1.0 EXECUTIVE SUMMARY

WSP Canada (WSP) was retained by The Canada Life Assurance Company c/o GWL Realty Advisors Inc.(GWL) to conduct a Phase Two Environmental Site Assessment (Phase Two ESA) of the property located at 170 Slater Street in Ottawa, Ontario, (the "Site" or "Phase Two Property") as shown on Figure 1 (Site Plan). It is WSP's understanding that GWL intends to redevelop the Phase Two Property into a mixed-use commercial-residential development with two stories of underground parking. The site is currently developed with a three and a half story above ground parking garage.

WSP previously completed a Phase One ESA for the Site, the results of which were documented in the report titled "*Phase One Environmental Site Assessment, 170 Slater Street, Ottawa, Ontario*", dated May 2023. Based on the findings of the Phase One ESA, WSP recommended a Phase Two ESA investigation to investigate the six identified areas of potential environmental concern (APECs).

The six APECs were investigated as part of the Phase Two ESA. Concentrations of electrical conductivity (EC), sodium adsorption ratio (SAR), Petroleum hydrocarbon (PHC) fractions 1 and 2 (F1 and F2), boron (Hot Water Soluble), barium, cobalt, lead, selenium, mercury, thallium and vanadium in soil, and chloroform in groundwater were identified at the Phase Two Property exceeding the applicable Ministry of Environment, Conservation and Parks (MECP) Table 3 Site Condition Standards, for residential land use and coarse textured soil(Table 3 SCS). The following parameters identified at concentrations above the Table 3 SCS are not attributed to past contaminating activities on the Phase Two Property or in the surrounding area and are therefore not considered exceedances of the Table 3 SCS as per section 49(1) of O.Reg. 153/04:

- Concentrations of barium, cobalt, thallium, and vanadium above the Table 3 SCS that were detected in native soil samples from the site are considered representative of background concentrations in marine clay deposits that are common throughout the Ottawa region (Geofirma, 2018).
- Concentrations of EC and SAR in soil above the Table 3 SCS in soil are attributed to the extensive use of road salt both on and off the site to maintain safe driving/walking conditions. In addition, elevated concentrations of these parameters are relatively common in the Champlain Sea deposits (Geofirma, 2018).
- Chloroform detected in groundwater collected from both monitoring wells installed in APEC 5 is attributed to the use of treated municipal water during drilling. No other parameters at concentrations above the Table 3 SCS were identified in groundwater samples analysed as part of the Phase Two investigation.

Some additional assessment of soil and groundwater conditions at the site is recommended to refine impacted areas and determine the influence of seasonal groundwater variations on groundwater contamination (if any).

Remediation of the Site to address the identified exceedances of the Table 3 SCS would be required in order to obtain a Record of Site Condition.

2.0 INTRODUCTION

2.1 Site Description

WSP was retained by The Canada Life Assurance Company c/o GWL Realty Advisors Inc. (GWL) to conduct a Phase Two Environmental Site Assessment ("Phase Two ESA") of the following property:

Municipal Address	170 Slater Street
Size of the Phase Two Property	0.42 hectares

The location of the Phase Two Property is provided in the appended Figure 1. A plan of survey for the Site is provided in Appendix A. The boundaries of the Phase Two Property are provided in Figure 2.

2.2 Property Ownership

The Phase Two Property is owned by The Canada Life Assurance Company as represented by Andrew Hanna. The contact information for Andrew Hanna is provided in the following table.

Project Contact:	Andrew Hanna
Address:	33 Yonge Street, Suite 1000, Toronto, ON, M5G 1G4
Phone Number:	416-507-2809

2.3 Current and Proposed Future Uses

The Site is currently occupied by a three and a half or seven staggered storey commercial aboveground parking garage with the lower level set one half storey below grade. The parking garage was reportedly constructed in 1985.

WSP understands that the Site will be undergoing future redevelopment to a multi-use high-rise commercial and residential building with two levels of underground parking.

2.4 Applicable Site Condition Standard

The analytical results of the samples collected for this Phase Two ESA were compared to the Table 3 generic site condition standards in a non-potable groundwater condition (residential/parkland use, coarse soil texture) presented in the MECP document "*Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*", dated April 15, 2011, herein referred to as the Table 3 SCS. The Table 3 SCS were selected based on the following rationale:

- The closest water body is The Ottawa River, located approximately 0.5 km north of the Site.
- No Areas of Natural or Scientifical Interest (ANSI) are known to be present within the Phase Two Property.
- There are no water supply wells present on the Phase Two Property and potable water for the surrounding area is supplied by the piped municipal (City of Ottawa) water distribution system.
- No features have been identified at the Phase Two Property that would meet the conditions of an environmentally sensitive site, as described in Section 41 of O.Reg 153/04.
- The pH of surface soil is between 5 and 9 and the pH of sub-surface soil meets the requirement of being between 5 and 11 (Section 6.4).
- The intended use for the Phase Two Property is commercial and residential.
- The overburden thickness is greater than 2 metres across the Phase Two Property.

3.0 BACKGROUND INFORMATION

This section presents the background conditions of the Phase Two Property including a description of the physical setting and a summary of past investigations conducted.

The objectives of the Phase Two ESA were to obtain information about environmental conditions in the soil and groundwater on, in or under the Site. The objectives of this Phase Two ESA were achieved by:

- Developing an understanding of the geological and hydrogeological conditions at the Phase Two Property.
- Conducting field sampling for all contaminants of concern ("COCs") associated with each APEC identified in the Phase One ESA.

3.1 Physical Setting

The nearest surface water body the Ottawa River, located approximately 0.5 km north of the Phase Two Property. There are no areas of natural significance within the 250 m of the Phase Two Property. Land uses surrounding the Phase Two Property include mostly commercial and residential, as shown in Figure 2.

Bedrock in the area consists of shale of the Billings Formation, and a significant fault extends in a northwest-southeast direction across the middle of the Phase Two Property. Overburden at the Site and in the surrounding area is described as offshore marine deposits consisting of clay, silty clay and Groundwater flow direction is inferred to be towards the north toward the Ottawa River.

The topography of the Site and surrounding areas is generally flat. The Site grade is at the same level relative to adjoining properties. Site specific geologic and hydrogeologic information is presented in Section 6.

3.2 Past Investigations

WSP completed a Phase One ESA for the Site in May 2023. The Phase One ESA was conducted and reported in accordance with O.Reg 153/04. As part of the Phase One ESA, past reports completed by Golder Associates (now WSP) were consulted to develop an understanding of the environmental condition at the Site and surrounding properties. All of the past investigations/reports completed for the Site by WSP/Golder were conducted under the supervision of a Qualified Person (QP) employed by WSP/Golder who meets the requirements to oversee Phase One and Two ESAs in Ontario as specified by O.Reg. 153/04. The reports can therefore be relied upon by WSP for the purposes of this Phase Two ESA.

3.2.1 Phase One ESA, May 2023

WSP conducted a Phase One ESA entitled, "*Phase One Environmental Site Assessment, 170 Slater Street, Ottawa, Ontario*", dated May 2023, to assess the likelihood of soil and/or groundwater contamination resulting from historical or present activities at the Site and/or in the surrounding area. This included a review of available historical information for the Site and the surrounding area within 250 m, and a Site reconnaissance.

As part of the historical information review, WSP referenced the following two reports which were completed by Golder (now WSP):

- Phase I Environmental Site Assessment 269 Laurier Avenue West & 170 Slater Street, Ottawa, Ontario*",* project number 12-1185-0092 (6900), prepared by Golder for Great-West Life Assurance Company and London Life Insurance Company c/o GWL Realty Advisors Inc, dated December 2013 (2013 Phase I ESA).
- Phase II Environmental Site Assessment 269 Laurier Avenue West & 170 Slater Street, Ottawa, Ontario*",* project number 12-1185-0092 (6900), prepared by Golder for Great-West Life Assurance Company and London Life Insurance Company c/o GWL Realty Advisors Inc, dated August 2015 (2015 Phase II ESA).

More detailed information from the 2015 Phase II ESA, which is relevant to the current Phase Two ESA is provided in Section 3.2.2.

Based on the information obtained through the completion of the Phase One ESA, multiple on and off-Site (within the phase one study area) potentially contaminating activities (PCAs) with the potential to generate contaminants of potential concern (COPC) including petroleum hydrocarbons (PHC), benzene, toluene, ethylbenzene, and xylenes (BTEX), volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), and metals were identified. Given the location of PCAs and known/inferred geologic and hydrogeologic conditions at the Site, WSP identified six areas of potential environmental concern (APECs) on the Site as summarized in the following table. As APECs were identified on the Phase One Property, a Phase Two ESA was recommended.

