EXECUTIVE SUMMARY

Shade Group Inc. was retained by Whelan Truck Repair Inc. to provide civil engineering design services pertaining to the proposed development at 158 Cardevco Road, Ottawa. The development is understood to include construction of an addition to the existing structure which is to consist of a new 50' by 100' pre-engineered building that is to be connected to the existing 50' by 100' structure by way of a new 14' x 100' breezeway.

The subject property is located at 158 Cardevco Road; approximately 400m north of Richardson Side Road and approximately 300m west of Carp Road. The site is located within a development adopted by way of Plan of Subdivision known as the Cardevco Industrial Park. Cardevco Industrial Park was adopted by Plan of Subdivision 4M-356.

The primary objective of this report is to provide stormwater management details in accordance with the recommendations and guidelines provided by the Ministry of the Environment, Conservation and Parks (MECP), the City of Ottawa and the Mississippi Valley Conservation Authority (MVCA). As this property is encompassed within a formerly adopted Plan of Subdivision, this report has also been prepared in reference to the specifications as outlined in the Subdivision Agreement for 4M-356, as applicable.

The site is rural in nature and serviced by private well and septic. For further information pertaining site servicing, refer to the Site Servicing Report prepared by Paterson Group.

The site has been designed to restrict post-development peak flow rates up to the 100-year storm event to no more than the 2-year pre-development peak flow rate, per City of Ottawa specifications.

The proposed stormwater management system is to be comprised of a clearstone filled perimeter drain, lined with an impermeable membrane, along much of the perimeter of the site. The perimeter drain is intended to intercept overland sheet flow, offer particle filtration through the clearstone, and offer temporary retention storage for runoff, without impeding traffic flow on the site. The trench bottom will be sloped at 0.5% and will convey runoff towards an outlet control structure that is to be comprised of a 102mm orifice within a manhole structure housing an oil-grit separator intended to provide enhanced quality control treatment of runoff prior to release. Runoff out of the treatment unit will be directed to the City's roadside ditch, with all infrastructure located on private property so as not to impede future City maintenance works. The proposed system is intended to meet the City's specifications for both quality and quantity treatment for the site.

1.0 INTRODUCTION

Shade Group Inc. was retained by Whelan Truck Repair Inc. to provide civil engineering design services pertaining to the proposed development at 158 Cardevco Road, Ottawa. The development is understood to include construction of an addition to the existing structure which is to consist of a new 50' by 100' pre-engineered building that is to be connected to the existing 50' by 100' structure by way of a new 14' x 100' breezeway. We understand that the proposed development is subject to Site Plan Control under the *Planning Act*.

2.0 OBJECTIVE

Shade Group was retained to prepare the civil engineering design works associated with the subject property. Our scope of work included preparation of the following:

- Grading and Drainage Plan (Appendix J);
- Stormwater Management Report.

The primary objective of this report is to provide stormwater management details in accordance with the recommendations and guidelines provided by the Ministry of the Environment, Conservation and Parks (MECP), the City of Ottawa and the Mississippi Valley Conservation Authority (MVCA). As this property is encompassed within a formerly adopted Plan of Subdivision, this report has also been prepared in reference to the specifications as outlined in the Subdivision Agreement for 4M-356 (as applicable).

3.0 BACKGROUND INFORMATION

The following guides, standards and supporting reports were referenced in the preparation of this report:

3.1 GUIDELINES & STANDARDS & WATERSHED STUDIES

- City of Ottawa Sewer Design Guidelines, Second Edition, City of Ottawa, October 2012;
- Technical Bulletin ISDTB-2014-01, City of Ottawa, February 5, 2014;
- **Technical Bulletin PIDTB-2016-01**, City of Ottawa, September 6, 2016;
- **Stormwater Management Planning and Design Manual**, Ministry of the Environment, March 2003;
- Interpretation Bulletin: Ontario Ministry of Environment and Climate Change Expectations Re: Stormwater Management, Ministry of the Environment and Climate Change (Now Ministry of the Environment, Conservation and Parks), February 2015;
- Carp River Watershed/Subwatershed Study, Robinson Consultants Inc., December 2004;
- Huntley Creek 2017 Catchment Report, Mississippi Valley Conservation Authority, 2017.

3.2 SUPPORTING STUDIES

- **Geotechnical Investigation (Rev 04)** Proposed Building Addition 158 Cardevco Road, Paterson Group, November 22, 2024.
- **Site Servicing Report (Rev 03)** Site Plan Application 158 Cardevco Road, Paterson Group, November 22, 2024.
- **Groundwater Monitoring Program** Proposed Industrial Addition 158 Cardevco Road, Paterson Group, November 22, 2024.

- **Preliminary Structural Engineering Drawing Package**, S0-S8, Daido Group Inc, November 14, 2021;
- **Site Plan + Architectural Drawing Package**, A0-A6, Chris A. Leggett Architect Inc, November 12, 2021;
- Former **Site Plan**, Pri-Tec Construction Ltd., January 1991;
- **Subdivision Agreement**, November 15, 1982;
- **Site Grading Plan Cardevco Industrial Park**, R. W. Connelly Associates Ltd, March 1990 (Drawing No. 88-1370-SGP);
- Phase II Environmental Site Investigation, Paterson Group, November 21, 2024;
- City of Ottawa Comments, January 27, 2023;
- City of Ottawa Comments, September 29, 2023;
- Input from Pri-Tec Staff and the Developer (Whelan Truck Repair).

4.0 PROJECT DESCRIPTION

The subject property is located at 158 Cardevco Road; approximately 400m north of Richardson Side Road and approximately 300m west of Carp Road. The site is located within a development adopted by Plan of Subdivision and is known as the Cardevco Industrial Park. Cardevco Industrial Park was adopted by Plan of Subdivision 4M-356.

The legal description of the subject property is Part of Block 11, Registered Plan 4M-356. The PIN for the subject property is 04536-0142.

The property is a corner lot and is bounded by Cardevco Road to the north and west; a (currently) vacant gravel storage yard to the south (154 Cardevco Road); and R&R Auto Repairs to the east (164 Cardevco Road). The subdivision is comprised of rural industrial lots; including R&R Auto Repairs, Akman Construction, Harris Rebar, Virtucom Metals, Carp and Cardevco West End Self Storage; just to name a few.

The subdivision is rural in nature, with roadside ditches used for stormwater conveyance, and each lot is serviced by private well and septic. There are no public services (sewer or water).

An aerial photograph of the subject property has been provided in Figure 1, while a Location Plan is available in **Appendix A**.

Figure 1: Map of subject property location. Source: GeoOttawa (accessed 2022-10-25)

4.1 SITE TOPOGRAPHY

A topographic survey was completed by Annis, O'Sullivan, Vollebekk Ltd. (AOV) dated July 12, 2022 and supplied to Shade Group by Pri-Tec for preparation of the civil engineering design. Supplemental information was provided by AOV Summer 2024 to confirm the contributing drainage area associated with the side yard swale located between 158 and 154 Cardevco Road.

The subject property ranges in elevation from approximately 117.00m to 117.20m at the property line adjacent Cardevco Road, to approximately 118.00m at the highest point of the property adjacent the existing structure. The existing structure is located at the highpoint of the property, with runoff directed away in either a southwesterly or northeasterly manner towards the surrounding ditches. These drainage patterns are consistent with the Site Grading Plan for the Cardevco Industrial Park (R.W. Connelly Associates Ltd, March 1990).

4.2 RECEIVING WATERSHED

The entirety of the property drains either indirectly (by way of a side yard swale located along the northeast property boundary) or directly (via overland sheet flow) to the Cardevco Road roadside ditch. The Cardevco Road roadside ditch flows in a north and easterly manner from the subject property – outletting to the roadside ditch at Carp Road.

The subject property is located within the subwatershed of Huntley Creek, which is a tributary to the Carp River.

4.3 SOURCE PROTECTION

The subject property is located within an Intake Protection Zone 3 within a Groundwater Recharge Area. The property is also identified as located within a Highly Vulnerable Aquifer. (Source Protection Information Atlas, Ministry of the Environment, Conservation and Parks).

4.4 SUBSURFACE CONDITIONS

A geotechnical investigation was performed by Paterson Group. As part of their works, three test pits were advanced on the site.

The Geotechnical Investigation Report describes the subsurface conditions as "2 to 2.2m thick fill layer underlain by a native silty sand deposit. The fill material was generally observed to consist of compact to very dense brown silty sand with gravel, crushed stone, brick fragments, asphalt and concrete....A compact, brown native silty sand with gravel and traces of cobbles was encountered underlying the fill."

Practical refusal is noted as being approximately 2.1-3.1m below grade on inferred bedrock surface. (Geotechnical Investigation, Section 4.2, Paterson Group, November 22, 2024)

Groundwater infiltration was noted at depths of approximately 1.6 to 1.8m. (Geotechnical Investigation, Section 4.3, Paterson Group, November 22, 2024).

A subsequent Phase II – Environmental Site Investigation (Patterson, November 21, 2024) also included subsurface investigations, which were conducted on March 24, 2023. Groundwater was encountered during their investigations at elevations ranging from 1.09-1.80m below grade.

4.5 INFILTRATION TESTING

Infiltration testing was conducted by McIntosh Perry Consulting Engineers Ltd. (MPCE) on June 29, 2023. Shade Group personnel were on-site to observe the works completed. Infiltration testing was completed by MPCE staff using a Guelph Permeameter. A total of 5 test pits were excavated using a backhoe, to varying depths; in locations specified by Shade Group as to the anticipated approximate location for the infiltration galleries. The design of the infiltration galleries has been discussed in Section 8.6, with calculations enclosed in **Appendix D**. A design rate of 5.0mm/hr was used for the site.

A summary of the test holes, depth of testing, and results, has been included in Table 1 below; while the results received from MPCE have been enclosed in **Appendix E**.

Table 1: Infiltration testing results

Test Pit Location	Hole ID	Depth (m)	Test Results (mm/hr)	Design Rate (3.5 safety factor) (mm/hr)
	1A	1	22.15	6.33
Southwest	1B	2	17.49	5.00
	1C	0.6	17.77	5.08
Northeast	2A	2	17.38	4.97
Northeast	2B	1	34.07	9.74

5.0 SITE SERVICING

The site is serviced by private well and septic. For more details pertaining to site servicing, refer to the Site Servicing Report prepared by Paterson Group.

6.0 UTILITIES

The site is understood to be serviced by overhead utilities as well as natural gas. No changes to utilities or services are proposed as part of the proposed addition. Any servicing extensions would be handled internally as part of the build; with design to be provided by the electrical or mechanical designer (i.e. by others), as applicable.

7.0 GRADING AND DRAINAGE

A Grading and Drainage Plan has been prepared as part of the scope of work undertaken by Shade Group. The Grading and Drainage Plan includes such details as existing and proposed spot elevations; overland flow routes; location of existing well and septic; location of proposed stormwater measures, etc. A copy of the plan has been provided in **Appendix J**.

8.0 STORMWATER MANAGEMENT DESIGN

8.1 METHODOLOGY

The stormwater peak flow calculations were completed using the Rational Method.

Q = 2.78CIA

Where

Q = Flow Rate (L/s) C = Runoff coefficient

I = Rainfall intensity (mm/hr)

A = Drainage area (ha)

The use of the Rational Method is permitted per the City of Ottawa Sewer Design Guidelines – as the subject development is less than 40 hectares (City Guidelines - Section 3.5.1.1).

