Revision 2
March , 2023

1 Project Description:

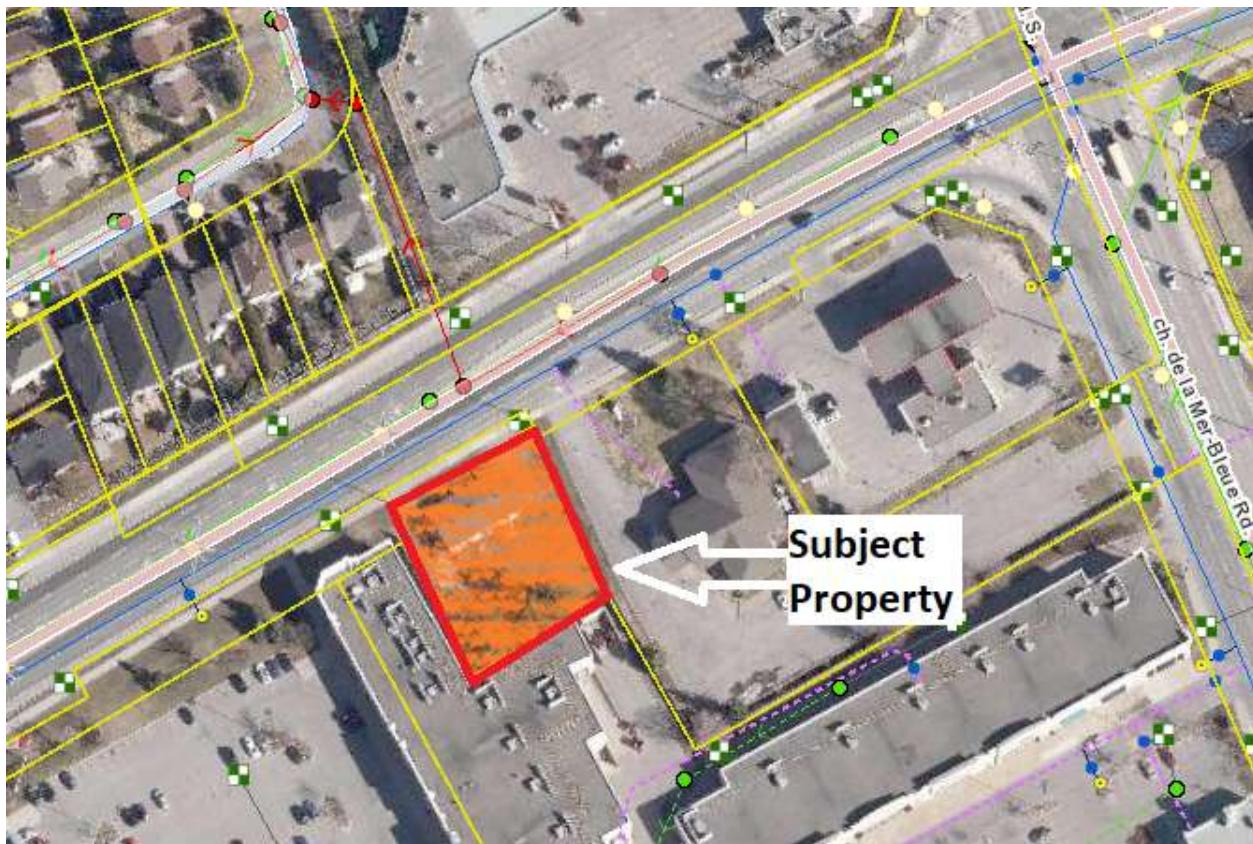

1.1. Introduction:

The property at 3996 Innes Road is located close to intersection of Mer Bleue Road and Innes Rd. The existing lot is 0.15 hectare, currently, contains a one story buildings built in circa 1970. It is proposed that the existing building to be demolished and a new 5-storey commercial/residential building be constructed. Property at 3996 Innes Road is currently zoned as AM (Arterial Mainstreet Zoning) which suits for the purpose of proposed development.

This report will address the servicing requirements associated with the proposed development located at 3996 Innes Road within the City of Ottawa. This report is prepared in response to the request from City of Ottawa Planning department.

1.2. Existing Conditions:

The property measures a total area of approximately 0.15 hectare. The site is fronting 610mm diameter DI water main, 250mm diameter PVC sanitary main and 600mm diameter concrete storm main.

