INTRODUCTION

Further to your request, Paterson has conducted a Hydrogeological Assessment and Terrain Analysis in support of a Re-Zoning Application and Site Plan Control Application for the proposed alteration to allow for a place of assembly as part of an on-farm diversified use (OFDU) and/or restaurant to be located at 1811 Richardson Side Road in Ottawa (Carp), Ontario.

The purpose of this work has been to determine the suitability of the water supply aquifer underlying the site as well as determine the capacity of the site to attenuate the sewage system impacts to support the Re-Zoning Application and Site Plan Control Application.

The Subject Site consists of a 11.68 ha lot and is currently occupied by a residential dwelling, located centrally near Bradley Side Road, a centrally located commercial building (Cidery), a commercial building to the south, and an agricultural area located on the northeastern portion of the property with an associated temporary tent-based greenhouse. The south-western portion of the site generally consists of treed areas. The ground surface generally slopes towards the east. There is a sharp slope from the central property to the northeastern agricultural area. The general direction of water flow is towards the Ottawa River to the north.

The Subject Site is bordered on all sides by agricultural lands, with a church and dwelling located to the south of the site. The site has frontage onto Bradley Side Road to the northwest, Huntmar Drive to the northeast and Richardson Side Road to the southeast.

The subject site itself and the surrounding commercial areas are zoned AG3 for Agricultural General Subzone 3 (GeoOttawa).

Hydrogeological Pre-consultation

A Hydrogeological pre-consultation was completed with a City of Ottawa Hydrogeologist on June 23, 2024. The City Hydrogeologist noted that water quantity and quality may be an issue. Evidence was provided from the water well hydrofracking process to increase the quantity and was to be confirmed with the pumping test. An 8-hour pumping test with the standard Subdivision Package suite of parameters, trace metals and Volatile Organic Compounds (VOC's) required by the City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG) was determined to be acceptable.

Description of Subject Site

The subject site is an approximately 11.68 ha lot and is currently occupied by a two-storey residential dwelling, a commercial building to the south with associated parking and storage, a commercial building (Cidery), and agricultural lands to the east, with an associated temporary tent-based greenhouse. The Re-zoning Application is for a zoning by-law amendment to increase the number of guests allowed at the OFDU and/or restaurant. Please refer to Figure-1 Key Plan, attached, for the proposed site location.

The residential dwelling is currently serviced by an onsite sewage system and an existing private drilled well. A newly drilled well was installed in 2022 to service the Cidery and a new sewage system will be required to service the proposed change of use . At this time no site plan has been completed.

The newly drilled well, hereafter referred to as Test Well 1 (TW1), is the well which is currently servicing the Cidery and will continue to service the building following the completion of construction. The property owner will need to ensure that protective measures are taken to protect the wellhead, such as the use of a barrier, during construction.

The suitability of the aquifer to supply the subject site was assessed using the methodology provided in City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG).

Based on available Ontario Geological Survey (OGS) mapping (GRS005), the subject site is not within an area of potential karst.

MISSISSIPPI-RIDEAU SOURCE PROTECTION PLAN

The Mississippi-Rideau Source Protection Plan (MRSPP) provides guidance as to which policies apply to a given property, municipality or specific activity and if there are specific designations that apply to the area. The subject site and surrounding areas have not been

designated as a Significant Groundwater Recharge Area (SGRA), Highly Vulnerable Aquifer (HVA), or Intake Protection Zones (IPZ) Zone within the MRSPP.

There are no related requirements for this site relative to the MRSPP.

Karst Mapping

As discussed in the City pre-consultation meeting, karst was not considered a concern at the site. Available Karst mapping (OGS GRS005) was reviewed as part of this assessment. The available mapping does not indicate the presence of any inferred or potential karstic features. Furthermore, no indication of karstic features was observed during the site visits completed by Paterson personnel.

FIELDWORK PROGRAM

Well Inspection

A visual inspection of TW1 was performed by Paterson personnel which confirmed that the well casing and cap are in good condition. The final grading around the well will be sufficiently graded to direct surface water away from the wellhead (as required by O.Reg 903) at the time of the new sewage system installation. The stick-up was measured to be 0.49 m above ground surface. Based on a visual inspection by Paterson personnel, the well was deemed to be in good condition.