8.2 DESIGN CRITERIA AND CONSTRAINTS

Stormwater design criteria have been established in reference to current design practices as outlined in the City of Ottawa Sewer Design Guidelines, through consultation with City of Ottawa Staff (pre-application consultation, February 2022), through input from the Mississippi Valley Conservation Authority (pre-consultation completed by others), and through specifications provided by the client's representative (Pri-Tec).

8.2.1 QUANTITY CONTROL

- Post-development peak flow conditions for the 2 through 100-year storm events have been controlled to not exceed the 2-year pre-development peak flow rate;
- Pre-development conditions have been determined using the smaller of a runoff coefficient of 0.5 or the actual site runoff coefficient (City of Ottawa Section 8.3.7.3);
- Infiltration of the site to be no less than 104mm/yr.

8.2.2 QUALITY CONTROL

- The site has been designed to ensure a minimum 80% Total Suspended Solids (TSS) removal rate (pre-application consultation, February 2022).

8.2.3 RUNOFF COEFFICIENTS

The following coefficients were used to develop a weighted runoff coefficient for each area in post-development conditions:

Paved and Roof Areas	0.90
Grass	0.20
Off-Site Areas	0.50
Gravel Surfaces	0.60

The runoff coefficients have been increased by 25% for the 100-year storm (up to a maximum value of C=1.0), as per City of Ottawa Sewer Design Guidelines, Section 5.4.5.2.1.

8.2.4 TIME OF CONCENTRATION

The time of concentration used to calculate peak flow rates was 10 minutes as per City of Ottawa Sewer Design Guidelines, Section 5.4.5.2 ("an inlet time of 10 minutes is to be used for all land uses and lot grading configurations").

8.2.5 RAINFALL INTENSITY

Rainfall intensities were derived from City of Ottawa Sewer Design Guidelines (City Guidelines - Section 5.4.2), where

```
2-Year Intensity = 732.951 / (Time in min + 6.199)<sup>0.810</sup>
5-Year Intensity = 998.071 / (Time in min + 6.053)<sup>0.814</sup>
10-Year Intensity = 1174.184 / (Time in min + 6.014)<sup>0.816</sup>
100-Year intensity = 1735.688 / (Time in min + 6.014)<sup>0.820</sup>
```

8.3 PRE-DEVELOPMENT DRAINAGE PATTERNS

Under pre-development conditions the site has been assessed as a single drainage area measuring approximately 0.56 hectares. The majority of the site consists of impervious or relatively impervious (gravel) surfaces. A small grass area on-site is located at the northwest corner, encompassing the existing septic system. The property houses an approximately 466m² building that includes truck and auto repair shop bays and a small office.

The existing building is located at the highest point of the property at an elevation of approximately 118.00. Runoff is conveyed by overland sheet flow in a north, west or easterly direction, towards the Cardevco Road roadside ditch.

Under pre-development conditions, the site has a calculated runoff coefficient of 0.58; however as per the City Design Standards (Section 8.3.7.3), a runoff coefficient of 0.50 was used to calculate the pre-development allowable release rates.

Under pre-development conditions, the property is estimated to have peak flow rates of 60 L/s for the 2-year storm event. This calculated flow rate has been used as the control rate for the design of the restricted outlet during post-development conditions.

A Pre-Development Drainage Area Plan and associated calculations have been enclosed in **Appendix B**.

8.4 POST-DEVELOPMENT DRAINAGE PATTERNS

Under post-development conditions, the site has been split into three sub-drainage areas: B1, B2 and B3.

Post-development drainage area B1 encompasses the southern half of the property and part of the new proposed addition. Runoff from B1 is to be conveyed by overland sheet flow towards a proposed stormwater perimeter drain along the perimeter of the site. B1 encompasses an area of approximately 0.34 hectares and has a weighted runoff coefficient of approximately 0.59 (2-10-year) and 0.73 (100-year). The peak flow rate under uncontrolled post-development conditions is estimated to be 42 L/s, 58 L/s, 68 L/s and 122 L/s for the 2-, 5-, 10- and 100-year storm events respectively.

Post-development drainage area B2 encompasses a northern portion of the property as well as a portion of land along the east property line. The area encompasses part of the existing structure, the grassed swale on the east property line, and a small area of gravel parking. Runoff from B2 will remain uncontrolled and will flow via overland sheet flow or shallow concentrated flow (grassed swale), consistent with conditions prior to the addition. B2 encompasses an area of approximately 0.16 hectares and has a weighted runoff coefficient of approximately 0.42 (2-10 year) and 0.50 (100-year). The peak flow rate under uncontrolled post-development conditions is estimated to be 15 L/s, 20 L/s, 23 L/s and 40 L/s for the 2-, 5-, 10- and 100-year storm events respectively.

Post-development drainage area B3 encompasses half the roof from the existing building, the entirety of the roof from the new proposed breezeway, and half the roof of the new addition. Runoff from these rooftops will be controlled by way of roof scuppers connected to downspouts, outletting to infiltration galleries to be located beneath the existing gravel parking/driving area. The area measures approximately 0.06 hectares and has a weighted runoff coefficient of 0.90 (2-10-year) and 1.0 (100-year). The peak flow rate from the rooftop is estimated to be 12 L/s, 16 L/s, 19 L/s and 30 L/s for the 2-, 5-, 10- and 100-year storm events respectively.

A Post-Development Drainage Area Plan and associated calculations have been enclosed in **Appendix C**.

8.5 PEAK FLOW RESULTS

The following tables provide a summary of the peak flow results for both pre- and post-development (uncontrolled) conditions. These results can also be found in **Appendix B and C** along with their associated supporting calculations.

Table 2: Pre-development peak flow results

Table 3: Post-development (uncontrolled) peak flow results

	B1	B2	В3
Peak Flow (L/s) - 2-Year	42	15	12
Peak Flow (L/s) - 5-Year	58	20	16
Peak Flow (L/s) - 10-Year	68	23	19
Peak Flow (L/s) - 100-Year	122	40	30

8.6 QUANTITY CONTROL

Quantity control measures have been proposed to limit post-development peak flow rates to the 2-year pre-development peak flow rate. This is proposed to be achieved through the

implementation of a clearstone filled perimeter drain that would be constructed along most of the perimeter of the site, equipped with an outlet control structure.

QUANTITY CONTROL B1

For post-development drainage area B1, a clearstone filled perimeter drain is proposed to be constructed along the majority of the perimeter of the site. The drain is comprised of two different cross-sections; a width of 1.2m along the southwest property limit, and a width of 2.8m along the southeast and northeast property limits. This change in cross-section is due to the maximum available ponding depth available for the 100-year storm event based on grading constraints on site. With that, the drain along the southwest property limit serves solely as a conveyance method, intercepting flow and conveying it within the trench. The drain along the southeast and northeast property lines offers temporary retention while peak flow rates are restricted to the 2-year pre-development peak flow rate by way of the outlet control structure. The drain length is approximately 23m on the southwest; and approximately 130m along the southeast and northeast. The bottom elevation of the drain varies, with a 0.5% slope along the bottom of the drain, providing positive slope towards the outlet. It is acknowledged that an increased slope would be preferred, however this is not possible without a significant grade raise on a property that is already fully developed and operational. This reduced slope may require increased maintenance compared to a drain with a greater slope however on-going monitoring will determine if that is to be the case, as sediment accumulation varies from site to site. Monitoring wells have been proposed to assist in monitoring sediment accumulation. Information associated with operations and maintenance practices for the proposed stormwater measures has been included in Section 10 of this report.

The perimeter drain is to be lined with an impermeable geomembrane to prevent runoff from infiltrating prior to being treated through the end-of-pipe treatment unit. The perimeter drain is to be equipped with an outlet control structure comprised of an orifice outlet measuring 102mm; which will result in temporary ponding behind the outlet (within the trench); and offer control of peak flow rates. The orifice is to be located on the inlet side of an oil-grit separator unit within a 1200mm diameter manhole. The oil-grit separator will address the required quality control objective for the site and has been discussed in further detail in Section 8.7 of this report.

Detailed calculations for the design of the quantity control for area B1 can be found in **Appendix D**.

QUANTITY CONTROL B2

No quantity control is proposed for area B2. Instead, runoff will flow uncontrolled, almost entirely over grassed surfaces, towards the Cardevco roadside ditch, consistent with conditions prior to the construction of the addition.

QUANTITY CONTROL B3

Runoff from post-development area B3 is to be controlled by way of two proposed infiltration galleries that have been sized to offer infiltration of runoff from the rooftop. Runoff will flow from half of the rooftop of the addition and half of the existing structure, onto the roof of the breezeway, and be conveyed towards scuppers to be located on the side of the building. The scuppers are to be connected to downspouts, which will connect by way of a pipe network into the proposed infiltration galleries. The downspouts will outlet to catchbasins equipped with filter cloths to allow for preliminary filtration of any potential sediment. The catchbasin filters can be removed to be flushed as part of on-going maintenance works — and should be immediately reinstated. The catchbasins will feature a 150mm diameter SDR 35 (or approved equivalent) outlet pipe that direct connects into 2-runs of 150mm diameter SDR 35 perforated pipe to disperse runoff within the infiltration gallery. The number of runs was limited to 2 runs as the depth of cover continues to reduce further away from the building. The west and east are to be direct connected by a 200mm diameter SDR 35 PVC pipe, which will serve as an overflow from the western infiltration gallery into the eastern infiltration gallery. This pipe would allow the systems to operate in equilibrium, offering capacity as a single system.

The combined capacity of the infiltration galleries is sufficient to capture and infiltrate the 100-year storm event. The infiltration design allows for the objective of 104 mm/yr for the site to be met.

The infiltration galleries serve only to offer infiltration from rooftop runoff. The top of the infiltration trench is proposed to be capped with an impermeable membrane and further capped with compacted granular 'A' to allow the flow of traffic through the site to continue as per preaddition conditions, without infiltrating parking lot runoff. This design prevents parking lot water (which is considered to be potentially contaminated) from entering the infiltration trench, and instead directs such runoff towards the perimeter drain where it can be treated by the oil-grit separator. The cross-section is also proposed to include geogrid underneath the Granular 'A' which will allow for the dispersal of loading across the gallery from above. Compaction is not considered to be a concern given the media proposed for the infiltration gallery is to be clearstone – which cannot be compacted. The soils underneath the infiltration gallery are also not a concern for further compaction as the existing site has been in operation for over 20 years with the same use; and the testing results of the subsoil as obtained during the infiltration testing reflect the compacted soils present onsite. The proposed cross-section would not be expected to be a concern for operating as intended.

The infiltration galleries have been designed in reference to groundwater monitoring information from both the Phase II ESA which noted an elevation of 116.21m in March 2023; and the Groundwater Monitoring Program, which noted a maximum elevation of 115.94m in 2024. While the 2024 results would be generally considered more relevant as they were conducted in a closer

proximity to the location of the proposed infiltration gallery; the results from the Phase II ESA in March 2023 have been used to provide an additional level of conservatism.

The proposed rooftops are all to be metal so contamination from asphalt shingles is not a concern and the runoff from the rooftops is expected to be free of contaminants. The addition of the catchbasins, which are to be equipped with filters, will offer a first line-of-defense against any particles within the raindrops, limiting sediment buildup or contamination of the gallery.

