Our File Ref.: 01348

MacEwen Petroleum Inc.
18 Adelaide Street, P.O. Box 100
Maxville, Ontario K0C 1T0

Attention: Roch Lortie,

Subject: Hydrogeological Assessment & Terrain Analysis - Proposed Fuel Dispensing Facility Re-development
5546 Albion Road South, Ottawa (Gloucester), Ontario

Dear Mr. Lortie,

LRL Engineering (LRL) was retained by MacEwen Petroleum Inc. (MPI) to complete a Hydrogeological Assessment & Terrain Analysis for the property located at 5546 Albion Road in Ottawa (Gloucester), Ontario as part of a proposed site re-development and associated Site Plan Application submission to the City of Ottawa. It is anticipated that the existing fuel dispensing facility will be re-developed to include new fuel storage and dispensing equipment, and convenience store serviced by a private water supply well and sewage disposal system.

The assessment was carried out to determine if the existing supply well can adequately and safely supply the proposed development with potable water according to the Ontario Drinking Water Standards (ODWS) and *Procedure D-5-5 Technical Guideline for Private Wells: Water Supply Assessment (August 1996)*; and that the proposed development can be serviced with a private septic system. The assessment was also intended to confirm that the construction of the supply well, and proposed construction activities, will be such as to minimize impairment to the regional aquifer, local Well Protection Area, and that it meets the current Ontario Regulation 903 requirements.

The assessment was conducted according to Ontario Ministry of the Environment, Conservation and Parks (MECP) “Hydrogeological Technical Information Requirements for Land Development Applications” (April 1995), which include the following guidelines and procedures:

- Guideline D-5 Planning for Sewage and Water Services (August 1996);
- Procedure D-5-4 Technical Guideline for Individual On-site Sewage Systems: Water Quality Impact Risk Assessment (August 1996); and
- Procedure D-5-5 Technical Guideline for Private Wells: Water Supply Assessment (August 1996).

Furthermore, the assessment was completed in accordance with the City of Ottawa’s Hydrogeological and Terrain Analysis Guidelines (March 2021).

The assessment involved a desktop review of available information on the geology and hydrogeology of the site and adjacent lands, in addition to in-situ activities and testing. Based on our review of available information, it is determined that the proposed development can be supplied with a sufficient quantity and quality of potable water, and that the site conditions are suitable for an on-site sewage disposal system.

1 SCOPE OF INVESTIGATION

LRL was retained by MacEwen Petroleum Inc. (MPI) to complete a Hydrogeological Assessment & Terrain Analysis for the property located at 5546 Albion Road in Ottawa (Gloucester), Ontario as part of a proposed site re-development and associated Site Plan Application submission to the City of Ottawa. It is anticipated that the existing fuel dispensing facility will be re-developed to include new fuel storage and dispensing equipment, and convenience store serviced by a private water supply well and sewage disposal system. Further details pertaining to the anticipated development are included in Section 3.

LRLs scope for this investigation was in general accordance with current applicable provincial guidelines, in addition to the City of Ottawa, Hydrogeological and Terrain Analysis Guideline, dated March 2021. Prior to the initiation of the scope of this investigation, a virtual meeting was held with the City of Ottawa's Hydrogeologist to review the project, discuss the Wellhead Protection Area identified across the site (discussed in greater detail in Section 2), and how this can be addressed through the pumping test of the supply well. LRLs scope for this Hydrogeological Assessment & Terrain Analysis was generally as follows:

- Conduct a search of available well information for neighbouring properties through the MECP water well records database;
- Perform a desk top review of available geological maps and local well records to obtain information pertaining to the quantity supply aquifer of the subject site;
- Conduct one (1) – six (6) hour pumping test on the existing supply well by using a submersible pump, lowered above the existing installation components, and generator.
    - As discussed with the City, and agreed upon by the client, as not to disrupt site operations, the pumping test was completed during over-night hours when the facility was closed. The pumping rate was increased throughout the shorter duration of the test (6-hours rather than the typical 8-hours recognized for a commercial establishment) to account for comparable demand volumes;
    - Manual water levels were collected from the supply well during the pumping test to analyse the hydrogeological characteristics of the aquifer onsite. A datalogger meter was also lowered in the supply well to further collect measurements of groundwater fluctuation;
    - Collect and submit water samples from the supply well periodically during the pumping test, 3-hours and 6-hours of pumping, for laboratory analysis under the subdivision package, and volatile organic compounds; and
    - Following the pumping test, record water levels for up to 24 hours or until 95% recovery has occurred.
- In conjunction with additional sub-surface investigation fieldwork, in support of the proposed development application, advance boreholes across the property to characterize the site's hydrogeological conditions as part of the Terrain Analysis study;

- Submit select soil samples collected from the various subsurface materials for grain size analysis;
- Using piezometers/monitoring wells installed as part of additional sub-surface investigation fieldwork, in support of the proposed development application, collect groundwater measurements to aid in characterizing the shallow groundwater aquifer;
- Compare the laboratory analysis results, from the supply well, to the applicable Ontario Drinking Water Standard (ODWS) and MECP D-5-5 Treatability Limits;
- Prepare a summary regarding the quality and the quantity of the supply aquifer and comparison to D-5-5 compliance requirements set forth by the City of Ottawa Technical Authority. Summarize the findings to confirm that the lot size and soil conditions are suitable to attenuate the impacts of the septic system effluent; and
- Provide recommendations on the construction of the septic system based on the information retrieved.

2 SITE AND AREA DESCRIPTION

The subject site (5546 Albion Road, herein referred to as the 'Site') is located within a generally rural residential and commercial area of Ottawa, at the northwest corner of the intersection of Albion Road, and Mitch Owens Road. The location of the Site is presented in **Figure 1**. The property is legally described as Part of Lot 30, Concession 3 (Rideau Front), Geographic Township of Gloucester, City of Ottawa with Zoning - Rural Commercial 2 (RC2). It is understood that the proposed development will not require a zoning amendment or zoning change.

The Site is irregular shaped being generally rectangular with a portion of the southeastern extent being reduced. The Site is between approximately 85 and 110 m wide (east-west) by between 90 and 115 m deep (north-south) for an approximate surface area of 11 920 m². The dimensions of the Site, and general configuration, are presented in **Figure 2**. For the purpose of this report, Albion Road will be inferred as running in a north-south direction.

2.1 Topography

The topography of the Site and neighbouring lands is generally flat. The subject Site and the neighbouring lands have a common topographic elevation of approximately 100 m above mean sea level (amsl) according to The Atlas of Canada - Toporama. More specifically, the Site has a slight slope to the south, towards Mitch Owens Road. Elevations along the southern extent of the site range between 103.7 and 102.5 m amsl according to the Annis, O'Sullivan, Vollebekk Ltd. Topographic Survey plan, dated April 18, 2022, and included in **Attachment A**.

According to The Atlas of Canada – Toporama, the regional groundwater flow direction is to the northwest towards the Rideau River, located approximately 8.5 km to the west of the Site.

2.2 Existing Development Features

The Site is presently developed and operated as a retail petroleum dispensing facility equipped with the following equipment:

- Six (6) gasoline dispensing pumps;
- One (1) diesel dispensing pump, and
- Five (5) underground storage tank located at the general southeastern portion of the Site.

No further details pertaining to the size, capacity or construction details of the storage tanks are available at this time. The fuel dispensing pumps are set over a concrete apron with an over-head canopy. A single-story convenience store is located at the approximate central portion of the Site

with pavement structure associated with parking and circulation across the central and general eastern portions of the Site. The western and northern portions of the Site is manicured grass with trees. The Site is serviced with a private sewage disposal system located at the northern portion of the property, and a supply well located at the east-central extent of the Site. Further details pertaining to the supply well on the Site is presented in Section 5.1.

2.3 Aerial Imagery

Aerial imagery was access through the City of Ottawa's on-line interactive mapping portal, geoOttawa. The available historical imagery for the Site dates back to the mid 1970's (1976) when the Site and neighbouring lands to the north, west and south following Mitch Owens Road appear undeveloped. East of the subject Site, following Albion Road, is developed with what can be assumed as commercial, or light industrial type facility with large buildings/structures present and significant cleared inferred parking and circulation area.

The subsequent 1991 aerial imagery confirms these observations. The Site is noted to be developed in the available 1999 aerial imagery, in comparable conditions and with similar features to those of present time. The 2005 aerial imagery depicts alterations, and likely re-development of the Site, with a larger parking and circulation area, a new peaked roof building, and additional underground storage tank fill ports along the south of the Site. In the 2002 aerial imagery, it is observed that development of the "Albion Sun Vista Community" residential subdivision is underway to the south of the Site, following Mitch Owens Road.

2.4 Neighbouring Properties and Land Uses

According to the City of Ottawa's Zoning information, available through the City of Ottawa's on-line interactive mapping portal, geoOttawa, the neighbouring lands are zoned as follows:

- Rural Residential Zone (RR5) to the west and north;
- Rural Heavy Industrial Zone (RH1) followed by Mineral Extraction Zone (ME2) to the east of the Site following Albion Road; and
- Rural Commercial Zone (RC and RC3) to south and southeast of the Site, respectively; and Mobile Home Zone (RM3) to the southwest.

The neighbouring land uses generally include the following:

- The neighbouring land to the south includes Mitch Owens Road followed by wooded land and high-density residential developments, including the Albion Sun Vista mobile home community, between 160 m and 400 m from the southern property limit of the Site;
- East of the Site, following Albion Road, is un-developed grass land with the exception to the portion of the land in the vicinity to the Mitch Owen Road and Albion Road intersection which includes an asphalted structure across the ground surface;
- West of the Site is wooded in addition to an unevaluated wetland, as identified by the City of Ottawa (Further details are provided in subsequent sections); and
- North of the subject Site is a residential subdivision development.

2.5 Hydrology

The Site is generally flat with a slight incline mound at the northern portion of the property, in the location of the septic disposal field. According to a topographic survey completed for the Site, included **Attachment A**, in support of the proposed re-development activities, the top of the incline is approximately 104 amsl, and the toe of the mound has an elevation of approximately 103 m amsl. The Site has a slight slope to the south, towards Mitch Owens Road. Elevations along the southern extent of the site range between 103.7 and 102.5 m amsl.

The Site is fitted with storm water structures, including catch basins and buried catchment drainage piping. These systems set in place are used to collect and control surface runoff across the Site and distributes it into accepted City services and infrastructure for further off-Site handling. No swales or drainage courses are present on the subject Site. A municipal ditch however does run in a general east-west direction along Mitch Owens Road, along the adjacent lands to the west. Based on the topography of the site, and site features, it is inferred that the property drainage pattern flows south towards Mitch Owens Road.

A watercourse is located on the neighbouring property to the west; however, the City of Ottawa identifies it as a 'ditch' in the interactive mapping system, geoOttawa. As discussed in greater detail below in Section 2.6, the wooded lands located immediately west of the Site, and the neighbouring lands to the north, are identified to contain unevaluated wetlands according to provincial mapping systems (Ministry of Natural Resources and Forestry, Make a Map: Natural Heritage Areas). The location of the wetlands identified are presented in **Figure 3**. Such natural features may be indicative of the possibility for elevated seasonal saturated conditions on, or in the vicinity of the Site. Storm water management designs are considered a suitable approach to mitigate possible concerns to the developed portion of the Site resulting from these features, in additional to recognized setbacks requirements and additional engineering controls to sensitive features (i.e. sump pumps in building basement, where applicable). Storm water management is discussed in greater detail in the Stormwater Management Report and Servicing Brief, Site Re-Development MacEwen Albion, 5546 Albion Road, Gloucester, Ontario report prepared by LRL, dated December 22, 2022, and included in the re-development application submission package to the City of Ottawa.

2.6 Natural Heritage Features

A watercourse has been identified in the vicinity of the Site, on the neighbouring land to the west. According to the City of Ottawa's interactive mapping system, geoOttawa, the watercourse is further defined as a ditch, extending approximately 5.0 m from the western Site boundary. The extents of the proposed development footprint, excluding the landscaped grassed portion of the Site, is within 30 metres of the watercourse. LRL has been requested to complete an Environmental Impact Study to provide greater detail of this natural feature and acceptable mitigation measures to reduce possible impacts to the quality of the watercourse. The findings of this study are presented in the Environmental Impact Study report, prepared by LRL, dated January 11, 2023.

The wooded lands located immediately west of the Site, and the neighbouring lands to the north, are identified to contain unevaluated wetlands according to provincial mapping systems (Ministry of Natural Resources and Forestry, Make a Map: Natural Heritage Areas). The location of the wetlands identified are presented in **Figure 3**.

GEMTEC Consulting Engineers and Scientists Limited (GEMTEC) were retained by MacEwen Petroleum Inc. to complete a Wetland Boundary Assessment for unevaluated wetland on the neighbouring lands. The assessment was initiated to confirm the extents of the unevaluated wetland in support planning and design of the proposed re-development of the Site. The conclusions of the report revealed that the unevaluated wetland boundaries, based on vegetation species, extends approximately 30 m from the western boundary of the Site. A copy of this report is included **Attachment B**.

2.7 Geology & Hydrogeology

2.7.1 Geological Mapping

Surficial soil deposit mapping[1] indicates that the surficial geology is fine- to medium-grained sand, calcareous and commonly fossiliferous; nearshore sand generally occurs as a sheet or as bars or spits associates with glaciofluvial materials. The surficial mapping details are presented in **Figure 4**. Bedrock mapping[2] indicates that the bedrock is described as the Oxford Formation: dolomite and limestone. The bedrock mapping details are presented in **Figure 5**.

The surficial overburden, and more specifically the confining clay layer, which is anticipated to restrict impacts from the proposed Site operations to the local supply aquifer, are summarized below in the summary table. Using details revealed through the previously completed intrusive investigation on the Site, in support of the proposed re-development (Geotechnical Investigation, June 2022 as detailed in Section 4.3; and Phase II Environmental Site Assessment January 2023 as detailed in Section 4.2), the soil characteristics, including the clay layer at the northern portion of the Site, are inferred to be as follows:

- Northern extent of the Site, represented by BH2; BH3; BH22-5; and BH22-9 (as presented in **Figure 9**):

Borehole Reference Identification	Clay Characteristics
BH2	Encountered from between 2.9 and 4.4 m below grade. Grey in colour, saturated, firm with traces of sand, silty. In-situ vane shear testing readings were found to be in the range of between 30 and 38 kPa. Particle size analysis (Geotechnical Investigation, June 2022) of a sample collected from between 3.05 and 3.66 m below grade from BH2 (sample BH2-SS-5) was reported to have a D60 value of 0.0038 and a D50 value o 0.0026. No D10 value was derived in the analysis report based on the consistency of the clay. However, interpretation of the curve of the analysis for BH2-SS-5, it is found that the D10 values would be approximately 0.0003. Using the Slichter (1899) method, the hydraulic conductivity of the clay, specifically in the sample collected from depths between 3.05 and 3.66 m below grade, and is considered representative of the clay material encountered, was interpreted to be approximately $1x10^{-5}$. A copy of the particle size analysis is included in **Attachment C**.
BH3	Encountered from between 2.9 and 4.1 m below grade. Grey in colour, saturated, firm with traces of sand, silty. In-situ vane shear testing readings were found to be in the range of between 30 and 38 kPa. No particle size testing was performed on the clay encountered in BH3, however is considered comparable to that of BH2 discussed above.
BH22-9	Encountered from 3.8 m below grade, to at least 4.6 m below grade, where the borehole was terminated. Grey in colour, silty. No further in-situ testing was performed on the clay material in the location, however, based on its vicinity to BH2, the characteristics of the clay described above should be comparable.

[1] St-Onge, D.A., Surficial Geology, Lower Ottawa Valley, Ontario, Map 2140A, Geological Survey of Canada, 2009.
[2] Richards, J.H., Generalized Bedrock Geology, Ottawa-Hull, Ontario and Quebec, Map 1508A, Geological Survey of Canada, 1979.

- Clay was not encountered in borehole BH22-5, but rather glacial till, with traces of clay, beneath a sand layer extending between 0.6 and 3.6 m below grade;
- Central portion of the Site, represented by BH4; BH22-3; BH22-4; and BH22-10 (as presented in **Figure 9**). Clay was not encountered in these boreholes, which extended to depths of between 4.6 and 6.7 m below grade. Rather a glacial till, being clayey to with traces of clay, was found commencing at depth from between 3.7 and 4.5 m below grade, to the extent of the boreholes; and
- Southern extent of the Site, represented by BH22-1; BH22-2 and BH22-6 (as presented in **Figure 9**). Clay was not encountered in these boreholes, which extended to depths of between 4.6 m below grade. Rather a glacial till, with traces of clay, was found commencing at depth from between 2.8 and 3.5 m below grade, to the extent of the boreholes.

Based on the underlying overburden conditions encountered across the Site, at the time of the previous geotechnical and environmental investigations, it is anticipated that the clay confining layer is present at the northern extent of the subject property, with a hydraulic conductivity of $1x10^{-5}$. It is anticipated that this area includes the area of the proposed septic disposal system, which will act as a confining layer to the supply aquifer by possible septic effluent impacts. Select locations, namely the central and southern portion of the Site, did not encounter a district clay layer. **Figure 11** and **Figure 11A** depicts the approximately inferred extent of the clay subsurface material encountered as well as overall overburden conditions, and a further visual depiction of the underlying conditions anticipated to be present across the Site based on previous intrusive investigations. Bedrock was encountered in the on-Site supply well (discussed in Section 2.8) at a depth of 16.5 m below grade.

According to the Brunton, F.R. and Dodge, J.E.P. Karst map of Southern Ontario, including Manitoulin Island; Ontario Geological Survey, Groundwater Resource Study 5, 2008, known areas to potential areas of karst geology is present in the vicinity of the Site, namely to the south. The Site and adjacent land to the east and west are identified as “Unknown or no observed evidence of karstification due to the character of bedrock, lack of outcrop and/or relative thickness of overburden.” Based on the available well record for the on-Site supply well, bedrock on the Site is anticipated to be encountered at depths of approximately 16.5 m below grade.

2.7.2 Well Head Protection

Initial pre-consultation discussions with the City of Ottawa, September 22, 2021, revealed that the proposed development is located within the wellhead capture zone for the neighbouring Albion Sun Vista communal supply well system. This communal well is located downgradient (south) of the subject Site, following Mitch Owens Road and is sourced by the shallow bedrock aquifer which is hydraulically connected to the sand/gravel/till overburden recharge zone.

A copy of the *Wellhead Protection Area Plan, Albion Sun Vista Community & Peer Review – Albion Sun Vista Wellhead Protection Area Plan* report, prepared by Trow Associates Inc. and Jacques Whitford Environmental Limited, dated June 2004, was provided to LRL from the City of reference. The report outlines details of the identified Wellhead Protection area, as well as clearly indicating appropriate recommendations to protect the drinking water source of the communal supply well.

The study interpreted a groundwater flow model that was initiated to determine the likely time of travel within the Albion Sun Vista Community capture zones. The modeling took into consideration local potential contamination sources to evaluate the relative risk of these areas towards the communal well. Seven (7) sites were identified to have, or potentially have uses and activities with the potential for contamination impacts to the groundwater within the wellhead capture zone, the risk to the communal wells supply aquifer was considered low to moderate due to the

underlying low permeable layer present. The Site, as discussed herein, was identified as a potential for contamination impacts, based on its up-gradient location and facility operations. Based on the modelling included as part of the study, 5546 Albion Road is inferred to encompass the 50 Day – 2 Year Capture Zone, which signifies that groundwater can travel through the capture zone in less than two (2)-year time (Zone 1).

An exert of the 50 Day – 2 Year Capture Zone, as included in the Wellhead Protection Plan, is included in **Figure 6A**. Furthermore, exerts from this previous report depicting the following are included:

- The two (2) to ten (10)-year time capture zone (Zone 2) is presented in **Figure 6B;**
- The ten (10) to 25 – year time capture zone (Zone 3) is presented in **Figure 6C**; and
- The capture zone limit is included in **Figure 6D**.

Based on the pre-consultation with the City of Ottawa, it has been indicated that **the proposed re-development of the Site (pre- and post- construction activities) must follow the recommendations set out in the Wellhead Protection Area Plan documentation prepared by Trow Associates Inc. and Jacques Whitford Environmental Limited, dated June 2004 to protect the communal supply aquifer.** These recommendations are reiterated in Section 11, with greater detail on how the proposed re-development of the Site will follow the recommendations, but are summarized as follows:

- The sand and gravel unit, set over the bedrock layer, acts as the recharge area of the supply aquifer. A Spill & Risk Management shall be implemented, including the best management practices, spills prevention plan, spills response plan, staff training requirements outlined therein, during construction and throughout the operational period of the Site;
- Prior to finalization of the re-development of the Site, a sounding inspection of the exiting well grouting should be completed by a licenced well installer to confirm that the bedrock aquifer intercepted by the supply well construction is isolated from possible surficial impacts (i.e. spills);
- All underground storage tanks must be equipped with interstitial monitoring systems and the tanks and associated piping should have leak detection systems in place; and
- A monitoring program of the Site's supply well must be established to provide ongoing water quality information. This should include monitoring on an annual basis for general water quality parameters and metals in addition to parameters often associated with fuel dispensing and handling facilities: petroleum hydrocarbons (PHC) Fractions F1 through F4; and Volatile Organic Compounds (VOCs) including Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

The *Wellhead Protection Area Plan, Albion Sun Vista Community & Peer Review – Albion Sun Vista Wellhead Protection Area Plan* report is summarized in below in Section 4.1. Clear risk prevention measures with respect to the Wellhead Protection Area, specifically those to be implemented on the Site by the Owner, are generally presented in Section 9. A formal Construction Risk Management Plan for Source Water Protection, a Spills Prevention and Risk Management Plan (which will include staff training and record keeping as a risk management measure), and the Monitoring Program will be prepared.

Furthermore, to support the protection of the local communal well, as outlined in the Wellhead Protection Plan Report (Jacques Whitford, 2004), the distribution of clay encountered across the Site requires detail characterization, as provided above in Section 2.7.

A copy of this report can be made available from the City of Ottawa, upon request.

2.7.3 Recharge Areas

Locally, the groundwater recharge zone for the bedrock supply aquifer is most likely the unconfined soil conditions encountered to the north, east and west of the Site, across the vast area of wooded and undeveloped land. Surficial geological mapping available from the Ontario Ministry of Northern Development, Mines, Natural Resources and Forestry, interactive mapping system reviewed as part of this assessment, reveal that the following surficial conditions are present.

- Glaciomarine and Marine Deposits: sand, gravelly sand and gravel, nearshore and beach deposits;
- Glaciofluvial ice-contact deposits: gravel and sand, minor till, includes esker, kame, end moraine, ice-marginal delta and subaqueous fan deposits; and
- Till: undifferentiated, predominantly sandy silt to silt matrix, commonly rich in clasts, often high in total matrix carbonate content.

Each of which are considered to have a suitable permeability which could attribute to infiltration and bedrock aquifer recharge.

2.7.4 Hydrogeologically Sensitive Areas

The Site is not considered Hydrogeologically Sensitive in regard to shallow soils or bedrock outcrops. Review of geological mapping and additional supporting documents, including MECP water well records, have revealed a deposit of overburden greater than 1.5 m in thickness. This was further confirmed through the advancement of boreholes across the Site at the time of additional sub-surface investigation fieldwork completed by LRL, in support of the proposed development application. These additional investigations included a Geotechnical Investigation and a Phase ll Environmental Site Assessment. No bedrock outcrops were encountered at the time of LRLs Site visits associated with the corresponding investigations and assessments.

Subsurface conditions encountered during these studies are summarized as follows, although greater detail is available in the corresponding reporting documents completed for the respective investigations. Copies of the borehole logs from the Phase ll Environmental Site Assessment and Geotechnical Investigation are included in **Attachment D**, and further detail pertaining to each summary, including chemical analysis and conclusions are provided in Section 4.

Geotechnical Investigation (June 2022):

Topsoil was found to have a thickness of 75 mm in a borehole advanced at the general central portion of the Site, on the grassed landscaped area of the property. The remaining boreholes, advanced across the asphalted parking and circulation areas of the Site revealed the presence of consisting of 100 mm thickness of asphalt overlying granular material have a thickness of 300 – 400 mm. The pavement structure, and topsoil, was followed a fill material to depths ranging between 1.06 and 1.75 m bgs. The fill was generally be described as a mixture of brown sand and gravel.

Underlying the fill was sand that extended to depths ranging between 2.97 and 6.71 m bgs. This material can be described as having trace silt, trace clay, greyish brown, and wet. Two (2) boreholes advanced to the north of the existing store encountered a thin layer of silt and clay under the sand layer, to depths of between 4.12 and 4.42 m bgs. This material can be described as having trace sand, grey, and wet.

Glacial Till was encountered under the sand, or silt and clay materials which extended to a depth of 6.71 m bgs, where the boreholes were terminated. This material can be described as a mixture of silt-sand, some gravel sized stone, trace clay, grey, and wet.

As part of the investigation, select soil samples were submitted for laboratory gradation analyses. The results of these analysis are summarized as follows:

Sample Location	Depth (m)	Percent for Each Soil Gradation							Estimated Hydraulic Conductivity 'K' (m/s)
		Gravel		Sand			Silt (%)	Clay (%)	
		Coarse (%)	Fine (%)	Coarse (%)	Medium (%)	Fine (%)			
BH1	1.5 - 2.1	0.0	0.0	0.1	24.0	66.1	8.9	0.9	2×10^{-7}
BH2	3.1 - 3.7	0.0	0.0	0.2	0.4	5.4	51.6	42.4	1×10^{-7}
BH3	4.6 - 5.2	0.0	12.0	5.9	9.1	26.6	42.7	3.7	2×10^{-6}

Phase II Environmental Site Assessment (January 2023)

The subsurface soil conditions in the area investigated on the Site generally consist of asphalt structure beneath approximately 0.1 m of asphalt followed by fill to depths between 0.4 and 1.8 m bgs, sand to depths between 2.8 and 4.5 m bgs, and silty till to a depth of 4.6 where the boreholes were terminated. The fill generally consists of medium-grained sand with gravel and stones, and black silty organics. The overburden material was moist at depths between 1.2 and 1.7 m bgs and saturated at depths between 1.5 and 2.1 m bgs.