2 Guidelines, Previous Studies, And Reports

The following studies were utilized in the preparation of this report:

- Ottawa Sewer Design Guidelines,
City of Ottawa, SDG002, October 2012.
(City Standards)
 - Technical Bulletin ISTB-2018-01
City of Ottawa, March 21, 2018.
(ISTB-2018-01)
 - Technical Bulletin ISTB-2018-04
City of Ottawa, June 27, 2018.
(ISTB-2018-04)
- Ottawa Design Guidelines Water Distribution
City of Ottawa, July 2010.
(Water Supply Guidelines)
 - Technical Bulletin ISD-2010-2
City of Ottawa, December 15, 2010.
(ISD-2010-2)
 - Technical Bulletin ISDTB-2014-02
City of Ottawa, May 27, 2014.
(ISDTB-2014-02)
 - Technical Bulletin ISTB-2018-02
City of Ottawa, March 21, 2018.
(ISTB-2018-02)
- Design Guidelines for Sewage Works,
Ministry of the Environment, 2008.
(MOE Design Guidelines)
- Stormwater Planning and Design Manual,
Ministry of the Environment, March 2003.
(SWMP Design Manual)
- Ontario Building Code Compendium
Ministry of Municipal Affairs and Housing Building Development Branch,
January 1, 2012 Update. (OBC)
- Geotechnical Report
Prepared by Paterson Group
Report Number: PG5925-1
Dated, November 17, 2021

3 Water Supply

Residential Water Demand:

The water demand is calculated based on the City of Ottawa Water Distribution Design Guidelines as follows:

Demand Type	Amount	Units
Commercial and Institutional		
- Shopping Centres	2500	L/(1000m ² /d)
- Hospitals	900	L/(bed/day)
- Schools	70	L/(Student/d)
- Trailer Parks no Hook-Ups	340	L/(space/d)
- Trailer Parks with Hook-Ups	800	L/(space/d)
- Campgrounds	225	L/(campsite/d)
- Mobile Home Parks	1000	L/(Space/d)
- Motels	150	L/(bed-space/d)
- Hotels	225	L/(bed-space/d)
- Tourist Commercial	28,000	L/gross ha/d
- Other Commercial	28,000	L/gross ha/d
Maximum Daily Demand		
Residential	2.5 x avg. day	L/c/d
Industrial	1.5 x avg. day	L/gross ha/d
Commercial	1.5 x avg. day	L/gross ha/d
Institutional	1.5 x avg. day	L/gross ha/d
Maximum Hour Demand		
Residential	2.2 x avg. day	L/c/d
Industrial	1.8 x avg. day	L/gross ha/d
Commercial	1.8 x avg. day	L/gross ha/d
Institutional	1.8 x avg. day	L/gross ha/d

➤ Residential occupancy :

- 1.4 persons per 18 bedroom apartment
- 2.1 persons per 2 bedroom apartment

$$\square 18 \times 1.4 + 2 \times 2.1 = 29.4$$

Total Residential Occupancy = 29.4 persons rounded up to 30 persons

Residential Average Daily Demand = 280 L/c/d.

$$\square \text{Average daily demand of } 280 \text{ L/c/day} \times 30 \text{ persons} = 8400 \text{ Liters/day}$$

➤ Commercial occupancy :

$$\square 28000 \times 0.15 = 4200 \text{ L/d}$$

Total Demand : $8400 + 4200 = 12,600 \text{ L/d}$ or 0.15 L/s

- Maximum daily demand (factor of 2.5) is $0.15 \text{ L/s} \times 2.5 = 0.375 \text{ L/s}$
- Peak hourly demand (factor of 2.2) = $0.375 \text{ L/s} \times 2.2 = 0.825 \text{ L/s}$

Fire Fighting Requirement

Based on Fire Underwriter Survey Method

Fire flow protection requirements were calculated as per the Fire Underwriter's Survey (FUS). Please see next page.