Design calculations associated with the design of the infiltration systems, which serve as quantity control for area B3, can be found in **Appendix D**. Runoff from area B3 has been designed to fully be captured within the infiltration galleries, for the 2- through 100-year storm events. Supporting information for the infiltration rate used, as obtained from MPCE, can be found in **Appendix E**.

SUMMARY - CONTROLLED PEAK FLOW RATES

The following table provides a summary of the peak flow results under post-developemnt controlled conditions. These results can also be found in **Appendix D**.

	B1	B2	В3	Total	Pre/	^
	Controlled	Uncontrolled	Controlled	Outflow	Allowable	Δ
Peak Flow (L/s) - 2-Year	10	15	0	25		-35
Peak Flow (L/s) - 5-Year	11	20	0	31	60	-29
Peak Flow (L/s) - 10-Year	12	23	0	35	00	-24
Peak Flow (L/s) - 100-Year	16	40	0	56		-4

8.7 QUALITY CONTROL

The employment of Best Management Practices (BMPs) serves as the primary method of quality control for the site. Stormwater BMPs are present at the conveyance and end-of-pipe levels.

The proposed clearstone filled perimeter drain will offer a means of temporary storage (end-of-pipe) and conveyance. Runoff is to enter the perimeter drain through overland sheet flow, where water will percolate down through the clearstone. Given the retention storage, this perimeter drain will offer an opportunity for particle settlement and filtration within the clearstone.

An end-of-pipe oil-grit separator will serve to provide quality treatment of total suspended solids prior to outletting to the Cardevco Road roadside ditch. The outlet control structure for quality treatment has been designed by ADS and the calculations have been enclosed in **Appendix F**. Per the calculations from ADS, it is understood that the designed separator is expected to provide 90% total suspended solids (TSS) removal, which exceeds the requirements from the City (and that of the Carp River Watershed/Subwatershed Study) of 80% TSS removal. Applicable certification for the design of the quality control unit has also been enclosed in **Appendix F**.

8.8 DOWNSTREAM ROADSIDE DITCH REVIEW

Per the City's request, a review of the receiving Cardevco Road roadside ditch has been completed as part of this report and the results have been enclosed in **Appendix G**. In summary, based on the existing cross-section of the ditch as surveyed (by Annis, O'Sullivan, Vollebekk Ltd.) in front of 164 Cardevco Road, and an assumed runoff coefficient of 0.50 for the upstream properties, the available capacity of the roadside ditch is greater than the anticipated 100-year peak flow rate of the upstream contributing area.

8.9 SIDE YARD SWALE REVIEW

There is an existing side yard swale that straddles the property line between 158 and 164 Cardevco Road. Based on the topography of the surrounding lands, the side yard swale is intended to service 154, 158 and 164 Cardevco Road, however after the implementation of the perimeter drain, it is not anticipated that runoff from 158 Cardevco will enter the swale at all as runoff will be intercepted by the perimeter drain and directed towards the treatment unit. Per the City's request, the capacity of the drainage swale has been reviewed against the contributing area and associated 100-year peak flow rate and confirmed to have adequate capacity. A map delineating the approximate contributing area and the associated runoff and capacity calculations have been enclosed in **Appendix H**.

9.0 EROSION AND SEDIMENT CONTROL

As the site is an existing development, constructions works are anticipated to be limited to those required to erect the proposed addition and breezeway; and to implement the proposed stormwater management measures.

Silt fence is recommended for erection along the perimeter of the site where works are proposed. Silt fence is to be installed in accordance with the manufacturer's specifications and is to be monitored and maintained throughout the duration of the construction period. Additional measures may be required at the direction of the City, conservation authority or other agency, to ensure that the site is operating as intended and not causing the displacement of sediment. Inspection is recommended to be completed weekly and following rainfall events. When required, repairs and maintenance should be conducted as soon as possible, so as not to run the risk of sediment displacement or failure of the erosion and sediment control measure. When conducting maintenance, the removal of sediment should be done with care so as not to allow for sediment transport into the neighbouring ditches or swales.

An Erosion and Sediment Control Plan has been enclosed in **Appendix J**, with the remainder of the engineering design drawings.

10.0 OPERATIONS AND MAINTENANCE

All stormwater management measures require some level of inspection and maintenance throughout the duration of their lifespan. Sites with significant grass and natural vegetation generally require a lower level of on-going maintenance than those urban or industrial in nature as natural vegetation can offer pre-treatment. In this case, the subject property is comprised of approximately 84% impervious surface so pre-treatment is generally not available. The proposed stormwater management features have been designed to comply with the City's quality and quantity objectives for the site, but these measures are expected to require on-going monitoring (inspection), operations and maintenance.

The following routine inspection recommendations have been taken from the Stormwater Management Planning and Design Manual (March 2003):

Table 5: Inspection Recommendations for Stormwater Management Features

Stormwater Measure	Inspection Routine			
Infiltration Gallery	 Is the trench draining? Review the observation well. If it is not drained in 48 hours, the trench may need to be partially or wholly re-constructed to restore its performance. Is the trench always dry or relatively dry within less than 24 hours of a storm? This could indicate a blockage of the inlet (i.e. the downspouts). Inspect and perform maintenance as required to ensure runoff is being directed into the gallery as designed. 			
Stormwater Measure	Inspection Routine			
Perimeter Trench	 Is the perimeter drain draining? Verify the water levels in the observation wells. If the perimeter drain is not draining it may indicate excessive sediment buildup in the clearstone preventing the flow of water, which may require reconstruction of the trench to restore the storage capacity. Is the OGS receiving runoff? If it's always dry it could indicate a blockage in the inlet. Perform maintenance to remove any blockage from the inlet to restore the system to its intended design. 			
Oil-Grit Separator	 Is there sediment in the separator? The level of sediment should be measured using a graduated pole with a flat plate attached to the bottom. The pole should be graduated such that the true bottom of the separator compared to the cover/grate is marked for comparison. Maintenance should be performed in accordance with the manufacturer's specifications. 			

2. Is there oil in the separator? A visual inspection of the contents should be made from the surface for trash/debris and the presence of oil/industrial spill. An oily sheen, frothing or unusual colouring of the water may indicate the occurrence of an oil or industrial spill. The separator should be cleaned in the event of a spill contamination. Refer to the manufacturer's specifications for further details.

11.0 CONCLUSIONS

11.1 STORMWATER MANAGEMENT

The site is proposed to address stormwater management quantity and quality objectives through the implementation of a clearstone filled perimeter drain constructed along the majority of the perimeter of the site. The perimeter drain is to be lined with an impermeable membrane and will serve as both a conveyance and temporary retention area for runoff, outletting to a 102mm diameter orifice opening. Prior to outletting to the Cardevco Road roadside ditch, runoff will enter an oil-grit separator unit, designed to offer a minimum treatment of 80% total suspended solids (TSS) removal. Based on calculations prepared by ADS (enclosed in **Appendix F**), the unit is anticipated to offer a removal of 90% TSS.

11.2 GRADING AND DRAINAGE

Grading and drainage changes are anticipated to be minimal given this is an existing developed site. Grading has been limited to that as required to accommodate the proposed addition and accommodate the required stormwater management measures. A copy of the Grading and Drainage Plan has been enclosed in **Appendix J**. A copy of the Site Plan has been enclosed in **Appendix I**.

12.0 CLOSING

This report is submitted for consideration in support of the proposed Site Plan Control Application for the subject property noted herein.

Should you have any questions or concerns, please do not hesitate to contact the undersigned at your earliest convenience.

13.0 LIMITATIONS

This report was prepared exclusively for Whelan Truck Repair in support of the proposed Site Plan Approval Application associated with the proposed building addition at 158 Cardevco Road, Ottawa. This report has been prepared to review, assess and provide recommendation relating to stormwater management on the site, in conformance with the guidelines from the Ministry of the Environment, Conservation and Parks, the City of Ottawa, and the Subdivision Agreement associated with the development in which the site is located.

This report has been prepared in reference to information and data prepared by others, including those reports as outlined in Section 3.0 of this Report. Conclusions, calculations and assessments have been made in this report in reliance to the information provided by others (Section 3.0); no field measurements or conformance testing has been performed by Shade Group to confirm the results concluded by others.

Any reliance on this report by a third party is strictly prohibited. This report reflects Shade Group Inc.'s professional judgement with respect to the scope, schedule and other limitations as noted in this document. The opinions formed in this report are based on data, conditions and information that was existing at the time of the document preparation.

The findings, conclusions and recommendations of this report are only valid as of the date of this report. No assurance can be made with respect to the changes in site conditions following the date of this report. If additional information is discovered or becomes available Shade Group Inc. shall be contacted to review and re-evaluate the conclusions presented; and provide amendments, if required.

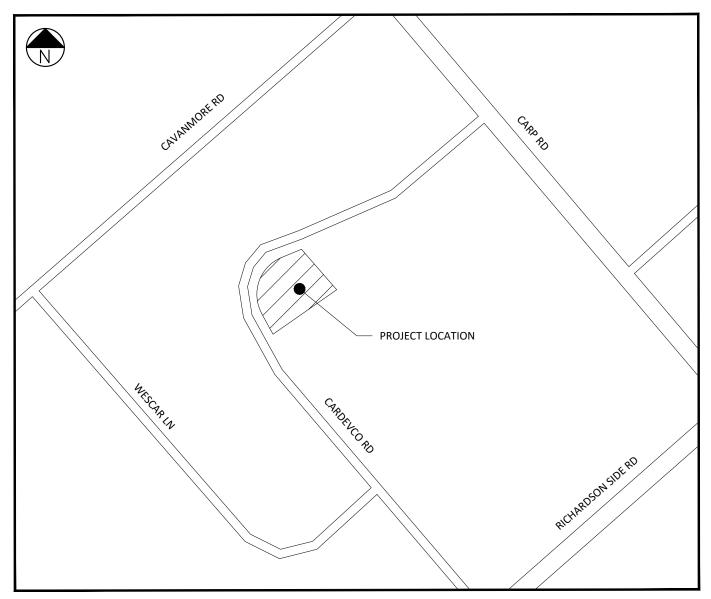

Any use which a third party makes of this document remains the responsibility and liability of such third party. Shade Group Inc. shall not be responsible for damages of any kind suffered by a third party as a result of decisions made or actions taken based on the findings of this report.

APPENDIX A

LOCATION PLAN

LOCATION PLAN N.T.S.