Well Testing

As a means to demonstrate the adequacy of the aquifer underlying the subject lands, with respect to water quality and quantity, TW1 was tested. TW1 has a Water Well Record (WWR) Well ID of A342224 with a 152.4 mm diameter steel casing that extends to 20.1 m below ground surface (bgs) and a 0.49 m stick-up. The well itself extends to a depth of 121.9 m bgs. Based on available geological mapping, the drift thickness at TW1 varies from 15 to 25 m.

As a means to evaluate the water supply aquifer intercepted by the well, the well was subjected to an 8-hour constant rate pumping test. The pumping test was conducted on June 25, 2024 under the full-time supervision of Paterson personnel. Prior to the pumping test the well was disinfected as per the MECP Disinfection Instruction Sheet, and a data-logger was installed to monitor the background groundwater levels.

The existing submersible pump was used for the 8-hour pumping test. A licensed water well technician (Air Rock) completed the necessary plumbing related activities. The discharge line was placed at a sufficient distance to ensure that the discharge water was being directed away from the well as well as any septic systems in the area. Upon completion of the test, the system was returned to its normal configuration.

The pumping test was carried out at a pumping rate of 30 L/min for a duration of 8 hours. During the pumping test, the pumping rate was periodically measured using the timed volume correlation method. The pumping rate was maintained within 5% of the selected pumping rate. The static water level was recorded manually and an electric datalogger (VanEssen TD-Diver) was installed in the test well prior to the start of the pumping test.

The selected rate of 30 L/min provides approximately 1.4 times (14,400 L) the maximum total daily design sanitary sewage flow (TDDSSF) of 10,000 L/day for the subject site during the 8-hour pumping test in support of the Re-zoning Application. The TDDSSF for the proposed development is 7,125 L/day (design by others) under the Site Plan Application. This provides greater than 2 times the TDDSSF proposed for the Site Plan Application. The total daily design sanitary sewage flows (TDDSSF) are proposed to remain below the limit of 10,000 L/day as set out by the Ontario Building Code (OBC) and does not require a large-scale subsurface sewage system.

The data logger recorded water levels at 30 second intervals. In addition, manual water level readings were taken at periodic intervals during the test.

Recovery data was collected from the well following the completion of the pumping. The well was noted to have achieved 95% recovery approximately 13 hours after the completion of pumping.

Groundwater samples were collected at 4 hours and 8 hours after the start of pumping. Prior to collection of the groundwater samples, the free chlorine residual was verified as non-detectable. The water samples were submitted for comprehensive testing of bacteriological, chemical, and physical water quality parameters consistent with the standard “Subdivision Supply” suite of parameters plus trace metals. VOCs were sampled 4 hours and 8 hours after the start of pumping.

All samples were collected unfiltered and unchlorinated and were placed directly into clean bottles supplied by the analytical laboratory. Samples were placed immediately into a cooler with ice and were transported directly to Environmental Testing Canada Inc.(Eurofins) laboratory in Ottawa. All samples were received by the laboratory within 24 hours of collection.

A series of field tests of the pumped water were carried out at the well head during the 8-hour pumping test. The parameters tested at the well head included: pH, total dissolved solids, conductivity, turbidity, apparent colour, hydrogen sulfide (olfactory only), and temperature. Calibration / confirmation of calibration of all field-testing equipment was performed in Paterson’s laboratory the day prior to the pumping test. Values are then confirmed again onsite prior to the start of the pumping test.

Due to elevated measurements for turbidity, colour, and aluminum levels encountered during the pumping test, Paterson personnel returned to the site on July 19, 2024 to collect an additional untreated sample under normal operating conditions of TW1.

Aquifer Analysis

Water Quantity

Pumping test data was analyzed using AQTESOLV Pro Version 4 aquifer analysis software package by HydroSOLVE Inc. Drawdown data was measured using an electronic water level tape and an electronic datalogger unit.