Area of Potential Environmental Concern	Location of Area of Potential Environmental Concern on Phase One Property	Potentially Contaminating Activity	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern	Media Potentially Impacted (groundwater, soil and/or sediment)
APEC 1 – Fill of unknown quality.	Entire Site	#30. Importation of Fill Material of Unknown Quality (on-Site).	On-Site	Metals, PAHs, PHCs/BTEX	Soil
APEC 2 – Location of former Mid-City Ribbon and Carbon Manufacturing Ltd Eclipse Plating Service c. 1920-1940, and unnamed printer c. 1901 Offsite PCAs to the west and south.	NW Corner of Site	#31. Ink Manufacturing, Processing and Bulk Storage #33. Metal treatment, coating plating and finishing #8. Chemical Manufacturing, Processing and Bulk Storage	On-Site/ Off-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 3 – Previous location of auto repair garage. Historical PHC impacts to the north.	West side of property, laneway	#10. Commercial Autobody Shops (on-site)	On-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 4 – Previous location of USTs. Former dry-cleaning facilities up-gradient (SE) of Site.	NE Corner of Site	#28. Gasoline and Associated Products Storage in Fixed Tanks (on-site) #37. Operation of Dry-Cleaning Equipment (where chemicals are used) (off-site)	On-Site/ Off-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater

Area of Potential Environmental Concern	Location of Area of Potential Environmental Concern on Phase One Property	Potentially Contaminating Activity	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern	Media Potentially Impacted (groundwater, soil and/or sediment)
APEC 5 – Previous on-Site machine shop, manufacturing, and auto repair garage.	Centre of Site	#10. Commercial Autobody Shops (on-site) #34. Metal Fabrication	On-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 6 – Previously documented VOC impacts in groundwater. Three former USTs south of the Site.	South central part of Site	#28. Gasoline and Associated Products Storage in Fixed Tanks (off-site)	On-Site/ Off-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater

3.2.2 2015 Phase II ESA

A Phase II ESA was completed for 170 Slater Street (Phase Two Property), and the adjacent property at 269 Laurier Avenue West with field work being completed in 2014-2015. The purpose of the Phase II ESA was to determine the presence/albescence of contaminants of potential concern (COPC) in soil and groundwater in accordance with the recommendations of a Phase I ESA that was completed by Golder in 2013.

Field investigations supporting the Phase II ESA were carried out between October 2014 and May 2015. The following salient points were noted from the review of the 2015 Phase II ESA:

- A total of five boreholes were drilled in fall 2014, three of which were completed as monitoring wells. One borehole was located in the laneway between the two properties, while the four other boreholes were located inside of the parking structure at 170 Slater Street.
- Soil samples were collected at regular intervals from each of the boreholes, and one or two worst case (based on screen results) soil samples from each borehole were submitted for laboratory analysis of the following parameters: petroleum hydrocarbon (PHC) fractions 1 to 4 (F1-F4), polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and select metals.
- Groundwater sampling was conducted in November 2014 and May 2015. All three monitoring wells were found to be dry in 2014. In 2015, only MW14-02 contained enough groundwater to collect a sample. The sample collected from MW14-02 was analysed for PHCs F1 to F4, VOCs, PAHs, and dissolved metals,

Based on the results of the 2015 Phase II ESA Golder offered the following conclusions:

- Based on the 2014 soil sample results, no soil impacts above the MOE Table 3 Standards were identified in fill and native soil below the parking garage at 170 Slater Street which was historically occupied by industrial works and an automobile repair garage, and potentially adjacent to USTs.

- Shallow soil samples recovered from the fill below the laneway between 269 Laurier and 170 Slater, from BH14-01, did not contain concentrations of PHCs F1 to F4, VOCs, PAHs or metals above the Ministry of Environment (MOE) Table 3 Standards. However, native soil recovered at BH14-01 between 3.81 – 4.24 meters below ground surface (mbgs) did contain concentrations of PHC fractions F1 and F2 above the MOE Table 3 Standards.
- Groundwater quality at 170 Slater Street was not assessed in 2014, as all installed monitoring wells were dry, or blocked. In 2015, MW14-01 and MW14-03 were dry, but a groundwater sample was collected from MW14-02 (located near the south Site boundary) and contained measurable concentrations of VOCs (cis-1,2-dichloroethylene, tetrachloroethylene and trichloroethylene) above the MOE Table 3 Standards.

3.2.3 2013 Phase I ESA

A Phase I ESA was completed for 170 Slater Street and the adjacent property to the west at 269 Laurier Avenue West. Based on the review of the 2013 ESA the 170 Slater Street property, or the Site, was occupied by a three and a half storey, or seven staggered level aboveground parking garage.

The following previous environmental site assessment and remediation reports were provided to, and reviewed by Golder as part of the 2013 Phase I ESA:

- Phase II Environmental Site Assessment, Parking Garage and Adjacent Parking Lot, 170 and 190 Slater Street, Ottawa, Ontario (E2434-1), dated June 24, 2002, completed by John D. Paterson and Associates Limited (Paterson) and prepared for Arnon Corporation (Arnon) (2002 Paterson Phase One-II ESA Report).
- *Supplemental Phase II ESA, 269 Laurier Avenue West (E2434-2)*, dated February 17, 2003, completed by Paterson and prepared for GWLRA (2003 Paterson Phase II ESA Report).
- *Environmental Site Remediation, 269 Laurier Avenue West, Ottawa, Ontario (E2434-3)*, dated November 6, 2003, completed by Paterson and prepared for GWLRA (2003 Paterson Site Remediation Report).
- *Phase I Environmental Site Assessment, 269 Laurier Avenue West, Ottawa, Ontario*, March 4, 2008, completed by RiskCheck Environmental Ltd. (“RiskCheck”) and prepared for GWLRA (2008 RiskCheck Phase One ESA Report).
- *Phase I Environmental Site Assessment Update, 269 Laurier Avenue West, Ottawa, Ontario*, January 7, 2011, completed by RiskCheck and prepared for GWLRA (2011 RiskCheck Phase One ESA Update Report).

Based on the information obtained as described in the 2013 Phase I ESA, Golder identified the following issues of potential environmental concern:

- Historical Site Summary: The presence of a former repairs garage, a former machine shop, a former gasoline service station (identified in the 2002 Paterson Phase II ESA Report but this finding could not be corroborated by Golder during the historical review), and the former generation of oil skimmings and sludges as waste.
- Historical Summary (Surrounding Properties): The former/current presence of multiple dry cleaners, retail fuel outlets, auto repair garages, industrial facilities, USTs, and generators of many types of registered wastes, as well as spills of various types of contaminants, including diesel fuel, furnace oil, and hydraulic oil.

Golder recommended that a Phase II ESA be conducted at the Site to further assess the above-noted issues of concern related to the historical uses of the site and surrounding properties, and to confirm current site conditions that were previously assessed over 10 years previous as documented in the 2002 Paterson Phase II ESA Report, 2003 Paterson Supplemental Phase I Report and 2003 Paterson Site Remediation Report. Additionally, the issues of concern related to then current and historical records of underground storage tanks, generation of various types of registered wastes and spills of various contaminants on surrounding properties (in particular those to the south or west of the Site, inferred as up- and cross- to up-gradient of the Site, respectively, and to the east of the site, where USTs may have been very close to the Site boundary).

4.0 SCOPE OF THE INVESTIGATION

4.1 Overview of Site Investigation

The Phase Two ESA investigation activities were completed between March 9, 2023, and April 4, 2023. The investigation included the following tasks:

- **Health and Safety Plan**: Preparation of a Health and Safety Plan for internal and subcontractor use prior to initiating any field work at the Site.
- **Utility Clearances**: Coordination of utility clearances with local utility companies along with retaining the services of a private locator to assess for possible services in the areas of the proposed test locations.
- **Borehole Advancement and Monitoring Well Installation**: The borehole drilling and monitoring well installation program included drilling of six boreholes, each completed as groundwater monitoring wells, all of which were used for groundwater sampling at the Site. The locations of the boreholes and monitoring wells are provided in Figure 4. The monitoring well construction details are presented in the appended Table 1.
- **Soil Sampling**: Soil samples were collected during the advancement of the boreholes. Selected soil samples were submitted for chemical analysis of one or more of the following: petroleum hydrocarbons (“PHCs”), volatile organic compounds (“VOCs”), polycyclic aromatic hydrocarbons (“PAHs”) and metals.
- **Groundwater Monitoring and Sampling**: Groundwater samples were collected on March 22, March 29, April 3, and April 4, 2023. Groundwater samples were submitted for analysis of one or more of the following: PHCs, PAHs, VOCs, and metals.
- **Surveying**: An elevation survey of the monitoring wells ground surface and top of pipe was completed on March 22, 2023.
- **Reporting**: WSP compiled and assessed the field and laboratory results from the above noted activities into this report.

The Phase Two investigation was carried out in general accordance with WSP’s standard operating procedures, which conform to the requirements of O. Reg. 153/04. The data from the Phase Two ESA investigation completed by WSP at the Site were incorporated into a single Phase Two ESA report following the Phase Two ESA report format required by O. Reg. 153/04.

There were no impediments or access limitations that in the opinion of the Qualified Person (“QP”) would affect the conclusions of this Phase Two ESA report.

4.2 Media Investigated

To address the potential environmental issues identified in the Phase One ESA, the Phase Two ESA field program included sampling of soil and of groundwater from boreholes and monitoring wells completed within the overburden at the Site. No sediment was present at the Site and therefore no sediment sampling was completed. Summaries of media investigated, and the applicable contaminants of potential concern are provided in the appended Tables 3 and 4.

4.3 Phase One Conceptual Site Model

The following describes the Phase One ESA Conception Site Model (CSM) for the Site based on the information obtained and reviewed as part of this Phase One ESA:

- The Phase One Property consisted of a rectangular parcel of land measuring 0.42 hectares in area. An aboveground parking garage was present on the Site.
- A plan of survey was not available for review and would be required to satisfy the requirements of O.Reg. 153/04.
- No areas of natural significance were identified on or within 30 m of the Phase One Property.
- Potable water in the vicinity of the Phase One Property is provided by the city municipal water system.
- At the time of the Phase One ESA, the neighbouring properties within the Phase One Study Area consisted of commercial and residential land uses.
- Overburden at the Site consists of a clayey silty clay over a gravelly sand.
- Bedrock beneath the site consists of shale.
- Groundwater flow is inferred to be to the north, toward the Ottawa River.
- The closest water body is the Ottawa River, located approximately 0.5 km north of the Site.
- At the time of the Phase One ESA, the surrounding properties within the Phase One Study Area included:
  - West: 19 storey BMO building with outdoor and underground parking.
  - North: To the north of the property is Slater Street, followed by a hotel with underground parking, a hair salon, an architectural firm, and a Tim Hortons restaurant.
  - South: Laurier Ave, followed by an indoor shopping mall/market.
  - East: A commercial building with several retail stores.
- Fifty-Eight Potentially Contaminating Activities (PCAs) were identified in the Phase One Study Area, four of which were on the Phase One Property, as shown on Figure 3. Based on site characteristics and the locations of the PCAs, a total of six Areas of Potential Environmental Concern (“APECs”) were identified for the Phase One Property as shown on Figure 4.
- Electrical power is distributed through underground services.
- Soil at the Site consists primarily of offshore marine deposits consisting of clay, silty clay, and silt. Bedrock in the area consists of shale of the Billings Formation, and that a significant fault extends in a northwest-southeast direction across the middle of the Site.