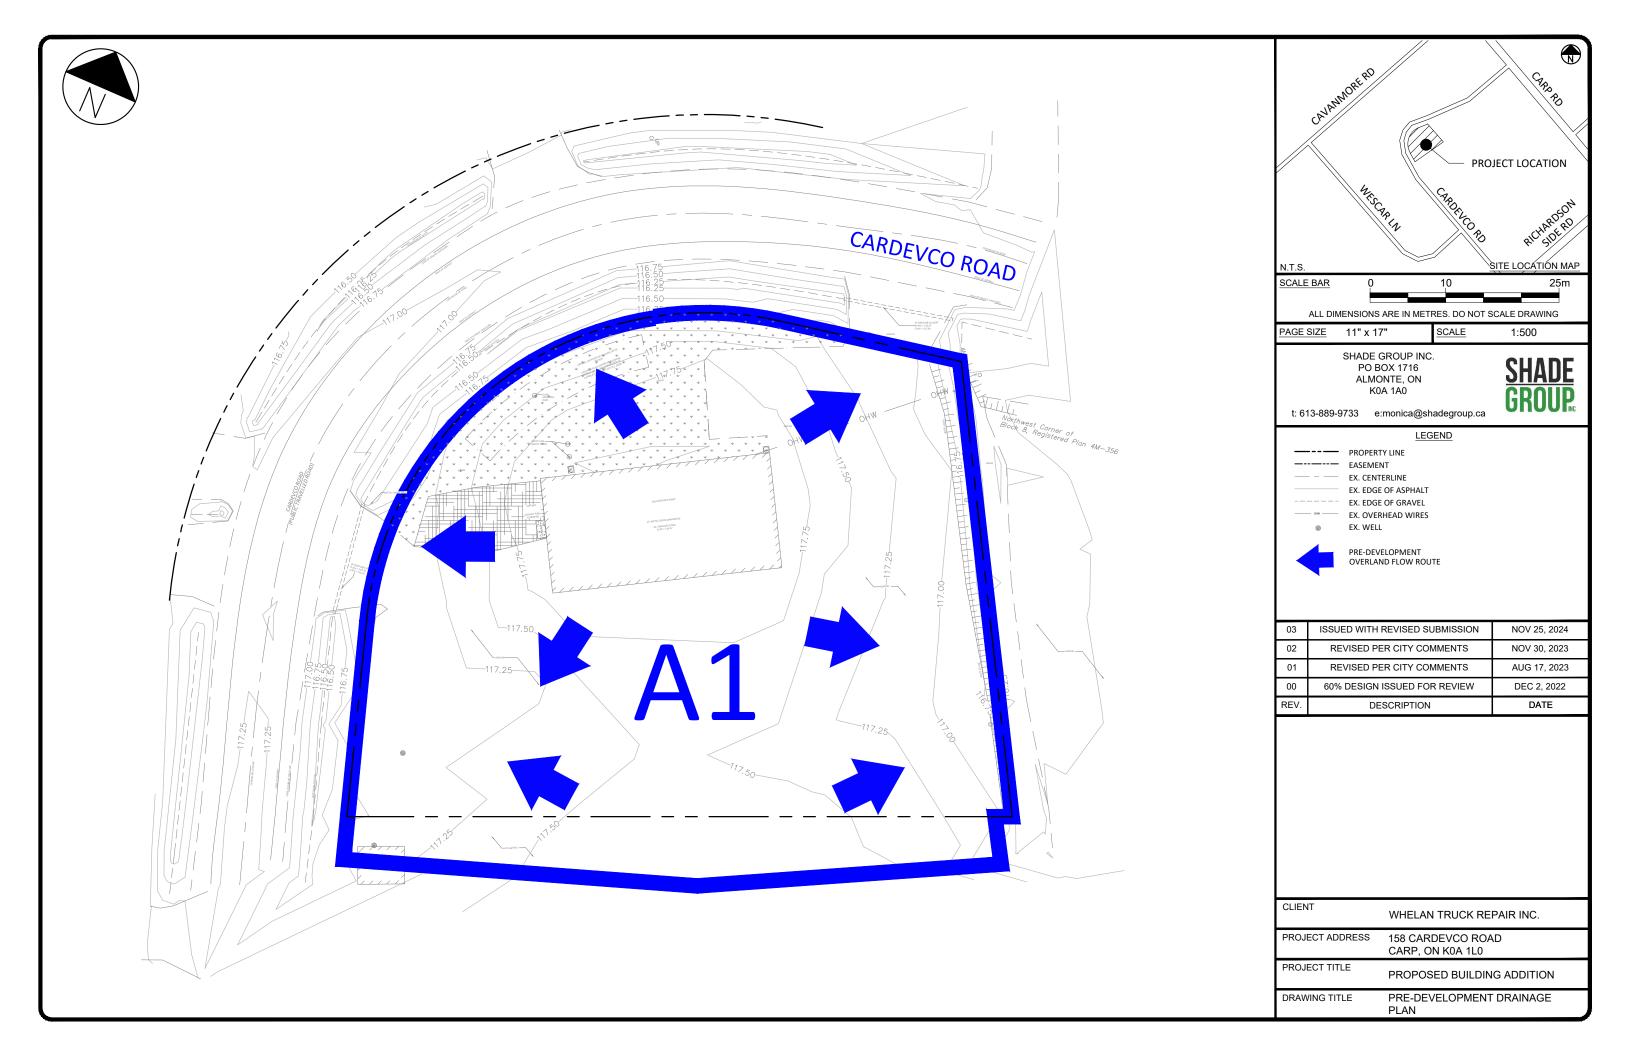

158 CARDEVCO ROAD WHELAN TRUCK REPAIR

PROPOSED ADDITION

Stormwater Management Calculations Whelan Truck Repair Inc. Pre-Development

Pre-Development - Runoff Coefficient

	Area ID
	A1
Total Area (m²)	5598
Grass (m²)	856
Runoff Coefficient (C)	0.20
Gravel (m²)	4146
Runoff Coefficient (C)	0.60
Asphalt/Roof (m ²)	596
Runoff Coefficient (C)	0.90
Weighted Runoff Coefficient (C)*	0.57

^{*}Pre-development conditions will be determined using the smaller of a runoff coefficient of 0.50 or the actual site runoff coefficient (City of Ottawa – Section 8.3.7.3)

Therefor the pre-development conditions will be calculated using a runoff coefficient of 0.50.

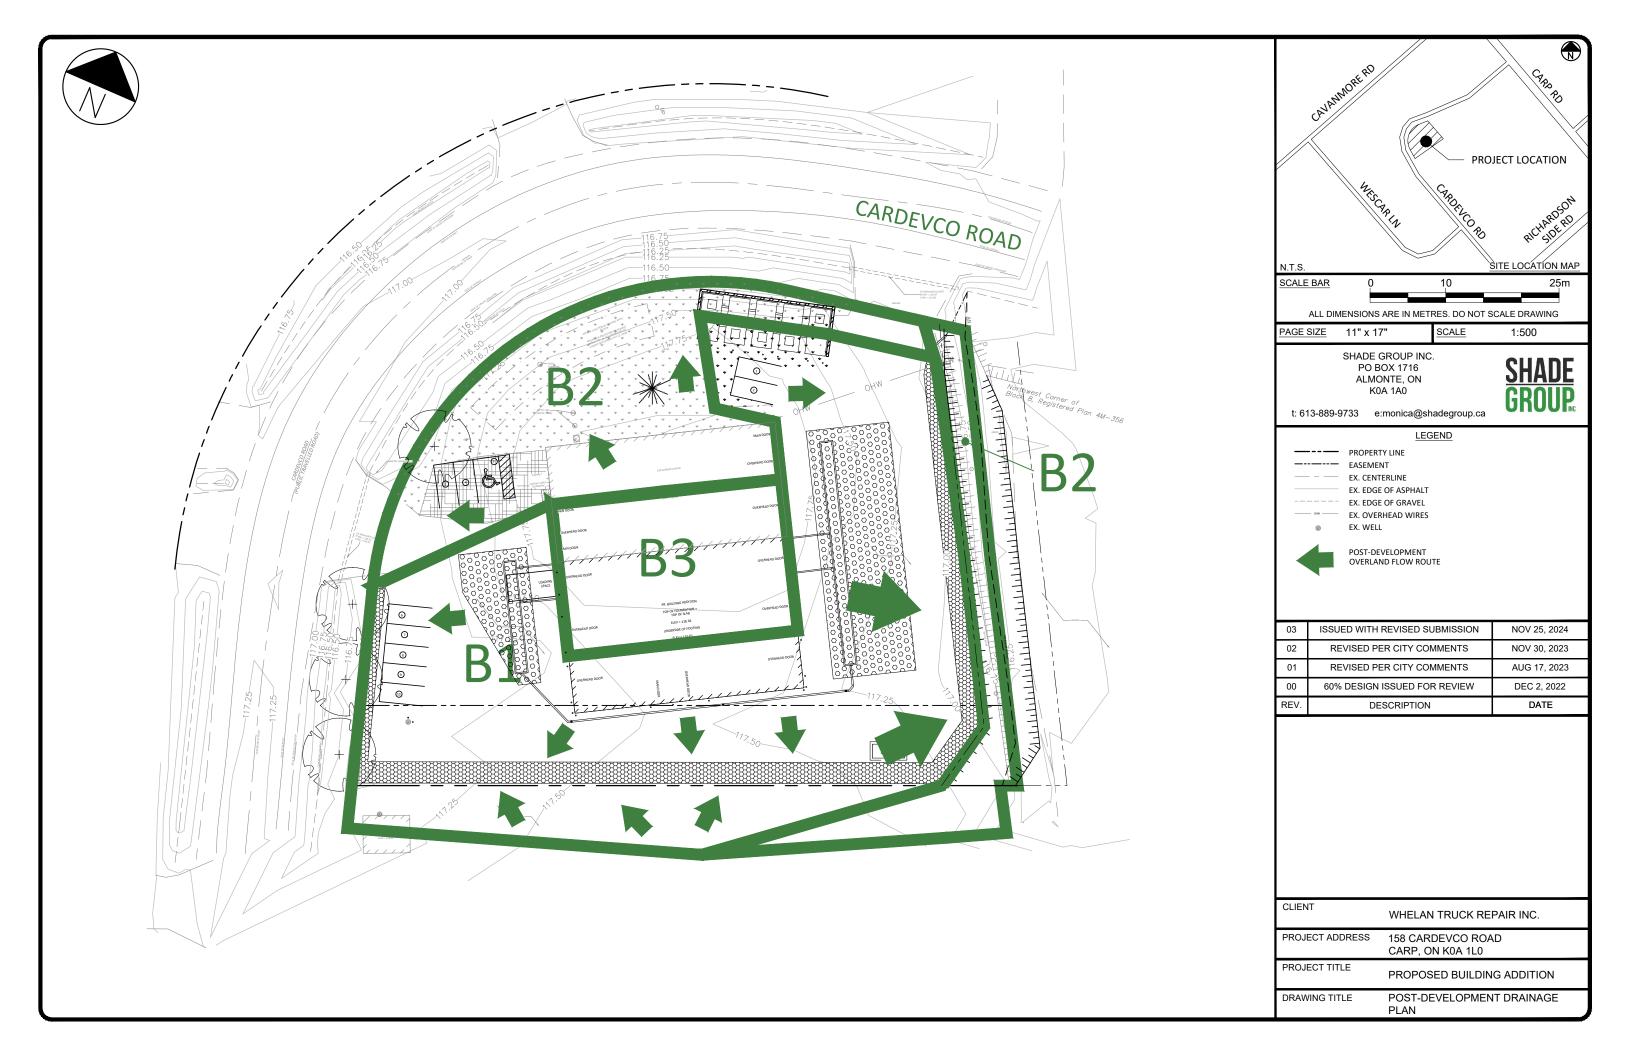

Post-Development - Peak Flow

	Area ID B1
Weighted Runoff Coefficient (C)	0.50
Total Area (ha)	0.56
Time of Concentration (min)	10
Intensity (mm/hr) - 2-Year	77
Intensity (mm/hr) - 5-Year	104
Intensity (mm/hr) - 10-Year	122

Peak Flow (L/s) - 2-Year 60 Max Allowable Outflow

MPCE INFILTRATION RESULTS

158 Cardevco Road - Infiltration Values

1 message

Rebecca Leduc <r.leduc@mcintoshperry.com>
To: Monica Shade <monica@shadegroup.ca>
Cc: Jordan Bowman <j.bowman@mcintoshperry.com>

Thu, Jul 13, 2023 at 10:48 AM

Hi Monica,

As discussed in our meeting this morning, we have calculated the following infiltration rates based on the infiltration testing which took place on June 29th, 2023 at 158 Cardevco Road:

Area southwest/west of the building on-Site:

Hole ID	Depth of Hole (cm)	Infiltration Rate (mm/hour)	Infiltration Rate (with safety factor of 3.5)
Hole 1A	100	22.15	6.33
Hole 1B	200	17.49	5.00
Hole 1C	60	17.77	5.08

Area northeast/east of the building on-Site:

Hole ID	Depth of Hole (cm)	Infiltration Rate (mm/hour)	Infiltration Rate (with safety factor of 3.5)
Hole 2A	200	17.38	4.97
Hole 2B	100	34.07	9.74

These values and corresponding calculations are available in the attached excel spreadsheet (and PDF).