The Site is considered Hydrogeologically Sensitive due to its proximity to the wellhead capture zone for the neighbouring Albion Sun Vista communal supply well system as discussed above in Section 2.7.2.

According to the Brunton, F.R. and Dodge, J.E.P. Karst map of Southern Ontario, including Manitoulin Island; Ontario Geological Survey, Groundwater Resource Study 5, 2008, known areas to potential areas of karst geology is present in the vicinity of the Site, namely to the south. The Site and adjacent land to the east and west are identified as "Unknown or no observed evidence of karstification due to the character of bedrock, lack of outcrop and/or relative thickness of overburden."

2.7.5 Potential Sources of Contamination

As part of this assessment, a desktop review of potential sources of contamination to the supply aquifer was completed. This review was completed with general reference to Ontario Regulation 153/04, which is the provincial regulation which is most often referenced when considering the environmental conditions of a Site. The regulation outlines possible Potential Contaminating Activities (PCA) which can be associated with impairment or impacts to the quality of the subject property conditions. The review revealed the following potential sources of contamination, and the corresponding PCA as set out by Ontario Regulation 153/04.

The subject Site is presently operated as a retail fuel dispensing facility equipped with underground petroleum storage tanks, and associated petroleum dispensing equipment (piping and dispensing pumps). The property has been used for its current operations since at least the mid to late 1990's. Petroleum handling and dispensing facilities are often considered a high risk for potential impairment to subsurface quality and conditions. Ontario Regulation 153/04 considers the "*Gasoline and Associated Products Storage in Fixed Tanks*" as a PCA (PCA 28). Therefore, the Site operations have been identified as a potential source of contamination.

Confining aquifer conditions, like that present in the area of the Site, may be considered less likely to be impacted by the possible contamination sources, although in cases of damaged bedrock

supply well seals/grouting, contamination within shallow aquifers may penetrate down into deeper points.

A large aggregate extraction facility is located approximately 390 m northeast and 600 m east of the Site. Aggregate extraction (pits and quarries) is also considered a high risk for potential contaminant to the natural environment, and aquifers mainly due to the equipment usage, and activities. Disturbance to aquifers can be the result of operational de-watering activities and blasting. Mechanical and equipment malfunctions can result in chemical spills (i.e. petroleum hydrocarbons) which could infiltrate into possible drinking water sources or impair the surficial materials at the facility. Ontario Regulation 153/04 considers the "*Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems*" a PCA (PCA 52).

The historical industrial/commercial development previously occupying the property located immediately east of the Site, following Albion Road, is also identified as a potential source of contamination. Little detail regarding the historical operations which took place at the property from between at least the mid 1970's and 2019. Available aerial imagery retrieved through the City of Ottawa's interactive portal, geoOttawa, reveal the presence of a fueling station along the southern extent of the property. The storage container (tank) appeared to be above-grade, and the contents are unknow. In the 2014 aerial imagery, numerous pieces of heavy machinery and large vehicles are visible across the property. The activities, namely the inferred re-fueling station at the south of the property, are considered a potential source of contamination, generally comparable to the activities at the subject Site. PCA identified with the historical land use, as per Ontario Regulation 153/04 include "*Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems*", and "*Gasoline and Associated Products Storage in Fixed Tanks*".

2.8 Ontario Water Well Records

A search was conducted of the well records from the MECP Water Well Record (WWR) department. The search by UTM coordinates covered a 500 m radius from the site. The search returned 70 WWRs. A copy of the WWRs is included in **Attachment E** and their approximately locations are presented in **Figure 7**.

The records of the wells within 500 m of the Site revealed that the wells are drilled wells extending to depths between 14.0 and 67.9 m. The well records show that that the geological conditions within 500 m are generally similar and consist of sand or sand and gravel mix, followed by clay over bedrock. Glacial till material was encountered in select wells retrieved, and additionally, clay was not identified in all locations. The bedrock typically includes limestone, sandstone, or a combination of both. Two (2) well records retrieved, Well No. 1501837 approximately 385 m north of the Site, and Well No. 1501841, the supply well for the site, have granite rock listed.

Inferred subsurface profiles cross sections are presented in **Figure 8A** through **Figure 8B** and include select wells in the vicinity of the cross-section segments as shown in **Figure 7**. The general overburden conditions encountered in the wells within 500 m of the site are as follows:

MECP Well Number	Distance and Direction From Site (m)	Depth (m)	Overburden Details						
			Topsoil/ Clayey Loam (m)	Sand/ Gravel/Till (m)	Clay (m)	Weathered Bedrock/ Bedrock (m)	Groundwater Encountered (m)	Static Water Level (m)	Type of Water

2.8.1 Water Well Record Summary

Based on the details of the well records obtained in the area (within 500 m of the Site) the aquifer can yield a sufficient amount to supply the proposed development on the Site in the long term. For example, pumping test results from select neighbouring wells within 500 m of the Site, indicate the bedrock aquifer being able achieve 189 L/min over 60 minutes utilizing approximately 84% of the available drawdown; and a pumping rate of 75.7 L/min over 60 minutes utilizing approximately 95% of the water column available. The locations of wells within 500 m are presented in **Figure 7.** A summary of the quantity of water of select neighboring wells within a 500 m radius of the Site is as follows:

MECP Well Number	Distance and Direction from Site	Depth (m)	Pump Test Details					
			Pump Rate (L/min)	Duration (min)	Drawdown (m)	Specific Capacity (L/Sec/m)	Recovery (%)	Recommended Pump Rate (L/min)
1510978	40 E	26.5	45.4	120	10.6	0.0713	--	18.9

xx Well Described in Greater Detail Above (available drawdown)

2.9 Shallow Overburden Groundwater Monitoring Wells

MacEwen Petroleum Inc. retained LRL to complete a Phase II Environmental Site Assessment (ESA) on the Site in the context of property redevelopment. The assessment was completed to determine if recognized potential environmental concerns have negatively impacted soil and groundwater quality of the subject Site. The potential environmental concerns identified that requires investigation includes:

- The past and present Site operations as a retail fuel outlet, and corresponding fuel dispensing equipment;
- The historical fueling station, and presence of heavy machinery on the neighbouring lands to the east following Albion Road (5545 Albion Road) encountered in aerial imagery obtained from between the period of mid 1970's and 2019; and
- The mineral aggregate operations on the neighbouring land approximately 390 m northeast.

To address these concerns, an intrusive investigation was carried out on July 28 and 29, 2022 by LRL. Further details pertaining to the findings of the Phase II Environmental Site Assessment, namely concentrations of contaminates encountered, contamination plumes, and recommendations are described below in Section 11. This section pertains solely to the geological and hydrogeological characteristics across the Site.

A total of ten (10) boreholes were advanced across the Site. The subsurface soil conditions in the area investigated on the Site generally consist of asphalt structure beneath approximately 0.1 m

of asphalt followed by fill to depths between 0.4 and 1.8 m bgs, sand to depths between 2.8 and 4.5 m bgs, and silty till to a depth of 4.6 where the boreholes were terminated. The fill generally consists of medium-grained sand with gravel and stones, and black silty organics. The overburden material was moist at depths between 1.2 and 1.7 m bgs and saturated at depths between 1.5 and 2.1 m bgs.

Four (4) boreholes were completed as monitoring wells: BH22-1, BH22-2, BH22-3 and BH22-4 (herein referred to as MW22-1, MW22-2, MW22-3, and MW22-4). Monitoring wells were constructed within the 91 mm diameter boreholes with a 51 mm slotted PVC piezometer. The top of the screen was extended to the ground surface using a solid riser pipe. Annular space around the slotted portion of the piezometer was backfilled with pre-washed and graded silica sand up to 300 mm above the top of the screen. A bentonite seal was placed above the sand pack and bentonite was used to fill the remainder of the hole to the surface. Monitoring wells were finished at the surface with a flush-mount aluminum casing.

The locations of the monitoring wells are described as follows:

Monitoring Well Identification	Location
MW22-1	Southeast portion of the Site.
MW22-2	Southeastern portion of the Site
MW22-3	Vicinity of the petroleum dispensing pump islands
MW22-4	Vicinity of the petroleum dispensing pump islands

The borehole and monitoring well locations are presented in **Figure 9**, and a copy of the borehole logs are included in **Attachment D**. Static groundwater elevations were measured at each monitoring well prior to the respective sampling activities and are summarized in the following Table. Groundwater depth measurements were between 1.77 and 1.98 m bgs, which corresponded to elevations between 98.15 and 98.43 m, with respect to an arbitrary benchmark established and assigned an elevation of 100.00 m.

The groundwater elevations and interpreted flow contours are shown in **Figure 9**. Based on these elevations the groundwater flow direction on the Site is towards the south-southwest.

Monitoring Well	Ground Surface Elevation (m)	Reference Elevation (m)	Depth to Water Table (m)		Groundwater Elevation (m)
			Reference Point	Ground Surface	
MW22-1	100.17	100.06	1.67	1.77	98.39
MW22-2	99.94	99.86	1.71	1.79	98.15
MW22-3	100.20	100.13	1.91	1.98	98.22
MW22-4	100.21	100.10	1.67	1.78	98.43

3 PROPOSED DEVELOPMENT

It is anticipated that the existing features mentioned above in Section 2 will be decommissioned or demolished, and removed from the Site accordingly, and replaced as follows:

- 400 m² single-story convenience store at the central portion of the Site;
- An approximately 525 m^2 concrete apron with overhead canopy;
- Four (4) underground storage tank, including the following:
  - 25 000 L capacity, fiberglass diesel fuel storage tank;
  - 25 000 L capacity, fiberglass super grade gasoline storage tank; and
  - Two (2) 65 000 L capacity, fiberglass regular grade gasoline storage tank.
- Six (6) fuel dispensing pumps; and
- New private sewage disposal system at the northwest portion of the Site, as described in greater detail herein.

The location and dimensions of the existing and proposed features are presented in **Figure 2** and **Figure 10,** respectively. It should be noted that during the redevelopment of the Site, soils with impacts from the on-going fuel dispensing activities (as identified in the Phase II Environmental Site Assessment, LRL, 2023) will be remediated accordingly and as considered practical, and the formal summary report will be submitted to the Technical Standards and Safety Authority (TSSA), and all other required regulatory authorities. A post re-development groundwater monitoring plan will be prepared and followed as discussed in Section 11.

Additionally, soils included in the existing sewage disposal system will be removed from the Site and disposed of accordingly. The Demolition Plan (C102) included in the proposed re-development application package to the City includes a note with reference to the area of the existing sewage disposal system to be removed.

To protect the local supply aquifer, namely that of the neighbouring residential development with a communal supply well, the low conductivity layer (clay) present at the northern portion of the Site should be protected during the redevelopment activities. The proposed construction activities associated with the re-development should not puncture the low conductivity layer, unless it is to remove known contaminates which will pose a notable risk to the environmental quality and conditions of the Site and neighbouring lands.

The proposed construction activities associated with the re-development will include:

- The removal and replacement of the underground petroleum storage tanks.
  - As presented in the included **Figure 11**, the proposed underground storage tanks will be positioned in the general same location as their existing position, with a slight shift towards the east and north, and the inclusion of two (2) additional tanks to the west of the exiting installations.
  - The excavation associated with the installation of underground storage tanks of this size (two (2) at 65,000 L capacity and two (2) at 25,000 L capacity) generally extends to a depth of approximately 4.2 m below grade, which includes 0.6 m of granular underlying the installations.
  - The majority of excavation related to the installation of the underground storage equipment will include the area presently encompassed by the current installations.

  - Based on the finding of the Phase II ESA, prepared by LRL (2023), although petroleum hydrocarbon-based contamination was not identified in the sampling program completed, it was inferred that underlying soils within the existing tank nest (i.e. fill around the installations) and under the fuel dispensing pumps may be impacted. This area is estimated to be 300 m^2 (tank nest area) and 450 m^2 (pump island area). Based on the properties of petroleum-based contaminates (LNAPL), they are often limited to the depth of the groundwater table. The boreholes advanced as part of the Phase II ESA revealed that groundwater was encountered at depths of between 1.2 – 2.1 m below grade, which can suggest that impacted overburden is likely limited to these depths.
  - Further discussion and procedures related to the excavation of the impacted material are included in the Construction Management Plan.
- The removal and replacement of the fuel dispensing equipment (i.e. fuel dispensing pumps and corresponding piping and lines) and the overhead canopy.
- The removal of existing asphalt and cement structure and features, as presented in the Demolition Plan (C102) included in the proposed re-development application package to the City.
- The removal and replacement of the sewage disposal system on the northern portion of the Site.
- The removal and re-construction of the convenience store.
  - It should be noted that the convenience store will be comparable to that of the existing one on the site with no significant quantities of fuels, oils or lubricants stored. Those which are present are in small quantities and contained in sealed containers for retail. No vehicle repair or carwash operations presently occur on the site, nor are they anticipated.

Further details with respect to training, construction management, spill & risk management to be followed at the Site, will be included in a Construction Risk Management Plan for Source Water Protection, a Spills Prevention and Risk Management Plan (which will include staff training and record keeping as a risk management measure), and the Monitoring Program – will be prepared and reviewed by the City as a condition of the site plan agreement.

4 PREVIOUSLY PREPARED REPORTS

4.1 Wellhead Protection Area Plan, Albion Sun Vista Community & Peer Review – Albion Sun Vista Wellhead Protection Area Plan, June 2004

The report was prepared by Trow Associates Inc. and Jacques Whitford Environmental Limited in support of a Wellhead Protection Study carried out for the water wells that supply the existing and proposed expansion of the Albion Sun Vista Community mobile home park located in the vicinity of the community now known as Greely, formerly the Osgoode Township within the City of Ottawa. The Wellhead Protection Study was completed to identify the supply aquifer which services the respective communal well for the Albion Sun Vista Community as well as to identify and locate existing and potential areas of contamination situated within the corresponding capture zone of the communal well.

The study interpreted a groundwater flow model initiated to determine the likely time of travel within the Albion Sun Vista Community capture zones. The modeling took into consideration local

potential contamination sources to evaluate the relative risk of these areas towards the communal well. The study generally concluded the following:

- Recharge zone for the supply aquifer of the communal wells includes the sand and gravel overburden layer extending approximately 1.5 km northeast of the Site;
- The presence of a low permeability zone consisting of clay and silt was identified above the deeper water supply aquifer located within the capture zone, downgradient of the corresponding communal wells recharge zone. This low permeability zone is anticipated to reduce possible impacts from surface sources;
- Although seven (7) sites were identified to have, or potentially have uses and activities with the potential for contamination impacts to the groundwater within the wellhead capture zone, the risk to the communal wells supply aquifer was considered low to moderate due to the underlying low permeable layer present; and
- The following recommendations were specified to protect the communal wells supply aquifer and source zone:
    - It was recommended that source protection measures to the sand and gravel layer should be implemented which can include limiting the land uses within the identified recharge area to those of lower risk;
    - All wells constructed within the capture zone should be constructed accordingly so that there is prevention of downward drive of contamination through the low permeable layer into the supply aquifer. Penetration of the low permeability layer can result in impacts to the underlying aquifer;
    - Installation and sealing of well casings should be completed under supervision of a qualified person, such as a professional geoscientist or a professional engineer;
    - Underground storage tanks, installed within the identified 10-year Time-of-Travel zone, should be equipped with an interstitial monitoring system. Leak detection units should equip the tanks and associated piping at these locations;
    - An on-going water quality monitoring program should be established to verify the on-going water quality of the upgradient region from the site. This includes the monitoring of the supply well at 5446 Albion Road (rather, it is inferred that this should read 5546 Albion Road), where it is recommended that annual monitoring for petroleum-based parameters be completed, including petroleum hydrocarbons and volatile organic compounds; and
    - A monitoring well should be constructed on the northern extent of the Albion Sun Vista Community property. It was recommended that samples from this monitoring wells should be collected for analysis in accordance with Schedule 13 of the Ontario Regulation 170/03 for a groundwater source. Furthermore, it was recommended that the proposed monitoring well be sampled for total petroleum hydrocarbons and select volatile organic compounds, namely BTEX, annually.

A copy of this report can be provided upon request to the City of Ottawa.

4.2 Phase II Environmental Site Assessment, 5546 Albion Road, Ottawa, Ontario, March 17, 2023

The report was prepared by LRL for MacEwen Petroleum Inc. in support of the proposed Site re-development application. The assessment was completed as per CSA Standards. The purpose of a Phase II Environmental Site Assessment (ESA) was initiated to determine if recognized

potential environmental concerns have negatively impacted soil and groundwater quality of the subject Site. The potential environmental concerns identified that requires investigation includes:

- The past and present Site operations as a retail fuel outlet, and corresponding fuel dispensing equipment;
- The historical fueling station, and presence of heavy machinery on the neighbouring lands to the east following Albion Road (5545 Albion Road) encountered in aerial imagery obtained from between the period of mid 1970's and 2019; and
- The mineral aggregate operations on the neighbouring land approximately 390 m northeast.

Contaminants of potential concern (COPCs) include: Petroleum Hydrocarbon Compounds (PHCs), Volatile Organic Compounds (VOCs), Polycyclic Aromatic Hydrocarbons (PAH), Polychlorinated Biphenyls (PCBs), metals, and inorganics.

Regulatory requirements for assessing environmental conditions of a site are established by Ontario Regulation 153/04 – Records of Site Conditions, Part XV.1 of the Environmental Protection Act (O. Reg. 153/04). Site condition standards are set out in the MECP's "Soil, Ground Water and Sediment Standards for Use Under Part IV.1 of the Environmental Protection Act", April 15, 2011, as amended. The applicable SCS used was the Table 2 Full Depth Generic Site Condition Standards in a Potable Groundwater Condition, commercial property use and coarse-textured soils.

The investigation involved advancing ten (10) boreholes across the Site at strategic locations based on areas of potential environmental concern. Four (4) of the boreholes were completed as monitoring wells to assess hydrogeological conditions and facilitate groundwater sampling.

The subsurface soil conditions in the area investigated on the Site generally consist of asphalt structure beneath approximately 0.1 m of asphalt followed by fill to depths between 0.4 and 1.8 m bgs, sand to depths between 2.8 and 4.5 m bgs, and silty till to a depth of 4.6 m where the boreholes were terminated. The fill generally consists of medium-grained sand with gravel and stones, and black silty organics. The overburden material was moist at depths between 1.2 and 1.7 m bgs and saturated at depths between 1.5 and 2.1 m bgs. No olfactory or visual evidence of petroleum hydrocarbon impacts were observed in the soils collected from all boreholes. The combustible soil vapours (CSV) concentrations measured in the soil samples collected ranged between less than the machine detection limit (<0.1 ppm) and 0.7 ppm.

Based on the groundwater elevations measured on August 2, 2022, at the time of groundwater monitoring well development, the groundwater flow direction in the overburden is interpreted to be towards the south-southwest. Headspace VOC levels in MW22-1, MW22-2, MW22-3, and MW22-4 were 0.6 ppm, 3.2 ppm, <0.1 ppm, and 0.7 ppm, respectively, prior to development of the wells. During the sampling event, following purging, the levels were <0.1 ppm, 1.0 ppm, 0.1 ppm, and 0.4 ppm, respectively.

Select soil and groundwater samples were submitted for analysis to establish if areas of potential environmental concern have negatively impacted soil and groundwater conditions. In the soil, VOC and PAH parameters analysed were not detected in any of the samples submitted for analysis. Select PHC and metals parameters analysed were detected, however levels were measured below applicable Table 2 SCS's. The general inorganic parameters analysed met the applicable standards with the exception of BH22-4-SS1A which exceeded for conductivity with a level of 1430 µS/cm, above the SCS of 1400 µS/cm.

In the groundwater, VOC, PAH, and PCB parameters were not detected in the samples submitted. PHC F3 and F4 were detected in MW22-1, however levels were measured below the SCSs of

500 µg/L. Select metal parameters were detected, however all levels are below the applicable SCS's with the exception of sodium in MW22-1, MW22-2, MW22-3 and MW22-4 with levels of 708 000 µg/L, 702 000 µg/L, 531 000 µg/L and 715 000 µg/L, respectively, above the SCS of 490 000 µg/L. The duplicate of MW22-2 was below the SCS with a level of 307 000 µg/L. Chloride exceeded the applicable SCS of 790 µg/L in MW22-1 (1500 µg/L), MW22-2 (1350 µg/L and duplicate 1360 µg/L), and MW22-3 (980 µg/L).

The report indicates that based on the observations during drilling activities, along with screening of samples and laboratory analysis, there is evidence of conductivity impacts to the surface soil in the southeast portion of the Site, and sodium and chloride impacts in the groundwater across the Site. The horizontal and vertical extent of contaminated soil has not been fully delineated; however, it is anticipated that the fill across the majority of the Site maybe contaminated. It was recommended that if groundwater monitoring wells are not required for future monitoring purposes, they should be decommissioned in accordance with O. Reg. 903.

During the proposed re-development activities of the Site, an environmental remediation program will be implemented to address the identified or anticipated impacted overburden across the southern extent of the Site. The environmental remediation program will support the future protection of the on-Site supply well, in addition to the further protection of additional natural features and aquifers from possible contamination and damage in the long term. As presented in the Phase ll Environmental Site Assessment, and discussed above in this section, generally contaminates associated with fuel handling facility were not encountered, although suspected to be present in the surrounding soils encompassing the underground storage tanks, and in the area of the pump islands, which could not be investigated due to the risk of damaging the fuel handing equipment.

Following the Technical Standards and Safety Authority's (TSSA) Environmental Management Protocol for Fuel Handling Sites in Ontario, August 2012 (formerly GA1/99), contaminated soils will be remediated to conditions which meet the corresponding site conditions standards, as best possible. Caution will be taken to not puncture the confining clay barrier, which acts as a protective layer to the neighbouring supply aquifer. Should restrictions to the excavation activities be encountered, alternative remediation methods will be implemented.

4.3 Geotechnical Investigation, Proposed Site Redevelopment, 5546 Albion Road South, Ottawa, Ontario, June 2022 (Revised November 2023)

LRL was retained by MacEwen Petroleum Inc. to perform a geotechnical investigation for the proposed site redevelopment, located at 5546 Albion Road Street South, Ottawa, Ontario. The purpose of the investigation was to identify the subsurface conditions across the Site and provide guidelines on the geotechnical engineering aspects of the design of the project, including construction considerations.

The fieldwork for this investigation was carried out on May 25, 2022. A total of four (4) boreholes, labelled BH1 through BH4, were drilled onsite to get a general representative of the Site's soil condition. The boreholes were advanced using a truck mount CME 75 drill rig equipped with 200 mm diameter continuous flight hollow stem auger supplied. Sampling of the overburden materials encountered in the boreholes was carried out at regular depth intervals using a 50.8 mm diameter drive open conventional spoon sampler in conjunction with standard penetration testing (SPT) "N" values. The SPT were conducted following the method ASTM D1586 and the results of SPT, in terms of the number of blows per 0.3 m of split-spoon sampler penetration after first 0.15 m designated as "N" value.

The boreholes were advanced to a depth of 6.71 m bgs. The subsurface conditions encountered at the time of the borehole drilling generally included the following:

- Topsoil, with a thickness of 75 mm, was encountered in a borehole advanced at the general central portion of the Site, on the grassed landscaped area of the property. The remaining boreholes, advanced across the asphalted parking and circulation areas of the Site revealed the presence of consisting of 100 mm thickness of asphalt overlying granular material have a thickness of 300 – 400 mm.
- The pavement structure, and topsoil, was followed a fill material to depths ranging between 1.06 and 1.75 m bgs. The fill was generally be described as a mixture of brown sand and gravel.
- Underlying the fill was sand that extended to depths ranging between 2.97 and 6.71 m bgs. This material can be described as having trace silt, trace clay, greyish brown, and wet.
- Two (2) boreholes advanced to the north of the existing store encountered a thin layer of silt and clay under the sand layer, to depths of between 4.12 and 4.42 m bgs. This material can be described as having trace sand, grey, and wet.
- Glacial Till was encountered under the sand, or silt and clay materials which extended to a depth of 6.71 m bgs, where the boreholes were terminated. This material can be described as a mixture of silt-sand, some gravel sized stone, trace clay, grey, and wet.

Groundwater was carefully monitored during this field investigation. During drilling, water was encountered at depths ranging between 2.9 and 3.3 m bgs.

Based on the conditions encountered at the time of the field investigation, and the results of the corresponding laboratory analysis, detailed geotechnical considerations with respect to the various aspects of the proposed construction are provided. For specific details related to these considerations, the formal report dated June 2022 (revised November 2023) should be consulted.

5 WATER QUALITY AND QUANTITY ASSESSMENT

5.1 Supply Well – 5546 Albion Road South

The supply well (1501841) which services the subject property was installed on September 1, 1965, by McLean Water Supply Ltd. Although the specified location of the supply well is different that that of the actual Site location, it is possible that references previously used at the time of the well installation have since been altered (i.e. edge of roadways). A copy of the WWR is included in **Attachment E**. The well is located along the eastern perimeter of the Site, which includes a grassed median. A curb is present on either side of median, however, the well may be prone to possible damage should an automotive incident occur. Recommendations for well placement improvement are included in Section 11. Furthermore, the proposed development grading is anticipated to be such, as presented in **Figure 10**, that runoff is away from the structure.