Based on calculation, 145 L/S required duration 2.5 hours. In fact, any fire hydrant in the City of Ottawa has minimum of 150L/S capacity. Knowing the fact that the closest fire hydrant is 30m from the frontage property lines, we can assure that there is enough capacity for the proposed development. The boundary condition is requested and here is the result:

Demand Scenario	Head (m)	Pressure ¹ (psi)	KPa
Maximum HGL	130.3	56.5	390
Peak Hour	127.0	51.8	358
Max Day plus Fire #1	128.5	53.9	372
Max Day plus Fire #2	127.6	52.7	363

1. Consult proposed connection to the 610mm transmission main with Drinking Water Services

Analyzing results:

- ❖ Ground Elevation = 90.50 m

Floor Elevation	Head (m)	Pressure (KPa) at Each Floor
Ground Floor EL. = 90.50m	127	358
Second Floor EL. = 92.90m	124.6	334
Third Floor EL. = 95.30m	122.2	311
Fourth Floor EL. = 97.70m	119.8	287
Fifth Floor EL. = 100.10m	117.4	264

Based on City of Ottawa Design Guidelines – Water Distribution, minimum water pressure of 275KPa is required for domestic use. From the above table, the fifth floor water pressure is slightly less than the minimum requirement. Note that due to the presence of the sprinkler, the size of water later is proposed to be 100mm diameter connecting to existing 610mm diameter DI water main on Innes road. Due to a large lateral connect for this size of the building, the water supply would adequate for the entire development.

Fire Flow Calculations as per Fire Underwriter's Survey Guidelines

$$F=220C\sqrt{A}$$

4 Sanitary Sewage

Sanitary Sewage Calculation

Design Flows

- Residential occupancy :
- 1.4 persons per 18 bedroom apartment
- 2.1 persons per 2 bedroom apartment

$$\square 18 \times 1.4 + 2 \times 2.1 = 29.4$$

Total Residential Occupancy = 29.4 persons rounded up to 30 persons

Residential Average Daily Demand = 280 L/c/d.

$$\square \text{Average daily demand of } 280 \text{ L/c/day} \times 30 \text{ persons} = 8400 \text{ Liters/day}$$

- Commercial occupancy :

$$\square 28000 \times 0.15 = 4200 \text{ L/d}$$

Total: $8400 + 4200 = 12,600 \text{ L/d or } 0.15 \text{ L/s}$

Peaking Factor = $1 + 14/(4 + (7/1000)^{0.5}) * 0.8 = 3.54$ *use 4 maximum

$Q_{\text{Peak Domestic}} = 0.15 \text{ L/sec} \times 4.0 = 0.6 \text{ L/sec}$

Infiltration

$Q_{\text{Infiltration}} = 0.33 \text{ L/S/Gross hectare} \times 0.15 \text{ ha} = 0.05 \text{ L/sec}$

Total Peak Sanitary Flow = 0.6 + 0.05 = 0.65 L/sec

The Ontario Building Code specifies minimum pipe size and maximum hydraulic loading for sanitary sewer pipe. OBC 7.4.10.8 (2) states "Horizontal sanitary drainage pipe shall be designed to carry no more than 65% of its full capacity." A 200mm diameter sanitary service with a minimum slope of 1.0% has a capacity of 65.0 Litres per second. The maximum peak sanitary flows for the site is 0.65 L/s. Since $0.65 \times 65.0 = 42.3 \text{ L/s}$, therefore, 200mm diameter PVC pipe will be satisfactory.

Sewage discharges will be domestic in type and in compliance with the Ontario Building Code. The proposed service connection from the proposed building will be made to the existing sanitary sewer on Innes Road. The proposed service will be a 200mm diameter PVC pipe installed at a minimum slope of 1%.

The peak sanitary flow from the proposed development is less than 10 percent of the capacity of the existing sanitary. As such the proposed increase in sanitary flow as a result of the construction of the proposed building is negligible and there is sufficient available capacity for the proposed development.

5 Geotechnical Report Recommendation

The Geotechnical report, prepared by Patersongroup Inc., recommends that a perimeter foundation drainage system be provided for the proposed structures. The system should consist of a 100 to 150 mm diameter perforated, corrugated plastic pipe which is surrounded on all sides by 150 mm of 19 mm clear crushed stone and is placed at the footing level around the exterior perimeter of the structure. All other Geotechnical recommendation shall be implemented on its entire context.

6 Conclusions

This report addresses the storm water management of the proposed site. The following list below itemizes the conclusions of this report.