Let me know if you need anything else.

Rebecca

 $Calculation \ formulas \ related \ to \ shape \ factor \ (C). \ Where \ H_{7} \ is \ the \ first \ water \ head \ height \ (cm), H_{2} \ is \ the \ second \ water \ head \ height \ (cm), H_{2} \ is \ the \ second \ water \ head \ height \ (cm), H_{3} \ is \ the \ second \ height \ (cm), H_{3} \ is \ the \ second \ height \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ second \ (cm), H_{3} \ is \ the \ secon$ (cm), α is borehole radius (cm) and α^* is microscopic capillary length factor which is decided according to the soil texture-structure category. For one-head method, only C_1 needs to be calculated while for two-head method, C_1 and C_2 are calculated (Zang et al., 1998).

Soil Texture-Structure Category	α*(cm ⁻¹)	Shape Factor
Compacted, Structure-less, clayey or silty materials such as landfill caps and liners, lacustrine or marine sediments, etc.	0.01	$C_1 = \left(\frac{H_1/_a}{2.102 + 0.118(^{H_1}/_a)}\right)^{0.655}$ $C_2 = \left(\frac{H_2/_a}{2.102 + 0.118(^{H_2}/_a)}\right)^{0.655}$
Soils which are both fine textured (clayey or silty) and unstructured; may also include some fine sands.	0.04	$C_1 = \left(\frac{H_1/a}{1.992 + 0.091(^{H_1}/a)}\right)^{0.683}$ $C_2 = \left(\frac{H_2/a}{1.992 + 0.091(^{H_2}/a)}\right)^{0.683}$
Most structured soils from clays through loams; also includes unstructured medium and fine sands. The category most frequently applicable for agricultural soils.	0.12	$C_1 = \left(\frac{H_1/a}{2.074 + 0.093(^{H_1}/a)}\right)^{0.754}$ $C_2 = \left(\frac{H_2/a}{2.074 + 0.093(^{H_2}/a)}\right)^{0.754}$
Coarse and gravely sands; may also include some highly structured soils with large and/or numerous cracks, macro pores, etc.	0.36	$C_1 = \left(\frac{H_1/_a}{2.074 + 0.093(^{H_1}/_a)}\right)^{0.754}$ $C_2 = \left(\frac{H_2/_a}{2.074 + 0.093(^{H_2}/_a)}\right)^{0.754}$

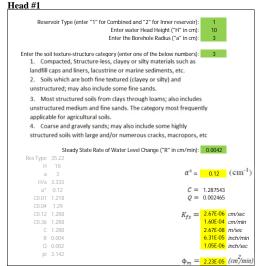

Calculation formulas related to one-head and two-head methods. Where R is steady-state rate of fall of water in reservoir (cm/s), K_{fa} is Soil saturated hydraulic conductivity (cm/s), Φ_m is Soil matric flux potential (cm²/s), a^* is Macroscopic capillary length parameter (from Table 2), a is Borehole radius (cm), H_1 is the first head of water established in borehole (cm), H_2 is the second head of water established in borehole (cm) and Cis Shape factor (from Table 2).

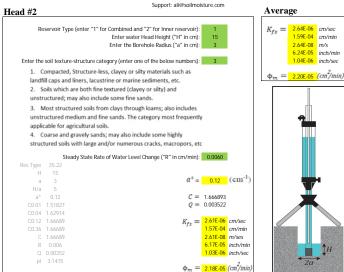

One Head, Combined Reservoir	$Q_1 = \overline{R}_1 \times 35.22$	$K_{fs} = \frac{C_1 \times Q_1}{2\pi H_1^2 + \pi a^2 C_1 + 2\pi \left(\frac{H_1}{a^2}\right)}$
One Head, Inner Reservoir	$Q_1 = \bar{R}_1 \times 2.16$	$\Phi_m = \frac{C_1 \times Q_1}{(2\pi H_1^2 + \pi a^2 C_1)a^* + 2\pi H_1}$
Two Head, Combined Reservoir	$Q_1 = \overline{R}_1 \times 35.22$ $Q_2 = \overline{R}_2 \times 35.22$	$\begin{split} G_1 &= \frac{H_2C_1}{\pi(2H_1H_2(H_2 - H_1) + a^2(H_1C_2 - H_2C_1))} \\ G_2 &= \frac{H_1C_2}{\pi(2H_1H_2(H_2 - H_1) + a^2(H_1C_2 - H_2C_1))} \\ K_{fg} &= G_2Q_2 - G_1Q_1 \\ G_3 &= \frac{(2H_2^2 + a^2C_2)C_1}{2\pi(2H_1H_2(H_2 - H_1) + a^2(H_1C_2 - H_2C_1))} \end{split}$

Notes:

Removal efficiencies are based on NJDEP Test Protocols and independently verified.

All units supplied by ADS have numerous local, provincial, and international certifications (copies of which can be provided upon request). The design engineer is responsible for ensuring compliance with applicable regulations.

PRODUCT SPECIFICATION:

- 1. PEAK HYDRAULIC FLOW: 18.0 cfs (510 l/s)
- 2. MIN SEDIMENT STORAGE CAPACITY: 0.7 cu. yd. (0.5 cu. m.)
- 3. OIL STORAGE CAPACITY: 191 gal. (723 liters)
- 4. MAXIMUM INLET/OUTLET PIPE DIAMETERS: 24 in. (600 mm)
- 5. THE TREATMENT SYSTEM SHALL USE AN INDUCED VORTEX TO SEPARATE POLLUTANTS FROM STORMWATER RUNOFF.
- 6. FOR MORE PRODUCT INFORMATION INCLUDING REGULATORY ACCEPTANCES, PLEASE VISIT

https://hydro-int.com/en/products/first-defense

GENERAL NOTES:

- 1. General Arrangement drawings only. Contact Hydro International for site specific drawings.
- 2. The diameter of the inlet and outlet pipes may be no more than 24".
- 3. Multiple inlet pipes possible (refer to project plan).
- 4. Inlet/outlet pipe angle can vary to align with drainage network (refer to project plan.s)
- 5. Peak flow rate and minimum height limited by available cover and pipe diameter.
- 6. Larger sediment storage capacity may be provided with a deeper sump depth.

Verified Performance Claims

The Hydro International First Defense® High Capacity (HC) Oil Grit Separator (OGS) was tested by Good Harbour Laboratories Inc. (GHL), Mississauga, Ontario, Canada in 2018. The performance test results were verified by Toronto and Region Conservation Authority (TRCA), Vaughan, Ontario, Canada following the requirements of ISO 14034:2016 and the VerifiGlobal Performance Verification Protocol. The following performance claims were verified:

Capture test1:

Application

With a false floor set to 50% of the manufacturer's recommended maximum sediment storage depth and an influent test sediment concentration of 200 mg/L, the First Defense[®] HC OGS device removes 67, 60, 55, 50, 45, 45, and 41 percent of influent sediment by mass at surface loading rates of 40, 80, 200, 400, 600, 1000, and 1400 L/min/m², respectively.

Scour test1:

With 10.2 cm (4 inches) of test sediment pre-loaded onto a false floor reaching 50% of the manufacturer's recommended maximum sediment storage depth, the First Defense[®] HC OGS device generates adjusted effluent² concentrations of 0, 0, 11, 2, and 0 mg/L at 5-minute duration surface loading rates of 200, 800, 1400, 2000, and 2600 L/min/m², respectively.

¹ The claims can be applied to other units smaller or larger than the tested unit as long as the untested units meet the scaling rule specified in the Procedure for Laboratory of Testing of Oil Grit Separators (Version 3.0, June 2014)

² The effluent suspended sediment concentration is adjusted based on the background concentration and the smallest 5% of particles captured during the 40 L/min/m² sediment capture test (see Table 2)

Technology Application

The First Defense® HC (FDHC) Oil Grit Separator can be used as a stand-alone stormwater treatment technology, depending on water quality objectives, or as a pretreatment component in a treatment train when higher TSS removals are required and polishing or volume reduction best management practices (BMPs), such as infiltration or bio-infiltration, are installed downstream. FDHC applications include: stormwater treatment at the point of entry into the drainage line; sites constrained by space, topography or drainage profiles with limited slope and depth of cover; retrofit installations where stormwater treatment is placed on or tied into an existing storm drain line; pretreatment for filters, infiltration, other sedimentation BMPs and storage.

Technology Description

The Hydro International First Defense® HC (FDHC) is an Oil Grit Separator designed to remove oil, sediment, trash and debris from stormwater and snowmelt runoff as well as other pollutants that attach to sediment particles, such as nutrients and metals. The patented flow modifying internal components are designed to be inserted into standard precast concrete manholes where they collect and treat runoff as part of the drainage system (Figure 1).

Flow entering the manhole via an inlet pipe or inlet grate is diverted into a vortex chamber beneath a separation module that includes both inlet/outlet chutes and bypass weirs. The internal bypass weirs divert flows greater than the maximum design treatment flow rate over the separation module and away from the vortex chamber where oil, sediment, debris and attached pollutants are accumulating. This function prevents high velocities from re-suspending previously captured pollutants during large storm events. The FDHC can be designed and sized to function effectively in either online or offline configurations.

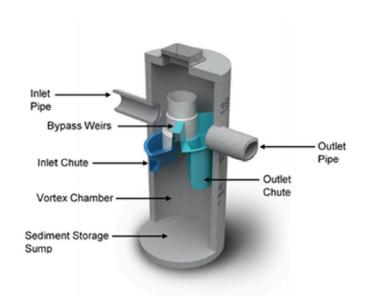

Figure 1: Hydro International First Defense® HC Oil Grit Separator

The test unit was 1.2 m (4 foot) in diameter with a 1.51 m (59 5/8 inches) sump depth measured from the outlet invert to the floor of the unit. The effective treatment area (also known as the effective sedimentation area) is 1.2 m^2 (12.6 ft^2). The maximum sediment storage depth is 0.457 m (18 inches).