4.4 Deviations from Sampling and Analysis Plan

There were no material deviations to the Phase Two ESA requirements set out in O.Reg. 153/04. All soil and groundwater sampling was conducted in accordance with WSP standard operating procedures. It is noted that PAHs were not included in the initial analysis plan for groundwater samples collected from all monitoring wells. The analytical suit was expanded to include PAHs after additional information was gathered through record review being conducted as part of the concurrent Phase One ESA (WSP, 2023). Monitoring wells MW22-02 and MW22-05, which were initially sampled on March 22, 2023, were therefore re-sampled to facilitate the collection PAH samples on March 29, 2023.

Monitoring well MW14-02, which was installed as part of the 2015 Phase II ESA (Golder, 2015) was sampled twice for VOC parameters as part of the Phase Two ESA. The initial sample was collected on March 22, 2023, and an additional sample was collected on April 4, 2023, to confirm the initial analytical result. The re-sampling was deemed necessary as groundwater from MW14-02 had historically contained concentrations of several VOC parameters exceeding the applicable Table 3 SCS.

4.5 Impediments

Physical impediments to the Phase Two ESA investigation were encountered on February 14, 2023, when locating the groundwater wells. Due to underground utilities the location of MW23-02 that was proposed in the sampling plan had to be moved from the outdoor laneway to the inside of the garage.

5.0 INVESTIGATION METHOD

5.1 General

The following sections describe the field investigation methods employed during the Phase Two ESA. The field work was conducted between March 7, 2023, and April 4, 2023. Some field activities occurred concurrently with the completion of the Phase One ESA.

Prior to initiating the field work, WSP developed and implemented Site-specific protocols to protect the health and safety of its employees and subcontractors through the preparation of a Site-specific Health and Safety Plan. An assessment of potential health and safety hazards at the Phase Two Property and those associated with the proposed work was completed each day of the field program. A health and safety tailgate meeting was held with WSP's subcontractors each day prior to commencement of the field work. The document was reviewed and signed on-Site by field personnel prior to commencing work. Additionally, prior to any intrusive investigations, including drilling, WSP completed public and private utility clearances.

5.2 Drilling

Between March 7 and March 24, 2023, seven boreholes (MW23-01, MW23-02, BH23-02A, MW23-03, MW23-04, MW23-04A, and MW23-05) were advanced to depths of 4.80 to 16.86 metres below ground surface (mbgs). Six of the seven boreholes were completed as monitoring wells. Borehole BH23-02A was advanced to obtain SPT N values; it was backfilled upon completion. Borehole locations are provided on the appended Figure 4 and borehole logs are provided in Appendix B. A description of the quality assurance/quality control (QA/QC) measures taken to minimize the potential for cross-contamination between sampling locations is provided in Section 5.11.

Boreholes were advanced under the supervision of WSP personnel by Strata Drilling Group (Strata). Exterior boreholes were advanced using a track mounted Massenza MI3 drill rig, interior boreholes were advanced using either a Massenza MSPT portable drill rig or a Geoprobe 420m portable drill rig. At each drilling location, continuous soil cores were collected using a dual tube sampler for field screening (including visual inspection and field measurement of headspace concentration), soil sample collection and stratigraphic logging by WSP field personnel. Bedrock drilling was accomplished using a combination of coring and hammering techniques.

5.3 Soil: Sampling

Soil samples were collected from the dual tube samplers and split in the field into two components. One component was placed into laboratory-prepared containers with minimal headspace and stored in a cooler for potential laboratory analysis. The second component was placed inside a plastic bag for field screening including noting the soil description, and the presence of any staining, odour and/or debris. A photoionization detector (RKI Eagle 2) calibrated to 100 parts per million (ppm) isobutylene was used to measure the total organic vapour concentration in the headspace in the sealed plastic bag. Samples were collected approximately once for every 0.61 m of borehole advancement in addition to whenever there was an observed change in soil stratigraphy and/or evidence of potential contamination (e.g. staining, debris).

At least three soil samples were submitted from each test location. Where the results of field screening indicated the presence of potentially impacted soil, an additional soil sample at greater depth was submitted for laboratory analysis in effort to vertically delineate impacts.

Soil samples representing potential "worst-case" conditions based on the field headspace screening measurements, visual observations (e.g., staining, discoloration and/or free product, if any), and olfactory observations (if any) and fill material collected from each borehole location were selected for laboratory analysis. Three to four samples were selected from each borehole for laboratory analysis. Soil samples were submitted to the analytical laboratory under chain-of-custody procedures. A summary of the soil samples submitted for analysis is provided in the appended Table 3.

5.4 Field Screening Measurements

Field measurements of sample headspace concentrations were made using the equipment specified in the table below:

Equipment	Parameters Detected	Detection Limit	Precision	Accuracy	Calibration Standard
RKI Eagle 2	Combustible gas (CG)	0-50,000 ppm	NA	±5%	Hexane (100 ppm)
RKI Eagle 2	Total organic vapour (TOV)	0-2,000 ppm	NA	±5%	Isobutylene (100 ppm)

Instruments were calibrated daily, with daily calibration checks completed by WSP.

One soil sample representing "worst-case" conditions at each sampling location was selected for laboratory analysis based on the soil headspace screening measurements, visual observations (e.g., staining, discoloration and/or free product, if any), and olfactory observations (if any). Soil screening results are provided in the following table.

Location	Sample ID	Depth	TOV (ppm)	CG (ppm)	Observations
MW23-01	SA01	0.15-0.46	0	0	
	SA02	0.76 – 1.37	0	0	
	SA03	1.52 – 2.13	0	0	
	SA04	2.29 – 2.91	0	0	
	SA05	3.05 – 3.66	0	0	
	SA06	3.81 – 4.22	0	0	
MW23-02	SA01	0.05 – 0.46	0	1	
	SA02	0.61 – 1.22	0	1	
	SA03	1.22 – 1.83	0	1	
	SA04	1.83 – 2.08	0	0	
	SA05	2.44 – 3.66	0	0	

Location	Sample ID	Depth	TOV (ppm)	CG (ppm)	Observations
MW23-03	SA01	0.05 – 0.36	0	0	
	SA02	0.61 – 1.22	0	0	
	SA03	1.22 – 1.83	10	0	
	SA04	1.83 – 2.44	5	0	
	SA05	2.44 – 3.05	5	0	
	SA06	3.05 – 3.66	5	0	
	SA07	3.66 – 3.86	10	0	
MW23-04A	SA01	0.05 – 0.38	0	0	
	SA02	0.61 –1.07	0	0	
	SA03	1.07 – 1.22	0	1	
	SA04	1.22 – 1.83	0	2	
	SA05	1.83 – 2.44	10	0	
	SA06	2.59 – 3.05	15	0	
	SA07	3.05 – 3.66	35	0	
	SA08	3.66 – 4.27	10	0	
	SA09	4.27 – 4.88	20	0	
	SA10	4.88 – 5.18	20	1	
MW23-05	SA01	0.05 – 0.46	0	0	
	SA02	0.61 – 1.07	0	0	
	SA03	1.07 – 1.83	0	0	
	SA04	2.44 – 3.66	135	1	
	SA05	3.66 – 4.27	0	0	
	SA06	4.27 – 4.50	0	0	

5.5 Groundwater: Monitoring Well Installation

Groundwater monitoring wells were installed by Strata using threaded, schedule 40, polyvinyl chloride (“PVC”) well screens and riser pipe, which were brought to the Site in sealed plastic bags. The annular space was filled with silica filter sand to at least 0.3 m above the well screen. The monitoring well was sealed with bentonite from the top of the sand pack to ground level and completed with a flush mount protective well casing. The riser pipes were sealed with a J-plug. A description of the QA/QC measures taken to minimize the potential for cross-contamination between sampling locations is provided in Section 5.11.

Following drilling, the monitoring wells were developed by removing ten well volumes using dedicated Waterra® pumps (tubing with foot valves). During monitoring well development, qualitative observations were made of water colour, clarity, and the presence or absence of any hydrocarbon sheen or odours. Water purged from all of the well locations was observed to have a high amount of suspended sediment; however, no evidence of potential contamination was noted.

5.6 Groundwater: Sampling

The six newly installed monitoring wells and previously installed monitoring well MW14-02 were included in the groundwater sampling program. MW14-02 was installed as part of the 2015 Phase II ESA (Golder, 2015) and was found to be in good condition in 2023. Concentrations of several VOC parameters exceeding the applicable regulatory limits were identified in this well during the previous Phase II ESA.