- The allowable release rate for the site and required storage volume for 5 year and 100 year storm event calculated.
- Runoff from the roof and parking area will be retained in the parking and driveway area then discharged to the City storm system via an ICD
- During all construction activities, erosion and sedimentation shall be controlled by techniques outlined in this report.

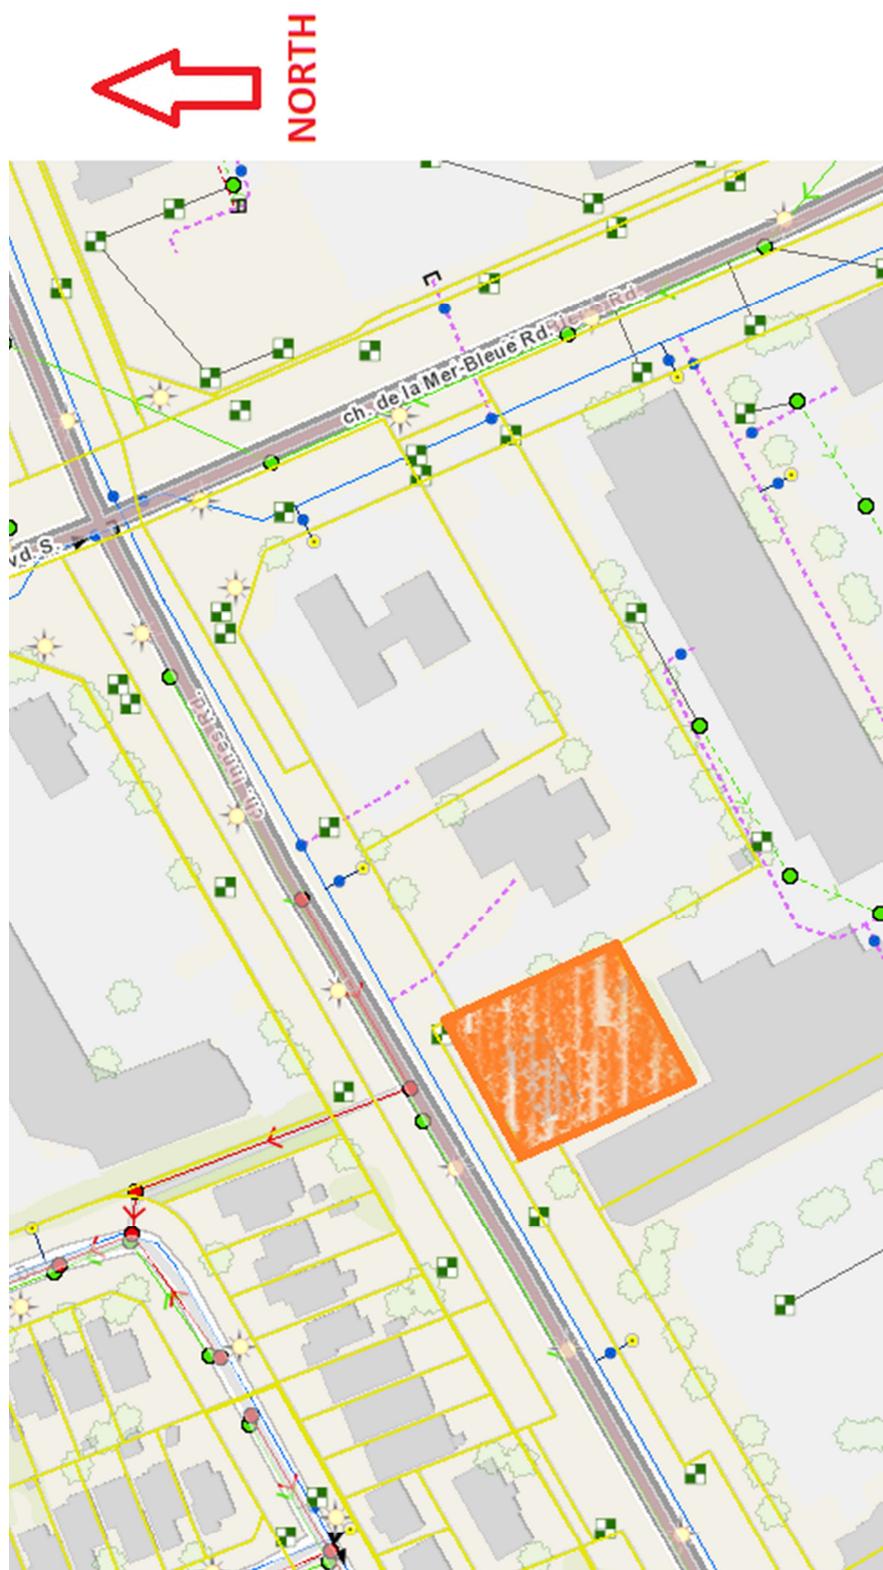

Should you have any question, do not hesitate to let us know.