Description of Test Procedure

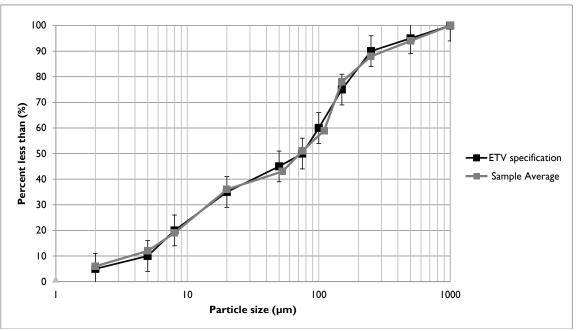

The test data and results for this verification were obtained from independent testing conducted on a 1.2 m (48 inch) diameter Hydro International First Defense® HC OGS device, in accordance with the *Procedure for Laboratory Testing of Oil-Grit Separators (Version 3.0, June 2014)*. The laboratory test procedure was originally prepared by the Toronto and Region Conservation Authority (TRCA) in association with a 31 member advisory committee from various stakeholder groups.

Verification Results

Toronto and Region Conservation Authority verified the performance test data and other information pertaining to the First Defense[®] HC Oil Grit Separator. A Verification Plan was prepared to guide the verification process based on the requirements of ISO 14034:2016 and the VerifiGlobal Performance Verification Protocol.

The test sediment consisted of ground silica (1 – 1000 micron) with a specific gravity of 2.65, uniformly mixed to meet the particle size distribution specified in the testing procedure. The *Procedure for Laboratory Testing of Oil Grit Separators* requires that the three sample average of the test sediment particle size distribution (PSD) meet the specified PSD percent less than values within a boundary threshold of 6%, and a median particle size no greater than 75 μ m. Comparison of the individual sample and average test sediment PSD to the specified PSD shown in Figure 2 indicates that the test sediment used for the capture and scour tests met this condition. The median particle size was 73 μ m. Samples from test sediment batches used for each run met the specified PSD within the required tolerance thresholds.

Figure 2 - The three sample average particle size distribution (PSD) of the test sediment used for the capture and scour test compared to the specified PSD

The capacity of the device to retain sediment was determined at seven surface loading rates using the modified mass balance method. This method involved measuring the mass and particle size distribution of the injected and retained sediment for each test run. Performance was evaluated with a false floor simulating the technology filled to 50% of the manufacturer's recommended maximum sediment storage depth. The test was carried out with clean water that maintained a sediment concentration below 20 mg/L. Based on these conditions, removal efficiencies for individual particle size classes and for the test sediment as a whole were determined for each of the tested surface loading rates (Table 1).

In some instances, the removal efficiencies were above 100% for certain particle size fractions. These discrepancies are not unique to any one test laboratory and are attributed to errors relating to the blending of sediment, collection of representative samples for laboratory submission, and laboratory analysis of PSD. Due to these errors, caution should be exercised in applying the removal efficiencies by particle size fraction for the purposes of sizing the tested device (see Bulletin # CETV 2016-11-0001). The results for "all particle sizes by mass balance" (see Table 1) are based on measurements of the total injected and retained sediment mass, and are therefore not subject to blending, sampling or PSD analysis errors.

Table 1 - Removal efficiencies (%) of the First Defence HC at specified surface loading rates

Particle size	Surface loading rate (L/min/m²)						
fraction (µm)	40	80	200	400	600	1000	1400
>500	100*	100*	100*	81	72	86	80
250 - 500	100*	97	99	100*	100*	59	88
150 - 250	100*	91	95	93	47	100*	84
105 - 150	96	89	94	89	90	70	75
75 - 105	100*	90	95	77	-20**	100	51
53 - 75	74	100*	97	62	100*	46	37
20 - 53	60	33	10	5	4	0	0
8 - 20	29	16	8	3	3	I	1
5 – 8	8	5	8	4	4	4	3
<5	5	3	0	0	0	3	3
All particle sizes By mass balance	66.5	59.9	55.4	50.2	44.9	45.2	40.5

^{*} Removal efficiencies were calculated to be above 100%. Calculated values ranged between 101 and 184% (average 115%). See text and Bulletin # CETV 2016-11-0001 for more information.

Figure 3 - Particle size distribution of sediment retained in the First Defense HC in relation to the injected test sediment average

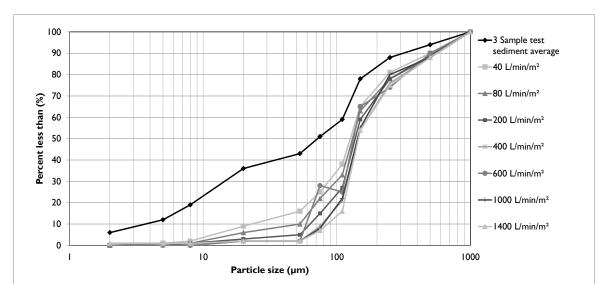

Figure 3 compares the particle size distribution (PSD) of the three sample average of the test sediment to the PSD of the sediment retained by the FDHC device at each of the tested surface loading rates. As expected, the capture efficiency for fine particles was generally found to decrease as surface loading rates increased, particularly in the 40 to 400 L/min/m² range.

^{**} An outlier in the retained sediment sample sieve data resulted in negative removal for this size fraction. The outlier at the 75 um particle size is shown in Figure 3.

Table 2 shows the results of the sediment scour and re-suspension test for the First Defense HC unit. The scour test involved preloading 10.2 cm (4 inches) of fresh test sediment into the sedimentation sump of the device. The sediment was placed on a false floor to mimic a device filled to 50% of the maximum recommended sediment storage depth. Clean water was run through the device at five surface loading rates over a 30 minute period. Each flow rate was maintained for 5 minutes with a one minute transition time between flow rates. Effluent samples were collected at one minute sampling intervals and analyzed for Suspended Sediment Concentration (SSC) and PSD by recognized methods. The effluent samples were subsequently adjusted based on the background concentration of the influent water. The smallest 5% of particles captured during the 40 L/min/m² sediment capture test (13.5 μ m in this case) was used to further adjust the effluent sediment concentrations, as per the method described in Bulletin # CETV 2016-09-0001. Results showed average adjusted effluent sediment concentrations below 11 mg/L at all surface loading rates. Effluent concentrations would be expected to decrease at higher flow rates since bypass over the insert bypass weirs was observed to begin at 1,032 L/min/m².

Table 2 - Scour test adjusted effluent sediment concentration at each surface loading rate

Run	Surface loading rate (L/min/m²)	Run time (min)	Background sam- ple concentration (mg/L)	Average adjusted effluent suspended sediment concentration (mg/L)*
1	200	1:00 - 6:00	0.8	0
2	800	7:00 – 12:00	1.0	0
3	1400	13:00 – 18:00	1.1	10.6
4	2000	19:00 – 24:00	2.8	2.4
5	2600	25:00 – 30:00	6.6	0

^{*}The effluent suspended sediment concentration is adjusted based on the background concentration and the smallest 5% of particles captured during the 40 L/min/m² sediment capture test, as per the method described in Bulletin # CETV 2016-09-0001.

Variances from the Procedure

Minor variances from the *Procedure for Laboratory Testing of Oil-Grit Separators* used as the basis of testing for this verification were as follows:

- 1. The *Procedure* states that the tested device "must be a full scale commercially available device with the same configuration and components as would be typical for an actual installation." The unit tested for this verification had the same internal components as would be typical for a commercial installation, but the internal components were placed inside a structure constructed of composite materials, rather than a manhole made of concrete, the latter of which is typical for most installations. The dimensions of the structure were the same as would have been the case had the manhole been concrete. The use of alternate materials for the structure was not believed to significantly affect system performance.
- 2. As part of the capture test, evaluation of the 40 and 80 L/min/m² surface loading rate was split into 3 and 2 parts, respectively. The test was conducted in parts because of the long duration (i.e. over 10 hours) needed to feed the required minimum 11.3 kg of test sediment into the unit. At the end of the first and second parts of the test, the flow rates were gradually decreased to prevent capture of particles that would have been washed out under normal circumstances. The requirement to split the test into parts was not anticipated in the *Procedure for Laboratory Testing of Oil-Grit Separators*, but has been a common feature of testing at the 40 L/min/m² surface loading rate. Conducting the test in two parts for the 80 L/ min/m² surface loading rate is less common. The testing did not assess the significance of the breaks, however, the test laboratory and verifier do not believe that the breaks significantly affected the test results.

Hydro International First Defense® HC Oil Grit Separator Verification Statement

3. During the sediment scour test, the flow rate coefficient of variation (COV) at the 200 $L/min/m^2$ surface loading rate of 0.045 slightly exceeded the target COV of 0.04. The average flow rate during the test remained within $\pm 10\%$ of the target flow rate.

Quality assurance

Performance testing and verification of the First Defense® HC Oil Grit Separator were performed in accordance with the requirements of ISO 14034:2016 and the VerifiGlobal Performance Verification Protocol. The verifier, Toronto and Region Conservation Authority, has confirmed that quality assurance requirements were addressed throughout the performance testing process and in the generation of performance test results. This includes reviewing all data sheets and data downloads, as well as overall management of the test system, quality control and data integrity.

Verification Summary

In summary, the First Defense® HC Oil Grit Separator is designed to remove oil, sediment, trash and debris from stormwater and snowmelt runoff as well as other pollutants that attach to sediment particles, such as nutrients and metals. Verification of performance claims for the Hydro International First Defense® HC Oil Grit Separator was conducted by Toronto and Region Conservation Authority based on independent third-party performance test results provided by Good Harbour Laboratories, as well as additional information provided by Hydro International. Table 3 summarizes the verification results in relation to the technology performance parameters that were identified to determine the efficacy of the First Defense® HC Oil Grit Separator.

Table 3 - Summary of Verification Results Against Performance Parameters

Performance Parameter	Verified Performance
Sediment Removal Rate	The sediment removal rate of the FDHC is dependent upon flow rate, particle density and particle size. Removal efficiency decreased with increasing surface loading rate from 67% at 40 L/min/m² to 41% at 1400 L/min/m². The weighted average removal efficiency achieved by the unit will vary depending on the rainfall distribution of the jurisdiction in which it is installed, and site characteristics.
Sediment Scour	When pre-loaded with sediment with a particle size distribution matching that of the feed sediment used in the sediment capture test, the FDHC generated effluent suspended solids concentrations of less than 11 mg/L at surface loading rates ranging from 200 to 2600 L/min/m².
Bypass flow rate	The flow rate at which bypass occurs will vary based on model size. For the 1.2 m (4 foot) diameter test unit, the flow rate at which bypass occurred over the insert bypass weirs was 1238 L/min (327 gpm).
Head loss	The loss of hydraulic head across the FDHC was determined by measuring the water elevation difference between the inlet and outlet sides of the insert. Head loss may vary based on model size. For the tested unit the head loss ranged from 2 mm (0.08 inches) at 93.5 L/min (12.3 gpm) to 100 mm (3.94 inches) at 1238 L/min (327 gpm) when bypass was observed to occur. At 327 gpm, when bypass occurred, the depth of the water was 177 mm upstream and 77 mm downstream for a difference of 100 mm (3.94 inches). The highest water elevation difference was 111mm (4.37 inches) at a flow rate of 1635 L/min (431.8 gpm), after which head loss declined up to the maximum measured flow rate of 3036 L/min (801.9 gpm).

Hydro International First Defense® HC Oil Grit Separator Verification Statement

What is ISO 14034?

The purpose of environmental technology verification is to provide a credible and impartial account of the performance of environmental technologies. Environmental technology verification is based on a number of principles to ensure that verifications are performed and reported accurately, clearly, unambiguously and objectively. The International Organization for Standardization (ISO) standard for environmental technology verification (ETV) is ISO 14034, which was published in November 2016.