Each monitoring well was purged prior to sample collection. During purging, qualitative observations were made of water colour, clarity, and the presence of hydrocarbon sheen or odour. Purging was completed by pumping at least three well volumes or, where the well was considered a “low-yield” monitoring well, by

purging at least one half of the well volume. Groundwater sampling was carried out on March 22, March 29, April 3, and April 4, 2023. Multiple sampling deployments were required due to low yields of wells, additional information obtained through the concurrent Phase One ESA process which identified the need to analyse additional parameters, and/or to resample wells to confirm initial analytical results. Sampling deployments are summarised in the table below:

Date	Wells Sampled	Parameters
March 22, 2023	MW23-02, MW23-05	VOC, metals, PHC, BTEX
	MW14-02	VOC
March 29, 2023	MW23-03, MW23-04, MW23-04A	VOC, metals, PHC, BTEX, PAH
	MW23-02, MW23-05	PAH
April 3, 2023	MW23-01	VOC, metals, PHC, BTEX, PAH
April 4, 2023	MW14-02	VOC

Groundwater samples were placed in laboratory-prepared containers and stored in a cooler until delivery to the analytical laboratory under chain-of-custody procedures. A summary of the groundwater samples submitted for analysis is presented in the appended Table 4.

5.7 Sediment: Sampling

No sediment samples were collected as part of this investigation.

5.8 Analytical Testing

The contact information for the analytical laboratory: AGAT Laboratories, 5835 Coopers Avenue, Mississauga, Ontario, L4Z 1Y2 (905-712-5100).

The analytical laboratory is accredited in accordance with the International Standard ISO/IEC 17025 (General Requirement for the Competence of Testing and Calibration Laboratories, May 5, 2005, as amended) and the standards for proficiency testing developed by the Standards Council of Canada, the Canadian Association for Laboratory Accreditation (CALA) or another accreditation body accepted by the MECP.

5.9 Residue Management Procedures

All residues produced during the investigation (e.g., soil cuttings from drilling, groundwater from well development purging, wash water from equipment decontamination) were placed in sealed drums and stored at the Phase Two Property for eventual disposal by the owner.

5.10 Elevation Surveying

Elevations were determined relative to a Temporary Benchmark. The Temporary Benchmark was set as the top of the catch basin located outside the main garage entrance.

5.11 Quality Assurance and Quality Control Measures

WSP's quality assurance program for environmental investigations was implemented to ensure that analytical data obtained by the investigation were valid and representative. The quality assurance program included the following measures:

- The use of standard operating procedures for all field investigation activities.
- All monitoring wells were developed following installation to remove fine particles from the filter pack and any fluids introduced during drilling.

- Monitoring wells were appropriately purged prior to groundwater sample collection to remove stagnant water from the well bore and improve sample representativeness, minimizing sample agitation and aeration to the extent practicable.
- The collection of field duplicate samples at a minimum frequency of one duplicate for every ten samples.
- Initial calibration of field equipment was performed at the start of each field day, with a daily check of calibration, as needed, using a standard of known concentration.
- Soil and groundwater samples were handled and stored in accordance with the sample collection and preservation requirement of the MECP "*Protocol for Analytical Methods Used in the Assessment of Properties Under Part XV.I of the Environmental Protection Act"*, July 1, 2011. Samples were collected directly into pre-cleaned, laboratory-supplied sample containers with the appropriate preservative for the analyte group. Upon collection, samples were placed in insulated coolers with ice for storage and transport to the analytical laboratory under chain-of-custody.
- Dedicated sampling equipment (tubing and foot valves) and clean disposable Nitrile™ gloves were used at each sampling location to prevent potential cross-contamination. All non-dedicated sampling equipment (e.g., water level meters, split spoons) was decontaminated between sampling locations. Sampling equipment in contact with soil, or groundwater was: cleaned by mechanical means; washed with a phosphate-free, laboratory-grade detergent (e.g., Alconox) and, if necessary, an appropriate desorbing wash solution; and thoroughly rinsed with analyte-free water.
- Detailed field records documenting the methods and circumstances of collection for each field sample were prepared at the time of sample collection. Each sample was assigned a unique sample identification number recorded in the field notes, along with the date and time of sample collection, the sample matrix, and the requested analyses.
- The submission of samples to the analytical laboratory in accordance with standard chain of custody procedures.

A summary of the primary and duplicate samples is found below in the following table:

Date	Media	Sample ID	Duplicate ID	Trip Blanks
March 10, 2023	Soil	MW23-02 SA06	DUP-01	NA
March 15, 2023	Soil	MW23-04 SA06	DUP-01	NA
March 22, 2023	Groundwater	MW23-05 (Metals, PHCs, VOCs)	DUP-01	NA
March 22, 2023	Groundwater	MW23-03 (PAHs only)	DUP-01	NA

6.0 REVIEW AND EVALUATION

This section of the report presents a review and evaluation of the results of the drilling, monitoring, and sampling activities conducted as part of the Phase Two ESA.

6.1 Geology

The soil conditions encountered during the borehole drilling program are presented in the borehole logs (Appendix B). The following presents a summary of the subsurface soil conditions encountered during the investigation.

The ground surface at all the borehole locations was asphalt covered with asphalt thickness ranging from 0.05 to 0.10 m. Asphalt was underlain by sandy gravel fill material and sand fill material that extended to

depths ranging from 0.46 mbgs at MW23-02 to 1.98 mbgs at MW23-04. Fill material was underlain by native clayey silt and silty clay at all locations except MW23-03 and MW23-05; where encountered, the clayey silt and silty clay extended to depths ranging from 1.83 mbgs at MW23-02/02A to 2.90 mbgs at MW23-01. The native clayey silt/silty clay was underlain by glacial till with varying content of sand, gravel, and silt at all locations except MW23-01. At MW23-03 and MW23-05, the glacial till was encountered directly beneath the sand and gravel fill material. Where encountered, the glacial till material extended to the bedrock surface at depths ranging from 2.90 mbgs at MW23-01 to 5.18 mbgs at MW23-04. Bedrock consisted of weathered shale of the Billings formation. The bedrock surface elevation is highest at MW23-01 (69.07 masl) which is located near the northwest corner of the Site in the laneway west of the parking garage, and lowest at MW23-05 (66.12) which is located near the south Site boundary on lower level of the parking garage.

No groundwater was encountered in the overburden at the Site and the permanent water table was present in the weathered/fractured shale bedrock. Given the onsite PCAs identified through the Phase One ESA (WSP, 2023), and known subsurface conditions as described in the 2015 Phase II ESA, assessment of the upper shale aquifer was considered appropriate for most monitoring well locations. At locations MW23-04 and MW23-05, well screens were placed deeper (i.e., below the water table) into the shale aquifer to assess the potential presence of VOC contamination from off-site sources. Shallow wells at these locations (MW23-04A an MW14-02) were also included in the investigation to evaluate the potential presence of light non-aqueous phase liquids (LNAPL) that may have been generated from on or off-Site sources.

6.2 Groundwater: Elevations and Flow Direction

All shallow monitoring wells were used in the interpretation of shallow groundwater contours and shallow groundwater flow direction. Any temporary/seasonal fluctuation in water levels on the Phase Two Property is not anticipated to affect the conclusions of the Phase Two ESA.

The base of the newly installed groundwater monitoring well screens were installed at elevations ranging from approximately 53.93 to 59.02 masl (16.46 to 12.95 mbgs). The location and depth of the screens for the six new monitoring wells were selected based on the issues being investigated and shallow wells were installed based on the perceived location of the water table during drilling. The potentiometric surface at shallow monitoring well MW23-04A was above the top of the well screen on March 29, 2023. A summary of the monitoring well construction details are presented in the appended Table 1. No evidence of petroleum hydrocarbon free product or sheen in groundwater was observed during development, purging, or sampling activities.

The elevations of the potentiometric surface at each monitoring well are summarized in the appended Table 2. Groundwater elevations ranged from 59.63 masl at MW23-01 to 62.59 masl at MW23-04A (12.19 to 9.32 mbgs) on March 29, 2023. The measured groundwater elevations suggest a west-north-west flow beneath the site. Groundwater flow direction beneath the Site has not been previously determined as elevation data collected as part of the 2015 Phase II ESA was not considered suitable to determine a flow direction (Golder, 2015), Based on local topography and the position of the Ottawa River relative to the Site, the flow direction was previously assumed to be toward the north. Inferred groundwater elevation contours and groundwater flow direction are shown on the appended Figure 5.

Seasonal fluctuation in water levels and flow direction on the Site should be expected. Given the limited number of monitoring events, seasonal trends could not be identified; however shallow groundwater water levels are typically highest following the spring recharge and decline throughout the summer and fall months into the winter.

The presence of subsurface utilities such as electrical conduits at the Site are not expected to act as preferential pathways promoting the migration of contaminants as the water table is not inferred to intercept buried utilities and subsurface structures at the Phase Two Property.

6.3 Groundwater: Hydraulic Gradients

Based on the groundwater elevations measured on March 29, 2023, the approximate horizontal gradient to the west-northwest across the site is 0.05 m/m.

Vertical gradients at the site are downward based on elevations measured at nested pair MW23-04A/04 which indicate a vertical gradient of 0.38 m/m.

6.4 Soil: Field Screening

The results of headspace vapour measurements are presented in Section 5.4.

6.5 Soil: Quality

The analytical results for soil samples are summarized in the appended Tables 5a to 5d. Certificates of analysis are provided in Appendix C.

All soil samples were analysed for VOCs, PHCs F1-F4, BTEX, PAHs, metals, electrical conductivity (EC) and sodium absorption ratio (SAR). Results for EC exceeded the Table 3 SCS value (0.7 mS/cm) for all of the analysed samples except MW23-01 SA02 (0.15-0.45 mbgs). Results for SAR exceeded the Table 3 SCS value (5) in 11 of the 20 soil samples submitted for analysis. Elevated EC ad SAR in soil are attributed to long term winter road salting activities both at the Site and in the surrounding area but may also be, in part, naturally occurring.