On November 28, 2023, PV Well Water (Carp, Ontario) conducted a camera inspection of the existing supply well to address questions related to the integrity of the existing well raised by the City of Ottawa. The details on the inspection are included in **Attachment F**. Please note that in the report, 'TOC' is an abbreviation for Top of Casing. The inspection confirmed that the casing extended to approximately 18.2 m in depth, where open hole construction was encountered. The pump was set at 22.2 m below TOC, which restricted further decent of the camera. PV Well Water concluded that the well should be extended to a minimum of 40 cm above the existing grade and completed with a vermin proof cap as per O. Reg. 903.

LRL has reached out to PV Water Well to proceed with the modification to the well. A formal quotation has been received, reviewed and accepted (stick up of the supply well casing to 74 cm to match the proposed final grade, and the addition of a vermin proof cap). The requirements for

the well modifications in accordance with O. Reg. 903 requires that post well modifications, the well will require formal disinfection. To comply with the O. Reg. 903 requirements, the chlorination requires that the well be not used for between 12 and 24 hours. This will require that the operations of the site be stopped for this duration. As the Site operates as a 24-hour fuel service station, this would require the station to close for a period which is not considered practical at this time. The importance of the well modifications is understood, and it is guaranteed that during the initial stages of the construction activities associated with the re-development (i.e. removing asphalt and cement structures), PV Water Well will be retained to complete the required modifications. **The City can request as a condition of occupancy that formal written acknowledgement and evidence that these modification have been completed.**

The annular space of the well was not confirmed through the camera inspection, nor could it be verified through a casing depth sensor inspection. PV Well Water indicated that the annular space would need to be excavated and disturbed to establish the conditions of the grout, however during initial conversations with the sub-contractor, they indicated that excavation around the well is not advisable or recommended, as it most often would result in damaging the grout thus compromising the integrity of the well construction. This could result in a potential contamination pathway into the deeper bedrock aquifer.

The well record specifies approximately 3.0 m of sand, followed by gravel and boulders to 10.0 m below grade. The sand and boulders are underlaid by till to a depth of 16.2 m followed by bedrock. The well is identified to extend to a total depth of 40.8 m below grade. Water was reported to be found between 22.5 and 33.0 m below grade and was noted to be fresh. The steel casing extends to a depth of 19.2 m below grade with the remainder of the well being assumed open hole. The well record specifies a 24-hour pumping test at a rate of approximately 90 L/minute (30 Gallons per Minute). No details pertaining to drawdown or recovery are included in the well record, however a recommended pumping rate of 30 gallons per minute was reported. A formal draw down evaluation (pumping test) was completed as part of this assessment. The findings are presented in Section 5.2.

5.2 Quantity

The proposed re-development of the Site is anticipated to include a gasoline retail outlet and convenience store; much like that of present time. The required aquifer yield has been derived from the City of Ottawa's Water Distribution Guidelines, July 2010, as amended, including the August 18, 2021, Technical Bulletin specified alterations, and the MECP's Design Guidelines for Drinking-Water Systems, 2008.

The anticipated average daily flow demands have been evaluated based on the septic design. The daily flow demand is estimated based on the total daily design sanitary sewage flow, calculated as per Table 8.2.1.3.B of the Ontario Building Code, 2012. The calculation is shown in the following table.

Occupancy Type	Column 2 (L/unit)	Column 1 (unit)	Number of units	Daily Design Flow
Service Station*	560 L	fuel outlet	7**	3 920
	950 L	water closet	4	3 800
Total Daily Demand				**7 720 L**

Notes

* Volumes listed apply to Service Stations, with no vehicle washing, as indicated in Table 8.2.1.3.B of the Ontario Building Code, 2012

** The number of fuel outlets is considered the maximum number of fuel nozzles that could be in use at the same time, as per the Table 8.2.1.3.B of the Ontario Building Code, 2012.

Therefore, based on the septic design, the anticipated daily flow demand is 7 720 L/day. The average daily flow demand was estimated based on the anticipated daily flow demand of 7 720 L/day over a 12-hour period as 17.9 L/min. Although the facility operates 24-hour daily, it is considered a more conservative approach to establish peak demand within 12-hours which is often the period which a fuel dispensing facility would encounter greater 'traffic'.

For general consideration, and although not the anticipated volume to be meet at the Site during operations, the maximum daily flow is often estimated based on a multiplier of 1.5 the average daily flow. This is intended to confirm the aquifer can meet this arbitrary value in the event of a possible isolated increase in demand. The maximum daily flow is estimated as 11 580 L/day or 16.08 L/min (1.5 times the average daily flow, over a 12-hour period) and the peak hourly flow is estimated as 19.30 L/min (1.8 times the maximum daily flow).

5.2.1 Pumping Test

To establish the hydraulic properties of the proposed supply aquifer, a 6-hr pump test was conducted on the existing supply well throughout the over-night period of October 16 and 17, 2022, as mentioned above in Section 1. As discussed with the City, and agreed upon by the client, as not to disrupt site operations, the pumping test was completed during over-night hours when the facility was closed. The pumping rate was increased throughout the shorter duration of the test (6-hours rather than the typical 8-hours recognized for a commercial establishment) to account for comparable demand volumes.

The well was pumped at a constant flow rate (±5%) of approximately 30 L/min over 6-hr period using a temporary submersible pump lowered into the well, above the existing components so not cause potential disruption to the Site operations (i.e. damage pump during the test). Drawdown was measured manually during the pumping and recovery periods using an electronic water level tape. A data logger was also submersed into the well throughout the duration of the pumping test as an additional means for data collection. Field measurements of turbidity, residual chlorine, colour, conductivity, total dissolved solids (TDS), pH and temperature were frequently collected at the pumping of the well during each pumping test. Following the pump's cessation, the supply well water level recovery was measured. Data collected in the field for the pumping test which includes the flow rate, water levels and measurement intervals, in addition to in-field quality measurements such as turbidity, are presented in **Attachment G.**

The initial static water level was measured as 2.98 m below top of casing (btc), and test well depth was measured as 30.7 m btc. As the existing supply submersible pump was left in the well throughout the duration of the test, it is likely that the well depth measurement recorded in the field is that of the set pump, as the corresponding well record indicates a depth of 41.4 m below ground surface.

The drawdown after 6-hr of pumping was 1.55 m. This represents only approximately 4.0% of the available drawdown in the well. The specific capacity of the well after 6-hr of pumping was calculated to be 0.322 L/sec/m with a long-term availability of 51.1 m³ per day. The calculation is presented in **Table 1**. The recovery was commenced at the end of the 6-hr pumping duration. The submersible pump remained in the well throughout this time so not to alter the recovery test process and measurements. After one (1) hour of recovery, the well returned to 97.4% of the initial water level (3.02 m btc).

5.2.2 Aquifer Characteristics

Following the completion of the constant rate pumping test, the data was analysed using the Aquifer Test software package, by Waterloo Hydrogeologic. The data underwent Theis and Agarwal-Theis Recovery analysis, the results of which are shown in the table below. Graphical analyses are provided for reference purposes in **Attachment H**.

Based on the information gathered from the pump test, the wells' transmissivity and coefficient of storage were calculated using the average of the Theis logarithmic approximation for the drawdown and Agarwal/Theis for the recovery. The specific yield of the well was calculated using the information obtained from the pump test, the transmissivity and coefficient of storage. The yield takes into account a minimum safety factor of 3. The characteristics of the well are summarized in the table below. The yield was calculated using the safety factor; therefore, the theoretical yields can be higher.

Parameter	**Supply Well (1501841)**
	6 Hour Test
	Theis
Transmissivity (m^2/sec)	1.00 x 10-3
Coefficient of Storage	1.00 x 10-4
Pumping Rate (L/min)	30
Available Drawdown (m) – assuming pump set at 36 m as per the water well record	33.0
Maximum Drawdown (m)	1.55
% Drawdown	4.0%
Specific Yield (L/sec/m)	0.032
Maximum Pumping Rate (L/min)	128.9
Long Term Availability (m^3/day)	185.6

Based on the observed drawdown/recovery relationship, it is concluded that the long-term yield of the test well is in excess of minimum daily demand of 7 720 L (7.72 m^3/day) and is found to be able meet a maximum pumping rate of 128.9 L/minute. This is considered sufficient to supply the inferred average and peak hourly flow demands of 16.08 L/min and 19.30 L/min, respectively.

5.3 Quality

5.3.1 Supply Aquifer – Supply Well No.1501841

The groundwater chemistry of the proposed supply aquifer for the commercial re-development was obtained by collecting water samples from the existing supply well (No. 1501841) located at the eastern perimeter of the property. The well was installed within the various bedrock formation common of the area, including limestone to between 16.2 and 29.7 m; sandstone to between 29.7 and 35.7 m; and granite to between 35.7 and 40.8 m. Water was reported to be found within the limestone and sandstone formation, as identified on the corresponding well record, at depths between 22.5 and 33.0 m.

To represent the long-term water quality of the well, samples were collected during different stages of the pump test and well development (after 3 and 6-hours of pumping). The water samples were collected using laboratory prepared bottles and were submitted to an accredited laboratory (Parcel Laboratories Ltd. of Ottawa, Ontario) for analysis of a standard "subdivision" package, and volatile organic compounds (VOCs). The laboratory certificates of analysis are included in **Attachment I**.

Table 2, **Table 4** and **Table 5** summarizes the water analysis and also includes the relative ODWS (O. Reg. 169/03) for the parameters tested. The water samples meet the ODWS parameters tested except for the following:

- Hardness was found to be 204 and 219 mg/L at 3- and 6-hours, respectively, above the ODWS operation guideline (OG) limit of 100 mg/L. High levels of hardness can lead to scale deposits and excessive utilization of regular soaps. Hardness can be reduced through the use of a water softener; however, the use of sodium chloride as a regenerant for the resins can increase the sodium content of the water. This poses a lower risk to the subject site based on it's anticipated use, although it should be noted that for individuals with sodium restricted diets, potassium chloride can be substituted for sodium in the ion exchange system to lower the hardness in the water supply.
    - The Langelier Saturation Index (LSI) is used to determine the calcium carbonate stability of water and the pH at which water is saturated with calcium carbonate (pHs). The LSI calculation is used to establish the level of saturation. The Ryznar Stability Index (RI) is used to determine the aggressiveness of water which can indicate the scale and corrosion potential. The calculations for RI and LSI are shown in **Table 3**. Using a water temperature of 10°C, the LSI was calculated for the 6-hour sample of 0.40 which indicate the water is slightly scale forming and corrosive. The RI was calculated to be 7.1 at the 6 hours sample which indicate significant corrosion potential.
- Turbidity was measured to have a level of 4.2 NTU in the 3-hour sample, and 8.8 NTU in the 6-hour sample. Both of which are above the ODWS OG of 1 NTU if the treatment system is required to provide filtration and, the 6-hour sample is above the AO of 5 NTU. The 6-hour sample level is also above the D-5-5 level considered reasonably treatable of 5 NTU. Turbidity measures the relative clarity of the water and likely represents the disturbance of the distribution system as a result of the pumping test. However, being that the water has an acceptable microbiological quality the elevated turbidity can be considered acceptable as long as the groundwater well is maintained properly. Turbidity can be reduced through proper filtration techniques.

  It should be noted that during the time of sample collection, as outlined above in Section 5.2.1, in-field turbidity measurements were recorded as 0.31 and 0.27 NTU, at the 3-hour and 6-hour sample time, respectively. It is possible that select chemicals or compounds may have reacted in the samples from between the sample collection time and the sample analysis at the laboratory. The field parameters recorded are included in **Attachment G**.
- Total Coliforms were detected in the samples collected at 3-hours and 6-hours of pumping, with values of 4 and 2 CFU/100 mL, respectively. The ODWS has a Maximum Allowable Concentration (MAC) of 0 CFU/100 mL for total coliforms in a drinking water system. According to the MECP D-5-5 guideline, a maximum concentration of 5 CFU/100 mL is considered reasonably treatable. The values obtained are considered to be reasonable treatable. Microbial impacts can be treated through the use of an ultraviolet disinfection system.
- Sulphide concentrations were below the reported detections limits by the laboratory in the sample collected after 3-hours of pumping (<0.02 mg/L). The concentrations increased to 0.12 mg/L after 6-hours of pumping, above the 0.05 mg/L ODWS aesthetic objective (AO). The presence of sulphide can lead to objectionable odours and taste in the water and black staining and deposits on fixtures. Sulphide can be reduced through aeration, which oxidizes it to sulphate, or an activated carbon filter.

- Iron levels were measured to be 0.4 and 0.9 mg/L, above the ODWS AO of 0.3 mg/L. This level is below the D-5-5 treatability limit of 10 mg/L. Iron can be reduced through the use of a water softener; however, the use of sodium chloride as a regenerant for the resins can increase the sodium content of the water. This poses a lower risk to the subject site based on it's anticipated use, although it should be noted that for individuals with sodium restricted diets, potassium chloride can be substituted for sodium in the ion exchange system to lower the hardness in the water supply.

In-field measurements, as summarized in the included **Attachment G**, were found to be generally as follows:

- Turbidity measurements collected were found to range between 1.14 NTU after one (1) hour of consecutive pumping, and 0.27 NTU after six (6) hours of pumping;
- Chlorine residual measurements were all below the machine detection limit of 0.01 mg/L, throughout the pumping test;
- Colour values were measured to be as high as 73 TCU after four (4) hours of pumping, to 13 TCU at the six (6) hour;
- pH of the water ranged between 7.99 and 8.25 pH units throughout the pumping test; and
- TDS values range from between 233 and 258 mg/L; and
- Conductivity values were measured to be between 463 and 519 µs.

LRL returned to the Site on October 21, 2022, to collect a raw water sample for Trace Metals. The laboratory certificates of analysis are included in **Attachment G**. **Table 4** summarizes the water analysis and includes the relative ODWS (O. Reg. 169/03) for the trace metal parameters tested.

All metal parameters analysed were below the respective OWDS, with the exception to Manganese which was reported with a value of 0.07 mg/L, above the ODWS of 0.05 mg/L. Elevated manganese can result in a brown or rust-colour discolouration to water and may cause staining to faucets, sinks, or laundry. As the levels are considered marginally above the ODWS, it is considered acceptable to treat these elevated concentrations with a water softener system, as mentioned above for the treatment of hardness.

5.3.2 Supply Aquifer – Additional Sampling

To address the minimum parameters outlined in the previous pre-consultation, and those outlined in the Wellhead Protection Plan Report (Jacques Whitford, 2004), LRL retuned to the Site on November 23, 2023, to collect an additional water sample from the supply well on the Site. The sample was collected directly from the pressure tank, located within the storage room of the convivence store on the Site. The tap was allowed to run for approximately ten (10) minutes, to allow for the supply line to be flushed, and to permit for a representative sample to be collected. The Site was in operation at the time of the sample collected, and throughout the initial flushing of the lines, audio observations of the pressure tank being re-filled, was encountered.

Laboratory supplied bottles were labelled clearly to indicate the sample identification, date and other required information for submission purposes. After the ten (10) minutes of the lines being flushed, new gloves were dawned, and each bottled was filled.

In field measurements revealed that chlorine residual was below the detection limit of the equipment (<0.01 mg/L). The water samples were collected using laboratory prepared bottles and were submitted to an accredited laboratory (Parcel Laboratories Ltd. of Ottawa, Ontario) for analysis of a standard "subdivision" package, VOCs, petroleum hydrocarbons (PHC) Fractions

F1 through F4, trace metals, and polycyclic aromatic hydrocarbons (PAH). The laboratory certificates of analysis are included in **Attachment I**.

Table 2, **Table 4** through **Table 6** summarizes the water analysis and also includes the relative ODWS (O. Reg. 169/03) for the parameters tested. The water samples meet the ODWS parameters tested except for the following:

- Hardness was found to be 203 mg/L, above the ODWS OG limit of 100 mg/L. High levels of hardness can lead to scale deposits and excessive utilization of regular soaps. Hardness can be reduced through the use of a water softener; however the use of sodium chloride as a regenerant for the resins can increase the sodium content of the water. This poses a lower risk to the subject site based on it's anticipated use, although it should be noted that for individuals with sodium restricted diets, potassium chloride can be substituted for sodium in the ion exchange system to lower the hardness in the water supply.
    - The Langelier Saturation Index (LSI), as presented in **Table 3**, is discussed above, with respect to the samples collected at the time of the six (6) hour pumping test. Using a water temperature of 10°C, the LSI was calculated for the 6-hour sample of 0.40 which indicate the water is slightly scale forming and corrosive. The RI was calculated to be 7.1 at the 6 hours sample which indicate significant corrosion potential.
- Total Coliforms were detected with a value of 1 CFU/100 mL, respectively. The ODWS has a MAC of 0 CFU/100 mL for total coliforms in a drinking water system. According to the MECP D-5-5 guideline, a maximum concentration of 5 CFU/100 mL is considered reasonably treatable. The values obtained are considered to be reasonable treatable. Microbial impacts can be treated through the use of an ultraviolet disinfection system.
- Iron levels were measured to be 0.5 mg/L, above the ODWS AO of 0.3 mg/L. This level is below the D-5-5 treatability limit of 10 mg/L. Iron can be reduced through the use of a water softener; however, the use of sodium chloride as a regenerant for the resins can increase the sodium content of the water. This poses a lower risk to the subject site based on it's anticipated use, although it should be noted that for individuals with sodium restricted diets, potassium chloride can be substituted for sodium in the ion exchange system to lower the hardness in the water supply.

No VOC, PHC or PAH parameters were detected in the samples collected, and all trace metals detected were below the appliable provincial drinking water standards, including manganese, which was previously detected in excess of the AO – ODWS in the October 17, 29023 sample collected.

6 WATER SUPPLY ASSESSMENT

Based on the Site's geology and hydrogeology the recommended potential supply aquifer for the Site, is the bedrock aquifer. The existing supply well currently intercepts this aquifer, and it is our understanding that the proposed re-development of the Site will utilize the existing well. The selection of this aquifer is supported by the following:

- Although the unconfined sand, gravel and boulder layer formation between 0 – 3.0 m (Sand) and 3.0 – 9.1 m (Gravel & Boulders) may be considered a suitable layer for the construction of a supply well, based on the proposed use of the Site being considered 'high risk' for possible shallow groundwater impacts, is considered unsuitable for the construction of a well within this layer. The risk to impairment of the on-Site water supply,

as well as the possible pathway for contaminates in the shallow soils is considered too great of a risk to explore this as a potential supply aquifer.

- No records of neighbouring shallow supply wells were returned which suggests it may not be a suitable source.
- The well is existing, and the client intends to keep the existing well for the proposed re-development on the site. The construction of a new supply well is not considered necessary, therefore other potential aquifers were not explored.

The water quantity assessment will demonstrate that:

- The water taking will not result in interferences which will impair existing or future on-Site and adjacent land use and groundwater use.

6.1.1 Demand

The average daily flow demand was estimated based on the anticipated daily flow demand of 7 720 L/day over a 12-hour period as 16.08 L/min. Although the facility operates 24-hour daily, it is considered a more conservative approach to establish peak demand within 12-hours which is often the time period which a fuel dispensing facility would encounter greater ‘traffic’.

For general consideration, and although not the anticipated volume to be meet at the Site during operations, the maximum daily flow is often estimated based on a multiplier of 1.5 the average daily flow. This is intended to confirm the aquifer can meet this arbitrary value in the event of a possible isolated increase in demand. The maximum daily flow is estimated as 11 580 L/day or 16.08 L/min (1.5 times the average daily flow, over a 12-hour period) and the peak hourly flow is estimated as 19.30 L/min (1.8 times the maximum daily flow).

7 TERRAIN ANALYSIS

The terrain analysis was conducted to demonstrate that the unconsolidated material on the Site is appropriate for the construction of an on-Site subsurface sewage disposal system on the Site. The subject property is currently developed with a sewage disposal system, however, to support the re-development and Site up-grades, a new structure and associated components will be constructed in accordance with the Ontario Building Code, 2012. The proposed location of the newly constructed sewage disposal system is presented in **Figure 11**. Details pertaining to specific design are not included herein. A formal submission to the Ottawa Septic System Office (OSSO) has been made by the client, or those engaged on their behalf. A copy of the formally issued septic permit, as issued by the Ottawa Septic System Office (OSSO) is included in **Attachment J**.

The Site is not considered Hydrogeologically Sensitive in regard to geological formations. Review of geological mapping and additional supporting documents, including MECP water well records, have revealed a deposit of overburden greater than 1.5 m in thickness. This was further confirmed through the advancement of boreholes across the Site at the time of additional sub-surface investigation fieldwork completed by LRL, in support of the proposed development application. These additional investigations included a Geotechnical Investigation and a Phase II Environmental Site Assessment. No bedrock outcrops were encountered at the time of LRLs Site visits associated with the corresponding investigations and assessments.

Subsurface conditions encountered during these studies are summarized as follows, although greater detail is available in the corresponding reporting documents completed for the respective investigations. Copies of the borehole logs from the Phase II Environmental Site Assessment and

Geotechnical Investigation are included in **Attachment D**, and further detail pertaining to each summary, including chemical analysis and conclusions are provided in Section 4.2.

As part of the geotechnical investigation, select soil samples were submitted for laboratory gradation analyses. The results of these analysis are summarized as follows:

Sample Location	Depth (m)	Percent for Each Soil Gradation							Estimated Hydraulic Conductivity K (m/s)
		Gravel		Sand			Silt (%)	Clay (%)	
		Coarse (%)	Fine (%)	Coarse (%)	Medium (%)	Fine (%)			
BH1	1.5-2.1	0.0	0.0	0.1	24.0	66.1	8.9	0.9	2×10^{-7}
BH2	3.1-3.7	0.0	0.0	0.2	0.4	5.4	51.6	42.4	1×10^{-7}
BH3	4.6–5.2	0.0	12.0	5.9	9.1	26.6	42.7	3.7	2×10^{-6}

The subsurface conditions indicated for the Site are considered suitable for a Class IV septic sewage disposal system with a partially to fully raised leaching bed depending on the Site-specific soil and groundwater conditions at the actual location of the proposed septic system leaching bed. The leaching bed should be constructed to conform to the specifications set out in the Ontario Building Code (OBC).

As part of this assessment, an analysis was carried out to ensure that sufficient space exists at the proposed lot for the construction of a septic system in accordance with the OBC. As a conservative approach to determining the expected largest septic system envelope required to service a commercial gasoline service station establishment at the Site, a septic system envelope size was calculated assuming a fully raised bed with mantle, a percolation rate of 12 min/cm for the imported sand required and a daily sewage flow of 7 720 L.

The total length of pipe required for the septic bed, and as described in greater detail in the included approved proposed septic design, and permit (**Attachment J**), assuming imported fill, was calculated as approximately 84 m:

$L = QT/200$

where L = length of pipe (m)

Q = daily sewage flow for the proposed development (L/day)

T = percolation rate of the imported sand fill material (min/cm)

Assuming a Norweco HK 4730L-3M treatment unit is used, the anticipated pipe runs will include two (2) cells, each with 6 runs and 7 m in length. All details related to the proposed installation, sizing of the equipment, and features are included in **Attachment J**, and should be referenced as part of this Terrain Analysis. Therefore, an area of approximately 772 m² is required for the septic bed. A mantle of 15 m in length would be required along the down gradient portion of the bed. Based on the total coverage of the septic bed (raised portion and mantle plus a replacement area) would be approximately 1 784 m².

The Site has a surface 11 920 m², of which, approximately 3 525 m² is considered suitable for placement of the sewage disposal system, which encompasses the north/northwestern portion of the property. Sufficient area of replacement area and mantle exists on the Site in accordance

with the OBC to service the proposed development with a design sewage flow of up to 7 720 L/day. A proposed development layout plan is presented in **Figure 10** which provides visual support to this. A copy of the approved septic permit is included in **Attachment J**.

8 PRIVATE SEWAGE DISPOSAL SYSTEM IMPACT STUDY

Section 5.2, Groundwater Impact Assessment in Non-Designated Areas, of the MECP's Procedure D-5-4 outlines the three (3) step assessment process for evaluating the potential risk for "*every proposed development involving on-site sewage systems*". The steps are intended to be followed in succession, where the conditions established in the previous step determine whether it is necessary to move on to the next step.

Step one of the assessment processes is ***Lot Size Consideration***. If it can be demonstrated that the area of the Site is not hydrogeologically sensitive, developments with lots that average 1 hectare (with no lot smaller than 0.8 ha) may not require a comprehensive hydrogeological assessment. It is expected that attenuative processes inside a one (1) hectare parcel of land will be adequate to decrease the nitrate-nitrogen to a satisfactory focus in groundwater underneath contiguous properties. The Site has a surface area of 11 920 m² (1.19 hectare), which meets the Lot Size Consideration. However, the Site is considered Hydrogeologically Sensitive due to its proximity to the wellhead capture zone for the neighbouring Albion Sun Vista communal supply well system as discussed above in Section 2.7.2. Therefore, the proceeding steps identified in the guidelines are to be considered.

Step Two is ***System Isolation Considerations***, which evaluates the risk to groundwater from septic effluent, where geological setting and characteristics present suitable isolation conditions. Such conditions are most often supported by a lower hydraulic or physical boundary of the receiving groundwater. Such boundaries can include a thick layer of underlying soils with low permeability (i.e. clays).