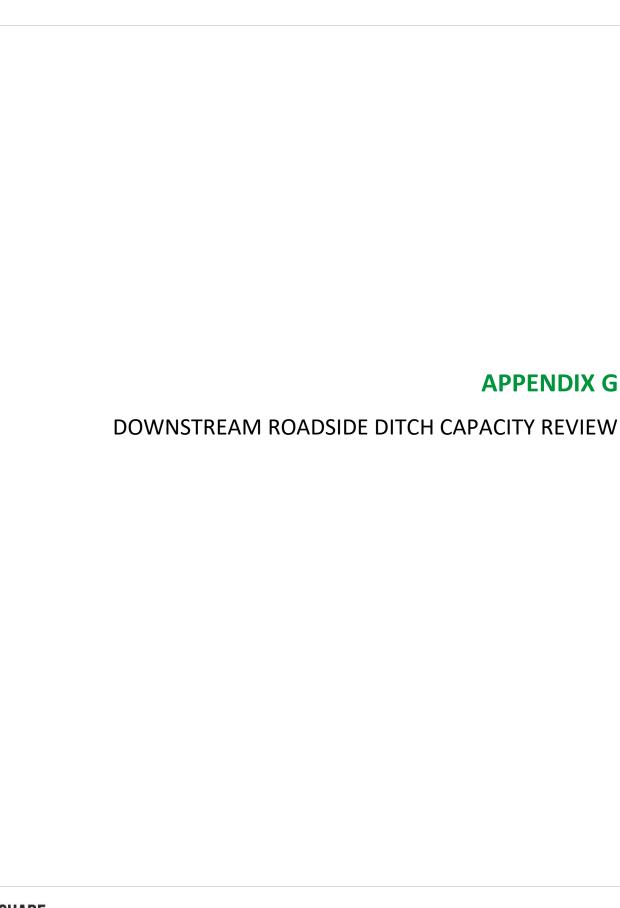

Benefits of ETV

ETV contributes to protection and conservation of the environment by promoting and facilitating market uptake of innovative environmental technologies, especially those that perform better than relevant alternatives. ETV is particularly applicable to those environmental technologies whose innovative features or performance cannot be fully assessed using existing standards. Through the provision of objective evidence, ETV provides an independent and impartial confirmation of the performance of an environmental technology based on reliable test data. ETV aims to strengthen the credibility of new, innovative technologies by supporting informed decision-making among interested parties.

Q

Side Yard Swale - 158/164 Cardevco Road Full Flow Capacity Analysis

U/S Limits of 158/164 Cardevco

Ditch Invert =	116.42	m
Top of Slope Elev 158 Cardevco =	117.10	m
Top of Slope Elev 164 Cardevco =	116.60	m
Max available ponding =	0.18	m
Side Slope 158 =	10.7	%
Side Slope 164 =	5.6	%
Rougness Coeff	0.03	
Channel Slope	0.52	%
Area	0.41	m^2

Midpoint of 158/164 Cardevco

4.59 m 0.09 m

197 L/s

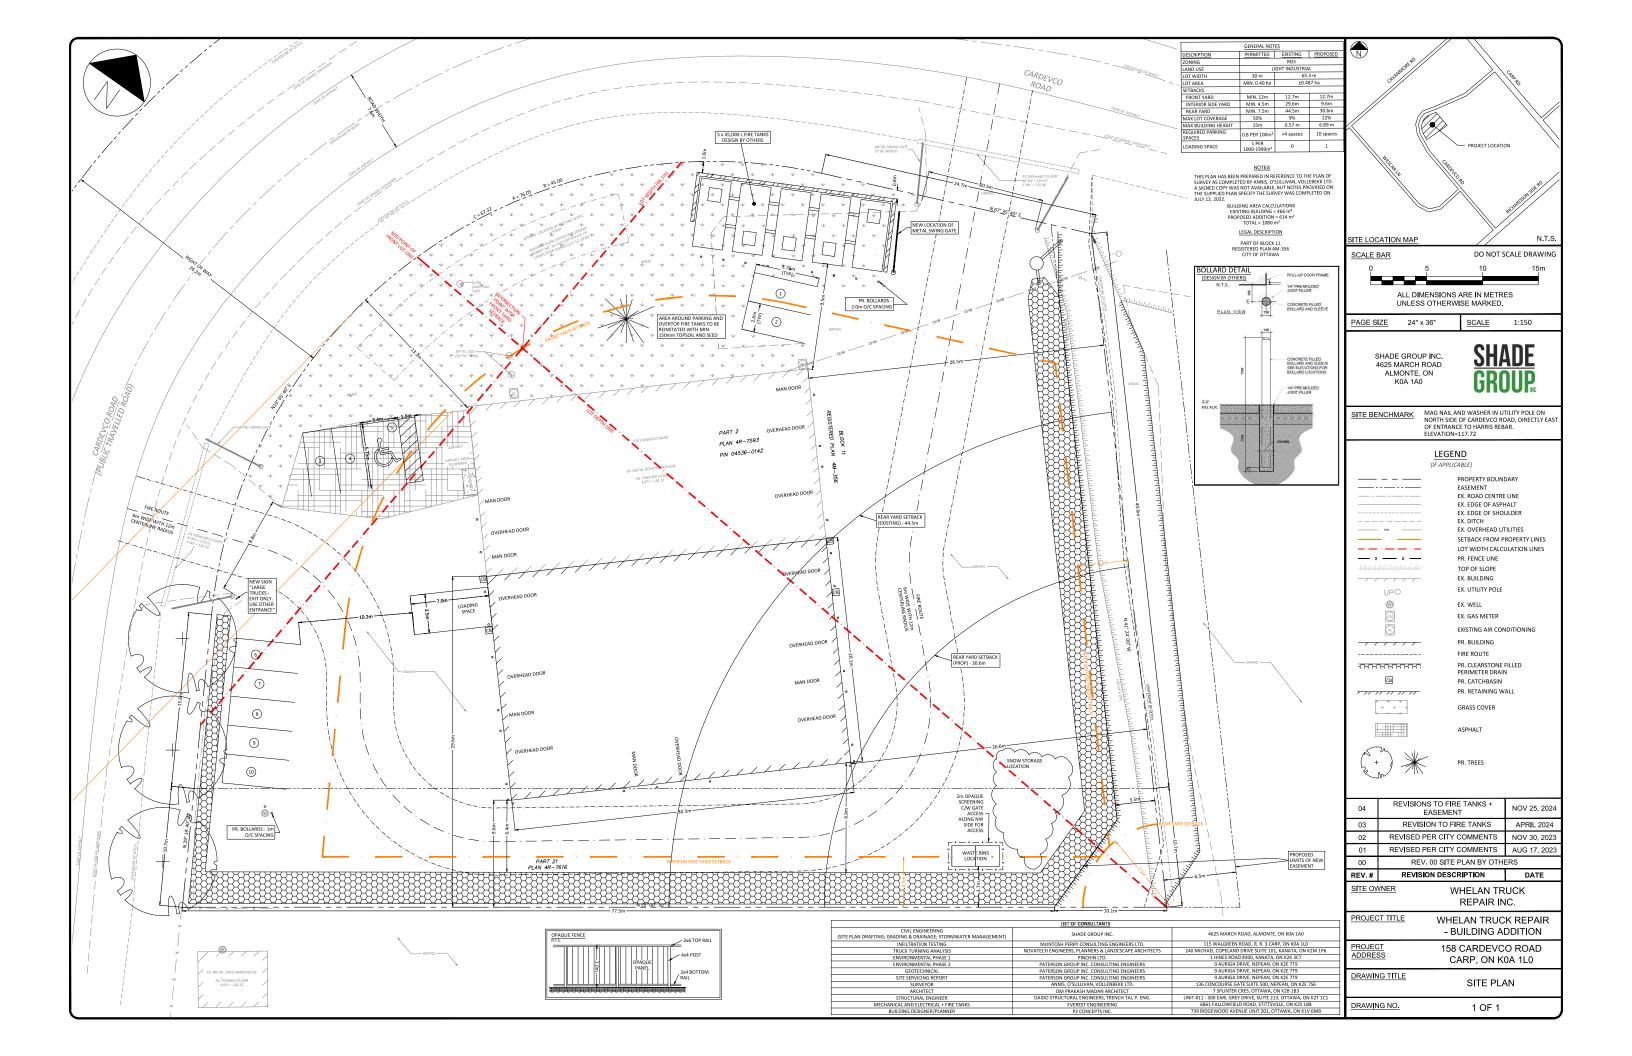

Ditch Invert =	116.29	m	
Top of Slope Elev 158 Cardevco =	117.25	m	
Top of Slope Elev 164 Cardevco =	116.50	m	
Max available ponding =	0.21	m	
Side Slope 158 =	33.0	%	
Side Slope 164 =	5.7	%	
Rougness Coeff	0.03		
Channel Slope	0.52	%	
Area	0.47	m^2	
Wetted Perimeter	4.56	m	
R	0.10	m	
Q	253	L/s	

As the full flow capacity of the side yard swale between 164 and 158 Cardevco Road is greater than the anticipated 100-year peak flow from the contributing area, the swale is considered to have adequate conveyance capacity.