Exceedances of PHC F1 and F2, and various metals parameters were also identified in the on-Site soil as summarized in the table below.

Date	Borehole ID	Sample ID	Sample Depth (mbgs)	Stratigraphy	COC Exceeding SCS	Table 3 SCS (µg/g)	Sample Concentration (µg/g)
March 23, 2023	MW23-01	SA06	3.81 - 4.22	Weathered shale	Molybdenum	**6.9**	21.8
					PHC F1	**55**	113
					PHC F2	**98**	189
March 10, 2023	MW23-02	SA02	0.61 - 1.22	Silt to clayey silt	Boron (Hot Water Soluble)	**1.5**	2.19
		SA03	1.22 - 1.83	Clayey silt	Barium	**390**	504
					Vanadium	**86**	102
		SA06	3.66 - 4.70	Glacial till	Molybdenum	**6.9**	12.2
		Dup-01					10.3
March 16, 2023	MW23-03	SA06	3.05 - 3.66	Glacial till	Cobalt	**22**	22.3
					Molybdenum	**6.9**	18.1
					Thallium	**1**	1.2
March 14, 2023	MW23-04	SA03	1.22 - 1.83	Sand fill	Barium	**390**	420
					Lead	**120**	1290
					Selenium	**2.4**	2.8
					Mercury	**0.27**	1.53
March 15, 2023	MW23-04	SA04	1.83 - 2.44	Clayey silt to silty clay	Barium	**390**	853
					Vanadium	**86**	88.1

Based on the groundwater quality results (Section 6.6), the soil does not serve as a contaminant mass contributing to groundwater. The soil quality results are not indicative of the presence of light or dense non-aqueous phase liquids at the site.

6.6 Groundwater: Quality

Monitoring well construction details are summarized in the appended Table 1 and a list of groundwater samples submitted for laboratory analysis is provided in the appended Table 4. The analytical results for groundwater samples are summarized in the appended Tables 6a to 6d. Laboratory certificates of analysis are provided in Appendix C.

The reported concentrations of all contaminants of potential concern in groundwater met the applicable Table 3 SCS except for chloroform in MW22-04A and MW22-04 as shown on the following table.

Date	Borehole ID	Sample ID	Screen Interval (mbgs)	Stratigraphy	COC Exceeding SCS	Table 3 SCS (µg/l)	Sample Concentration (µg/l)
March 29, 2023	MW23-04A	22-04 Shallow	10.06 - 13.10	Weathered/ Fractured Shale	Chloroform	**2.4**	3.8
March 29, 2023	MW23-04	22-04 Deep	15.34 - 16.86	Weathered/ Fractured Shale	Chloroform	**2.4**	7.17

Chloroform concentrations measured at these locations are attributed to the breakdown of disinfection agents (chlorine) in municipal water used during drilling. A low concentration of bromodichloromethane, another by-product of water disinfection, was detected in the groundwater sample collected from MW23-04. No other VOCs were detected in groundwater samples collected from the site including samples from previously installed monitoring well MW14-02 where concentrations exceeding the Table 3 SCS were previously detected.

The groundwater results do not indicate that soil serves as a contaminant mass contributing to groundwater. No evidence of free product or sheen in groundwater was observed.

6.7 Sediment: Quality

No sediment samples were collected as part of this investigation.

6.8 Data Quality Review

The quality assurance assessment of the field duplicate sample results was conducted according to the document entitled Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act, March 9, 2004 (Ontario Ministry of the Environment, Conservation, and Parks) amended in July 2009 and effective as of July 1, 2011) (Analytical Protocol).

Field duplicate samples were collected as part of the sampling program (soil, groundwater). Analytical results for the field duplicate samples are provided in the appended tables 7a (soil) and 7b (groundwater) , where the duplicate information is presented along with the primary sample data for comparison. The purpose was to assess the integrity of the samples. The relative percent difference (RPD) between the sample and its duplicate is expressed as an absolute value and is calculated using the following formula:

$$RPD\ (\%) = \frac{|C_o - C_{dup}|}{\frac{(C_o + C_{dup})}{2}}\ x\ 100$$

Where:

C_o = Detected concentration in the original sample

C_{dup} = Detected concentration in the field duplicate sample

RPDs are calculated only if the concentrations of a parameter are greater than the laboratory reported detection limit (RDL) in both the duplicate and original samples. In addition, lower precision in the RPD calculation is expected when concentrations of the analytes are less than five (5) times the RDL. Therefore, RPDs were calculated for the original and duplicate groundwater and soil samples only in cases where the measured concentrations of analytes in both samples were five (5) times greater than the RDL.

The following RPD limits were considered reasonable and are based on Analytical Protocol: RPDs in soil, 50% for metals, 30% for PHCs and PAHs, and in groundwater, 20% for metals, 30% for VOCs and 30% for PHCs and PAHs. Calculated RPDs are provided in Tables 7a and 7b, appended to this report. A summary of RPDs for samples and their corresponding duplicate samples are provided in the table below:

Field Duplicate Sample ID	Original Sample ID	Relative percent difference (RPD)			
		PHC	VOC	PAH	Metals
	Soil				
DUP-01	MW23-02 SA06	Not calculated due to parameters being less than 5X RDL	Not calculated due to parameters being less than RDL	Not calculated due to parameters being less than RDL	0 – 77.9 %
DUP-01	MW23-04 SA06	Not calculated due to parameters being less than 5X RDL	Not calculated due to parameters being less than RDL	Not calculated due to parameters being less than RDL	0 – 40.00 %
	Groundwater				
DUP-01	MW23-05	Not calculated due to parameters being less than RDL	Not calculated due to parameters being less than RDL	Not calculated due to parameters being less than RDL	5.93 – 12.2 %

One exceedance of the relevant RPD threshold was reported for copper concentrations in the soil duplicate pair MW23-02 SA06/DUP-01. All other calculated RPDs met the applicable thresholds and/or RPDs were not calculated because parameter concentrations we below 5x the RDL.

Given the RPDs for all other metals parameters in the sample duplicate pair MW23-02 SA06/DUP-01 met the applicable threshold and that the copper concentration did not exceed the Table 3 SCS in either sample from the pair, the elevated RPD result does not materially impact the results of this Phase Two ESA or the conclusions and recommendations predicated on said results.

All certificates of analysis or analytical reports received pursuant to clause 47 (2) (b) of O.Reg 153/04 comply with subsection 47(3). A certificate of analysis or analytical report has been received for each sample submitted for analysis and is provided in Appendix C. The laboratory did not qualify any of the sample results.

6.9 Phase Two Conceptual Site Model

The Phase Two conceptual site model is presented in the following sections.

POTENTIAL SOURCES OF CONTAMINATION

Potentially Contaminating Activities

Based on the information obtained as part of the Phase One ESA, several on-site potentially contaminating activities (PCAs) were identified as summarised in the table below. A detailed table of PCAs within the Phase One Study Area is provided in Appendix D. PCA locations are shown on Figure 3. PCAs identified on the Phase Two property are summarized in the table below:

Location	ID Number	PCA Description	PCA# (O.Reg, 153/04 Table 2)	Information Source	Rationale for Potential Contribution of the PCA to an APEC
Phase Two Property	1	Campbell Motors (Ottawa) Ltd., 1948-1963 Frederick Campbell Electric Manufacturing Company, 1920 Automobile Repair Garage, c. 1925-1956	#10. Commercial autobody shop #28. Gasoline and associated products storage in fixed tanks #34.Metal fabrication.	HLUI, FIPs	Automobile repair shop, and Machine shop (earlier). Two USTs present for gasoline c. 1948. 1 UST present for gasoline c. 1963. Automobile Repair Shop onsite 1925 to 1956 (FIPs). PCA is on-Site and therefore considered as an APEC.
	2	Mid-City Ribbon and Carbon Manufacturing Limited, 1960. Eclipse Plating Service c. 1920-1940	#31. Ink Manufacturing, Processing and Bulk Storage #33. Metal Treatment, Coating, Plating and finishing #8. Chemical Manufacturing, Processing and Bulk Storage	HLUI	Former manufacturing use on Phase One Property considered as a higher risk activity and is therefore considered as an APEC.
	3	Automobile Repair Garage, c. 1925-1956	#10. Commercial autobody shop #28. Gasoline and associated products storage in fixed tanks.	Fire Insurance Plans	PCA is on-Site and therefore considered as an APEC.
	4	Fill material identified during 2015 Phase II ESA.	#30. Importation of fill of unknown quality	Previous Reports (2015 Phase II ESA)	Fill was likely placed during the development of the Site and is on-Site and therefore considered as an APEC.

Areas of Potential Environmental Concern

A summary of the APECs identified at the Phase One Property is provided in the table below. The location of each APEC is presented in Figure 4.