As discussed above in Section 2.7.2, the subsurface conditions on the Site generally include Fill and Sand to depths between 2.8 and 6.7 m bgs. This is considered the proposed receiving layer for septic effluent based on the depths encountered and that the proposed septic bed will be a fully in-ground system (see **Attachment J** for details). Although a confining clay layer has been identified on the northern portion of the Site, it has not been confirmed as being 'widespread'' across the Site. The ***System Isolation Consideration*** approach is not considered suitable for the Site, therefore Step Three of the assessment will be applied for the Site.

The ***Contaminant Attenuation Consideration (Predictive Assessment)*** was used to determine the potential risk to groundwater resources on- and off-Site resulting from the proposed on-Site septic systems. More specifically, to confirm that the concentration of nitrates at the boundary of the Site are in accordance with the MECP's Procedure D-5-4: Technical Guideline for Individual On-Site Sewage Systems: Water Quality Impact Risk Assessment. The potential risk to off-Site receptors from the proposed upgraded sewage disposal system has been considered using the inferred nitrate contamination loading for commercial / industrial property use. Section 5.6.3 of the D-5-4 Guideline pertains to Predictive Assessment - Industrial/Commercial Development. The procedure (MECP's Procedure D-5-4 (1996)) followed for this study specifies a maximum allowable concentration of nitrate in the groundwater of 10 mg/L at the property boundary.

To support the corresponding estimation of anticipated nitrate concentration at the property boundary, nitrate dilution calculations for commercial / industrial properties were considered. The following details were included in the calculation used:

- Infiltration factors for the Site;
    - A total area of 11 920 m² (1.19 hectare);
    - Flat topography;
    - Infiltration Factors (Post Re-Development), and in accordance with Table 3.1 of the MECP Stormwater Management Planning and Design Manual (March 2003):
        i. Grain size analysis of the shallower soils more likely to intersect the septic effluent, as referenced above in Section 7, generally includes fine to medium grained sand;
        ii. Approximately 9 113 m² of the site is considered Cultivated Land, and 2 807 m^2 is considered to be woodland;
    - Moisture Surplus (Post Re-Development):
        i. The cultivated land (lawn and grassed area) is considered Shallow Rooted Crops, whereas the woodland at the general perimeter of the property is considered Deep Rooted Crops;
        ii. Laboratory grain size analysis revealed the overburden material, anticipated to be impacted by the septic bed, is sand;
    - Impervious areas (proposed development footprint) were calculated to be of 4 980 m^2 for the proposed convenience store building, pump island concrete apron and paved parking and circulation area. This equates to hard surface area, post re-development, of 41.7% of the subject property;
    - Background nitrate concentrations in the receiving aquifer will be inferred negligible (0 mg/L used in the calculation);
    - Moisture surplus values from the Ottawa weather station (Environment Canada, 2011). The moisture surplus printouts for the City of Ottawa are included in **Attachment K**; and
    - The use of an advanced tertiary treatment system, which is discussed in greater detail below, with a capability to treat nitrate concentrations of the effluent to at least 15 mg/L (67% nitrogen reduction).

The available infiltration, using the values and considerations identified above, has been calculated as 2 261 m³/year for the Site. A summary of the calculation is presented in the included **Table 4**. As indicated in Section 5.6.3 (b) of the D-5-4 Guideline, "*The maximum allowable flow for each lot or block in the industrial/commercial development can be calculated by dividing the amount of available infiltration by a factor of three*". This calculation assumes a nitrogen concentration of the effluent being 40 mg/L.

As discussed above in Section 7 and detailed in the OSSO approved Septic Permit included in **Attachment J**, an advanced tertiary treatment system is proposed as part of the Site re-development. Most often, tertiary treatment systems are considered to have the capability to reduce effluent nitrate levels to 20 mg/L from the non-treated standard value of 40 mg/L. The proposed tertiary treatment system, Norweco HK 4730L-3M, has the capability to reduce nitrates to at least 15 mg/L (67% nitrogen reduction). The specifications for the proposed unit are included in **Attachment L**.

As the septic system will be able to achieve a nitrate reduction of 67%, the factor included in the Predictive Assessment calculation has been adjusted from 3 (for conventional – non advanced treatment sewage disposal systems) to a value of 0.75. The Table below demonstrates Predictive Assessment calculation for establishing the maximum daily septic flow inferred for the Site assuming the advanced tertiary treatment system. Consideration to the use of a conventional treatment system (40 mg/L effluent nitrate concentration), as well as an alternative tertiary treatment system with a 50% nitrate reduction (20 mg/L effluent nitrate concentration) is also included in the following table, for demonstration of the value to support the proposed Norweco HK 4730L-3M unit.

Site Area (m^2)	Impervious Area (m^2)	Available Infiltration (m^3/year)	Effluent Nitrate Concentration (mg/L)	Annual septic flow required for the Site (m^3/year)[1]	Predictive Assessment Calculation Factor	Maximum allowable septic flow (m^3/year)
11 920	6 940	2 261	40	2 818	3	**754**
11 920	6 940	2 261	20	2 818	1	**2 261**
11 920	6 940	2 261	15	2 818	0.75	**3 014**

Notes

XXX	Does not meet the annual septic flow required for the Site
XXX	Meets the annual septic flow required for the Site
1	Calculated based on the assumption of 7,720 L/day, multiplied by 365 days

As presented above, the Contaminant Attenuation Consideration (Predictive Assessment) demonstrates that through the use of the advanced tertiary septic treatment system, with an effluent nitrate concentration of 15 mg/L, the risk for impairment to the groundwater is considered low. The annual septic flow for the Site of 2 818 m^3 will be meet with a calculated maximum allowable septic flow of 3 014 m^3, with nitrate reduction technologies.

Based on these considerations, the current Site conditions are suitable to attenuate the nitrate impacts generated by the septic systems on the development in accordance with current D-5-4 guidelines, provided an appropriate tertiary treatment is used and maintained. **The system must be able to treat the effluent to a nitrate level of 15 mg/L or less.** The potential impacts related to the use of the sewage disposal system on the Site, with respect to natural features, and shallow groundwater conditions is low risk. Furthermore, supply wells in the area retain their water supply from deeper bedrock aquifer which is confined by a thick overburden layer, therefore the on-Site septic system will have little to negligible impacts to the neighbouring water supply.

9 WELLHEAD PROTECTION AREA – SITE SPECIFIC RISK PREVENTION MEASURES

It is the responsibility of the Site Owner to follow and enforce the following site-specific risk prevention measures for all general daily operations, or future renovations, re-development or construction activities. At this time, the Site is owned and operated by MacEwen Petroleum Inc. If future land transactions or ease agreements occur, the following must be implemented by the respective parties overseeing, managing or operating the Site. A Construction Risk Management Plan for Source Water Protection, a Spills Prevention and Risk Management Plan (which will include staff training and record keeping as a risk management measure), and the Monitoring Program will be prepared to provide greater detail on the risk management and mitigation measures to be implemented.

WELLHEAD PROTECTION AREA – SITE SPECIFIC RISK PREVENTION MEASURES		
Responsible Party	**Risk Prevention Measure**	**Discussion**
Site Owner	Follow the specific recommendations set out in the *Wellhead Protection Area Plan* documentation prepared by Trow Associates Inc. and Jacques Whitford Environmental Limited, dated June 2004 to protect the communal supply aquifer.	Ensure that during work, or general Site operations, that source protection measures of the neighbouring supply well sand and gravel contact zone layer be implemented. These measures include: • Ensuring equipment on Site is maintained and is in property operating order. • Manufacturer service, inspection and maintenance schedules are followed. Including but not limited to the on-site sewage disposal system, and fuel dispensing / storage equipment. • Governing authority (i.e. TSSA) inspection and reporting requirements are completed, and accurately documented. • Fuel dispensing and storage equipment must include properly functioning interstitial monitoring system. Leak detection units must also equip the tanks and associated piping. • The details of the S Spills Prevention and Risk Management Plan are implemented. • Ensuring that operators, tenants, contractors, employees and other occupants of the Site are aware of the risks associated with the sensitive receptor and are formally trained on the procedures, risks and measures to be implemented relating to the site. • All wells constructed or located on the Site (supply and monitoring wells) are constructed accordingly, by an O. Reg. 903 licensed well installer, so that there is prevention of downward drive of contamination through the low permeable layer into the supply aquifer. • Ensure that it is communicated that snow piling is not permitted in the 15 m distance from the supply well on the Site. • That the supply well casing be maintained a minimum of 40 cm above grade. • That the supply well be constructed according to O. Reg. 903 and maintained as per O. Reg. 903. This includes a

		proper fitted cap, grading away from the structure and any work related to the supply well (i.e. pump replacement) be followed by disinfection. • Protective bollards or barriers be maintained around the supply well to prevent damaged. • Grading around the well is such as presented in the Site re-development grading plans and is maintained. • A qualified person, such as a professional geoscientist or a professional engineer must be retained to review the installation and sealing of well casings installed on the Site. • Retain the services of an environmental professional to formalize, and execute an annual groundwater quality monitoring program, as outlined in the corresponding Monitoring Program. • Take action to remedy and remediate impacted subsurface conditions and report the findings (during on-site construction, or groundwater monitoring) to the local MECP and the TSSA authorities. This shall be done with assistance from a qualified person (such as a professional geoscientist or a professional engineer in the environmental field). • Support the repair and maintenance of groundwater monitoring wells on the Site, as deemed required by the qualified person (such as a professional geoscientist or a professional engineer in the environmental field). • Comply with the Environmental Compliance Approval issued to the site, and all the respective conditions.
Site Owner (Continued)	Do not permit the land use to become such which may cause further risk to the supply aquifer.	Have a representative frequent the property to ensure that the Site continues to operate in a fashion which respects the points mentioned above. Ensure that the Site is well kept, with no excessive storage of potential hazardous materials. Ensure that operations on the Site do no include heavy industrial uses, mineral extraction, waste disposal, or other light industrial uses which are known to be a high risk for potential environmental concern such as automotive repair operations or chemical refinement.
	Have received a copy, have reviewed, and clearly understands the items included in the Spills Prevention and Risk Management Plan for the Site.	A Spills Prevention and Risk Management Plan will be prepared for the Site. In the event of a land transaction, or change in Site operator, a copy of this plan must be transferred to the new owner/operator, to ensure that they: 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.

	Have received a copy, have reviewed, and clearly understands the items included in the Employee & Contractor Training Plan.	This plan will be included in the Spills Prevention and Risk Management Plan to be prepared. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
	Have received a copy, have reviewed, and clearly understands the items included in the Construction Risk Management Plan for Source Water Protection.	A Construction Risk Management Plan for Source Water Protection will be prepared for the Site.
Site Operator	Follow the specific recommendations set out by the Owner with respect to the in the Wellhead Protection Area Plan. The Operator is Responsible to ensure that Staff and Contractors are aware of the Wellhead Protection Area restrictions, and measures to be applied. More specific duties and roles are included in the adjacent column.	• Notify the Owner if equipment on the Site, and specific to the Site (i.e. Septic) requires assistance, maintenance or does not appear to be operating accordingly. • In conjunction with the Site Owner, and at times, specific to the Site Operators Equipment, ensure that manufacturer service, inspection and maintenance schedules are followed. Including but not limited to the on-site sewage disposal system, and fuel dispensing / storage equipment. • Governing authority (i.e. TSSA) inspection and reporting requirements are completed, and accurately documented when related to Site Operator specific equipment. • The Spills Prevention and Risk Management Plan specific requirements and details are implemented. • Ensuring that tenants, contractors, employees and other occupants of the Site are aware of the risks associated with the sensitive receptor and are formally trained on the procedures, risks and measures to be implemented relating to the site. • Ensure that snow piling is not permitted in the 15 m distance from the supply well on the Site. • That the supply well casing be maintained a minimum of 40 cm above grade. • Protective bollards or barriers be maintained around the supply well to prevent damaged. If damaged, the Site Owner must be notified. • Comply with the Environmental Compliance Approval issued to the site, and all the respective conditions that apply to Site operations.
	Do not permit the land use to become such which may cause further risk to the supply aquifer.	Have a representative frequent the property to ensure that the Site continues to operate in a fashion which respects the points mentioned above. Ensure that the Site is well kept, with no excessive storage of potential hazardous materials. Ensure that operations on the Site do no include heavy industrial uses, mineral extraction, waste disposal, or other light industrial uses which are known to be a high risk for potential environmental

		concern such as automotive repair operations or chemical refinement.
	Have received a copy, have reviewed, and clearly understands the items included in the Spills Prevention and Risk Management Plan for the Site.	A Spills Prevention and Risk Management Plan will be prepared for the Site. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
	Have received a copy, have reviewed, and clearly understands the items included in the Employee & Contractor Training Plan.	This plan will be included in the Spills Prevention and Risk Management Plan to be prepared. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands. Including excavation limitations to protect the aquifer.
Site Contractor	Follow the specific recommendations set out by the Site Operator with respect to the in the Wellhead Protection Area Plan.	• Notify the Operator (or Staff Representative) if equipment on the Site, requires assistance, maintenance or does not appear to be operating accordingly. • Conduct respective activities in a fashion which is respectful to the sensitive features of the Site, and mitigate the risk of impacts to the supply aquifer (See Spills Prevention and Risk Management Plan).
	Have received a copy, have reviewed, and clearly understands the items included in the Spills Prevention and Risk Management Plan for the Site.	A Spills Prevention and Risk Management Plan will be prepared for the Site. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
	Have received a copy, have reviewed, and clearly understands the items included in the Employee & Contractor Training Plan.	This plan will be included in the Spills Prevention and Risk Management Plan to be prepared. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
	Have received a copy, have reviewed, and clearly understands the items included in the Construction Risk Management Plan for Source Water Protection.	This is only applicable during the proposed Site re-development discussed in this report. Future projects will require specific plans for contractors to follow.
Site Employee	Follow the specific recommendations set out by the Site Operator with respect to the in the Wellhead Protection Area Plan.	• Notify the Operator (or Staff Representative) if equipment on the Site, requires assistance, maintenance or does not appear to be operating accordingly. • Conduct respective activities in a fashion which is respectful to the sensitive features of the Site, and mitigate the risk of impacts to the supply aquifer as set out in the Spills Prevention and Risk Management Plan and included Employee & Contractor Training Plan.

	Have received a copy, have reviewed, and clearly understands the items included in the Spills Prevention and Risk Management Plan for the Site.	A Spills Prevention and Risk Management Plan will be prepared for the Site. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
	Have received a copy, have reviewed, and clearly understands the items included in the Employee & Contractor Training Plan.	This plan will be included in the Spills Prevention and Risk Management Plan to be prepared. 1. Create one of their own which follows the points included and 2. Are clear on the sensitive requirements of the Site and neighbouring lands.
MECP	Ensure that the conditions of the ECA are meet and issue orders are required to ensure compliance.	Should reported aquifer impairment be noted, the MECP must consult with the Owner and Operator to address the issue and come to a plan of resolution.

10 SUMMARY AND CONCLUSIONS

Based on the results of this investigation the following summary and conclusions are provided.

- The subject Site is located within a generally rural residential and commercial area of Ottawa, at the northwest corner of the intersection of Albion Road, and Mitch Owens Road. The Site is presently developed and operated as a retail petroleum dispensing facility equipped with six (6) gasoline dispensing pumps, one (1) diesel dispensing pump, and five (5) underground storage tank located at the general southeastern portion of the Site. The Site has operated as a fuel dispensing facility since at least the mid to late 1990's.
- The Hydrogeological Assessment & Terrain Analysis was completed in support of the proposed site re-development and associated Site Plan Application submission to the City of Ottawa. It is anticipated that the existing fuel dispensing facility will be re-developed to include new fuel storage and dispensing equipment, and convenience store serviced by a private water supply well and sewage disposal system.
- The proposed construction activities associated with the re-development will include the removal and replacement of the underground petroleum storage tanks. The excavation associated with the installation of underground storage tanks of this size (two (2) at 65,000 L capacity and two (2) at 25,000 L capacity) generally extends to a depth of approximately 4.2 m below grade, which includes 0.6 m of granular underlying the installations.
- The Site is irregular shaped being generally rectangular with a portion of the southeastern extent being reduced. The Site is between approximately 85 and 110 m wide (east-west) by between 90 and 115 m deep (north-south) for an approximate surface area of 10 920 m² (2.7 acres).
- The topography of the Site and neighbouring lands is generally flat with a gentle slope to the south, towards Mitch Owens Road.
- The Site is fitted with storm water structures, including catch basins and buried catchment drainage piping. These systems set in place are used to collect and control surface runoff across the Site and distributes it into accepted City services and infrastructure for further off-Site handling. No swales or drainage courses are present on the subject Site. A municipal ditch however does run in a general east-west direction along Mitch Owens Road, along the adjacent lands to the west. Based on the topography of the site, and site

features, it is inferred that the property drainage pattern flows south towards Mitch Owens Road.

- A watercourse is located on the neighbouring property to the west, however the City of Ottawa identifies it as a 'ditch'. The neighbouring lands to the north, are identified to contain unevaluated wetlands according to provincial mapping systems (Ministry of Natural Resources and Forestry, Make a Map: Natural Heritage Areas).
- Surficial soil deposit mapping indicates that the surficial geology is fine- to medium-grained sand, calcareous and commonly fossiliferous; nearshore sand generally occurs as a sheet or as bars or spits associates with glaciofluvial materials. Bedrock mapping indicates that the bedrock is described as the Oxford Formation: dolomite and limestone.
- The Site is located within the wellhead capture zone for the neighbouring Albion Sun Vista communal supply well system. This communal well is located downgradient (south) of the subject Site, following Mitch Owens Road and is sourced by the shallow bedrock aquifer which is hydraulically connected to the sand/gravel/till overburden recharge zone.
- As part of this assessment, a desktop review of potential sources of contamination to the supply aquifer was completed. This review was completed with general reference to Ontario Regulation 153/04. The review revealed the following potential sources of contamination, and the corresponding PCA as set out by Ontario Regulation 153/04:
    - Petroleum handling and dispensing facility operations and associated equipment on the Site;
    - Aggregate extraction facility located approximately 390 m northeast and 600 m east of the Site; and
    - The historical industrial/commercial development previously occupying the property located immediately east of the Site, which historically included a fueling station along the southern extent of the property, an above-grade storage container (tank) associated with the fueling station, and the numerous pieces of heavy machinery and large vehicles are visible across the property through historical aerial imagery reviewed.
- A search was conducted of the well records from the MECP Water Well Record revealed 70 wells recorded within an approximately 500 m radius of the Site. The records of the wells within 500 m of the Site revealed that the wells are drilled wells extending to depths between 14.0 and 67.9 m. Geological conditions within 500 m are generally similar and consist of sand or sand and gravel mix, followed by clay over bedrock. Glacial till material was encountered in select wells retrieved, and additionally, clay was not identified in all locations. The bedrock typically includes limestone, sandstone, or a combination of both.
- Four (4) groundwater monitoring wells were constructed on the Site as part of a Phase II Environmental Site Assessment completed in support of the proposed Site re-development application. The wells were advanced to depths of approximately 4.5 m bgs. Groundwater levels measured in the installations were recorded to be between 1.77 and 1.98 m bgs, which corresponded to elevations between 98.15 and 98.43 m, with respect to an arbitrary benchmark established and assigned an elevation of 100.00 m.
- Groundwater sampling of the shallow groundwater monitoring wells installed on the Site, and the corresponding chemical analysis for VOC, PAH and PCB parameters revealed that concentrations were below the laboratory method detection limits, with the exception to PHC F3 and F4 parameters detected in a single location. The levels encountered were measured below the respective site condition standard. Select metal parameters were

detected, however all levels are below the applicable site condition standards with the exception of sodium in each groundwater monitoring well location, and Chloride at the majority of the sample locations.

- During the proposed re-development activities of the Site, an environmental remediation program will be implemented to address the identified or anticipated impacted overburden across the southern extent of the Site. The environmental remediation program will support the future protection of the on-Site supply well, in addition to the further protection of additional natural features and aquifers from possible contamination and damage in the long term. As presented in the Phase II Environmental Site Assessment, and discussed above in this section, generally contaminates associated with fuel handling facility were not encountered, although suspected to be present in the surrounding soils encompassing the underground storage tanks, and in the area of the pump islands, which could not be investigated due to the risk of damaging the fuel handing equipment. Following the TSSA Environmental Management Protocol for Fuel Handling Sites in Ontario, August 2012 (formerly GA1/99), contaminated soils will be remediated to conditions which meet the corresponding site conditions standards, as best possible. Caution will be taken to not puncture the confining clay barrier, when encountered, which acts as a protective layer to the neighbouring supply aquifer. Should restrictions to the excavation activities be encountered, alternative remediation methods will be implemented.
- Based on the proposed re-development attributes, the anticipated average daily flow demands of the proposed development have been evaluated based on the septic design. The daily flow demand is estimated based on the total daily design sanitary sewage flow, calculated as per Table 8.2.1.3.B of the Ontario Building Code, 2012. The anticipated daily flow demand is 7 720 L/day.
- With consideration to the average daily flow demand, a 6-hr pump test was conducted on the existing supply well. The well was pumped at a constant flow rate (±5%) of approximately 30 L/min over 6-hr period. The drawdown after 6-hr of pumping was 1.55 m which represents only approximately 4.0% of the available drawdown in the well. The specific capacity of the well after 6-hr of pumping was calculated to be 0.322 L/sec/m with a long-term availability of 51.1 m^3 per day. The recovery was commenced at the end of the 6-hr pumping duration. After one (1) hour of recovery, the well returned to 97.4% of the initial water level (3.02 m btc).
- Based on the observed drawdown/recovery relationship, it is concluded that the long-term yield of the test well is in excess of minimum daily demand of 7 720 L (8.62 m^3/day) and is found to be able meet a maximum pumping rate of 128.9 L/minute. This is considered sufficient to supply the inferred average and peak hourly flow demands of 16.08 L/min and 19.30 L/min, respectively.
- To represent the long-term water quality of the well, samples were collected during different stages of the pump test (after 3 and 6-hours of pumping), and shortly thereafter. The water samples meet the ODWS parameters tested except for the following:
    - Hardness was found to be 204 and 219 mg/L at 3- and 6-hours, respectively, above the ODWS OG limit of 100 mg/L;
    - Turbidity was measured to have a level of 4.2 NTU in the 3-hour sample, and 8.8 NTU in the 6-hour sample. Both of which are above the ODWS OG of 1 NTU if the treatment system is required to provide filtration and, the 6-hour sample is above the AO of 5 NTU;

  - All trace metal parameters analysed were below the respective OWDS, with the exception to Manganese which was reported with a value of 0.07 mg/L, above the ODWS of 0.05 mg/L;
  - Sulphide concentrations were reported as 0.12 mg/L after 6-hours of pumping, above the 0.05 mg/L ODWS AO. Sulphide can be reduced through aeration, which oxidizes it to sulphate, or an activated carbon filter;
  - Total Coliforms were detected in the samples collected at 3-hours and 6-hours of pumping, with values of 4 and 2 CFU/100 mL, respectively. Microbial impacts can be treated through the use of an ultraviolet disinfection system; and
  - Iron levels were measured to be 0.4 and 0.9 mg/L, above the ODWS AO of 0.3 mg/L. This level is below the D-5-5 treatability limit of 10 mg/L. Iron can be reduced through the use of a water softener.
- Additional water samples collected from the supply well on the Site has confirmed the absence of potential contaminates of concern, related to the Site operations as a petroleum storage and dispensing facility (VOCs, PHC, PAHs).
- Based on the Site's geology and hydrogeology the recommended potential supply aquifer for the Site, is the bedrock aquifer. The existing supply well currently intercepts this aquifer, and it is our understanding that the proposed re-development of the Site will utilize the existing well. Based on the findings of the Hydrogeological Assessment, it is considered acceptable for the proposed re-development to use the existing supply well on Site.
- As a conservative approach to determining the expected largest septic system envelope required to service a commercial gasoline service station establishment at the Site, a septic system envelope size was calculated assuming a fully raised bed with mantle, a percolation rate of 12 min/cm for the imported sand required and a daily sewage flow of 7 720 L. An area of approximately 772 m² is required for the septic bed. A mantle of 15 m in length would be required along the down gradient portion of the bed. Based on the total coverage of the septic bed (raised portion and mantle plus a replacement area) would be approximately 1 784 m².
- The Site has a surface 11 920 m², of which, approximately 3 525 m² is considered suitable for placement of the sewage disposal system, which encompasses the north/northwestern portion of the property. Sufficient area of replacement area and mantle exists on the Site in accordance with the OBC to service the proposed development with a design sewage flow of up to 7 720 L/day.
- The proposed sewage disposal system for the Site is the Norweco HK 4730L-3M tertiary treatment unit. The Norweco HK 4730L-3M, has the capability to reduce nitrates to at least 15 mg/L (67% nitrogen reduction).
- It should be noted that only marginal changes from the current Site use and daily flows are anticipated for the Site (approximately daily flow increase of 1,900 L to account for one (1) additional washroom). The use of an upgraded sewage treatment/disposal system is considered a substantial improvement to the exiting conditions and current effluent concentrations, therefore the use of the proposed Norweco tertiary system will in fact have a beneficial improvement to the Site in comparison to current conditions.
- Section 5.2, Groundwater Impact Assessment in Non-Designated Areas, of the MECP's Procedure D-5-4 outlines the three (3) step assessment process for evaluating the potential risk for "every proposed development involving on-site sewage systems". The steps are intended to be followed in succession, where the conditions established in the previous

step determine whether it is necessary to move on to the next step. The Contaminant Attenuation Consideration (Predictive Assessment) was used to determine the potential risk to groundwater resources on- and off-Site resulting from the proposed on-Site septic systems. More specifically, to confirm that the concentration of nitrates at the boundary of the Site are in accordance with the MECP's Procedure D-5-4: Technical Guideline for Individual On-Site Sewage Systems: Water Quality Impact Risk Assessment.