SITE PLAN

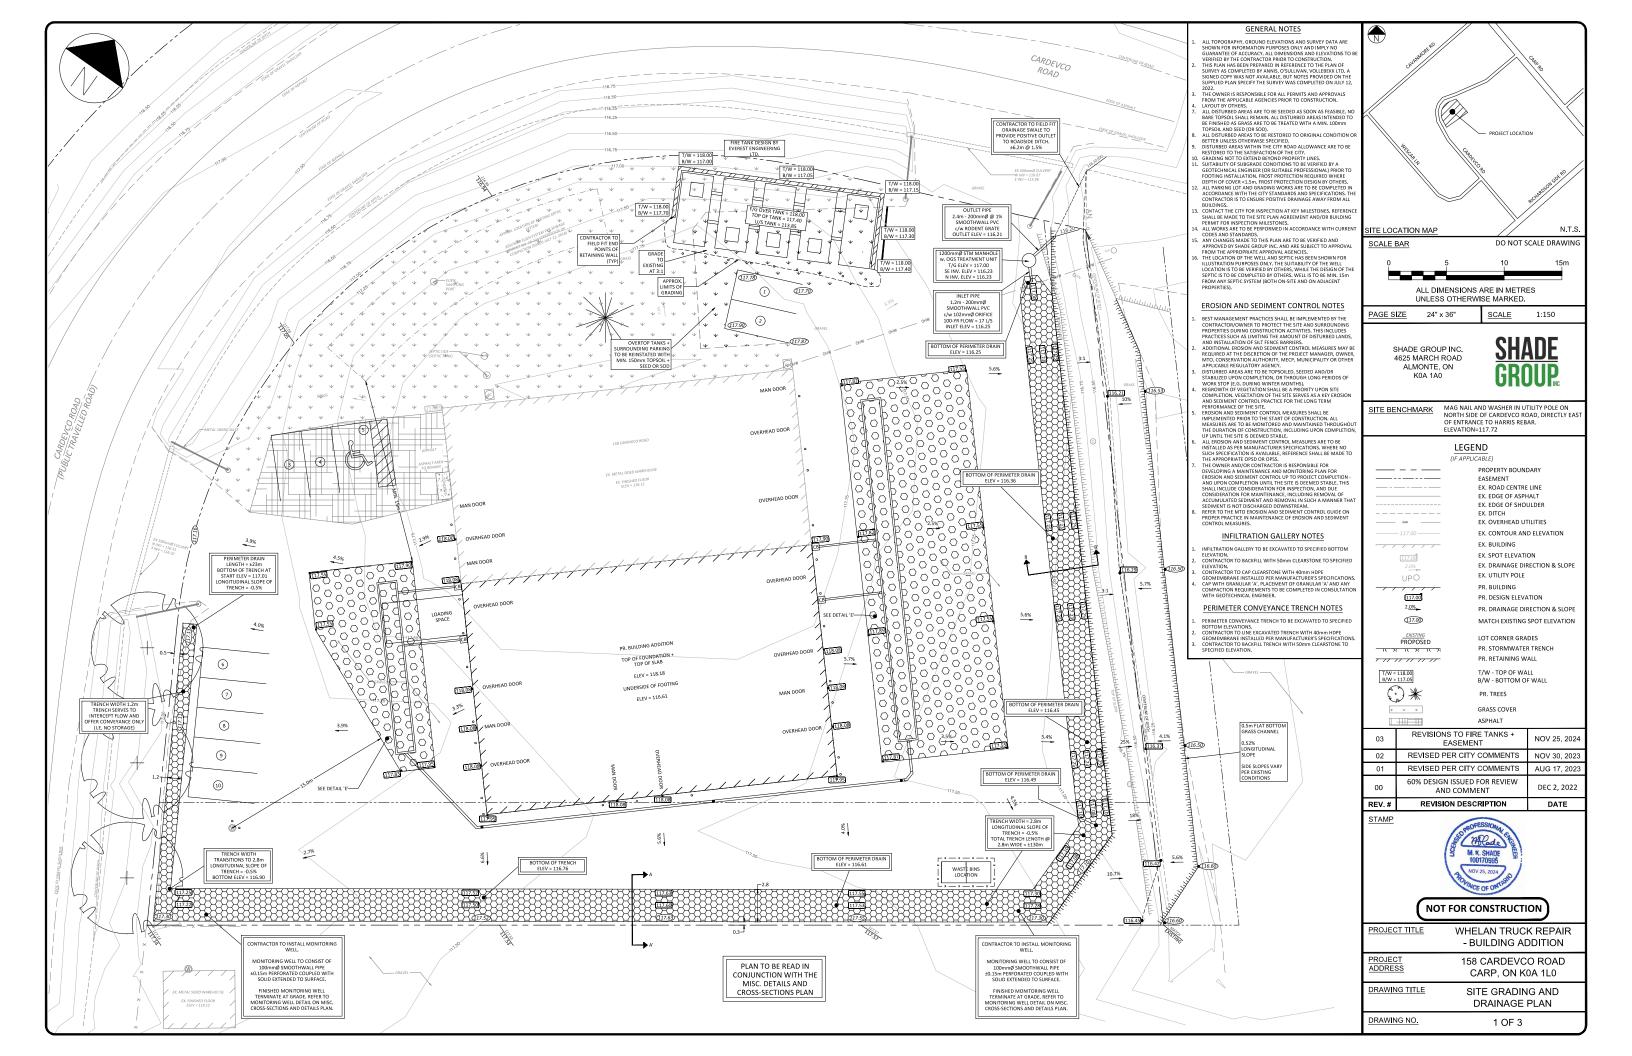

APPENDIX J

ENGINEERING DESIGN DRAWINGS

GENERAL NOTES

- ALL TOPOGRAPHY, GROUND ELEVATIONS AND SURVEY DATA ARE SHOWN FOR INFORMATION PURPOSES ONLY AND IMPLY NO GUARANTEE OF ACCURACY, ALL DIMENSIONS AND ELEVATIONS TO BE VERIFIED BY THE CONTRACTOR PRIOR TO CONSTRUCTION.
 THIS PLAN HAS BEEN PREPARED IN REFERENCE TO A SITE PLANS PREPARED BY CHRISTOPHER A. LEGGETT ARCHITECT INE, DATED DO SEZEZIENCE TO THE PLAN OF SURVEY AS COMPLETED BY ANNIS, O'SULLIVIAN, VOLLERSKE, IT AND SEZEZIENCE TO THE PLAN OF SURVEY AS COMPLETED BY ANNIS, O'SULLIVIAN, VOLLERSKE, IT AND SEXE COPP WAS NOT AVAILABLE, BUT NOTES PROVIDED ON THE DEVELOPMENT OF THE OWNER OF SEZEZIENCE TO THE OWNER OF SEZEZIENCE OF SEZEZIENCE TO SEZEZIENCE OWNER OF SEZEZIENCE OF SEZEZIENCE OWNER OWNER
- PRIOR TO CONSTRUCTION.

 LAYOUT BY OTHERS.

 ALL DISTURBED AREA SARE TO BE SEEDED AS SOON AS FEASIBLE. NO BARE TOPSOIL SHALL REMAIN.

 ALL DISTURBED AREAS INTENDED TO BE FINISHED AS GRASS ARE TO BE TREATED WITH A MIN. 100mm
- TOPSOIL AND SEED (OR SOD). ALL DISTURBED AREAS TO BE RESTORED TO ORIGINAL CONDITION OR BETTER UNLESS OTHERWISE
- SPECIFIED.

 DISTURBED AREAS WITHIN THE CITY ROAD ALLOWANCE ARE TO BE RESTORED TO THE SATISFACTION
 OF THE CITY.
- OF THE CITY.

 GRADINE NOT TO EXTEND BEYOND PROPERTY LIBES.

 SUITABILITY OF SUBGRADE CONDITIONS TO BE VERIFIED BY A GEOTECHNICAL ENGINEER (OR SUITABLE PROFESSIONAL) PRIOR TO FOOTING INSTALLATION, FROST PROTECTION REQUIRED WHERE DEPTH OF COVER 4.15m. FROST PROTECTION DESIGN BY OTHERS.

 ALL PARKING LOT AND GRADING WORKS ARETO BE COMPLETED IN ACCORDANCE WITH THE CITY STANDARDS AND SPECIFICATIONS. THE CONTRACTOR IS TO ENSURE POSITIVE DRAIMAGE AWAY FROM

- STANDARDS AND SPEGIFICATIONS, THE CONTRACTOR IS TO ENSURE POSITIVE DRAINAGE AWAY FROM ALL BUILDINGS.

 CONTACT THE CITY FOR INSPECTION AT KEY MILESTONES, REFERENCE SHALL BE MADE TO THE SITE PLAN AGREEMANT ANA/OR BUILDING PERMIT FOR INSPECTION MILESTONES.

 ALL WORKS ARE TO BE PERFORMED IN ACCORDANCE WITH CURRENT CODES AND STANDARDS.

 ANY CHANGES MANDE TO THE PERFORMED IN A ECTOR EVERIFIED AND APPROVED BY SHADE GROUP INC. AND ARE SUBJECT TO APPROVAL FROM THE APPROPRIATE APPROVAL AGENCIES.

 THE LOCATION OF THE WELL AND SEPTIC HAS BEEN FORMY FOR ILLISTRATION PURPOSES ONLY. THE SUITABILITY OF THE WELL AND SEPTIC HAS BEEN FORMY FOR ILLISTRATION PURPOSES ONLY. THE SUITABILITY OF THE WELL AND SETTIC HAS BEEN FORMY FOR ILLISTRATION PURPOSES ONLY. THE SUITABILITY OF THE WELL AND SETTIC HAS BEEN FORMY FOR ILLISTRATION PURPOSES ONLY. EROSION AND SEDIMENT CONTROL NOTES

- BEST MANAGEMENT PRACTICES SHALL BE IMPLEMENTED BY THE CONTRACTOR/OWNER TO PROTECT THE SITE AND SURROUNDING PROPERTIES DURING CONSTRUCTION ACTIVITIES. THIS INICLIDES PRACTICES SUCH AS LIMITING THE AMOUNT OF DISTURBED LANDS, AND INSTALLATION OF SILT FENCE.

- DARRIES AND AND SEMINATION FOR ANY DEPOSIT OF THE STREET O
- DURATION OF CONSTRUCTION, INCLUDING UPON COMMEDIA, S. C. C. STABLE.

 ALL EROSION AND SEDIMENT CONTROL MEASURES ARE TO BE INSTALLED AS PER MANUFACTURER
 SPECIFICATIONS. WHERE NO SUCH SPECIFICATION IS AVAILABLE, REFERENCE SHALL BE MADE TO THE
- SPECIFICATIONS. WHERE NO SUCH SPECIFICATION IS AVAILABLE, REFERENCE SHALL BE MADE TO THE APPROPRIATE OBSO OR OPS.
 THE OWNER ANN/OR CONTRACTOR IS RESPONSIBLE FOR DEVELOPING A MAINTENANCE AND MONITORING PLAN FOR REGISION AND SEDIMENT CONTROL UP TO PROJECT COMPLETION -AND UPON COMPLETION UNTIL THE SITE IS DEEMED STABLE. THIS SHALL INCLUDE CONSIDERATION FOR MAINTENANCE, INCLUDING REMOVAL OF ACCUMULATED SEDIMENT AND REMOVAL OF ACCUMULATED SEDIMENT AND REMOVAL OF ACCUMULATED SEDIMENT AND REMOVAL OF SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN MAINTENANCE OF SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN MAINTENANCE OF EROSION AND SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN MAINTENANCE OF EROSION AND SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN MAINTENANCE OF EROSION AND SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN MAINTENANCE OF EROSION AND SEDIMENT CONTROL GUIDE ON PROPER PRACTICE IN

INFILTRATION GALLERY NOTES

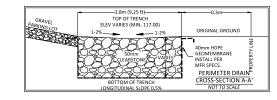

- INSTITATION GALLERY TO BE EXCANATED TO SPECIFED BOTTOM EEVATION.
 CONTRACTOR TO BACKFILL WITH SOOM ELEASTONE TO SPECIFED ELEVATION.
 CONTRACTOR TO CAP CLEASTONE WITH 40mm HDFE GEOMEMBRANE INSTALLED PER
 MANUFACTURESS SPECIFICATION.
 CAP WITH GRANULAR "A: PLACEMENT OF GRANULAR "A: AND ANY COMPACTION REQUIREMENTS TO
 BE COMPLETED IN CONSULTATION WITH GEOTEMINICAL BISINETE.

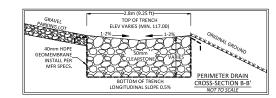

PERIMETER CONVEYANCE TRENCH NOTES

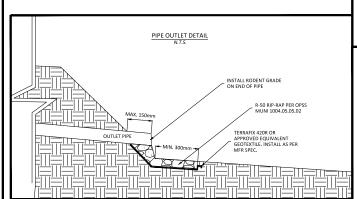

- PERIMETER CONVEYANCE TRENCH TO BE EXCAVATED TO SPECIFIED BOTTOM ELEVATIONS. CONTRACTOR TO LINE EXCAVATED TRENCH WITH 40mm HDPE GEOMEMBRANE INSTALLED PER MANUFACTURER'S SPECIFICATIONS. CONTRACTOR TO BACKFILL TRENCH WITH 50mm CLEARSTONE TO SPECIFIED ELEVATION.