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	PCA (O.Reg, 153/04 Table 2)	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern (COPC)	Media Potentially Impacted
APEC 1 - Fill of unknown quality.	Entire Site	#30. Importation of Fill Material of Unknown Quality (on-site)	On-Site	Metals, PAHs, PHCs/BTEX	Soil
APEC 2 - Location of former Mid-City Ribbon and Carbon Manufacturing Ltd.(1960), Eclipse Plating Service c. 1920-1940, and unnamed printer c. 1901	NW Corner of Site	#31. Ink Manufacturing, Processing and Bulk Storage #33. Metal treatment, coating plating and finishing #8. Chemical Manufacturing, Processing and Bulk Storage	On-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 3 - Previous location of auto repair garage. Historical PHC impacts to the north.	West side of property, laneway	#10. Commercial Autobody Shops (on-site)	On-Site / Off-site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 4 - Previous location of USTs. Former dry-cleaning facilities up-gradient (SE) of Site.	NE Corner of Site	#28. Gasoline and Associated Products Storage in Fixed Tanks (on-site) #37. Operation of Dry Cleaning Equipment (where chemicals are used) (off-site)	On-Site/ Off-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 5 - Previous On-Site machine shop, manufacturing, and auto repair garage.	Centre of Site	#10. Commercial Autobody Shops (on-site) #34. Metal Fabrication	On-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater
APEC 6 - Previously documented VOC impacts in groundwater. Three former USTs south of the Site.	South central part of Site	#28. Gasoline and Associated Products Storage in Fixed Tanks (off-site)	On-Site/ Off-Site	Metals, PAHs, PHCs/BTEX, VOCs	Soil and Groundwater

A summary of the investigation for each APEC conducted as part of the Phase Two ESA is as follows:

APEC 1 – The investigation included the collection of five fill samples from APEC 1 (MW23-01 SA02, MW23-03 SA03, MW23-04 SA03, M23-05 SA01, and MW23-05 SA03). The reported concentrations of all COCs for fill samples were below the applicable site condition standards with the exception of the reported concentrations of barium, selenium, lead and mercury from MW23-04 SA03 (1.22-1.83 mbgs).

APEC 2 – The investigation included installation of one monitoring well (MW23-01), collection of three soil samples and one groundwater sample from APEC 2. The reported concentrations of all COCs in soil met the applicable Table 3 SCS with the exception of the reported concentration of PHC F1 and F2, and molybdenum in the soil sample collected from a depth of 3.81 – 4.22 mbgs (MW23-01 SA06). The impacted soil sample was collected from the weathered shale horizon. Concentrations of all COCs met the applicable Table 3 SCS in the groundwater sample collected from MW23-01.

APEC 3 – The investigation included the installation of one monitoring well (MW23-02), collection of three soil samples and one groundwater sample from APEC 3. The reported concentrations of all COCs were below the applicable Table 3 SCS with the exception of boron (hot water soluble) in the soil sample collected from a depth of 0.61 - 1.22 mbgs (MW23-02 SA02), barium and vanadium from a depth of 1.22 – 1.83 mbgs (MW23-02 SA03), and Molybdenum from a depth of 3.66 – 4.70 mbgs (MW23-02 SA06). All the impacted samples were collected from the native silty clay/clayey silt, or glacial till horizons. Concentrations of all COCs met the applicable Table 3 SCS in the groundwater sample collected from MW23-02.

APEC 4 – The investigation included the installation of one monitoring well (MW23-03), collection of four soil samples and one groundwater sample from APEC 4. The reported concentrations of all COCs were below the applicable Table 3 SCS with the exception of cobalt, molybdenum and thallium in the soil sample collected from a depth of 3.05 - 3.66 mbgs (MW23-03 SA06). The impacted soil sample was collected from the native glacial till horizon. Concentrations of all COCs met the applicable Table 3 SCS in the groundwater sample collected from MW23-03.

APEC 5 – The investigation included the installation of two monitoring wells (MW23-04A and MW23-04), collection of four soil samples and two groundwater samples from APEC 5. The reported concentrations of all COCs were below the applicable Table 3 SCS in the soil samples with the exception of barium, selenium, lead and mercury in the soil sample collected from a depth of 1.22 – 1.83 mbgs (MW23-04 SA03), and barium and vanadium from a depth of 3.05 – 3.66 (MW23-04 SA04). The impacted soil samples were respectively collected from the sand fill, and native clayey silt to silty clay horizons. The concentration of chloroform in the groundwater samples collected from MW23-04A and MW23-04 exceeded the Table 3 SCS.

APEC 6 – The investigation included the installation of one monitoring well (MW23-05), the collection of four soil samples and two groundwater samples (one from pre-existing monitoring well MW14-02) from APEC 6. The reported concentrations of all COCs in soil and groundwater were below the applicable site condition standards.

Subsurface Structures and Utilities

There are no significant subsurface utilities at the Site. The south half of the parking garage building is half a story below ground. Subsurface structures and utilities are not expected to affect contaminant distribution and transport at the Phase Two Property. All COCs at concentrations exceeding the Table 3 SCS were identified in soil, no COCs were identified in groundwater and as such any subsurface utilities/structures are not expected to create preferential pathways for contaminant migration.

PHYSICAL SETTING

Stratigraphy

The ground surface at all the borehole locations was asphalt covered with asphalt thickness ranging from 0.05 to 0.10 m. Asphalt was underlain by sandy gravel fill material and sand fill material that extended to depths ranging from 0.46 mbgs at MW23-02 to 1.98 mbgs at MW23-04. Fill material was underlain by native clayey silt and silty clay at all locations except MW23-03 and MW23-05. Where encountered, the clayey silt and silty clay extended to depths ranging from 1.83 mbgs at MW23-02/02A to 2.90 mbgs at MW23-01. The native clayey silt/silty clay was underlain by glacial till with varying content of sand, gravel, and silt at all locations except MW23-01. At MW23-03 and MW23-05, the glacial till was encountered directly beneath the sand and gravel fill material. Where encountered, the glacial till material extended to the bedrock surface at depths ranging from 2.90 mbgs at MW23-01 to 5.18 mbgs at MW23-04. Bedrock consisted of weathered shale of the Billings formation. The bedrock surface elevation is highest at MW23-01 (69.07 masl) which is located near the northwest corner of the Site in the laneway west of the parking garage, and lowest at MW23-05 (66.12) which is located near the south Site boundary on lower level of the parking garage.

The depth to bedrock at the site ranged from 2.9 to 5.18 mbgs. The bedrock surface generally slopes downward from northwest to south-southeast.

Given that the average thickness of overburden is greater than 2 m, the Phase Two Property is not considered to be a shallow soil property as defined by O.Reg. 153/04 (as amended).

Hydrogeological Characteristics

No groundwater was encountered in the overburden at the Site, groundwater is present in the weathered shale bedrock, Groundwater flow beneath the Site is inferred to be to the west based on groundwater elevation measured on March 29, 2023. The regional groundwater flow direction is inferred to be towards the Ottawa River.

Depth to Groundwater

Depth to groundwater ranged from 9.32 to 12.19 mbgs (59.63 to 62.59 masl) on March 29, 2023).

SITE CONDITION STANDARDS

Environmentally Sensitive Areas

No areas of natural significance are located within the Phase Two Property. Accordingly, Section 43.1 of the Regulation does not apply to the Phase Two Property.

Shallow Soil Property or Water Body

The depth to beneath the Site ranges from 2.9 to 5.18 mbgs. The Site does not include all or part of a water body and is not adjacent to a water body or include land that is within 30 metres of a water body. Accordingly, Section 43.1 of the Regulation does not apply to the Phase Two Property.

Imported Soil

As identified in previous reports, fill is present across the Site beneath the garage building and the laneway. No other soil has been brought from another property and placed on, in or under the Phase Two Property as part of the Phase Two ESA. Fill samples analysed as part of the Phase Two ESA indicate that fill materials along the east site of the site contain barium, lead, selenium, and mercury at concentrations exceeding the Table 3 SCS.

Proposed Buildings and Other Structures

WSP understands that the Site will be undergoing future redevelopment to a multi-use high-rise commercial and residential building with two levels of underground parking.

DELINEATION OF CONTAMINANT IMPACTS

APEC Where Contaminants are Present at a Concentration Above the Applicable Site Condition Standard

Soil with concentrations of one or more metals COCs exceeding the applicable Table 3 SCS was identified in APECs, 1, 2,3, and 4. Soil with PHCs exceeding the Table 3 SCS was identified in APEC 2. Soil with EC and/or SAR exceeding the Table 3 SCS was identified in all six APECs.

Groundwater collected from APEC 4 contained chloroform above the applicable Table 3 SCS.

Contaminant Distribution

Metals in Soil

Metals COCs at concentrations above the Table 3 SCS including barium, boron (hot water soluble), cobalt, mercury, molybdenum, lead, selenium, thallium, and/or vanadium were identified in soil samples MW23-01 SA06, MW23-02 SA02, MW23-02 SA03, MW23-02 SA06, MW23-03 SA06, MW23-04 SA03 and MW23-04 SA04. Elevated concentrations were detected in soils from all areas of the Site with the exception of the area near the south Site boundary (APEC 6).

Barium, cobalt, and vanadium in the on-Site soil are inferred to originate from the natural deposition of the marine clay (Champlain Sea Deposits) common to the Ottawa region. The maximum concentrations of these parameters detected on-Site fall within the expected range of natural concentrations found in the Champlain Sea deposits as determined through the assessment background samples collected across the Ottawa region (Geofirma, 2018). As such, the concentrations of barium, cobalt, and vanadium are not considered to represent exceedances of the Table 3 SCS at the site as per section 49(1).3 of O. Reg.153/04.

Elevated concentrations of lead, selenium, and mercury in soil are attributed to the placement of poor quality fill materials. Lead, selenium, and mercury concentrations exceeding the Table 3 SCS were only detected in a sample collected from the sand fill on the east side of the Site at MW23-04 (1.22-1.83 mbgs). Boron exceeding the Table 3 SCS at MW23-02 (0.61-1.22 mbgs), may also be associated with fill placement.

Thallium above the Table 3 SCS was detected in one soil sample collected from MW23-03 at a depth 3.05-3.66 mbgs in the native soil; thallium was not detected in soil above this depth indicating that it may be attributed to a natural source; however additional investigation into the source of Thallium at the site is required.