Table 1: SUMMARY OF WATER SUPPLY AQUIFER CHARACTERISTICS OF TW1

AQUIFER PARAMETER	RESULT OF ANALYSIS
Transmissivity (m^2/day)	1.68
Pumping Rate (L/min)	30
Pre-test Static Water Level (m)	4.25
Post-test Static Water Level (m)	19.47
Available Drawdown (m)	118.16
% Drawdown During Pumping Test (%)	13
Specific Capacity (L/min/m drawdown)	1.97

The drawdown data was analyzed using the Theis and Cooper Jacob methods of analysis. Aquifer transmissivity is estimated to be 1.68 m^2/day. Refer to the Theis and Cooper Jacob methods of analysis data sheets attached to this report.

The pumping test results show that TW1 has a high yield to support the water demands that may be required. Overall maximum drawdown at a constant pumping rate for a period of 8 hours was approximately 15.22 m at approximately 8 hours into the pumping test (13% of the available drawdown). 95% recovery was achieved approximately 13 hours after the end of pumping.

The total volume of water pumped during the 8-hour pumping event was approximately 14,400 L. This is approximately 1.4 times the maximum total daily design volume of water (10,000 L/d) required to support the Re-Zoning Application for all uses on the property. This volume is more than twice the TDDSSF of 7,125 L/day for the Site Plan.

The suitability of the aquifer to support the proposed Re-Zoning Application and Site Plan Control Application for the proposed development was assessed using the methodology provided in the City of Ottawa HTAG. Based on the information summarized in Table 1, it is readily apparent that the water supply well has intercepted an adequately strong water supply aquifer which has sufficient quantity to service the maximum site requirements under OBC.

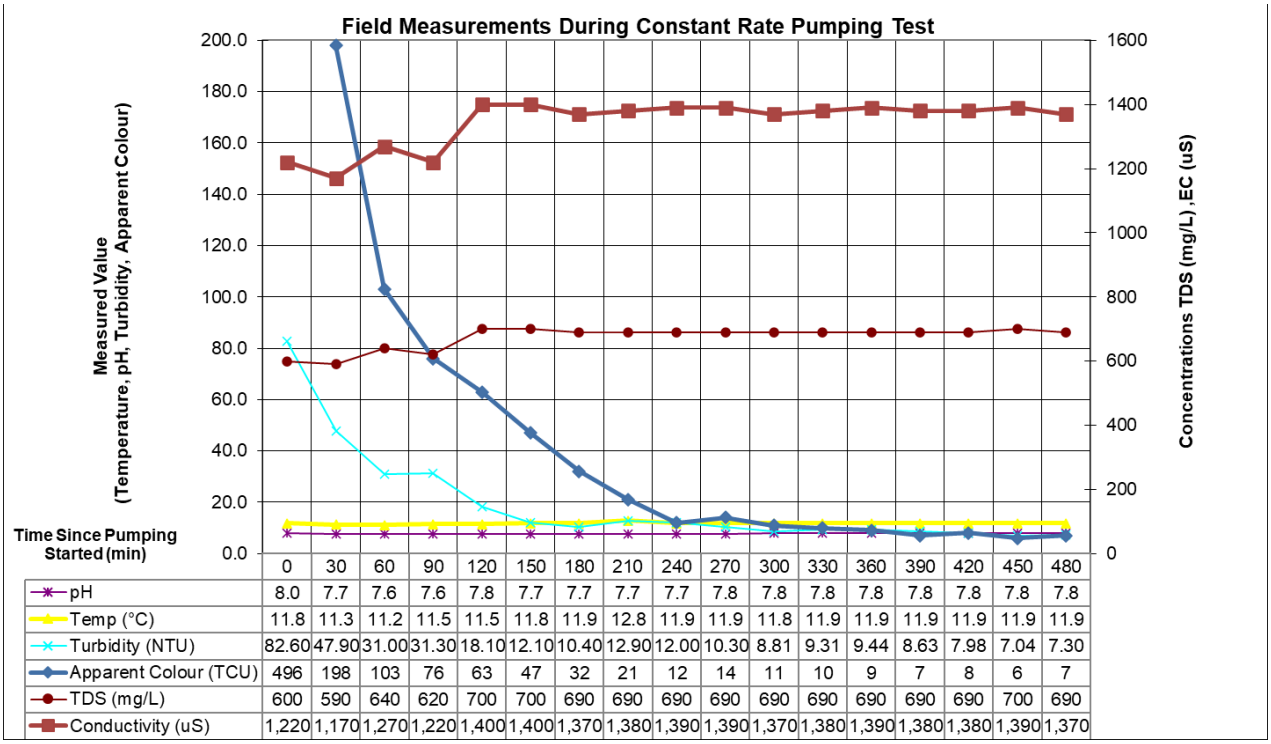
Given the analyses presented and summarized above, it is our opinion that there is an adequate supply of water to support the proposed Re-Zoning Application and Site Plan Control Application. Available water well records (WWR) of the neighboring properties on

