes to Municipal Drains.	N/A
☐	Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation, etc.).	N/A

4.6	CONCLUSION CHECKLIST	REFERENCE
☒	Clearly stated conclusions and recommendations.	SSR (Sect. 2, 3 & 4)
☐	Comments received from review agencies, including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	N/A (first submission)
☒	All draft and final reports shall be signed and stamped by a Professional Engineer registered in Ontario.	SSR, Drawings

ASSUMPTIONS

RESIDENTIAL DENSITIES

- DUPLEX (INFUSION TERRACES) 2.3 p / p / u
- TOWNHOUSE UNITS (AVENUE, EXECUTIVE, ROW) 2.7 p / p / u

AVG. DAILY DEMAND

- Residential 280 l / cap / day
- Institutional 28,000 l / ha / day
- Commercial 28,000 l / ha / day

MAX. DAILY DEMAND

- Residential 700 l / cap / day
- Institutional 42,000 l / ha / day
- Commercial 42,000 l / ha / day

MAX. HOURLY DEMAND

- Residential 1,540 l / cap / day
- Institutional 75,600 l / ha / day
- Commercial 75,600 l / ha / day

Demand for public parkette assumed to be 4.0 l/s for avg. day, max day, and peak hour

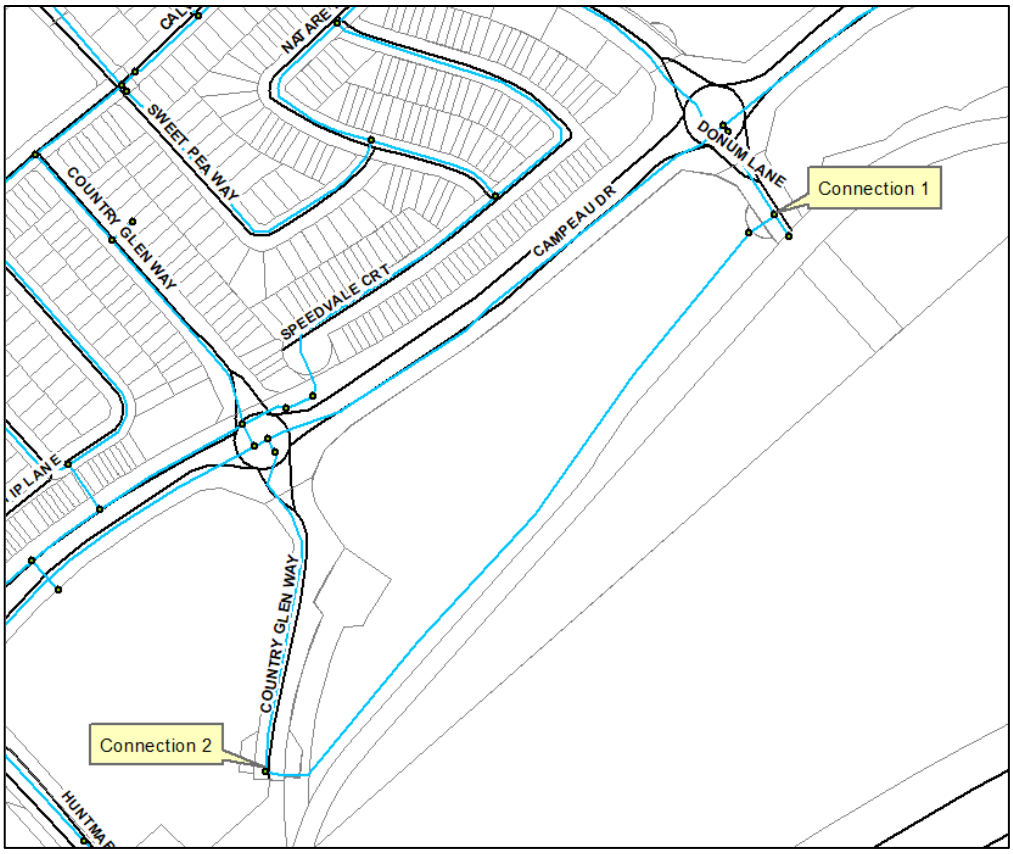
City Correspondence –
Boundary Conditions

Boundary Conditions
Arcadia Stage 6

Provided Information

Scenario	Demand	
	L/min	L/s
Average Daily Demand	179	2.98
Maximum Daily Demand	446	7.44
Peak Hour	982	16.36
Fire Flow Demand #1	10,000	166.67
Fire Flow Demand #2	15,000	250.00