Molybdenum concentrations exceeding the Table 3 SCS were detected in the native soil horizons at depths below 3 mbgs at MW23-01, MW23-02 and MW23-03. Molybdenum concentrations increased with depth at all of the sampling locations included in the Phase Two ESA indicating that molybdenum may be naturally occurring and not the result of former on-Site or off-Site activities; however additional investigation into the source of molybdenum in on-Site soil is required.

The lateral extent of all metals at concentrations exceeding the Table 3 SCS in soil has been coarsely delineated to the south as no exceedances were identified at MW23-05. Concentrations of lead, selenium, and mercury at concentrations above the Table 3 SCS in fill material have been coarsely delineated to the north, south, and west around MW23-04 and have also been vertically delineated at this location as no concentrations of these parameters exceeding the Table 3 SCS were detected in soil samples collected below 1.83 mbgs. The distribution of elevated metals concentrations in soil at the site is shown on the appended Figure 6.

PHCs in Soil

Concentrations of PHC F1 and F2 were identified in a soil sample collected from the weathered shale unit at MW23-01 (MW23-01 SA06) at a depth of 3.81-4.22 mbgs. MW23-01 is located at the northwest corner of the Site, adjacent to where PHC F1 and F2 impacts were previously identified in soil during the 2015 Phase II ESA. Elevated PHC F1 and F2 concentrations are attributed to past on and/or off-Site activities that occurred before the construction of the current parking garage in 1985.

No PHC concentrations were identified in soil above 2.90 mbgs at MW23-01. PHC F1 and F2 impacts in soil have been coarsely delineated to the south and west of MW23-01. The distribution of elevated PHC concentrations in soil is shown on the appended Figure 7.

EC & SAR in Soil

Concentrations of EC and SAR in soil above the Table 3 SCS in soil are attributed to the extensive use of road salt both on and off the site to maintain safe driving/walking conditions. In addition, elevated concentrations of these parameters are relatively common in the Champlain Sea deposits (Geofirma, 2018). As such, the elevated EC and SAR in soil are therefore not considered to represent exceedances of the Table 3 SCS as per section 49(1).1 of O. Reg. 153/04.

Chloroform in Groundwater

Chloroform at concentrations above the Table 3 SCS in groundwater collected from APEC 4 (east side of site), is interpreted to be the result of municipal water used during the drilling process and not the result of any on or off Site PCAs. Chloroform is therefore not considered to represent an exceedance of the Table 3 SCS as per section 49(1).2 of O. Reg. 153/04.

The distribution of VOCs in groundwater is shown on the appended Figure 8.

O. Reg 153/04, Section 49(1)

It is the opinion of the QP based on available data that the following parameters identified in soil or groundwater at the site solely exceeded the Table 3 SCS for one of the reasons specified under section 49(1) of O.Reg 153/04:

- EC and SAR in soil
- Cobalt, barium, and vanadium in soil
- Chloroform in groundwater

The Table 3 SCS is therefore deemed to not have been exceeded for the above noted parameters in the specified media.

Potential Reason for Discharge into the Environment at the Site

Concentrations of lead, selenium, mercury and PHC F1 and F2 exceeding the Table 3 SCS are likely associated with past on-Site activities as described in the APEC table.

Concentrations of molybdenum and thallium exceeding the Table 3 SCS in soil may be attributed to naturally occurring sources given their distribution, however further investigation is required.

Contaminant Migration

None of the COCs were detected in groundwater samples at concentrations exceeding the Table 3 SCS and therefore contaminant migration to groundwater from soil, and in groundwater to off-Site locations is not considered to be an issue at the Site.

Meteorological and Climatic Considerations

Seasonal fluctuation in groundwater levels and flow direction on the Site should be expected. Given the limited number of monitoring events seasonal trends could not be identified; however shallow groundwater water levels are typically highest following the spring recharge and decline throughout the summer and fall months into the winter. VOCs at concentrations exceeding the Table 3 SCS were historically identified in monitoring well MW14-02 near the southern site boundary. Elevated concentrations at this location were attributed to off-site sources in the upgradient area (Golder, 2015). Minor seasonal changes in groundwater flow direction over time could alter the concentrations of COCs detected in wells. It is therefore possible that VOCs could be detected at MW14-02 and/or the deeper nested well MW23-05 in the future. Additional groundwater sampling at the site to assess for VOCs is recommended to evaluate potential seasonal impacts on contaminant distributions.

Soil Vapour Intrusion Pathways

The concentration of PHC F2 detected in soil at MW3-01 exceeds the component value for vapour intrusion into residential indoor air and human exposure via inhalation (98 µg/g) as specified by the MECP (MECP, 2011). The concentration of PHC F1 detected in soil does not exceed the component value for vapour intrusion and indoor air inhalation.

As all soil is to be removed from the site as part of the future site redevelopment, vapour intrusion and subsequent inhalation resulting from the limited area of PHC F2 impacts at the northwest corner of the Site is not considered a potential issue for the future mixed residential-commercial development.

Given that the above ground parking structure is open-air, and the current site use is commercial, the potential for vapour intrusion and subsequent inhalation is not considered relevant at the Site if the property use remains the same.

POTENTIAL EXPOSURE PATHWAYS AND RECEPTORS

The Site is currently developed with three and a half story above ground parking garage. The ground surface at the site is entirely asphalt covered and the current Site use is commercial. As the entire surface of the site is covered with an impermeable surface and the parking garage is an open-air structure, there are currently no complete potential exposure pathways at the Site by which human or ecological receptors could be exposed to the identified soil contaminants. As no COCs were detected in groundwater at the Site, the soil to groundwater pathway (S-GW3) is considered to be incomplete in relation to COCs above the Table 3 SCS in soil.

The proposed development of the Site will include a mixed commercial-residential development with two stories of underground parking. All of the soil on the Site will be removed as part of the redevelopment. As the impacted soil material will be removed, potential exposure pathways for human and ecological receptors after the Site is redeveloped (including inhalation of indoor air) are considered incomplete.

There is potential for human and/or ecological receptors to be exposed to contaminated soil during the Site redevelopment/remediation. The following receptors and exposure pathways are considered operable during the site redevelopment/remediation:

Human Health

- Inhalation of dust sourced from soil and exposure by a subsurface worker, outdoor worker, and site visitor.
- Dermal exposure to contaminated soil by a subsurface worker, outdoor worker, and site visitor.

Ecological Health

- Dermal exposure to contaminated soil by mammals & birds.

7.0 CONCLUSIONS

The Phase Two ESA investigated the six APECs identified in the 2023 Phase One ESA. Soil with concentrations of EC, SAR, multiple metals parameters, and PHC F1 and F2 concentrations exceeding the Table 3 SCS were identified by the Phase Two investigation:

- Concentrations of barium, cobalt, and vanadium above the Table 3 SCS that were detected in native soil samples from the site are considered representative of background concentrations in marine clay deposits that are common throughout the Ottawa region (Geofirma, 2018). As such, concentrations of barium, cobalt, and vanadium on site are not considered exceedances of the Table 3 SCS as per section 49(1).3 of O.Reg. 153/04.
- Concentrations of molybdenum and thallium above the Table 3 SCS were detected in native soil samples at depths greater than 3 mbgs. Detected concentrations of these parameters increased with depth and they were not detected in surficial fill materials. Elevated molybdenum and thallium concentration detected in soil at the site may be attributed to natural sources; however further investigation is required.
- Concentrations of EC and SAR in soil above the Table 3 SCS in soil are attributed to the extensive use of road salt both on and off the site to maintain safe driving/walking conditions. In addition, elevated concentrations of these parameters are relatively common in the Champlain Sea deposits (Geofirma, 2018). As such, the elevated EC and SAR in soil are not considered to represent exceedances of the Table 3 SCS as per section 49(1).1 of O.Reg. 153/04.
- Chloroform detected in groundwater collected from both monitoring wells installed in APEC 5 is attributed to the use of treated municipal water during drilling. As such, concentrations of chloroform detected in groundwater are not considered exceedances of the Table 3 SCS as per section 49(1).2 of O.Reg 153/04. No other parameters at concentrations above the Table 3 SCS were identified in groundwater samples analysed as part of the Phase Two investigation.

Based on the results of the soil and groundwater samples submitted as part of this Phase Two ESA, the reported soil results were above the applicable Table 3 SCS at the following locations and depths:

- **APEC 1/APEC 5 – West side of site (fill material):**
  - Selenium, lead, and mercury in the soil sample collected from a depth of 1.22 – 1.83 mbgs (MW23-04 SA03)
- **APEC 2 – Northwest corner of Site:**
  - PHC F1 and F2, and molybdenum in the soil sample collected from a depth of 3.81 – 4.22 mbgs (MW23-01 SA06).
- **APEC 3 – West side of Site:**
  - Boron (hot water soluble) in the soil sample collected from a depth of 0.61 – 1.22 mbgs (MW23-02 SA02).
  - Molybdenum from a depth of 3.66 – 4.70 mbgs (MW23-02 SA06).
- **APEC 4 – Northeast corner of site:**
  - Molybdenum and thallium in the soil sample collected from a depth of 3.05 - 3.66 mbgs (MW23-03 SA06).

Additional investigation to better delineate the extent of fill materials along the west side of the site impacted with lead, selenium, and mercury, and to evaluate the source of molybdenum and thallium exceeding the Table 3 SCS would refine the results of this Phase Two ESA and assist in remedial/redevelopment planning.

It is recommended that additional groundwater sampling be conducted at the Site to assess the potential for VOC concentrations in groundwater to be seasonably variable.