Yours truly,
Derrick R. Clark, P. Eng.

Max Day plus Fire #1	128.5	53.9
Max Day plus Fire #2	127.6	52.7

Ground Elevation = 90.5 m

Results

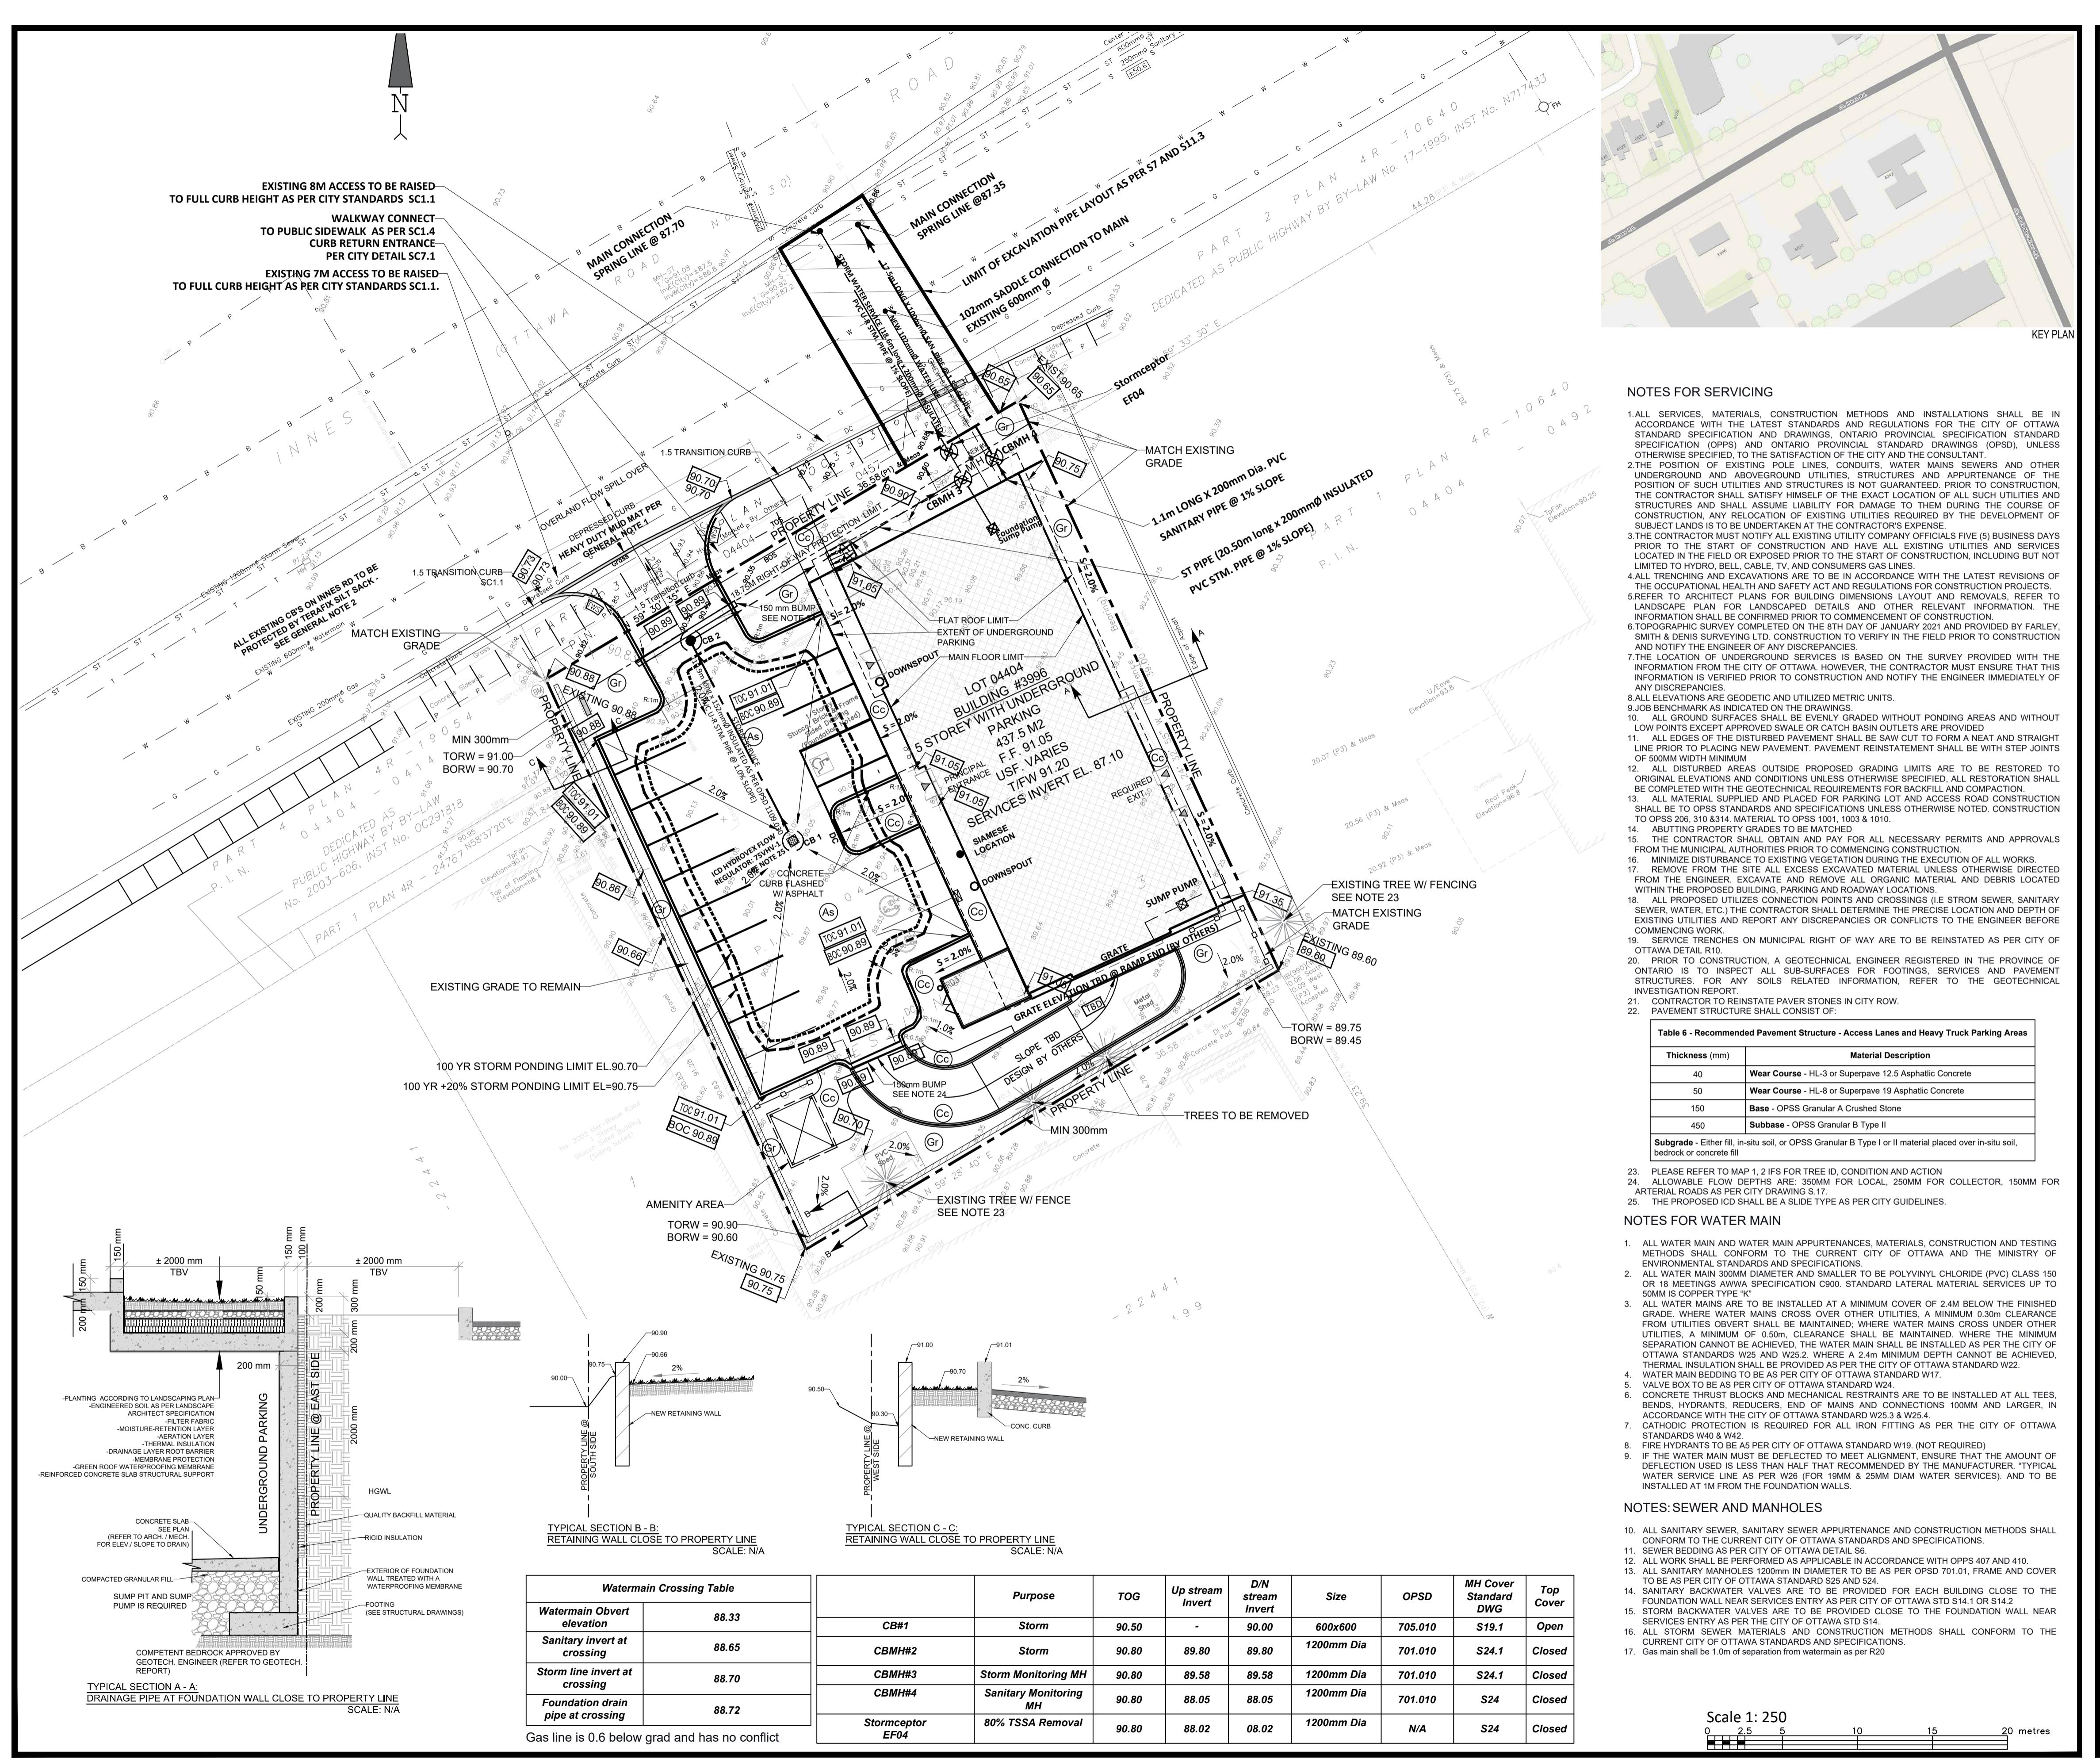

1. Consult proposed connection to the 610mm transmission main with Drinking Water Services

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of water mains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.