Location



Results

Connection 1 – Donum Lane

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	161.3	95.4
Peak Hour	156.3	88.3
Max Day plus Fire 1	153.8	84.8
Max Day plus Fire 2	150.5	80.0

Ground Elevation = 94.2 m

Connection 2 – Country Glen Way

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	161.3	88.8
Peak Hour	156.3	81.7
Max Day plus Fire 1	151.5	74.9
Max Day plus Fire 2	145.5	66.4

Ground Elevation = 98.8 m

Notes

1. As per the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi.) Pressure control measures to be considered are as follows, in order of preference:
    a. If possible, systems to be designed to residual pressures of 345 to 552 kPa (50 to 80 psi) in all occupied areas outside of the public right-of-way without special pressure control equipment.
    b. Pressure reducing valves to be installed immediately downstream of the isolation valve in the home/ building, located downstream of the meter so it is owner maintained.

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

Design Parameters:

Residential			ICI Areas			
SF	3.4	p/p/u				Peak Factor
TH/SD	2.7	p/p/u	INST	50,000	L/Ha/day	1.5
APT	1.8	p/p/u	COM	50,000	L/Ha/day	1.5
Other	60	p/p/Ha	IND	35,000	L/Ha/day	MOE Chart
				17000	L/Ha/day	

Notes:
1. Mannings coefficient (n) = 0.013
2. Demand (per capita): 350 L/day 300 L/day
3. Infiltration allowance: 0.28 L/s/Ha 0.4 L/s/Ha
4. Residential Peaking Factor:
Harmon Formula = 1+(14/(4+P^0.5))
where P = population in thousands

Designed: RM

Checked: DY

2.15
AREA (ha)

AREA DESCRIPTIONS

1. 87.3 ha COMMERCIAL / EMPLOYMENT AS PER SIGNATURE RIDGE PUMPING STATION HYDRAULIC GRADE ANALYSIS , IBI GROUP, 2014 (REV 2)
2. 5.2 COMMERCIAL & 3.56 ha INFILTRATION AS PER ARCADIA RETAIL DEVELOPMENT DESIGN (IBI GROUP, 2014)
3. 21 ha RESIDENTIAL DEVELOPEMITN AS PER ARCADIA STAGE 1 DETAILED DESIGN (IBI GROUP 2012) AND ARCADIA STAGE 2 DETAILED DESIGN (JLR 2014)
4. 2 ha RESIDENTIAL & R.O.W. AS PER ARCADIA STAGE 1 DETAILED DESIGN (IBI GROUP 2012)
5. 1.54 ha R.O.W. AS PER CURRENT DESIGN (JLR)
6. 2.15 ha FUTURE COMMERCIAL AS PER CURRENT DESIGN (JLR)
7. 0.37 ha R.O.W. AS PER CURRENT DESIGN (JLR)
8. 22.13 Ha COMMERCIAL AS PER SIGNATURE RIDGE PUMPING STATION HYDRAULIC GRADE ANALYSIS , IBI GROUP, 2014 (REV 2)

[†] *Required storage, to be confirmed at detail design stage*

The overland flow was evaluated at downstream locations, based on proposed grades. Using the channel routing routine in SWMHYMO, maximum normal depth and velocity of flow have been quantified and results are presented below. It should be noted that the 100 year SCS design storm is critical in terms of peak major system cascading flow.