- Following the procedures set forth in the D-5-4 Guidelines for the Contaminant Attenuation Consideration (Predictive Assessment) methodology, and assuming an effluent nitrate reduction of 67%, which can reduce nitrates from 40 mg/L to 15 mg/L, the annual septic flow required for the Site of 2 818 m³/year will be meet with a calculated maximum allowable septic flow of 3 014 m³.
- Based on the D-5-4 Guideline considerations, the current Site conditions are suitable to attenuate the nitrate impacts generated by the septic systems on the development in accordance with current D-5-4 guidelines, provided an appropriate tertiary treatment is used and maintained. The system must be able to treat the effluent to a nitrate level of 15 mg/L or less. The potential impacts related to the use of the sewage disposal system on the Site, with respect to natural features, and shallow groundwater conditions is low risk. Furthermore, supply wells in the area retain their water supply from deeper bedrock aquifer, therefore the on-Site septic system is anticipated to have little to negligible impacts to the neighbouring water supply.

11 RECOMMENDATIONS

Based on the results of this investigation the following recommendations are provided:

1. It is recommended that the existing supply well at the Site be utilized as a water supply for the proposed re-development features of the Site. The well is found to generally have acceptable groundwater supply for human consumption and will be able to meet the daily supply demands, as determined through the 6-hour pumping test initiated.
2. Stick up of the existing supply well casing must be extended to 74 cm to match the proposed final grade and to include a 40 cm above grade stick up. The addition of a vermin proof cap should also be included to the existing supply well. The requirements for the well modifications in accordance with O. Reg. 903 requires that post well modifications, the well will require formal disinfection. To comply with the O. Reg. 903 requirements, the chlorination requires that the well be not used for between 12 and 24 hours. This will require that the operations of the site be stopped for this duration. As the Site operates as a 24-hour fuel service station, this would require the station to close for a period which is not considered practical at this time. The importance of the well modifications is understood, and it is guaranteed that during the initial stages of the construction activities associated with the re-development (i.e. removing asphalt and cement structures), the required modifications will be completed. The City can request as a condition of occupancy that formal written acknowledgement and evidence that these modification have been completed.
3. As mentioned in recommendation Item 2, the casing of the well must be extended to 0.4 m (40 cm) above ground level. It is also required that protective barriers (bollards) be added around the well structure to prevent possible damage by vehicle traffic. The grading and development plans associated with the development include specific details related to the inclusion of bollards to act as additional protection to the supply well, and requirements for grading at the supply well to divert run-off away from the structure. These

details must be followed so the final grading and development are as specified in the plans.

4. Additional consideration with respect to maintaining the condition of the supply well, and the corresponding supply aquifer include the following:
    a. Snow should not be piled in the area of the well so as not to potentially damage the supply well;
    b. A monitoring program of the Site's supply well must be initiated to provide ongoing water quality information. This program will include monitoring on an annual basis for general water quality parameters and metals in addition to parameters often associated with fuel dispensing and handling facilities: petroleum hydrocarbons (PHC) Fractions F1 through F4; and Volatile Organic Compounds (VOCs) including Benzene, Toluene, Ethylbenzene and Xylenes (BTEX). A detailed Groundwater Monitoring scope will be prepared at a later date, as a condition of occupancy permits issuance with the City of Ottawa. The plan will provide details related to :
        i. Monitoring well locations, depths and construction details;
        ii. Monitoring well sampling frequency;
        iii. Provincial criteria, or standards to be applied to the water quality representative of the samples collected, and trigger mechanism to be applied to protect off-Site receptors;
        iv. Roles and responsibilities relating to the monitoring wells, and corresponding reporting and regulatory submission;
        v. Procedures and guidelines to be followed to ensure the presence of the monitoring wells to not present a potential pathway for impairment of local supply aquifer resources; and
        vi. Contingency planning with respect to contaminates of concern including, but not limited to formal reporting procedures, plans of actions, and necessary actions to be taken; and

        The proposed monitoring program and included proposed contingency plan will be reviewed by the City of Ottawa as a condition of the approval.
    c. The Site, post- re-development, should be graded such that surface run-off and drainage be diverted away from the supply well, which is demonstrated in the site redevelopment grading plans.
5. The water quality of the supply well is found to be in general accordance with the ODWS. The following exceptions were encountered:
    a. Hardness was found to be above the ODWS OG limit of 100 mg/L, and manganese exceeded the 0.05 mg/L ODWS. High levels of hardness can lead to scale deposits and excessive utilization of regular soaps, and elevated manganese can result in a brown or rust-colour discolouration to water and may cause staining to faucets, sinks, or laundry. Hardness and manganese can be reduced through the use of a water softener; however the use of sodium chloride as a regenerant for the resins can increase the sodium content of the water. This poses a lower risk to the subject site based on it's anticipated use, although it should be noted that for individuals with sodium restricted diets, potassium chloride can be substituted for sodium in the ion exchange system to lower the hardness in the water supply.

b. Turbidity was measured to have a level of 4.2 NTU in the 3-hour sample, and 8.8 NTU in the 6-hour sample. Both of which are above the ODWS OG of 1 NTU if the treatment system is required to provide filtration and, the 6-hour sample is above the AO of 5 NTU. Turbidity can be reduced through proper filtration techniques, although it is anticipated that the elevated concentration is a result of a chemical reaction which may have occurred post- sample collection.

c. Total coliforms were detected in both the 3- and 6- hour samples collected. Microbial impacts encountered (Total Coliforms) can be treated through the use of an ultraviolet disinfection system.

d. Sulphide concentrations were reported as 0.12 mg/L after 6-hours of pumping, above the 0.05 mg/L ODWS AO. Sulphide can be reduced through aeration, which oxidizes it to sulphate, or an activated carbon filter.

6. Water Treatment options should be considered on an individual basis. Any water treatment system should be maintained on a regular basis in accordance with the manufacturer's recommendations to ensure that it is properly functioning and providing a safe drinking water.

7. The water system will be a small drinking water system that is governed by the Ministry of Health and Long-Term Care (MOGLTC). The procedures outlined in O. Reg. 319/08, including procedures for regular testing of the drinking water, upkeep of records of sampling and maintenance, and the protection of the drinking water source must be adhered to. Although it appears that the supply well is hydraulically separated from the shallow overburden aquifer, it is recommended that the drinking water testing include petroleum hydrocarbons and volatile organic compounds.

8. The owner should maintain their supply well as outlined in the Ontario Ministry of Agricultural and Rural Affairs Best Management Series – Water Wells.

9. Risk Management measures are required as the Site is located within the Wellhead Protection Area for the Albion Sun Vista communal wells. The proposed development must adhere to the Well Protection Area Plan prepared by Jacques Whitford (2004), and associated risk management measures. A Construction Risk Management Plan for Source Water Protection, a Spills Prevention and Risk Management Plan (which will include staff training and record keeping as a risk management measure), and a Monitoring Program – will be prepared and reviewed by the City as a condition of the site plan agreement. Once approved, these plans are to be implemented.

   Site specific wellhead protection area – prevention measures are generally outlined above in Section 9. These measures must be implemented and will be outlined in the proposed Construction Risk Management Plan for Source Water Protection, a Spills Prevention and Risk Management Plan (which will include staff training and record keeping as a risk management measure), and a Monitoring Program to be prepared.

10. The proposed sewage disposal system for the Site is a Class IV – Filter Media. It is proposed that the system will be fully in-ground with two (2) septic beds, and two (2) 4 730 L capacity Norweco HK 4730L-3M units. The subsurface conditions indicated for the Site are considered suitable for this proposed sewage disposal system. Sewage system designs shall be based on specific investigations to evaluate the suitability of local conditions on each lot. The system should be designed using the percolation time of the native and imported sand and according to the Ontario Building Code (OBC). The leaching beds should be constructed to conform to the specifications set out in the OBC. The septic

systems shall be constructed above the groundwater table over the native soil once all organic soils have been stripped from is footprint.

11. A tertiary treatment system for the septic system is required, such as a Norweco HK 4730L-3M sewage disposal system, or equivalent, which can treat nitrates to a level, at least 67% of that of a conventional system (15 mg/L). It is required that such a system be used, and maintained accordingly by the client to ensure possible off-Site impacts are negligible.
12. A maintenance agreement for the tertiary treatment system must be prepared by the Site Owner and maintained. A condition will be included in the development agreement prepared by the City of Ottawa that indicates that the owner must provide support that a maintenance agreement has been signed for the long-term maintenance of the septic system, as required in the OBC for advanced treatment units.
13. The previous (existing at the time this report was prepared) sewage disposal system must be decommissioned and removed from the Site. Soils which make up the system shall be removed from the Site as ‘contaminated’ material, and the applicable provincial regulations (i.e. O. Reg. 558) shall be followed in support of the off-Site disposal requirements.
14. The septic system should be placed at least 15 m from any drilled supply wells, 30 m from any shallow/dug wells, and at least 3 m from the property boundary limits.
15. It is recommended that the water table be surveyed prior to installation of the sewage disposal systems by the septic system designer or installer.

12 LIMITATIONS

The findings contained in this report are based on data and information collected during the Hydrogeological Assessment & Terrain Analysis of the subject property conducted by LRL Engineering. The conclusions and recommendations are based solely on-Site conditions encountered at the time of our fieldwork between October 16th and 21st, 2022, supplemented by historical information and data obtained as described in this report. The information presented in this report represents the groundwater conditions at the locations sampled. Due to natural variations in geological conditions, no inference is made to the soil or groundwater conditions between sampling points. No assurance is made regarding changes in conditions subsequent to the time of this investigation. If additional information is discovered or obtained, LRL Engineering should be requested to re-evaluate the conclusions presented in this report and to provide amendments as required.

In evaluating the subject property, LRL Engineering has relied in good faith on information provided by individuals as noted in this report. We assume that the information provided is factual and accurate. We accept no responsibility for any deficiencies, misstatements or inaccuracies contained in this report as a result of omissions, misinterpretation or fraudulent acts of the persons contacted.

Yours truly,

LRL Engineering

Table 1
Specific Capacity and Longterm Availability
Hydrogeological Assessment & Terrain Analysis- Proposed Fuel Dispensing Facility Re-Development
5546 Albion Road South, Ottawa (Gloucester), Ontario
LRL File: 01348

Tested By: LRL Associates Ltd.
Well Depth 41.4

Date	Cs - Static mTOC	Cp - Pump* mTOC	Cp - Cs	Drawdown (m)	Pumping Rate L/min	*Sc* - Specific Capacity L/sec/m	Specific Yield (m^3/day/m)	Qsc -Maximum Pumping Rate L/min	Long Term Availability m^3/day	Qsc GPM (US)	Qsc GPM (IMP)
2022.10.17	2.98	22.86	19.88	1.55	30.0	3.23E-01	27.9	128.9	185.6	34.1	28.4

Notes:

$$Qsc = 0.67\frac{(C_p - C_s)S_c}{SF}$$

Where:

Qsc Pumping rate with safety factor (SF) of 2.5 (L/min);
$C_p - C_s$ Difference between pump level and static water level (m);
S_c Specific capacity (L/min/m); and
0.67 Is a factor that compensates for the variation of the static water level due to seasonal variations as well as to drawdown from nearby wells

SF 2.0
Minimum Demand 8.62 m^3/day
* Depth of Pump at the time of the Pumping Test.
Greater than Minimum Demand
Less than Minimum Demand

Re: Wetland Boundary Assessment, Unevaluated Wetland
Lot 30, Concession 3, From Rideau River Gloucester
Ottawa, Ontario

Please accept this letter as the GEMTEC Consulting Engineers and Scientists Limited (GEMTEC) Wetland Boundary Assessment completed for the property parcel municipally addressed as 5546 Albion Road and the west adjacent property located on Lot 30, Concession 3, From Rideau River Gloucester, herein collectively referred to as the study area.

INTRODUCTION

The purpose of this letter report is to provide a summary of the wetland boundary assessment completed for the unevaluated, local wetland identified by the City of Ottawa as occupying portions of both property parcels comprising the study area. The study area is illustrated on Figure A.1 in Attachment A.

BACKGROUND

It is GEMTEC's understanding that LRL Engineering (LRL) is completing an Environmental Impact Statement (EIS) for 5546 Albion Road and requires a certified Ontario Wetland Evaluation System (OWES) wetland evaluator to establish and ground-truth the boundary of wetlands within the study area.

The unevaluated, local wetland as identified by the City of Ottawa, covers approximately 10 ha, and is located immediately north of Mitch Owens Road, south of Ballycastle Crescent, east of the Spratt Municipal Drain (SMD) and west of Albion Road.

The nearest Provincially Significant Wetland (PSW), the Osgood PSW complex, is located approximately 4 km southeast of the study area.

Based on review of aerial photography (1976, 1999, 2002-2018) the study area was cleared sometime prior to 1976. Since 1976, the study area has been left in a fallow state to revegetate with the exception of periodic drainage improvements to the SMD and the construction of stormwater infrastructure associated with the Ballycastle Crescent subdivision to the north.

METHODOLOGY

To complete this Wetland Boundary Assessment, vegetation communities were delineated following the protocols outlined in the Wetland Evaluation System for Southern Ontario (OMNRF, 2014) supported by publicly available air photos and surficial soil data from the Ontario Soil Survey Complex (OMAFRA, 2022). A single field investigation was completed on May 25, 2022, from 07:00 to 09:00 to provide field verification of vegetation communities delineated during the desktop review. The conditions at the time of the field investigation were: clear skies with no precipitation, 21°C and light wind.

Field verification of vegetation communities was completed by walking linear transects along the soil moisture gradient from drier to wetter ecosites while documenting dominant vegetation species within the various vegetation community forms. The boundary between wetland ecosites and terrestrial ecosites was determined using the *50/50 Vegetation Rule* as outlined in the Ontario Wetland Evaluation System for Southern Ontario (OMNRF, 2014), where the wetland boundary is determined to be the point along each transect when 50% of the vegetation becomes comprised of hydrophilic or obligate wetland species.

EXISTING CONDITIONS

The study area is comprised of three vegetation communities including two upland vegetation communities and one wetland vegetation community. In general, vegetation on the subject property is consistent with cultural vegetation communities, those communities whose composition and form are heavily influenced by historical or on-going anthropogenic activities.

Vegetation communities present on the subject property are summarized in Table 1 below and are illustrated on Figure A.1.

Photograph 1 below provides illustrates the typical community form of the upland vegetation community present within the study area, while Photograph 2 illustrates the typical community form of the wetland vegetation community within the study area.

Table 1 - Vegetation Communities

ELC Type	Description
Fresh – Moist Poplar Deciduous Woodland (WODM5-1)	This upland vegetation community occurs over the eastern portions of the study area and is characterized by a semi-mature, fresh to moist poplar deciduous woodland. Dominant tree species included trembling aspen (*Populus tremuloides*), large-toothed aspen (*Populus grandidentata*) and sugar maple (*Acer saccharum*), and with lesser constituents including white pine (*Pinus strobus*), white elm (*Ulmus americana*), green ash (*Fraxinus pennsylvanica*) and glossy buckthorn (*Frangula alnus*).
Mineral Deciduous Thicket Swamp (SWT2)	This immature deciduous swamp is located over the western and central portion of the study area and is comprised primarily of hydrophilic tall shrub species. Dominant species consisted primarily of green alder (*Alnus viridis*) glossy buckthorn, red maple (*Acer rubrum*), slender willow (*Salix petiolaris*) and nannyberry (*Viburnum lentago*)

Photograph One

Photograph Two

SUMMARY

Based on the results of the desktop evaluation and completion of the vegetation survey, the ground-truthed wetland boundary is presented on Figure A.1.

We trust this report is sufficient for your current needs; however, should you require any clarification of the information presented above, please do not hesitate to contact the undersigned.

Sincerely,

Drew Paulusse, B.Sc.
Senior Biologist,
Manager, Environmental Services

NOTES:

Symbols and Terms Used on Borehole and Test Pit Logs

1. Soil Description

The soil descriptions presented in this report are based on commonly accepted methods of classification and identification employed in geotechnical practice. Classification and identification of soil involves some judgement and LRL Associates Ltd. does not guarantee descriptions as exact, but infers accuracy to the extent that is common in current geotechnical practice. Boundaries between zones on the logs are often not distinct but transitional and were interpreted.

a. Proportion

The proportion of each constituent part, as defined by the grain size distribution, is denoted by the following terms:

Term	Proportions
"trace"	1% to 10%
"some"	10% to 20%
prefix (i.e. "sandy" silt)	20% to 35%
"and" (i.e. sand "and" gravel)	35% to 50%

b. Compactness and Consistency

The state of compactness of granular soils is defined on the basis of the Standard Penetration Number (N) as per ASTM D-1586. It corresponds to the number of blows required to drive 300 mm of the split spoon sampler using a metal drop hammer that has a weight of 62.5 kg and free fall distance of 760 mm. For a 600 mm long split spoon, the blow counts are recorded for every 150 mm. The "N" value is obtained by adding the number of blows from the 2nd and 3rd count. Technical refusal indicates a number of blows greater than 50.

The consistency of clayey or cohesive soils is based on the shear strength of the soil, as determined by field vane tests and by a visual and tactile assessment of the soil strength.

The state of compactness of granular soils is defined by the following terms:

State of Compactness Granular Soils	Standard Penetration Number "N"	Relative Density (%)
Very loose	0 – 4	<15
Loose	4 – 10	15 – 35
Compact	10 - 30	35 – 65
Dense	30 - 50	65 - 85
Very dense	> 50	> 85

The consistency of cohesive soils is defined by the following terms:

Consistency Cohesive Soils	Undrained Shear Strength (C_u) (kPa)	Standard Penetration Number "N"
Very soft	<12.5	<2
Soft	12.5 - 25	2 - 4
Firm	25 - 50	4 - 8
Stiff	50 - 100	8 - 15
Very stiff	100 - 200	15 - 30
Hard	>200	>30

c. Field Moisture Condition

Description (ASTM D2488)	Criteria
Dry	Absence of moisture, dusty, dry to touch.
Moist	Dump, but not visible water.
Wet	Visible, free water, usually soil is below water table.

2. Sample Data

a. Elevation depth

This is a reference to the geodesic elevation of the soil or to a benchmark of an arbitrary elevation at the location of the borehole or test pit. The depth of geological boundaries is measured from ground surface.

b. Type

Symbol	Type	Letter Code
	Auger	AU
	Split Spoon	SS
	Shelby Tube	ST
	Rock Core	RC

c. Sample Number

Each sample taken from the borehole is numbered in the field as shown in this column.

LETTER CODE (as above) – Sample Number.

d. Recovery (%)

For soil samples this is the percentage of the recovered sample obtained versus the length sampled. In the case of rock, the percentage is the length of rock core recovered compared to the length of the drill run.

3. Rock Description

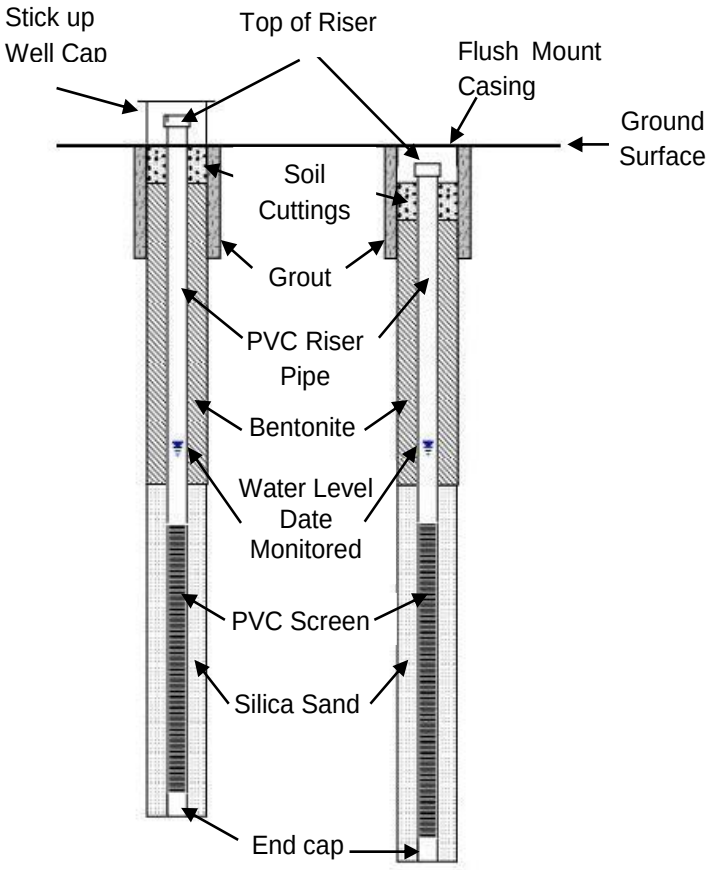
Rock Quality Designation (RQD) is a rough measure of the degree of jointing or fracture in a rock mas. The RQD is calculated as the cumulative length of rock pieces recovered having lengths of 100 mm or more divided by the length of coring. The qualitative description of the bedrock based on RQD is given below.

Rock Quality Designation (RQD) (%)	Description of Rock Quality
0 –25	Very poor
25 – 50	Poor
50 – 75	Fair
75 – 90	Good
90 – 100	Excellent

Strength classification of rock is presented below.

Strength Classification	Range of Unconfined Compressive Strength (MPa)
Extremely weak	< 1
Very weak	1 – 5
Weak	5 – 25
Medium strong	25 – 50
Strong	50 – 100
Very strong	100 – 250
Extremely strong	> 250

4. General Monitoring Well Data



5. Classification of Soils for Engineering Purposes (ASTM D2487)

(United Soil Classification System)

Major divisions			Group Symbol	Typical Names	Classification Criteria		
Coarse-grained soils More than 50% retained on No. 200 sieve* (>0.075 mm)	Gravels More than 50% of coarse fraction retained on No. 4 sieve(4.75 mm)	Clean gravels <5% fines	GW	Well-graded gravel	If 15% sand add "with sand" to group name.	Classification on basis of percentage of fines: Less than 5% pass No. 200 sieve - GW, GP, SW, SP More than 12% pass No. 200 sieve - GM, GC, SM, SC 5 to 12% pass No. 200 sieve - Borderline classifications, use of dual symbols	$C_u = \frac{D_{60}}{D_{10}} \geq 4$; $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3
			GP	Poorly graded gravel			Not meeting either Cu or Cc criteria for GW
		Gravels with >12% fines	GM	Silty gravel			Atterberg limits below "A" line or PI less than 4 → Atterberg limits plotting in hatched area are borderline classifications requiring use of dual symbols
			GC	Clayey gravel			Atterberg limits on or above "A" line and PI > 7 → If fines are organic add "with orgnic fines" to group name
	Sands 50% or more of coarse fraction passes No. 4 sieve(<4.75 mm)	Clean sands <5% fines	SW	Well-graded sand	If 15% gravel add "with gravel to group name		$C_u = \frac{D_{60}}{D_{10}} \geq 6$; $C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ between 1 and 3
			SP	Poorly graded sand			Not meeting either Cu or C ccriteria for SW
		Sands with >12% fines	SM	Silty sand			Atterberg limits below "A" line or PI less than 4 → Atterberg limits plotting in hatched area are borderline classifications requiring use of dual symbols
			SC	Clayey sand			Atterberg limits on or above "A" line and PI > 7 → If fines are organic add "with orgnic fines" to group name
Fine-grained soils50% or more passes No. 200 sieve* (<0.075 mm)	Silts and Clays Liquid Limit <50%	Inorganic	ML	Silt	If 15 to 29% coarse-grained, add "with sand" or "with gravel" as appropriate. If > 30% coarse-grained, add "sandy" or "gravelly" as appropriate. Class as organic when oven dried liquid limit is < 75% of undried liquid limit.		
			CL	Lean Clay -low plasticity			
		Organic	OL	Organic clay or silt (Clay plots above 'A' Line)			
	Silts and Clays Liquid Limit >50%	Inorganic	MH	Elastic silt			
			CH	Fat Clay -high plasticity			
		Organic	OH	Organic clay or silt (Clay plots above 'A' Line)			
	Highly Organic Soils		PT	Peat, muck and other highly organic soils

Test of Well Yield

Pumping test method: SubPump

Pump intake set at - (metres): 21.33

Pumping rate - (litres/min): 11

Duration of pumping: 1 hrs + 0 min

Final water level end of pumping: 0.22 metres

Recommended pump type: ☐ Shallow ☑ Deep

Recommended pump depth: 21.33 metres

Recommended pump rate: 11 (litres/min)

If flowing give rate - (litres/min):

If pumping discontinued, give reason.

	Draw Down Time min	Draw Down Water Level Metres	Recovery Time min	Recovery Water Level Metres
Static Level		Flow		0.22
1	0.18	1	Flow	
2	0.18	2		
3	0.18	3		
4	0.19	4		
5	0.19	5		
10	0.20	10		
15	0.20	15		
20	0.21	20		
25	0.21	25		
30	0.21	30		
40	0.22	40		
50	0.22	50		
60	0.22	60

Timeline

- 0 Minutes 16 Seconds - Camera enters well at top of casing.
- 0 Minutes 38 Seconds - 5ft TOC Pitless adapter visible.
- 0 Minutes 55 Seconds - Static water level reached at 9ft 2in TOC.
- 0 Minutes 58 Seconds - 10ft TOC Iron build up is visible on the casing.
- 1 Minutes 20 Seconds - 15ft TOC
- 1 Minutes 43 Seconds - 20ft TOC Very poor visibility due to turbidity.
- 2 Minutes 04 Seconds - 25ft TOC
- 2 Minutes 26 Seconds - 30ft TOC
- 2 Minutes 47 Seconds - 35ft TOC
- 3 Minutes 09 Seconds - 40ft TOC
- 3 Minutes 29 Seconds - 45ft TOC Visibility starts to improve. Possible Biofilm visible.
- 3 Minutes 50 Seconds - 50ft TOC
- 4 Minutes 11 Seconds - 55ft TOC Heavy build up on side of well.