Remediation of the Site to address the identified exceedances of the Table 3 SCS would be required to obtain a Record of Site Condition.

Although no COCs at concentrations above the Table 3 SCS were identified in groundwater by the Phase Two ESA, it is recommended that any groundwater encountered during the Site remediation be tested for the appropriate COCs prior to being discharge to the environment and/or the municipal sewer system (if permitted). Any water with concentrations exceeding the Table 3 SCS and/or applicable sewer discharge limits must be appropriately treated prior to discharge or taken offsite for disposal at an appropriate facility.

The data presented in this report follows the O. Reg. 153/04 Phase Two ESA report format.

9.0 LIMITATIONS AND USE OF REPORT

This report was prepared pursuant to and in accordance with the master services agreement (the "MSA") dated May 2, 2019 between WSP Canada Inc. ("Consultant") and the other parties listed thereto, and the project specific agreement dated February 15, 2023 between Consultant and The Canada Life Assurance Company c/o GWL Realty Advisors Inc. The report was prepared by Consultant for the use of Owner and Manager (as those terms are defined under the MSA). In addition to the use of and reliance on this report by Owner and Manager, any person who has received a reliance letter for this report may use and rely on this report as if was prepared for such persons. Any use of or reliance on this report by any other person (i.e., a person other than any Owner Manager or otherwise permitted person) is the sole and exclusive responsibility of such other person. Consultant accepts no responsibility for damages, if any, suffered by such other person as a result of the use of or reliance on this report.

This report is based on the best information available to Consultant at the time of preparing this report after Consultant has used best industry practices, in the circumstances, to obtain information. To the extent that Consultant was required to rely on information from other persons, Consultant has verified such information to the extent reasonably possible in the circumstances. The material provided in this report reflects best industry judgement in light of the information available at the time of preparation of this report.

Footnotes:

Tables should be read in conjunction with the accompanying document.

< value = Indicates parameter not detected above laboratory method detection limit.

> value = Indicates parameter detected above equipment analytical range.

-- Chemical not analyzed or criteria not defined.

Grey background indicates exceedances. In this case no exceedances are observed.

APPENDIX A

Plan of Survey

Topographic data was collected under Winter Conditions. Snow cover and ice preclude determining location and elevation of some topographical data that is otherwise visible.

UTILITY NOTES

1. This drawing cannot be accepted as acknowledging all of the utilities and it will be the responsibility of the user to contact the respective utility authorities for confirmation.
2. Only visible surface utilities were located.
3. Underground utility data derived from City of Ottawa utility sheet reference D-12-29C.
4. Sanitary and storm sewer grades and inverts were derived from

5. A field location of underground plant by the pertinent utility authority is mandatory before any work involving breaking ground, probing, excavating etc.

TOPOGRAPHIC PLAN OF SURVEY OF

LOTS 39, 40 AND 41

DISTANCES SHOWN ON THIS PLAN ARE IN METRES AND CAN BE CONVERTED TO FEET BY DIVIDING BY 0.3048

Surveyor's Certificate

I CERTIFY THAT :

1. This survey and plan are correct and in accordance with the Surveys Act, the Surveyors Act and the regulations made under them.
2. The survey was completed on the 24th day of February, 2023.

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

Toluene-d8	% Recovery	50-140		97
4-Bromofluorobenzene	% Recovery	50-140		80

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

4903901 Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

O. Reg. 153(511) - Metals & Inorganics (Soil)

DATE RECEIVED: 2023-03-16

DATE REPORTED: 2023-03-27

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4858516-4858529 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Analysis performed at AGAT Toronto (unless marked by *)

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4858516-4858529 Results are based on the dry weight of the soil.
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4858516-4858529 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4858516-4858529 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

SAMPLED BY:James Sullivan

O. Reg. 153(511) - Metals & Inorganics (Soil)

DATE RECEIVED: 2023-03-23

DATE REPORTED: 2023-03-31

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4876885-4876889 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Terphenyl	%	60-140			70	75	94	80

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4876885-4876889 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 2: Full Depth Generic Site Condition Standards in a Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils **pH range listed applies to surface soil only**
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4876885-4876889 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

F3 (C16 to C34)	µg/L	500	100	<100	<100	<100	<100
F4 (C34 to C50)	µg/L	500	100	<100	<100	<100	<100
Gravimetric Heavy Hydrocarbons	µg/L		500	NA	NA	NA	NA
Sediment				1	1	1	3
Surrogate	Unit	Acceptable Limits					
Toluene-d8	%	50-140		101	98	102	103
Terphenyl	% Recovery	60-140		70	65	72	66

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4876951-4876966 The C6-C10 fraction is calculated using Toluene response factor.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and nC34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16 - C50 and are only determined if the chromatogram of the C34 - C50 Hydrocarbons indicated that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6-C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified with the contribution of PAHs. Under Ontario Regulation 153/04, results are considered valid without determining the PAH contribution if not requested by the client.
NA = Not Applicable

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

4-Bromofluorobenzene	% Recovery	50-140		70	70	70	72

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4876951-4876966 Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

O. Reg. 153(511) - Metals & Inorganics (Soil)

DATE RECEIVED: 2023-03-30

DATE REPORTED: 2023-04-10

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4888965-4888969 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Acridine-d9	%	50-140			95	70	105
Terphenyl-d14	%	50-140			95	80	75

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4888965-4888969 Results are based on the dry weight of the soil.
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

Surrogate	Unit	Acceptable Limits					
Toluene-d8	%	50-140			104	106	103
Terphenyl	%	60-140			98	102	85

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4888965-4888969 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

O. Reg. 153(511) - VOCs (with PHC) (Soil)

DATE RECEIVED: 2023-03-30

DATE REPORTED: 2023-04-10

				SAMPLE DESCRIPTION:	23-01-SA02	23-01-SA04	23-01-SA06
				SAMPLE TYPE:	Soil	Soil	Soil
				DATE SAMPLED:	2023-03-23 09:25	2023-03-23 09:55	2023-03-23 10:40
Parameter	Unit	G / S	RDL		4888965	4888968	4888969
m & p-Xylene	ug/g		0.05		<0.05	<0.05	0.48
Bromoform	ug/g	0.27	0.05		<0.05	<0.05	<0.05
Styrene	ug/g	0.7	0.05		<0.05	<0.05	<0.05
1,1,2,2-Tetrachloroethane	ug/g	0.05	0.05		<0.05	<0.05	<0.05
o-Xylene	ug/g		0.05		<0.05	<0.05	0.16
1,3-Dichlorobenzene	ug/g	4.8	0.05		<0.05	<0.05	<0.05
1,4-Dichlorobenzene	ug/g	0.083	0.05		<0.05	<0.05	<0.05
1,2-Dichlorobenzene	ug/g	3.4	0.05		<0.05	<0.05	<0.05
Xylenes (Total)	ug/g	3.1	0.05		<0.05	<0.05	0.64
1,3-Dichloropropene (Cis + Trans)	µg/g	0.05	0.05		<0.05	<0.05	<0.05
n-Hexane	µg/g	2.8	0.05		<0.05	<0.05	0.60
Moisture Content	%		0.1		14.7	19.3	9.2
Surrogate	Unit	Acceptable Limits					
Toluene-d8	% Recovery	50-140			104	106	103
4-Bromofluorobenzene	% Recovery	50-140			83	80	96

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Soil - Residential/Parkland/Institutional Property Use - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4888965-4888969 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

Sodium Adsorption Ratio (2:1) (Calc.)	4887562		7.21	7.20	0.1%	NA									
pH, 2:1 CaCl2 Extraction	4888965	4888965	7.00	7.11	1.6%	NA	90%	80%	120%						

Comments: NA signifies Not Applicable.
pH duplicates QA acceptance criteria was met relative as stated in Table 5-15 of Analytical Protocol document.
Duplicate NA: results are under 5X the RDL and will not be calculated.

More than 90% of the elements met acceptance limits and overall data quality is acceptable for use. For a multi-element scan up to 10% of analytes may exceed the quoted limits by up to 10% absolute.

Comments: NA signifies Not Applicable.
pH duplicates QA acceptance criteria was met relative as stated in Table 5-15 of Analytical Protocol document.
Duplicate NA: results are under 5X the RDL and will not be calculated.

More than 90% of the elements met acceptance limits and overall data quality is acceptable for use. For a multi-element scan up to 10% of analytes may exceed the quoted limits by up to 10% absolute.

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

O. Reg. 153(511) - PAHs (Water)

DATE RECEIVED: 2023-03-30

DATE REPORTED: 2023-04-06

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4889145-4889162 Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amount
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&(j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

O. Reg. 153(511) - PHCs F1 - F4 (with PAHs and VOC) (Water)

DATE RECEIVED: 2023-03-30

DATE REPORTED: 2023-04-06

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4889145-4889152 The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

Should you require any information regarding this analysis please contact your client services representative at (905) 712-5100

*Notes

Disclaimer:

- All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.
- All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.
- AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.
- This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
- The test results reported herewith relate only to the samples as received by the laboratory.
- Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.
- All reportable information as specified by ISO/IEC 17025:2017 is available from AGAT Laboratories upon request.
- For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.

O. Reg. 153(511) - PAHs (Water)

DATE RECEIVED: 2023-04-03

DATE REPORTED: 2023-04-10

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4896256 Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amount
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&(j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

O. Reg. 153(511) - PHCs F1 - F4 (with PAHs and VOC) (Water)

DATE RECEIVED: 2023-04-03

DATE REPORTED: 2023-04-10

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4896256 The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition - Non-Potable Ground Water - All Types of Property Uses - Coarse Textured Soils
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

4896256 Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