Table 5.5 Summary of Cascading Major Overflow for Arcadia Stage 2

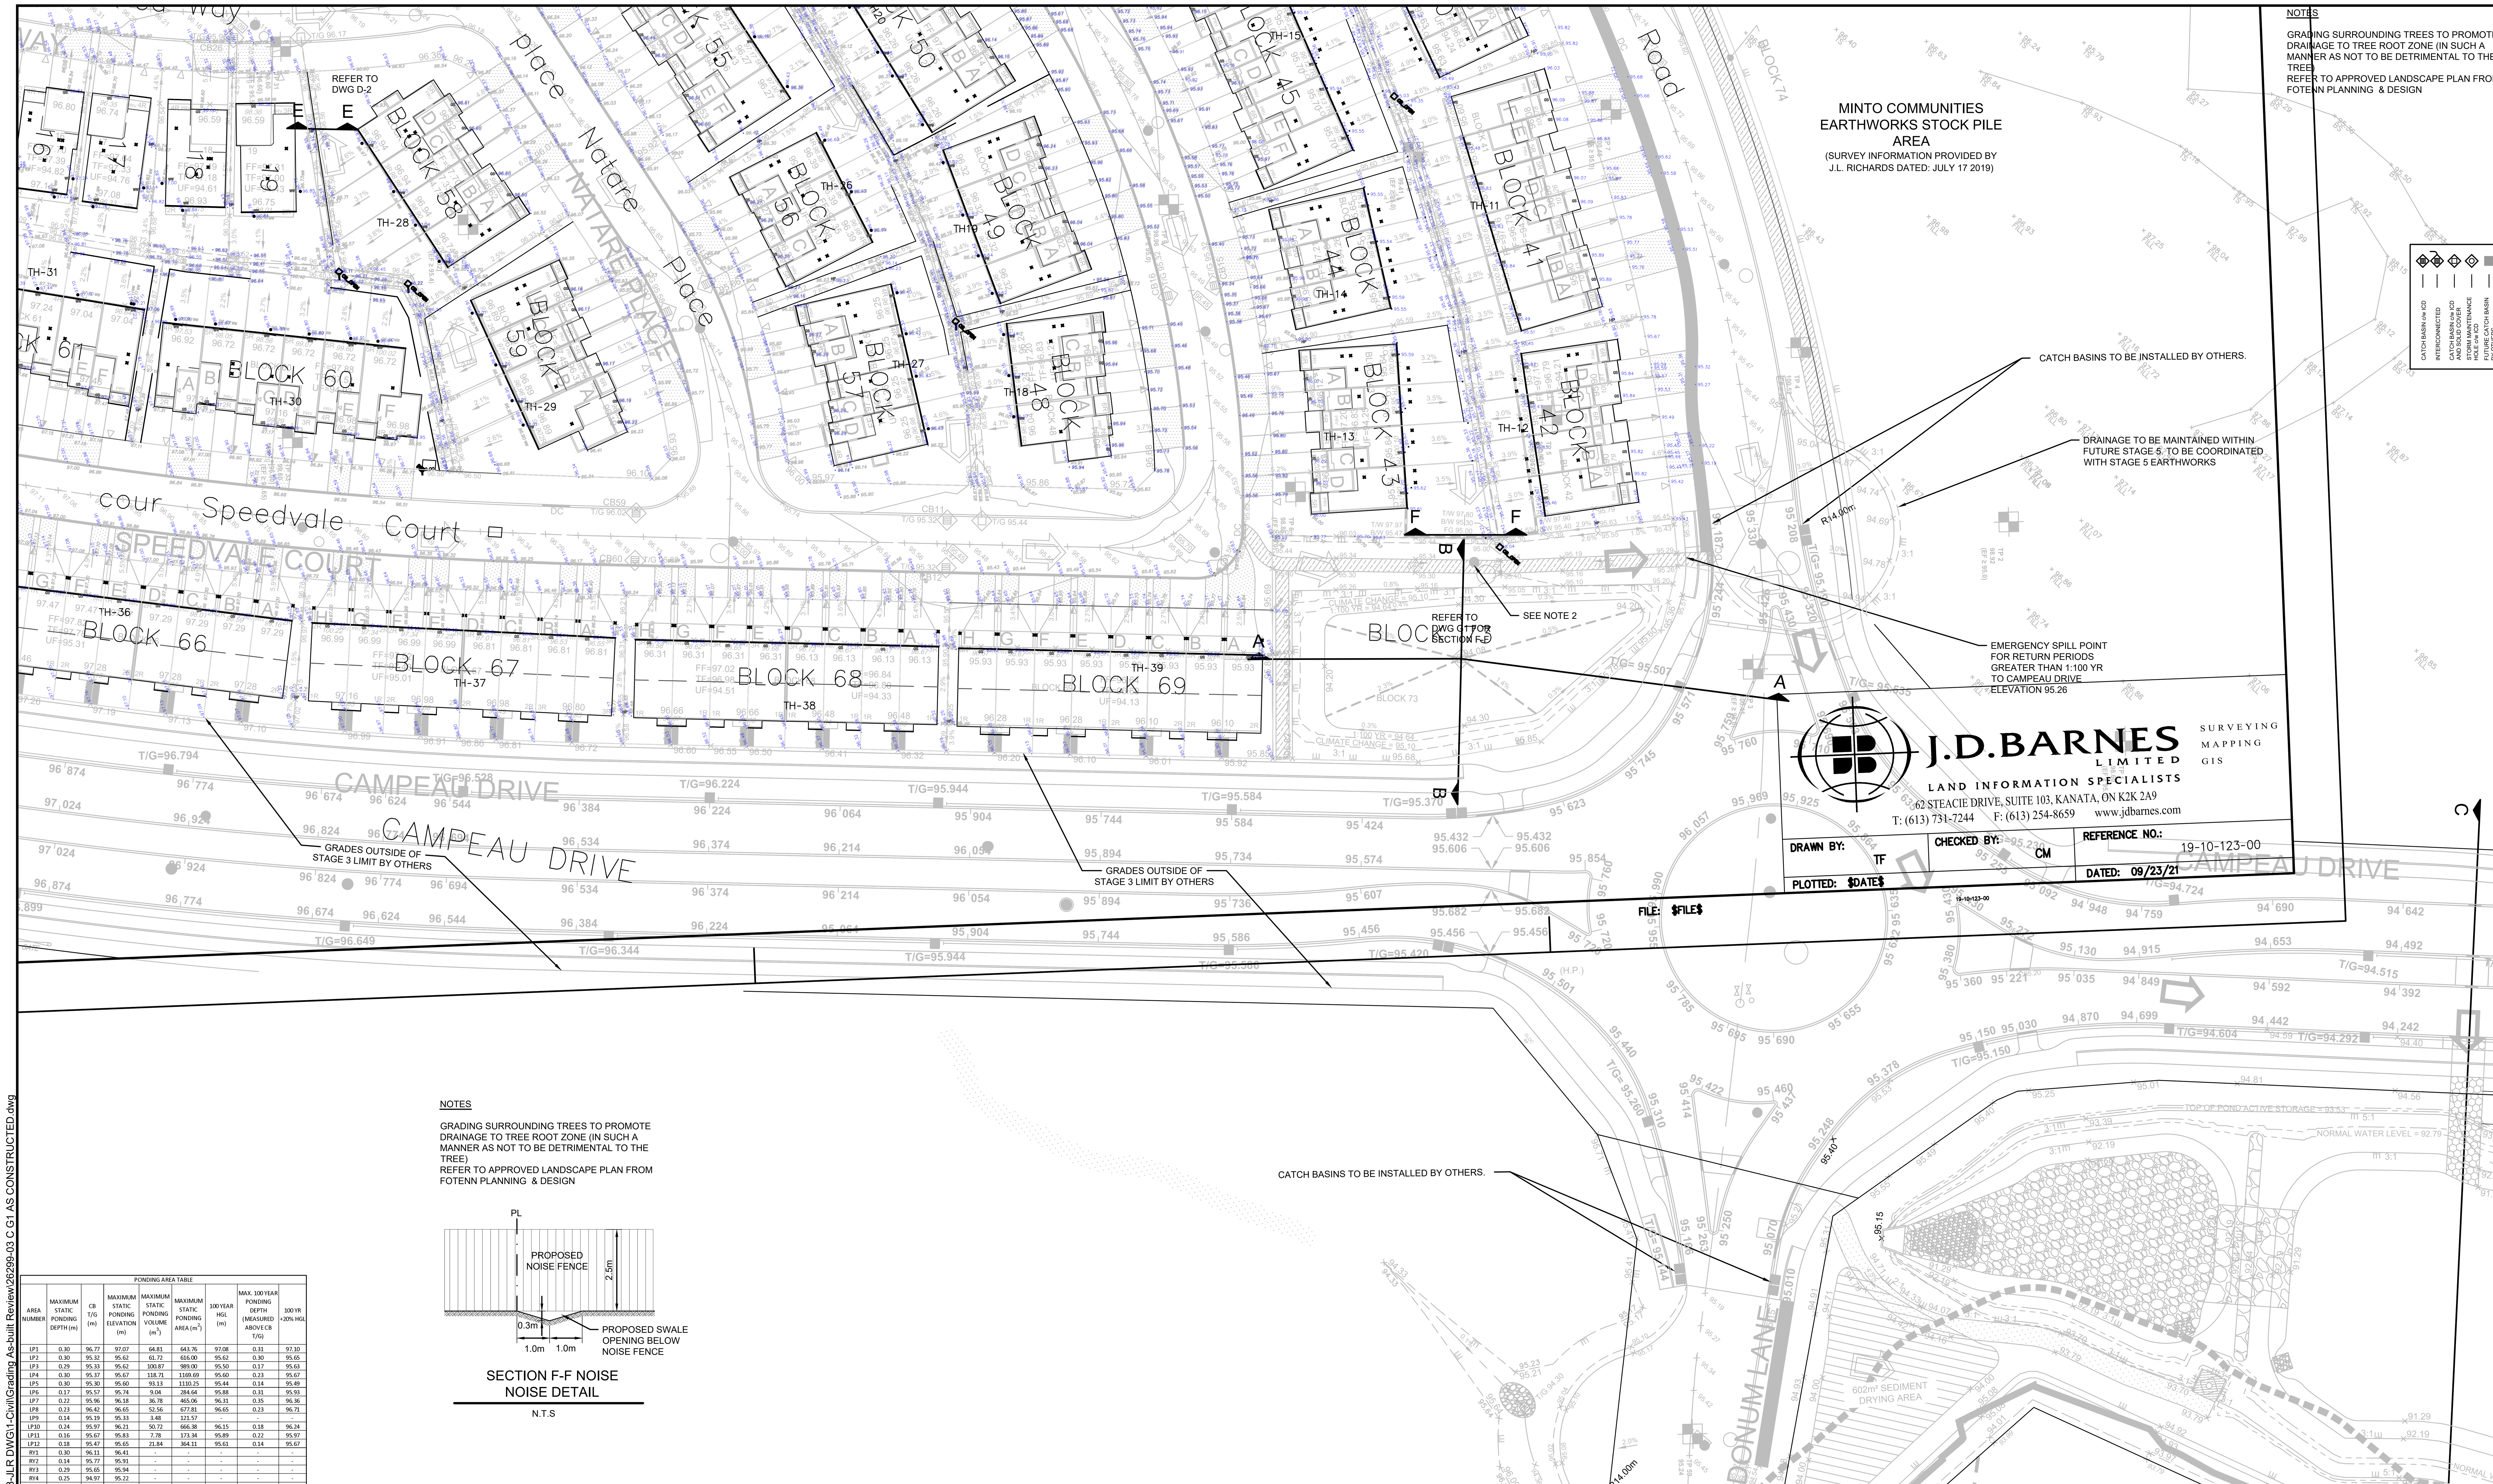
Notes: Major system segment overflow from the 100 year 12 hour SCS and 100 year 3 hour Chicago design storm events were taken from the results of the SWMHYMO model (35805IM.dat/out). The output file is presented in **Appendix C**. Maximum velocity and maximum depth results are for the 100 year 12 hour SCS design storm as it generates higher peak flows.