- 4 Minutes 30 Seconds - Transition from casing to open hole.
- 4 Minutes 32 Seconds - 60ft TOC Open hole clearly visible.
- 4 Minutes 57 Seconds - 65ft TOC
- 5 Minutes 18 Seconds - 70ft TOC
- 5 Minutes 30 Seconds - Approx. 73ft TOC Pump set depth reached, unable to proceed further down well.
- 5 Minutes 51 Seconds - Camera retrieval begins.
- 7 Minutes 05 Seconds - Camera exits well.

TOC = Top of Casing

Notes:
There appears to be approximately 60ft of casing from TOC to transition to open hole. Well casing is currently less than 16” above grade and should be extended and have a vermin proof well cap installed as per Ontario Regulation 903. Typically casing is sold in 20ft lengths so it is very likely they used three full lengths of casing in the construction of the well.

We are unable to verify the annular space seal via camera inspection or casing depth sensor inspection. Annular space would need to be dug and disturbed to establish if and how much grout was used to seal the annular space. No grout was visible at the grade.

For Services Rendered

Product/Service	Description	Qty.	Unit Price	Total
Nov 28, 2023				
WL / Well Inspection / Camera Inspection	Camera inspection of a well. Includes a report and video. Please note that if the pump remains in the well there is a risk that the camera can get stuck. If this happens pulling the pump to retrieve the camera is completed at additional cost.	1	$495.00	$495.00
WL / Inspection / Standard	Ontario Regulation 903. Compliance Inspection (grouting as visible from surface)***	1	$50.00	$50.00

Thank you for your business!

Standard One Year Parts and Labour Warranty
Warranty expires 365 days following service date on invoice.
All parts must be supplied and installed by us to be covered under warranty.
Please retain a copy of your invoice for verification purposes.

PV Well Water is a PV Plumbing & Water Inc. Brand.

HST/GST Number 784916934RT0001

Qualifier Notes:

Login Qualifiers :

Container and COC sample IDs don't match - Sulphide bottle is labelled as 5548 Albion Rd, chain of custody reads 5546 Albion Rd.

Applies to samples: 5546 Albion Rd - Supply Well - 3 hrs

Sample - Not submitted in the correct container - VOC sample decanted from plastic general 500mL bottle.

Applies to samples: 5546 Albion Rd - Supply Well - 6 hrs

Sample - F1/BTEX/VOCs (water) submitted with headspace which covered the bottom surface of the vial when inverted.

Applies to samples: 5546 Albion Rd - Supply Well - 6 hrs

Sample Qualifiers :

5 : Subcontracted analysis - Eurofins Environment Testing

QC Qualifiers :

QM-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Analysis Summary Table

Analysis	Method Reference/Description	Extraction Date	Analysis Date
Alkalinity, total to pH 4.5	EPA 310.1 - Titration to pH 4.5	27-Nov-23	27-Nov-23
Ammonia, as N	EPA 351.2 - Auto Colour	27-Nov-23	27-Nov-23
Anions	EPA 300.1 - IC	29-Nov-23	29-Nov-23
Colour	SM2120 - Spectrophotometric	23-Nov-23	24-Nov-23
Conductivity	EPA 9050A- probe @25 °C	27-Nov-23	27-Nov-23
Dissolved Organic Carbon	MOE 3247B - Combustion IR	23-Nov-23	24-Nov-23
E. coli	MOE E3407	23-Nov-23	23-Nov-23
Fecal Coliform	SM 9222D	23-Nov-23	23-Nov-23
Heterotrophic Plate Count	SM 9215C	23-Nov-23	23-Nov-23
Metals, ICP-MS	EPA 200.8 - ICP-MS	24-Nov-23	24-Nov-23
pH	EPA 150.1 - pH probe @25 °C	27-Nov-23	27-Nov-23
PHC F1	CWS Tier 1 - P&T GC-FID	27-Nov-23	28-Nov-23
PHCs F2 to F4	CWS Tier 1 - GC-FID, extraction	28-Nov-23	28-Nov-23
Phenolics	EPA 420.2 - Auto Colour, 4AAP	28-Nov-23	28-Nov-23
REG 153: PAHs by GC-MS	EPA 625 - GC-MS, extraction	27-Nov-23	27-Nov-23
Hardness	Hardness as CaCO3	29-Nov-23	29-Nov-23
Sulphide	SM 4500SE - Colourimetric	23-Nov-23	23-Nov-23
Tannin/Lignin	SM 5550B - Colourimetric	23-Nov-23	24-Nov-23
Total Coliform	MOE E3407	23-Nov-23	23-Nov-23
Total Dissolved Solids	SM 2540C - gravimetric, filtration	27-Nov-23	28-Nov-23
Total Kjeldahl Nitrogen	EPA 351.2 - Auto Colour, digestion	27-Nov-23	28-Nov-23
Turbidity	SM 2130B - Turbidity meter	23-Nov-23	23-Nov-23
VOCs by P&T GC-MS	EPA 624 - P&T GC-MS	28-Nov-23	28-Nov-23

Qualifier Notes:

Login Qualifiers :

Container(s) - Labeled improperly/insufficient information - All bottles missing sample time.

Applies to Samples: 5546 Albion Road

Sample Qualifiers :

QC Qualifiers:

QM-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions:

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable

ND: Not Detected

MDL: Method Detection Limit

Source Result: Data used as source for matrix and duplicate samples

%REC: Percent recovery.

RPD: Relative percent difference.

NC: Not Calculated

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.

- F1 range corrected for BTEX.

- F2 to F3 ranges corrected for appropriate PAHs where available.

- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.

- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.

- When reported, data for F4G has been processed using a silica gel cleanup.

INFORMATION FOR OWNER/APP

Attached is your Sewage System Permit. **A minimum of two inspections are required before your proposed sewage system can be approved for use (additional inspections may be required for clay soils/bedrock and/or re-inspections).** Inspections must be requested in writing. Please see attached:

- Inspection fax request form (all inspections MUST be requested in writing)
- As-built components and drawing form
- Copy of the approved application and schedule pages
- Approved Part 8 permit 2x copies: Copy 1: APPLICANT + Copy 2:Plans Examiner ** Agent Deliver Direct To City

Special Note

- A permit is valid for 12 months from the original date of issuance noted in "*permit date*". If lapsed, it may be renewed only once for a period of 12 months *from the date of expiry.*

- No person shall make a material change or cause a material change to be made to a plan, specification, document or other information on the basis of which a permit was issued without notifying, filing details with and obtaining the authorization of the Chief Building Official. *(Building Code Act 1992, c.23, s.8(12))*

Sewage System Permit Construction Requirements

1. Clay Soils/Bedrock only (if required per issued Approval)
In clay soils/bedrock, a site preparation inspection is required. The total contact area must be properly prepared. Scarification must be done under dry conditions prior to importing leaching bed fill.

2. Installation Inspection – 2nd inspection
When the sewage system is substantially completed (i.e., before the final fill is placed over the septic tank and leaching bed system) an installation inspection is required. Prior to any inspection request, the following must be submitted:

a) "as-built components" and "as-built drawings" — see attached form
b) "engineer letter" — if the system is engineered
c) grain size analysis and weight bills for all Filter Media types of septic systems
d) Weigh bills for washed septic stone, where applicable
e) Maintenance/service contract for treatment unit installed

3. Final Grading Inspection – 3rd inspection
When construction of the sewage system is complete, a final grading inspection is required. Before a Certificate of Completion can be issued, the following must be complete:

a) The leaching bed and septic tank must be covered with sand fill and topsoil and graded accordingly
b) All conditions of the Sewage System Permit & comments on the installation inspection report must be met
c) The depth of cover & material type must be identified by inspection pipes or holes placed over trenches at 4 corners of bed
d) The 4 corners of the bed must be staked

F. Tarion Warranty Corporation (Ontario New Home Warranty Program)

i. Is proposed construction for a new home as defined in the *Ontario New Home Warranties Plan Act*? If no, go to section G.	Yes	No ✓
ii. Is registration required under the *Ontario New Home Warranties Plan Act*?	Yes	No ✓

iii. If yes to (ii) provide registration number(s): _____

G. Required Schedules

i) Attach Schedule 1 for each individual who reviews and takes responsibility for design activities.

ii) Attach Schedule 2 where application is to construct on-site, install or repair a sewage system.

H. Completeness and compliance with applicable law

i) This application meets all the requirements of clauses 1.3.1.3 (5) (a) to (d) of Division C of the Building Code (the application is made in the correct form and by the owner or authorized agent, all applicable fields have been completed on the application and required schedules, and all required schedules are submitted).	Yes ✓	No
Payment has been made of all fees that are required, under the applicable by-law, resolution or regulation made under clause 7(1)(c) of the *Building Code Act, 1992*, to be paid when the application is made.	Yes ✓	No
ii) This application is accompanied by the plans and specifications prescribed by the applicable by-law, resolution or regulation made under clause 7(1)(b) of the *Building Code Act, 1992*.	Yes ✓	No
iii) This application is accompanied by the information and documents prescribed by the applicable by-law, resolution or regulation made under clause 7(1)(b) of the *Building Code Act, 1992* which enable the chief building official to determine whether the proposed building, construction or demolition will contravene any applicable law.	Yes ✓	No
iv) The proposed building, construction or demolition will not contravene any applicable law.	Yes ✓	No

I. Declaration of applicant

I Davis Patel declare that:
(print name)

1. The information contained in this application, attached schedules, attached plans and specifications, and other attached documentation is true to the best of my knowledge.
2. If the owner is a corporation or partnership, I have the authority to bind the corporation or partnership.

Date Oct 13, 2023 Signature of applicant

Personal information contained in this form and schedules is collected under the authority of subsection 8(1.1) of the *Building Code Act, 1992*, and will be used in the administration and enforcement of the *Building Code Act, 1992*. Questions about the collection of personal information may be addressed to: a) the Chief Building Official of the municipality or upper-tier municipality to which this application is being made, or, b) the inspector having the powers and duties of a chief building official in relation to sewage systems or plumbing for an upper-tier municipality, board of health or conservation authority to whom this application is made, or, c) Director, Building and Development Branch, Ministry of Municipal Affairs and Housing 777 Bay St., 2nd Floor, Toronto, M5G 2E5 (416) 585-6666.

Schedule 1: Designer Information

Use one form for each individual who reviews and takes responsibility for design activities with respect to the project.

A. Project Information

Building number, street name		Unit no.	Lot/con.
5546 Albion Rd.			30/3
Municipality	**Postal code**	**Plan number/ other description**	
Gloucester	K1X 1A6		

B. Individual who reviews and takes responsibility for design activities

Name		Firm	
Davis Patel		Green Valley Convironmental Inc.	
Street address		**Unit no.**	**Lot/con.**
6107 First Line Rd.			
Municipality	**Postal code / Province**	**E-mail**	
North Gower	K4M 1A4 ON	engineering@agvegroup.ca	
Telephone number	**Fax number**	**Cell number**	
(613) 692-2616	( )	(613) 229-3980	

C. Design activities undertaken by individual identified in Section B. [Building Code Table 3.5.2.1. of Division C]

House	HVAC – House	Building Structural
Small Buildings	Building Services	Plumbing – House
Large Buildings	Detection, Lighting and Power	Plumbing – All Buildings
Complex Buildings	Fire Protection	✓ On-site Sewage Systems

Description of designer's work

Design a septic system for proposed/replacement commercial building.

D. Declaration of Designer

I Davis Patel declare that (choose one as appropriate):
(print name)

I review and take responsibility for the design work on behalf of a firm registered under subsection 3.2.4.of Division C, of the Building Code. I am qualified, and the firm is registered, in the appropriate classes/categories.

Individual BCIN: 119685

Firm BCIN: 16035

R.V.C.A. RECEIVED
OCT 13 2023

SEPTIC FILE #
22-398

I review and take responsibility for the design and am qualified in the appropriate category as an "other designer" under subsection 3.2.5.of Division C, of the Building Code.

Individual BCIN: _____

Basis for exemption from registration: _____ OTTAWA

The design work is exempt from the registration and qualification requirements of the Building Code.

Basis for exemption from registration and qualification: _____

I certify that:

1. The information contained in this schedule is true to the best of my knowledge.
2. I have submitted this application with the knowledge and consent of the firm.

Date Oct 13, 2023 Signature of Designer

NOTE:

1. For the purposes of this form, "individual" means the "person" referred to in Clause 3.2.4.7(1) (c).of Division C, Article 3.2.5.1. of Division C, and all other persons who are exempt from qualification under Subsections 3.2.4. and 3.2.5. of Division C.
2. Schedule 1 is not required to be completed by a holder of a license, temporary license, or a certificate of practice, issued by the Ontario Association of Architects. Schedule 1 is also not required to be completed by a holder of a license to practise, a limited license to practise, or a certificate of authorization, issued by the Association of Professional Engineers of Ontario.

Schedule 2: Sewage System Installer Information

A. Project Information

Building number, street name		Unit number	Lot/con.
5546 Albion Rd.			30/3
Municipality	**Postal code**	**Plan number/ other description**	
Gloucester	K1X 1A8		

B. Sewage system installer

Is the installer of the sewage system engaged in the business of constructing on-site, installing, repairing, servicing, cleaning or emptying sewage systems, in accordance with Building Code Article 3.3.1.1, Division C?

Yes (Continue to Section C) No (Continue to Section E) ✓ Installer unknown at time of application (Continue to Section E)

C. Registered installer information (where answer to B is "Yes")

Name			BCIN	
Street address			Unit number	Lot/con.
Municipality	Postal code	Province	E-mail	
Telephone number ( )	Fax ( )		Cell number ( )	

D. Qualified supervisor information (where answer to section B is "Yes")

Name of qualified supervisor(s)	Building Code Identification Number (BCIN)

R.V.C.A. RECEIVED OCT 13 2023

SEPTIC FILE # 22-398 OTTAWA

E. Declaration of Applicant:

I Davis Patil (print name) declare that:

I am the applicant for the permit to construct the sewage system. If the installer is unknown at time of application, I shall submit a new Schedule 2 prior to construction when the installer is known;

OR

I am the holder of the permit to construct the sewage system, and am submitting a new Schedule 2, now that the installer is known.

I certify that:

1. The information contained in this schedule is true to the best of my knowledge.
2. If the owner is a corporation or partnership, I have the authority to bind the corporation or partnership.

NOTES:

1. ALL TREATMENT UNITS AND LEACHING BED ARE TO BE INSTALLED IN ACCORDANCE WITH MINIMUM OBC CLEARANCE DISTANCES. ANY OMISSIONS OR INACCURACIES SHALL BE BROUGHT TO THE ATTENTION OF GVE AND OSSO.

2. CARE IS TO BE EXERCISED DURING CONSTRUCTION ACTIVITIES NEAR OVERHEAD HYDRO WIRES.

3. EXISTING ELEVATIONS ARE APPROXIMATE. CONTRACTOR MUST VERIFY ALL ELEVATIONS AND DIMENSIONS PRIOR TO CONSTRUCTION.

4. SOIL CONDITIONS ARE ACCURATE FOR THE LOCATIONS SHOWN. CONTRACTOR MUST CONTACT THE DESIGN ENGINEER OR REGULATORY AUTHORITY SHOULD SOIL CONDITIONS DIFFER.

5. ALL DIMENSIONS AND CONDITIONS TO BE VERIFIED ON SITE. FIGURED DIMENSIONS TAKE PRECEDENCE OVER SCALE.

6. UTILITY LOCATES SHALL BE COMPLETED PRIOR TO ANY EXCAVATION.

7. THIS IS NOT A PLAN OF SURVEY AND SHALL NOT BE USED EXCEPT FOR THE PURPOSE INDICATED IN THE TITLE BLOCK.

8. THIS DOCUMENT IS COPYRIGHT PROTECTED AND IS THE SOLE PROPERTY OF GVE GROUP. THIS DRAWING SHALL NOT BE ALTERED IN ANY MANNER.

9. EXISTING LOT SERVICED WITH A DRILLED WELL.

Permit
Part 8 – Sewage System
Ontario Building Code

Do Not Complete
Permit No 22-398
Revision No
Date
Related Application

A copy of this permit must be posted on the property at all time during construction. OBC, Division C — Part 1, Section 1.3.2.1

This permit verifies that the on-site sewage system was reviewed and approved for construction under the *Ontario Building Code* and *O.Reg. 323/12* as amended by *O.Reg. 151/13.*

Inspected & Recommended by: Ryan Hiemstra
Owner: MacEwen Petroleum
Inspection Date & Time: Sept 28, 2022
Weather: Sunny
Civic Address: 5546 Albion Road
Legal: Lot 30, Con 3
In the former Township/City of Gloucester

Design Flow for Commercial / Institutional / Industrial (as per Table 8.2.1.3.B)

Q: 3800 (Water closets) + 3920 (Fuel pumps) L/day

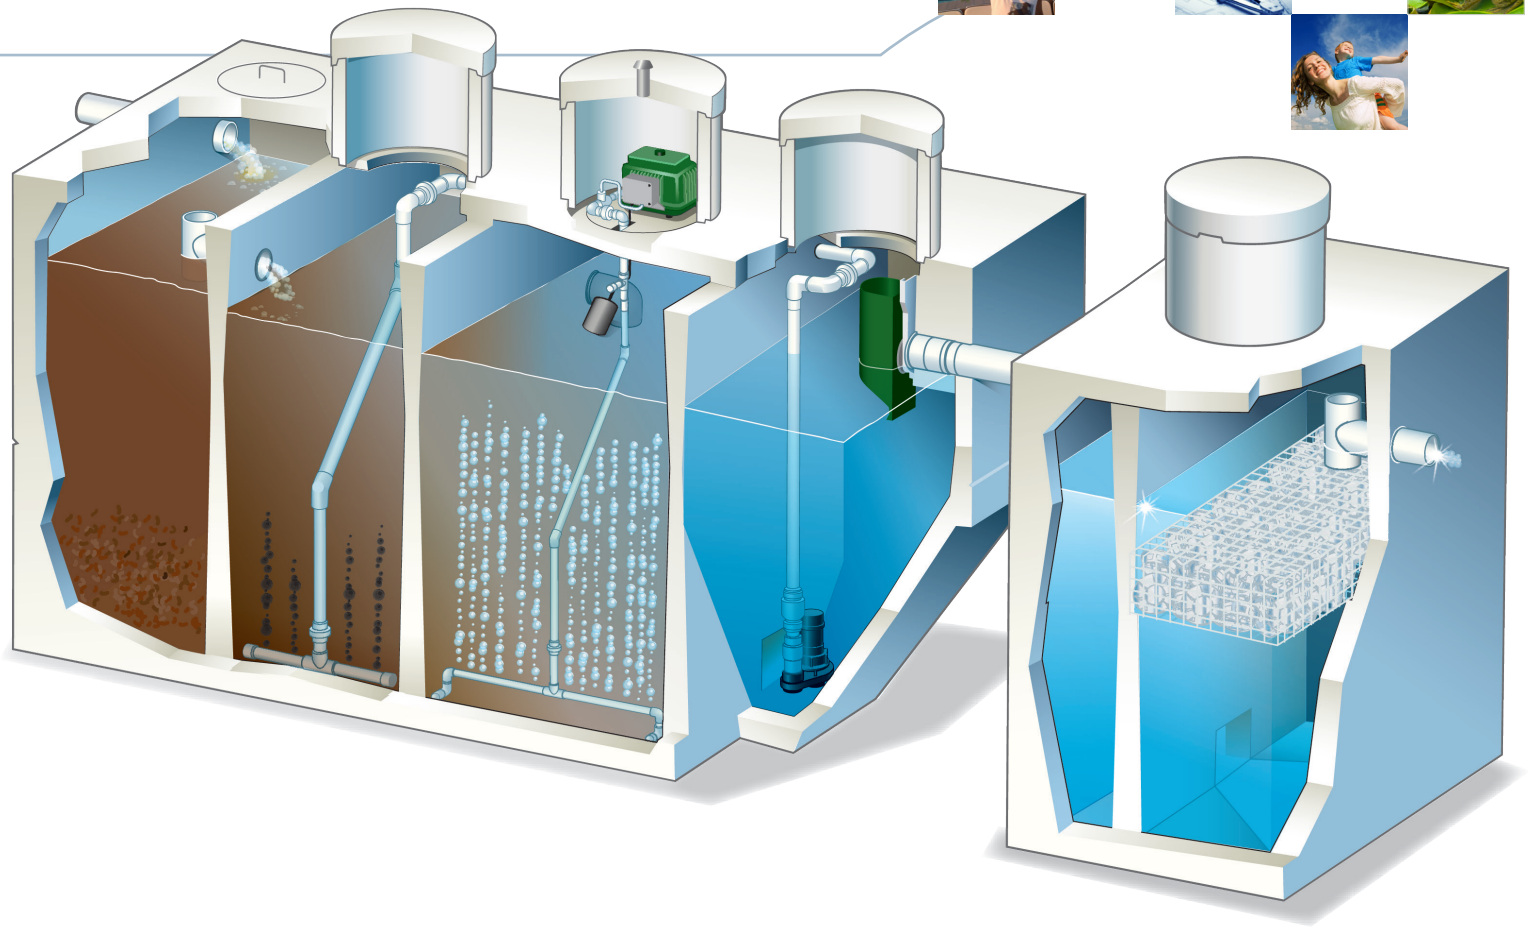
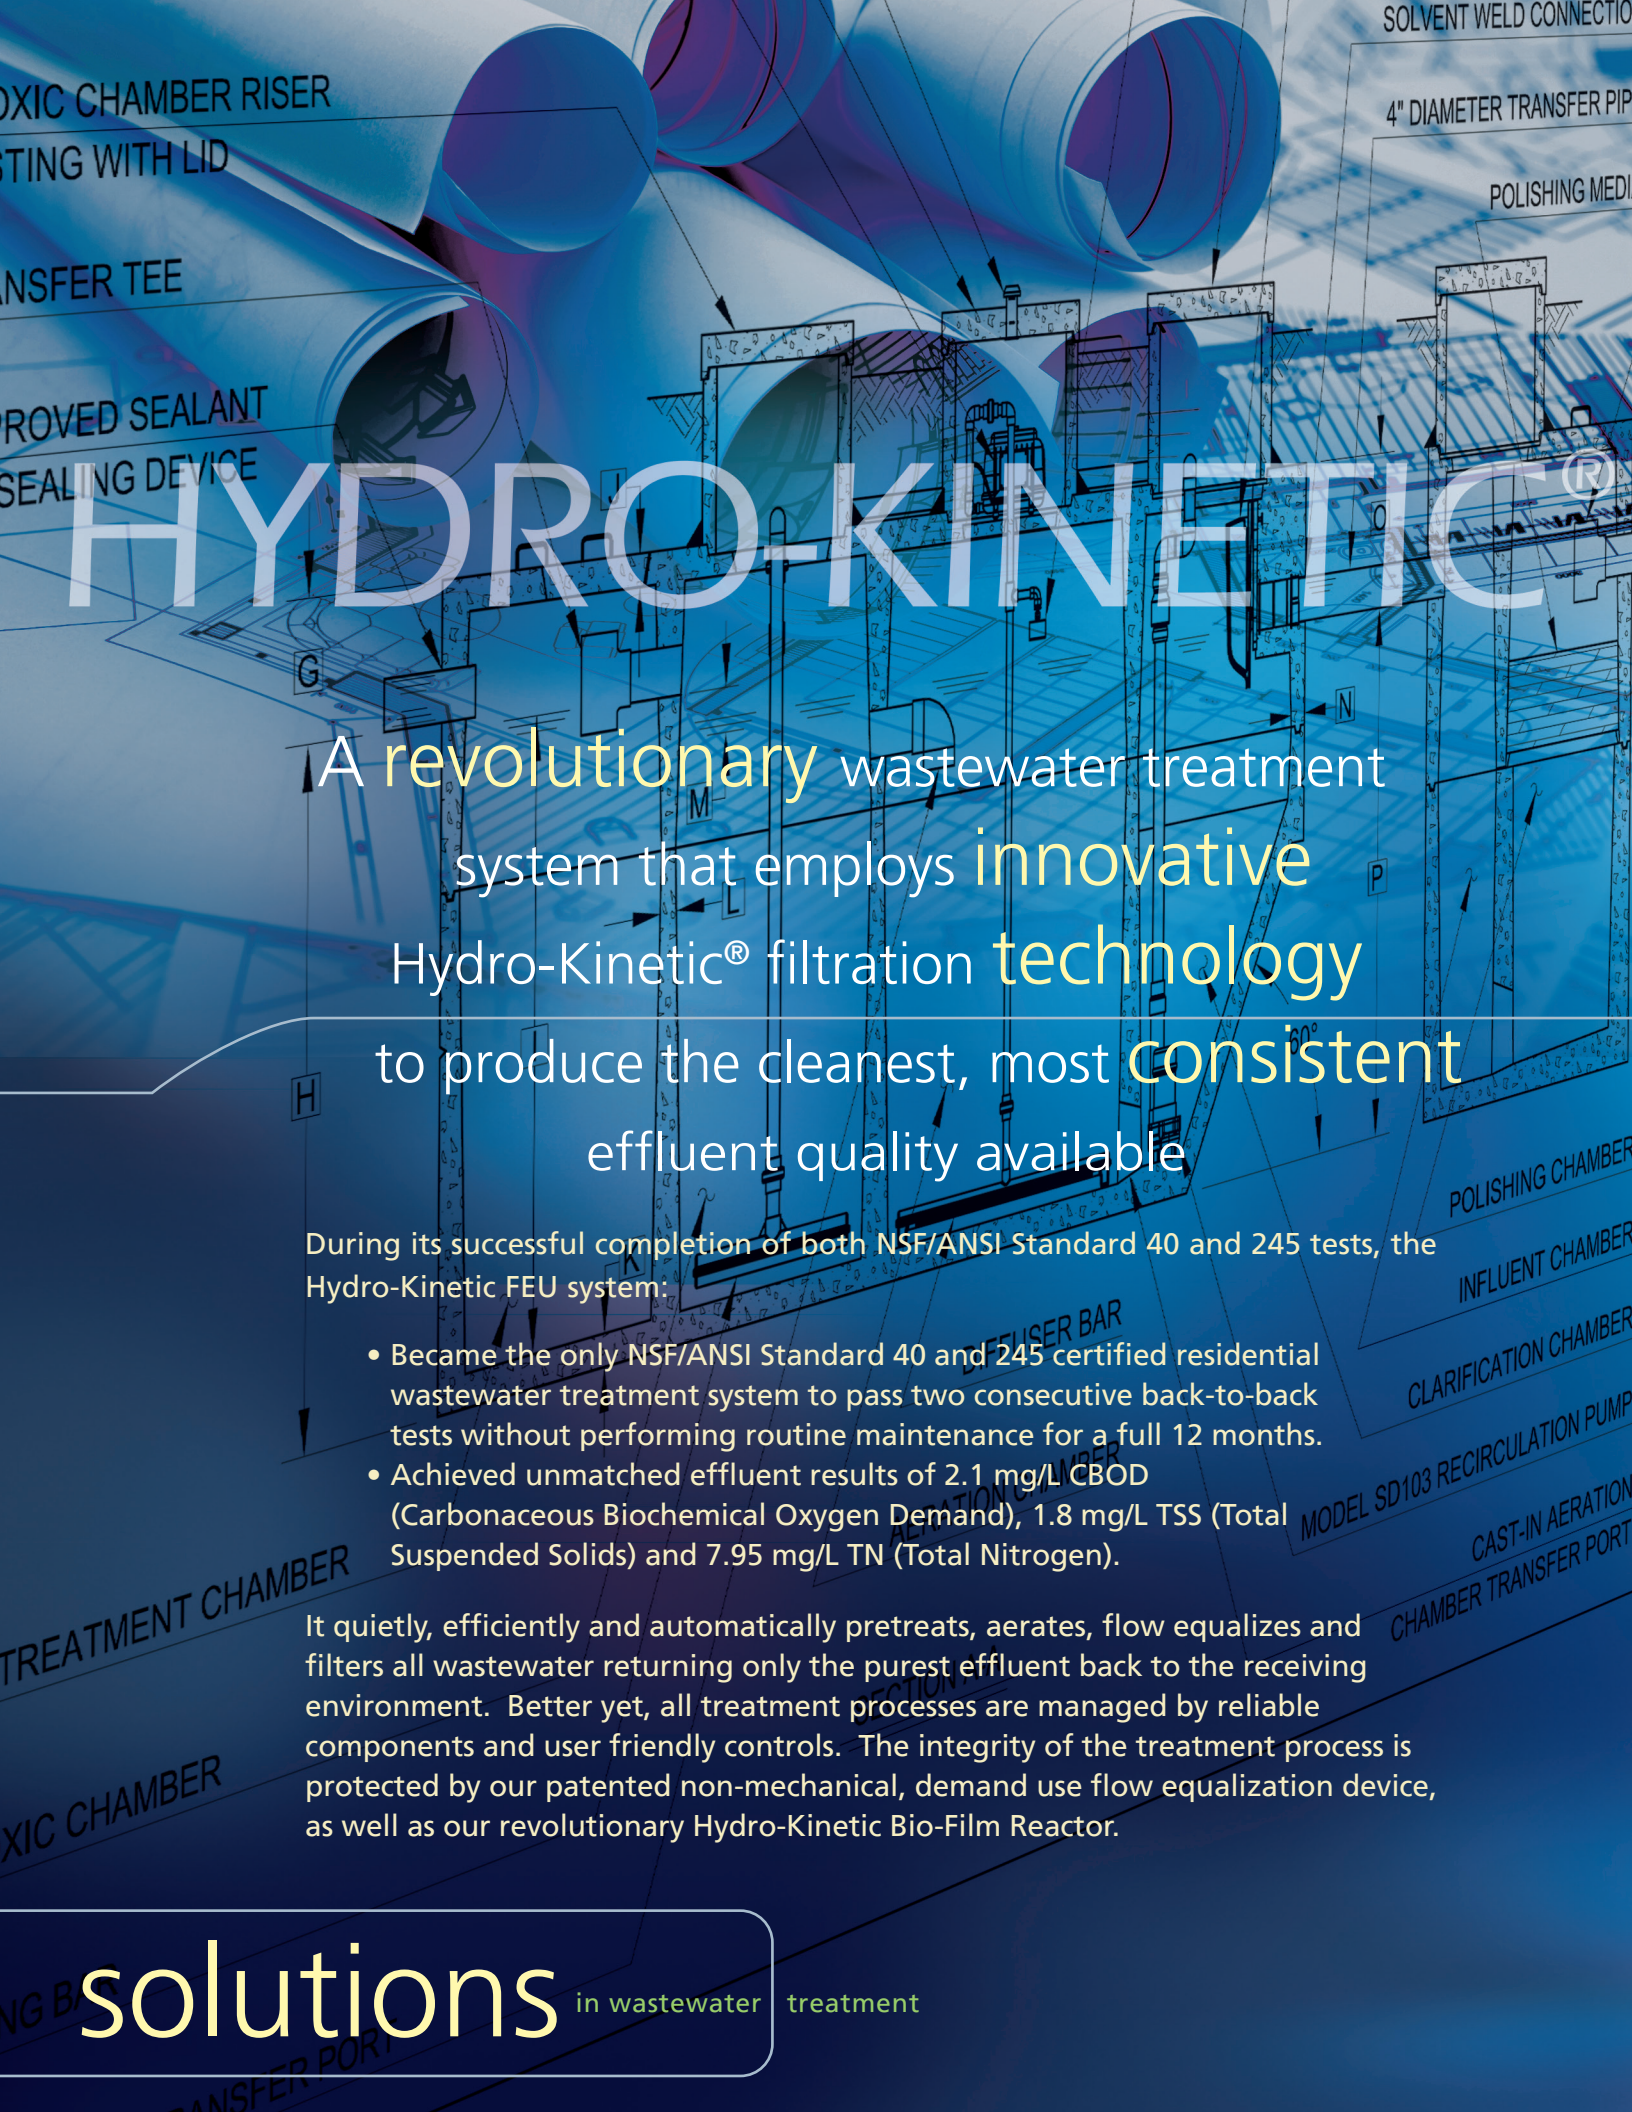
Norweco Tertiary System Specifications

HYDRO-KINETIC® FEU



norweco®

Engineering the future of water and wastewater treatment



HYDRO-KINETIC®

A revolutionary wastewater treatment system that employs innovative Hydro-Kinetic® filtration technology to produce the cleanest, most consistent effluent quality available

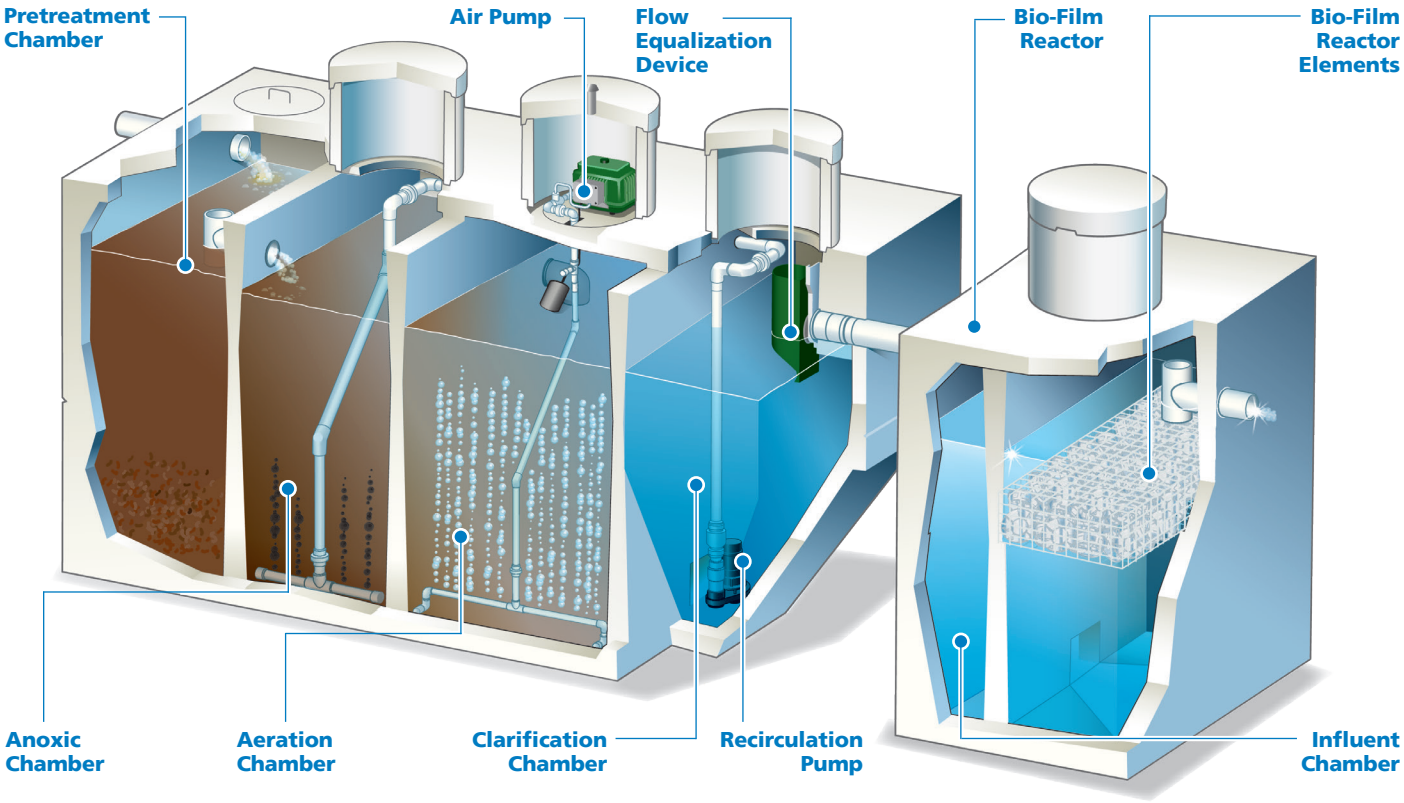
During its successful completion of both NSF/ANSI Standard 40 and 245 tests, the Hydro-Kinetic FEU system:

- Became the only NSF/ANSI Standard 40 and 245 certified residential wastewater treatment system to pass two consecutive back-to-back tests without performing routine maintenance for a full 12 months.
- Achieved unmatched effluent results of 2.1 mg/L CBOD (Carbonaceous Biochemical Oxygen Demand), 1.8 mg/L TSS (Total Suspended Solids) and 7.95 mg/L TN (Total Nitrogen).

It quietly, efficiently and automatically pretreats, aerates, flow equalizes and filters all wastewater returning only the purest effluent back to the receiving environment. Better yet, all treatment processes are managed by reliable components and user friendly controls. The integrity of the treatment process is protected by our patented non-mechanical, demand use flow equalization device, as well as our revolutionary Hydro-Kinetic Bio-Film Reactor.

solutions in wastewater treatment

Revolutionary in design, unparalleled in performance



Pretreatment Chamber
Anaerobic bacteria and gravity precondition the wastewater here to protect the integrity of downstream treatment processes.

Anoxic Chamber
Pretreatment Chamber effluent is mixed with nitrified liquid recirculated from the clarifier in measured doses, via a mixing bar in this chamber. Under carefully controlled conditions, bacteria remove nitrogen by consuming nitrate-bound oxygen during their respiratory process.

Aeration Chamber
Here, safe, living aerobic bacteria convert the wastewater into stable substances. Flow equalization maximizes this biological oxidation and assures proper retention and treatment.

Model A100 Air Pump
Our exclusive Model A100 air pump is a precision engineered electro-mechanical device that has been specifically designed for use in the system. It can be installed below grade or remotely located up to 75 feet from the system.

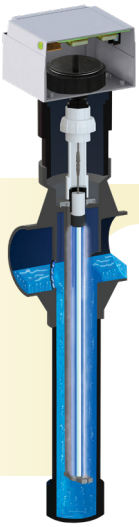
Clarification Chamber
Flow equalization enhances the settling of biologically active substances inside the Clarification Chamber. Pretreated, aerated wastewater has now been converted to clarified liquids for discharge from this chamber.

Model SD103 Recirculation Pump
This highly efficient recirculation pump is installed at the bottom of the Clarification Chamber and is used to transfer nitrified liquid back to the Anoxic Chamber for denitrification.

Flow Equalization Device
Controls flow through the treatment process and regulates the velocity of treated effluent that can leave the system, enhancing the efficiency of the attached growth filtration media in the Hydro-Kinetic system.

Bio-Film Reactor
Flow equalized liquid from the clarifier enters the Bio-Film Reactor where it flows downward and is evenly distributed beneath our exclusive Hydro-Kinetic filtration media. The liquid then travels through the proprietary attached growth filtration media where the final treatment takes place.

Precast Concrete Tank
Every tank is constructed of high quality, non-corrosive materials under rigid quality control standards. The tank, access risers and covers are reinforced precast concrete manufactured locally by your licensed Norweco distributor.

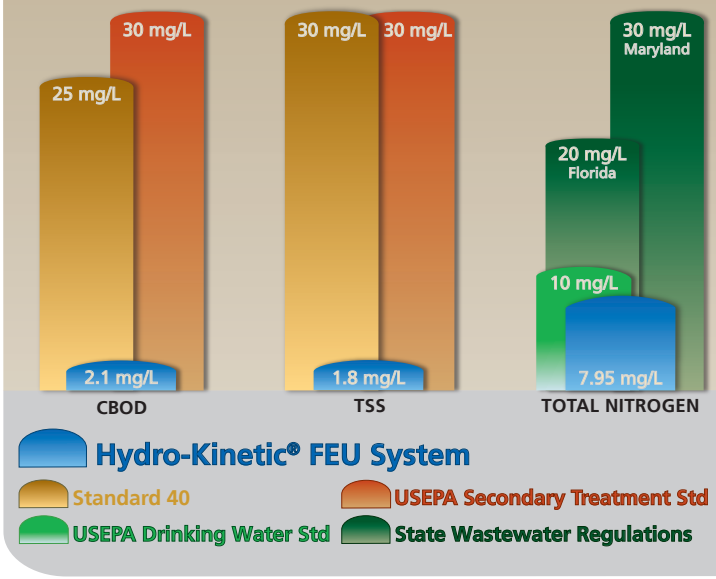


AT 1500 Ultraviolet Disinfection System
CAPABLE OF MEETING EVEN THE MOST STRINGENT ENVIRONMENTAL REQUIREMENTS, THE MODEL AT 1500 UV DISINFECTION SYSTEM REDUCES BACTERIA LEVELS FROM SECONDARY EFFLUENT TO MEET STRICT WATER QUALITY STANDARDS. THE AT 1500 IS THE ONLY UV TREATMENT SYSTEM LISTED BY UNDERWRITERS LABORATORIES FOR RESIDENTIAL APPLICATIONS.

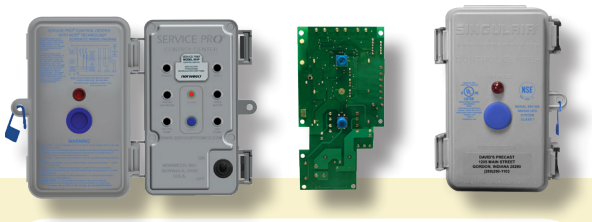
Consider the facts:

- The Hydro-Kinetic FEU system meets or exceeds regulatory standards and is performance certified and listed by NSF International to Standards 40 and 245. The system achieved an astounding effluent quality of 2.1 mg/L CBOD, 1.8 mg/L TSS and 7.95 mg/L TN.
- The system produced these unmatched effluent results while being tested for 12 continuous months without service. The Hydro-Kinetic system passed two consecutive 6 month tests with flying colors, including duplicate multi-stress sequences.
- We have engineered the Model A100 air pump to maximize operational efficiency and increase service life. It requires minimal electricity to operate and utilizes a standard 115V power connection. Multiple air pump mounting locations are available.
- The Model SD103 recirculation pump features a ⅓ horsepower electric motor that is securely mounted in an oil-filled, watertight, corrosion resistant housing with lubricated ball bearings to assure long life. The recirculation pump features a 2" discharge connection.
- The Hydro-Kinetic Bio-Film Reactor provides final treatment of the wastewater to a near pristine state. As liquid flows up through our proprietary attached growth filtration media, final polishing takes place insuring only the highest quality effluent is safely returned to the environment.

Unmatched Effluent Results



- 70-hour retention in the Hydro-Kinetic system insures adequate exposure to all treatment processes and reduces pumping frequency as compared to smaller capacity systems.
- Our patented non-mechanical flow equalization device guarantees that all incoming wastewater is fully treated, regardless of heavy use periods.
- All flow is equalized an average of 50% at the NSF Standard 40/245 600 GPD (gallons per day) design loading pattern.
- Durable, reliable components are safely installed out-of-sight below grade. No exposed power cords or air lines that are above ground.
- Your local licensed Norweco distributor sells, installs and services your Hydro-Kinetic system with pride. You'll find their name and contact info conveniently posted on the system's control center.



SERVICE PRO® Model 801P

EVERY SYSTEM COMES WITH THE SERVICE PRO MODEL 801P CONTROL CENTER THAT USES MCD TECHNOLOGY TO PROVIDE MONITORING, COMPLIANCE AND DIAGNOSTIC FUNCTIONS FOR THE TREATMENT SYSTEM. EACH CONTROL CENTER INCLUDES A TIME CLOCK, ALARM LIGHT, RESET BUTTON, POWER SWITCH, POWER LIGHT, PHONE/NETWORK LIGHT, RECIRCULATION PUMP ALARM, AIR PUMP ALARM, HIGH WATER ALARM AND ADDITIONAL AUXILIARY COMPONENT INPUT.

Blue Crystal® Residential Disinfecting Tablets and Bio-Max® Dechlorination Tablets

PURE CALCIUM HYPOCHLORITE TABLETS FORMULATED FOR USE IN RESIDENTIAL SYSTEMS, BLUE CRYSTAL TABLETS CONTAIN 70% AVAILABLE CHLORINE TO PROVIDE EFFICIENT, RELIABLE DISINFECTION. BIO-MAX TABLETS PROVIDE A CONVENIENT SOURCE TO INSTANTLY REMOVE CHLORINE FROM WASTEWATER, POTABLE WATER AND PROCESS WATER. EACH TABLET CONTAINS 92% SODIUM SULFITE.

Norweco distributors are located throughout the United States and much of the rest of the world. Research, product development, manufacturing, marketing and sales support are conducted inside our offices and factory in Norwalk, Ohio USA. Everyone at Norweco is committed to shaping the future of our industry.

engineering the future

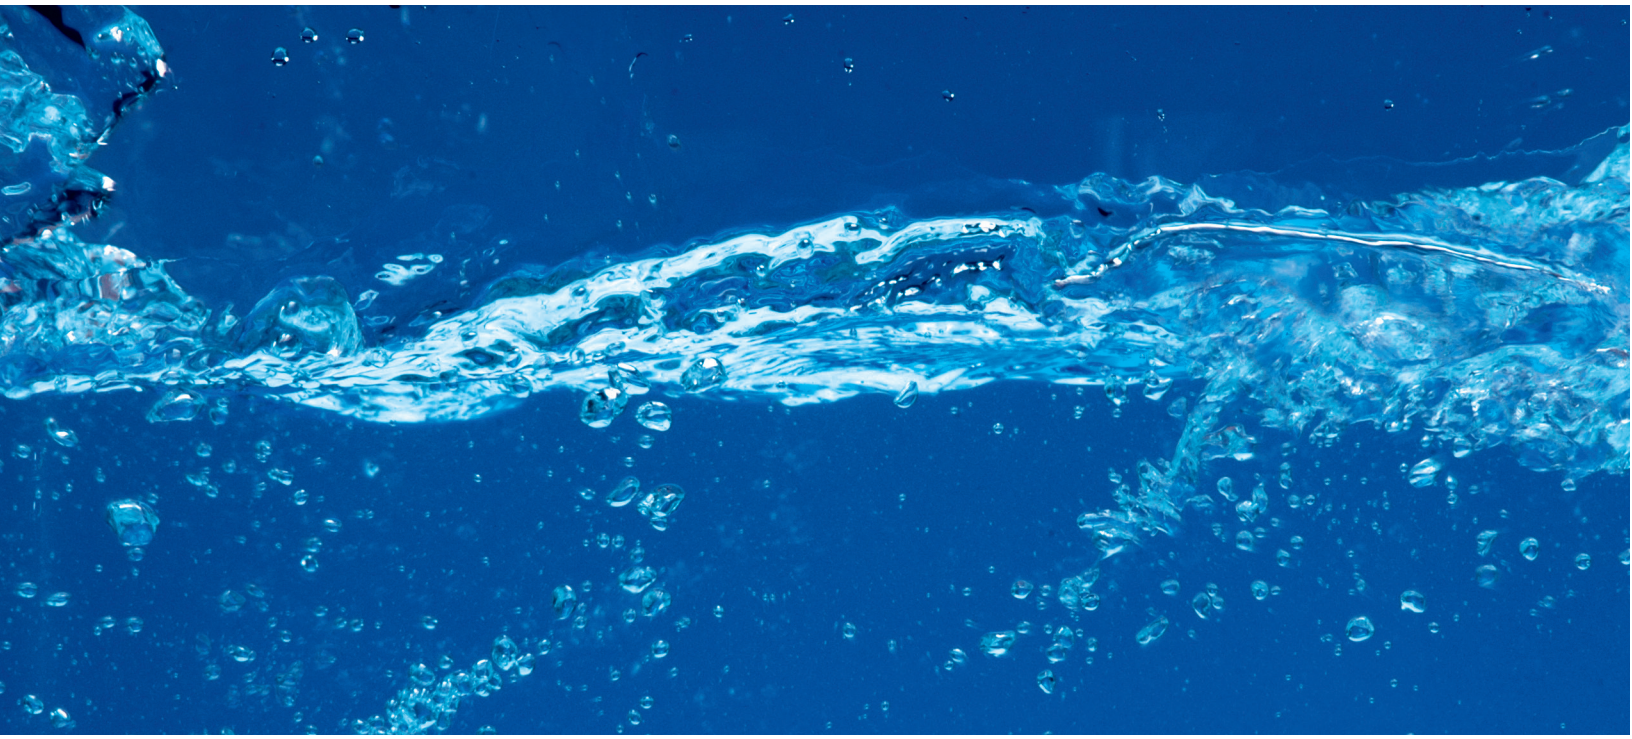
of water and wastewater treatment

Specify Hydro-Kinetic®

As a designer, choosing to incorporate the Hydro-Kinetic system in your project will insure that you achieve successful treatment while offering outstanding quality and reliability. At the same time, the reputation of your company will be protected for years to come. Your local Norweco distributor is fully trained to assist you in the design, installation and operation of a Norweco Hydro-Kinetic FEU (Flow Equalized Upflow) system.

As a homeowner, getting the highest quality product is essential. The Hydro-Kinetic system arrives to the jobsite complete, including delivery, tank setting, equipment installation, plant start-up and service. A series of service and adjustment inspections are prescheduled for the first two years of operation at the time your system is installed. These inspections are included in the sale so that your system continues to perform at the highest level to protect you and your investment. Extended service contracts are also available from your local Norweco distributor.

Today's Answer for the Protection of Tomorrow's Environment



comprehensive protection, guaranteed

The Hydro-Kinetic wastewater treatment system, Service Pro control center, and all Norweco components are warranted against defects in material and workmanship under normal use and service by our comprehensive 2 year Limited Warranty. A Warranty Registration Card and Owner's Manual are included with purchase. Warranty information is detailed on the back page of the Hydro-Kinetic System Owner's Manual.