The above table results indicate that at each location, the maximum ponding depth is less than the maximum allowable 0.3 m, and the d x v product is less than the maximum allowable product of 0.6 per City of Ottawa Sewer Design Guidelines.



NOTES

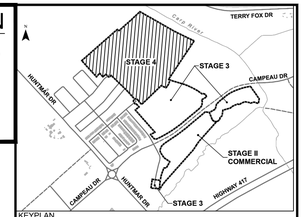
WITH RESPECT TO THE MEDIUM TREES AND THE TREE PLANTING IN SENSITIVE MARINE CLAY SOILS - 2017 GUIDELINES, THE LANDSCAPE PLAN AND DESIGN WILL NEED TO REQUIRE THAT GRADING SURROUNDING THE TREE PROMOTE PLANNING TO THE TREE ROOT ZONE (IN SUCH A MANNER AS NOT TO BE DETRIMENTAL TO THE TREE).



KEYPLAN

LEGEND:

- 91.00 — CONTOUR
- ×92.52 — PROPOSED ELEVATION
- 92.40 — BALANCED GROUND ELEVATION (0.9m ABOVE PROPOSED USF FROM DEC 2018)
- 92.49 — EXISTING ELEVATION FROM STANTEC SURVEY FROM OCTOBER, 2018
- × 92.52 — PROPOSED CL ROAD HIGH/LOW POINT
- 1.5% — SURFACE SLOPE
- FLOW DIRECTION
- MAJOR OVERLAND FLOW DIRECTION (1:100 YR)
- FF = 93.50 — FINISHED FLOOR ELEVATION
- TF = 93.20 — TOP OF FOUNDATION ELEVATION
- UF = 90.65 — UNDERSIDE OF FOOTING ELEVATION
- TERRACING (MAX. 3:1)
- PERFORATED PIPE SUBDRAIN
- SWALE
- DITCH CENTERLINE
- NOISE FENCE IN ACCORDANCE WITH THE NOISE FENCE DETAILED STUDY DATED APRIL 29, 2019
- TP 1 — TESTPIT NUMBER
- BH 1 — BOREHOLE NUMBER
- 95.48 — GROUND SURFACE ELEVATION (m)
- (95.48) — UNDERSIDE OF TOPSOIL WHERE PRESENT (m)
- [95.48] — PG - PREENGINEERED FILL LEVEL FROM TEST PIT INVESTIGATION (m)
- (EF ≥ 95.48) — GROUND SURFACE ELEVATION (m)
- TYPICAL REINFORCED GRASS SERVICE ROAD