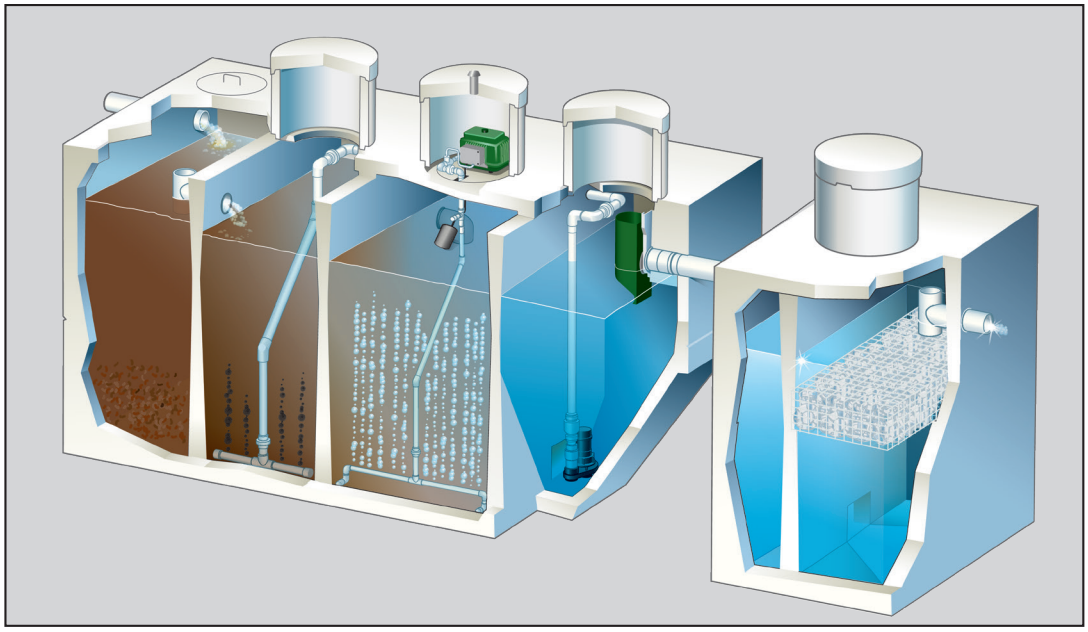
HYDRO-KINETIC®

WASTEWATER TREATMENT SYSTEM
MODEL 600 FEU

SPECIFICATIONS

GENERAL SPECIFICATIONS

The contractor shall furnish and install one complete Hydro-Kinetic wastewater treatment system with all necessary parts and equipment as described in the following specifications. Treatment of the domestic wastewater shall be accomplished by the extended aeration process with non-mechanical flow equalization, pretreatment of the influent and filtration of the final effluent. The treatment system shall provide primary, secondary and tertiary treatment of the wastewater flow, denitrification, and if required, chlorination/dechlorination or ultraviolet disinfection of the effluent prior to discharge. All treatment processes shall be contained within reinforced precast concrete tankage meeting the requirements of ACI Standard 318. The wastewater treatment system shall be a Hydro-Kinetic Model 600 FEU as manufactured by Norweco, Inc., Norwalk, Ohio, USA.



The wastewater treatment system shall include precast concrete tankage providing separate pretreatment, anoxic, aeration, clarification and final filtration chambers. The tankage shall be furnished with cast-in-place inlets, submerged transfer ports, access risers with removable covers, cast-in-place molded plastic vent assembly, cast-in-place clarification outlet coupling and cast-in-place outlet tee. Principal items of electro-mechanical equipment supplied with the Hydro-Kinetic system shall be a Model A100 air pump, Model SD103 recirculation pump, UL Listed Service Pro Model 801P electrical control center with MCD technology, flow equalization device and Hydro-Kinetic FEU filter for final filtration of system effluent.

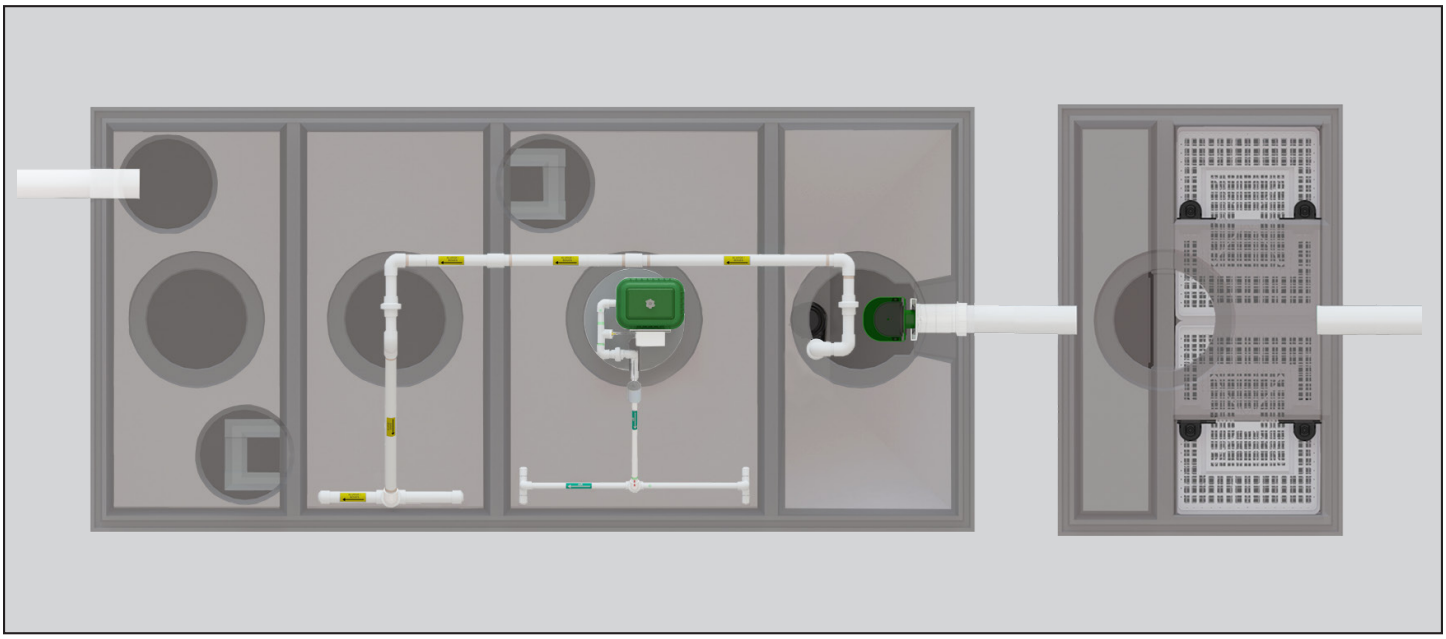
HYDRO-KINETIC®

OPERATING CONDITIONS

Total holding capacity of the system shall provide a minimum of 70 hour retention of the daily flow. The pretreatment chamber shall provide at least 15 hour retention, the anoxic chamber shall provide at least 15 hour retention, the extended aeration chamber shall provide at least 21 hour retention, the clarification chamber shall provide at least 7 hour retention and the Hydro-Kinetic filter shall provide at least 12 hour retention of the daily flow. The non-mechanical flow equalization device shall increase individual chamber and total system retention time in direct proportion to loading. Design of the system shall include a compartmented tank and non-mechanical flow equalization device to insure successful treatment performance without upset even when the significant runoff period is six hours. Hydraulic design considerations of the system and flow equalization device shall be such that intermittent peak flow factors as high as four shall not upset hydraulic reliability within the system. Capability of the system to perform as outlined, when built by an approved manufacturer, shall be certified by an independent testing laboratory and approved for use by the local governing regulatory agency.

PRETREATMENT CHAMBER

All domestic wastewater shall be preconditioned while passing through the pretreatment chamber prior to being introduced to the anoxic chamber. The outlet of the pretreatment chamber shall be equipped with a discharge tee that extends vertically into the liquid so that only the preconditioned flow from the center area of the chamber is displaced to the anoxic chamber. The discharge tee and transfer port shall be of adequate size to handle a peak flow factor of four without restricting the outlet and disturbing hydraulic displacement to the anoxic chamber. A removable inspection cover shall be cast into the top of the pretreatment chamber to allow tank and transfer tee inspection. As a safety measure, the uncovered opening shall be small enough to insure that the tank cannot be entered for inspection or service.



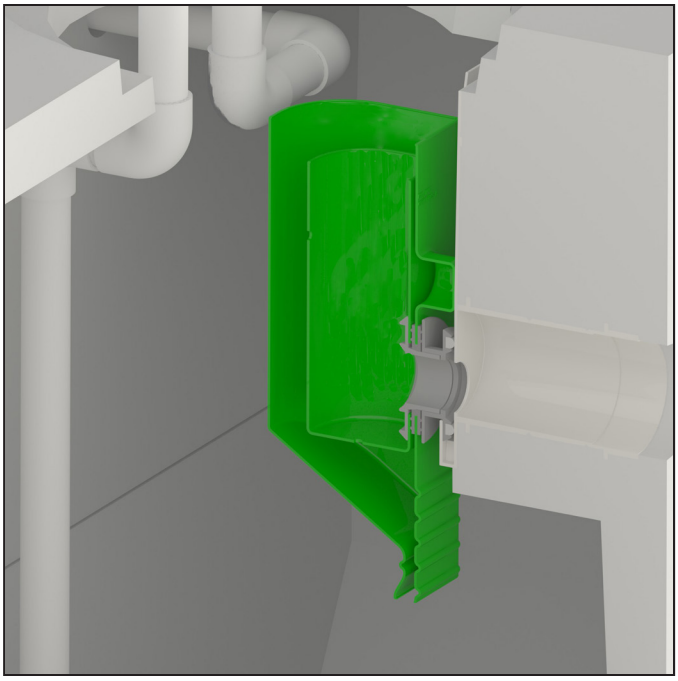
ANOXIC CHAMBER

The anoxic chamber shall provide in excess of 15 hour retention of the equalized daily flow. In the anoxic chamber, low oxygen levels shall compel facultative heterotrophic bacteria to use nitrate-bound oxygen in their respiratory process. Nitrified liquid from the clarifier shall enter the chamber in measured doses and nitrogen compounds shall be converted to harmless nitrogen gas which shall escape into the atmosphere. Overall design of the chamber shall insure that effective mixing and suspension of the biomass is maintained in an anoxic condition to insure consistent biological denitrification. Systems that have not been performance certified to reduce Total Nitrogen (TN) to less than 10 mg/L shall not be considered for this application.

AERATION CHAMBER

The extended aeration chamber shall provide in excess of 21 hour retention of the equalized daily flow. The chamber shall be of sufficient size to provide a minimum of 80 cubic feet of tank capacity per pound of applied BOD. The aeration chamber length-width-depth ratio shall be designed to insure uniform tank mixing and provide optimum treatment. The aeration chamber(s) shall be an integral part of the system flow path and constructed of properly reinforced 5,000 PSI, 28 day compression strength precast concrete. All castings used to construct the precast concrete tankage shall be monolithic units with external and internal walls incorporated into each section.

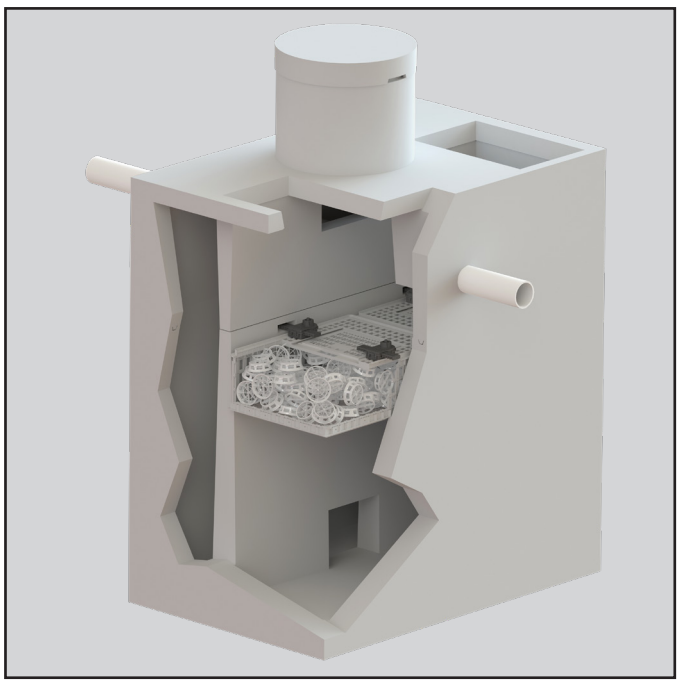
FINAL CLARIFICATION CHAMBER



The final clarification chamber shall consist of 5 functionally independent zones operating together to provide satisfactory settling and clarification of the equalized flow. An inlet zone shall be provided and shall dissipate transfer turbulence at the flow inlet of the clarification chamber. A recirculation pump in the settled sludge zone shall transfer a portion of the wastewater back to the anoxic chamber. Liquid is then displaced into the hopper zone of the clarifier. In this zone, settling by gravity takes place. Three of the four sidewalls are slanted to form a hopper which directs all settled material back to the settled sludge zone. Clarified liquid from the hopper zone shall be displaced into the final settling zone to provide additional clarification of the liquid. The liquid is finally displaced to the outlet zone where the treated effluent shall pass through the flow equalization device and be discharged from the final clarification chamber.

FLOW EQUALIZATION DEVICE

The system shall include a non-mechanical, demand use, flow equalization device. The device shall be installed with the design flow equalization port located below the normal liquid level of the clarifier. If intermittent flow rates exceed the capacity of the design flow port, flow shall be held upstream until the intermittent flow dissipates. If the intermittent flow continues to increase, the liquid level may reach a sustained flow equalization port. With both ports in use, flow through the system increases while continuing to provide flow equalization to upstream and downstream processes. A peak flow equalization port is supplied but should not be required in a properly sized system. The device shall control normal residential flow rates and reduce typical residential flow surges. The flow equalization rate shall be dependent upon the specific loading pattern and the duration of flow surges. At the 600 GPD (gallons per day) NSF Standard 40/245 design loading schedule, minimum performance of the device shall equalize daily flow an average of 50%.

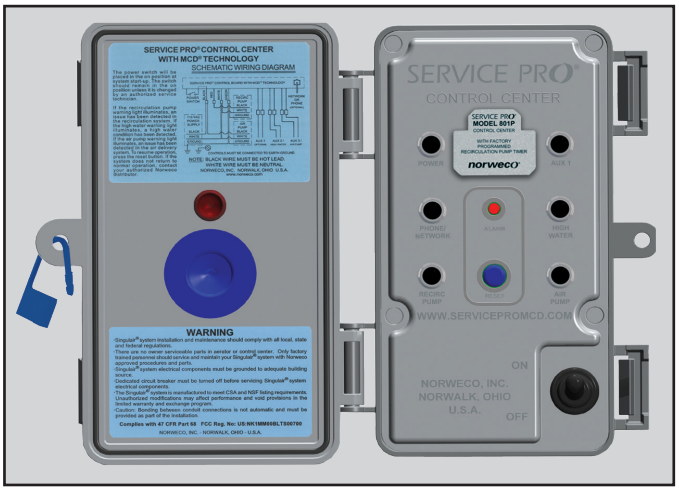


HYDRO-KINETIC® FILTER

Significant reduction of organic matter shall occur in the treatment system prior to the Hydro-Kinetic filter. This Bio-Film reactor shall provide final treatment of the effluent to a near pristine state. Flow equalized liquid from the clarifier shall enter the influent chamber, travel down and be evenly distributed beneath the filtration media. The effects of gravity shall cause solids to settle to the bottom of the tank. As liquid travels up through the proprietary attached growth media, further reduction of organic matter shall take place. Additional settling and consolidation of solids shall take place downstream of the filter media. After passing through the filtration media for final polishing, the highly treated liquid shall flow into the final effluent zone before exiting the Hydro-Kinetic filter through the outlet tee.

MODEL 600 FEU

SERVICE PRO® MODEL 801P ELECTRICAL CONTROL CENTER



The Model 801P control center with MCD technology shall provide Monitoring, Compliance and Diagnostic functions for the treatment system. The pre-wired controls shall be mounted in a lockable NEMA rated enclosure designed specifically for outdoor use. The control center shall be a UL Listed assembly and shall include a time clock, alarm light, reset button, power switch, power light, phone/network light, recirculation pump light, air pump light, high water light and auxiliary alarm light. A pre-programmed time clock shall control the recirculation pump to insure that approximately 400% of the average daily flow is returned to the anoxic chamber. The control center shall monitor recirculation pump current, air pump operation, high water and auxiliary alarm circuitry. In the event of an alarm from the air pump or auxiliary input, the audible and visual alarms shall activate and the optional telemetry system shall report the condition. If abnormal operation of the recirculation pump is detected, a diagnostic sequence shall begin and the visual alarm shall activate. After a factory programmed recovery interval, an automatic restart attempt shall be initiated. If normal pump operation does not resume during 24 programmed recovery and restart cycles, the audible alarm shall activate and the optional telemetry system shall report the condition to the Service Pro monitoring center.

SERVICE PRO® MONITORING CENTER

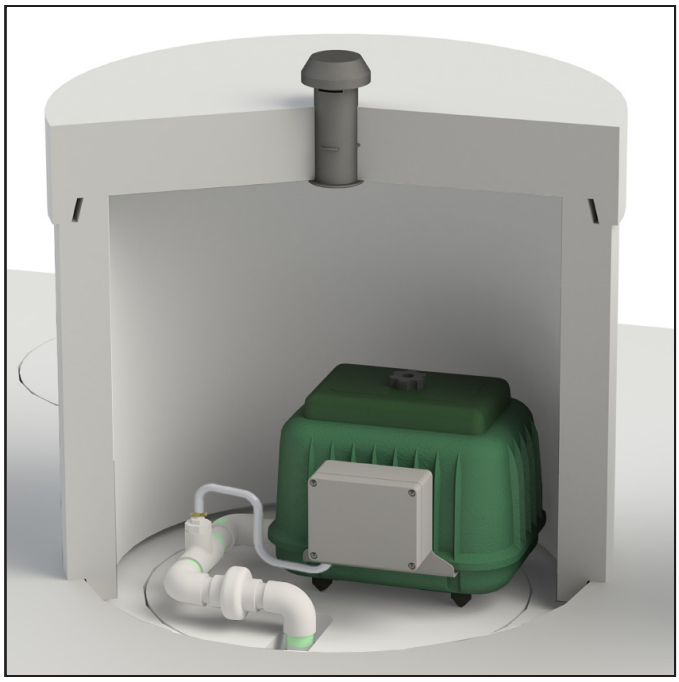
The Service Pro monitoring center shall include a 256 bit encrypted password protected website for interface with the monitoring center database. Access to the secure website shall be obtained through a unique user name and password that provides tiered access to data from monitored treatment systems. Access level tiers shall include distributors, service providers, regulatory agencies and individual system owners. Distributors and service providers shall be able to create accounts, enter serial numbers for system equipment, maintain service records and grant regulatory agencies access to the information. The monitoring center shall have the capability to schedule future service inspections and provide notification. Individual system owners shall be able to view information regarding their own systems, as well as download instructional information. Integrity of stored data shall be maintained through the use of multiple servers operating in geographically isolated locations.

MODEL AT 1500 ULTRAVIOLET DISINFECTION SYSTEM (Optional)

The Hydro-Kinetic system shall be furnished complete with a Model AT 1500 ultraviolet disinfection system. The AT 1500 system shall incorporate a turbulence inducer and dual-pass design to insure pathogenic organisms receive maximum exposure to the ultraviolet light source. Effluent fecal coliform concentrations shall be consistently reduced to less than 200 mg/L. The ultraviolet disinfection system shall be UL Listed under Standard 979 as a residential treatment device and shall include a disinfection chamber, turbulence inducer, extension riser, quartz tube, Teflon cover, ultraviolet bulb and controls. An interlock switch shall be furnished to automatically disable the ultraviolet light source when the disinfection chamber is accessed. Ultraviolet disinfection systems without a residential UL Listing and an interlock switch have not demonstrated compliance with international electrical standards for safety and reliability and shall not be considered for this application.

SPECIFICATIONS

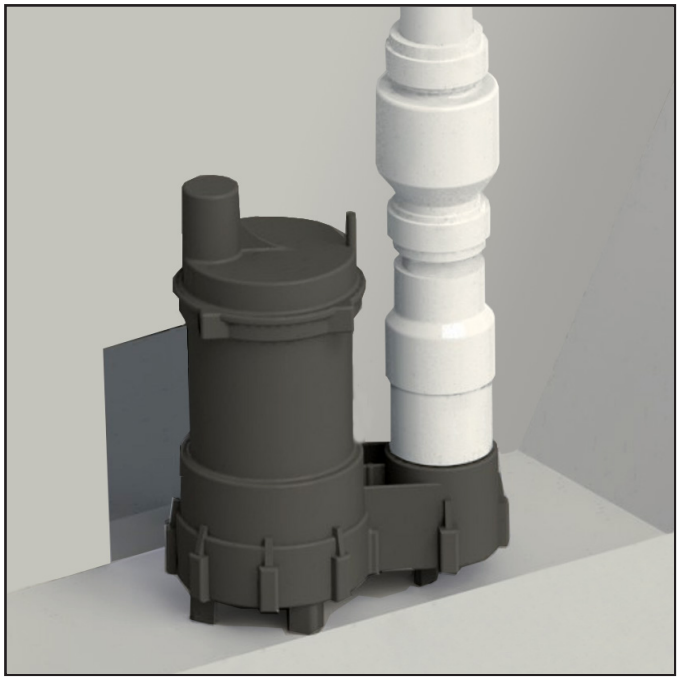
CERTIFIED PERFORMANCE



The wastewater treatment system shall be certified to operate for 12 consecutive months at the rated daily capacity without routine service. This performance shall be demonstrated by a continuous 12 month evaluation performed by an independent ANSI accredited, third-party testing facility. The evaluation shall consist of 2 consecutive ANSI/NSF Standard 40 and 245 evaluations back-to-back, including the stress sequences, with no maintenance allowed in between. When the first six-month evaluation is complete, the second full six-month evaluation shall immediately begin. For the entire certification protocol, the system shall achieve a total test average for the consecutive 12 month period of less than 5 mg/L Biochemical Oxygen Demand (CBOD), less than 5 mg/L Total Suspended Solids (TSS), and less than 10 mg/L Total Nitrogen (TN) in the effluent. Systems unable to meet these effluent quality parameters for at least 12 months of continuous testing by an independent ANSI accredited, third-party testing facility without service do not provide the desired level of effluent quality or service frequency, and shall not be considered for this application.

MODEL A100 AIR PUMP

The Model A100 air pump shall be configured to allow remote mounting or installation within the access riser above the aeration chamber. When installed in the access riser, fresh air shall enter through a molded plastic vent assembly or integral perimeter vent in the access cover above the air pump. Fresh air shall enter the air pump through a filter located under the housing cover and be introduced below the liquid surface through a prefabricated diffuser assembly. Only the plastic diffuser assembly and the air piping shall be installed in contact with the liquid. The Model A100 air pump shall be wired for 115 volt, single phase, 60 cycle operation. The air pump shall include impact-resistant rubber diaphragms and valves which prolong operational life. The unique design and construction shall provide easy maintenance, excellent cooling and quiet operation. The air pump shall continue aerating and mixing the aeration chamber even during high water conditions. Treatment systems that interrupt air delivery during high water conditions disrupt biological activity and shall not be considered for this application.



MODEL SD103 RECIRCULATION PUMP

The Model SD103 submersible recirculation pump shall be wired for 115 volt, single phase, 60 cycle operation and shall be installed in the clarification chamber. The pump motor shall be ⅓ horsepower, operating at 3000 RPM. All openings in the flow path of the recirculation pump shall be of sufficient size to permit the passage of a ¾" diameter sphere. The pump shall be designed to be non-overloading throughout the entire pump curve and shall draw less than 7 full load amps. The pump motor shall contain moisture resistant windings and shall be securely mounted inside an oil-filled, watertight housing for maximum pump life. The stator housing and casing shall be of high grade cast iron or thermoplastic construction.

BLUE CRYSTAL® CHLORINATION SYSTEM (Optional)

The Hydro-Kinetic system shall be furnished complete with a tablet feeder and a six month supply of Blue Crystal disinfecting tablets. Blue Crystal tablets shall be specifically formulated for consistent chlorine dosage and effluent disinfection to the sustained, variable and intermittent flows that are typical of domestic wastewater treatment systems. The tablets shall be manufactured from pure calcium hypochlorite and contain a minimum of 70% available chlorine. Each tablet shall be 2⅝" diameter, compressed to a 1" thickness, weigh approximately 5 ounces and be white in color with blue crystals for easy identification. The tablets shall dissolve in direct proportion to the flow rate, releasing controlled amounts of chlorine.

BIO-MAX® DECHLORINATION SYSTEM (Optional)

The Hydro-Kinetic system shall be furnished complete with a tablet feeder and a six month supply of Bio-Max dechlorination tablets. The dechlorination tablets shall contain 92% sodium sulfite as the active ingredient and shall be specially formulated to chemically neutralize both free and combined chlorine. Each tablet shall be 2⅝" diameter, compressed to a 13⁄16" thickness, weigh approximately 5 ounces and be green in color for easy identification. The tablets shall dissolve slowly, releasing controlled amounts of chemical for the instantaneous removal of residual chlorine from the system effluent.

LIMITED WARRANTY

The wastewater treatment system shall be covered by a two year limited warranty. The Model A100 air pump, Model SD103 recirculation pump, Service Pro Model 801P control center and any other Hydro-Kinetic components purchased from the manufacturer shall be warranted to be free from defects in material and workmanship, under normal use and service, for a period of two years from the date of purchase. A warranty registration card shall be attached to the system before shipment from the factory. A means to register the wastewater treatment system for warranty protection via the internet shall be provided by the manufacturer for the convenience of the distributor, customer and regulatory agency. The distributor shall provide details of the limited warranty to the regulatory agency, contractor and customer as required.

EQUIPMENT MANUFACTURER

The equipment specified herein shall be the product of a manufacturer having a minimum of seven years experience in the construction of prefabricated wastewater treatment equipment and systems. Bids shall be prepared on the basis of the equipment and material specified herein for purposes of determining the low bid. This is not done, however, to eliminate other products or equipment of equal quality and efficiency. If equipment is to be substituted, approval of such substitution must be made prior to execution of any order. It is assumed that substitution will result in a reduction of cost to the contractor and that if accepted, these savings will be passed along by a reduction in the base bid.