the MECP Well Record mapping website indicated that the wells were screened in limestone. Surrounding WWR's are attached to this report.

Water Quality

Field Data

Turbidity, electrical conductivity, total dissolved solids (TDS), pH, true color and temperature were measured at the wellhead during the pumping test. The measurements and time intervals for each of these parameters are summarized in the graphical representation below. In addition, a HACH Pocket Colorimeter II chlorine reader was used to measure the free chlorine residual level. No chlorine residual was detected in the discharge water prior to the collection of the water samples.



Time Since Pumping Started (min)	0	30	60	90	120	150	180	210	240	270	300	330	360	390	420	450	480

Figure 1: Field Testing Results

Laboratory Data

The Subdivision Package suite of parameters and trace metals laboratory water quality obtained from the pumping test of TW1 is provided in Table 2a and 2b below and the laboratory analyses reports can be found attached. VOC laboratory analytical testing was completed and measured to be non-detect in the sample results and is provided in Table 2c. All laboratory test results can be found attached to this report.

1. ODWS identifies the following types of parameters:
   MAC = Maximum Acceptable Concentration
   IMAC = Interim Maximum Acceptable Concentration
   AO = Aesthetic Objective
   OG = Operational Guideline
2. Shaded Concentration Indicates an Exceedance of the ODWS Objective

The bacteriological test results (Certificate of Analysis – Report No. 3966666) indicated that the test samples at the 4 and 8 hour interval were non-detect (0 ct/100 mL) for E.Coli and Total Coliforms.

The water quality of the subject water supply well meets all the Ontario Drinking Water Standards maximum acceptable concentrations (MAC). Furthermore, the water meets all of the Aesthetic Objectives (AO) and Operational Guidelines (OG) with the exception of the following.

- ❑ Hardness (as $CaCO_3$)
- ❑ Total Dissolved Solids (TDS)
- ❑ Iron (Fe)
- ❑ Total Sulphides
- ❑ Aluminum (Al)
- ❑ Colour
- ❑ Turbidity

Exceedances of the above parameters are not uncommon of the water supply in the subject aquifer. Each of these groundwater parameters are discussed in detail below.

Should any water treatment be desired by the owner, it is recommended that a water treatment specialist be retained to ensure that water treatment occurs in a safe manner.

Hardness as $CaCO_3$

Hardness, expressed as calcium carbonate, is an operation guideline and does not appear in the ODWS. Rather, it appears in the Technical Support Documents for Ontario Drinking Water Standards, Objectives and Guidelines as a parameter with an operational guideline at 100 mg/L. At the measured concentrations of 356 and 360 mg/L, the water is considered to be very hard, however, it is below the reasonable treatable limit of 500 mg/L specified in Table 3 of the MOECC guidance document Procedure D-5-5 (1996).

The Langelier calculation provided an LSI of 0.0. Based on the evaluation of the result, the water is saturated and tends to precipitate a scale layer of calcium carbonate (scale forming and mildly corrosive). Based on the range of stability, there are no mitigative measures needed. See Langelier Saturation Index Calculation attached for calculation details.

It is recommended that water hardness be treated using conventional technologies such as water softening or reverse osmosis, if desired by the owner. Without treating hardness, scaling can occur which can result in discolouration and residue build-up on water fixtures, or reduction in boiler efficiency due to scale build-up. According to Health Canada's *Guidelines for Canadian Drinking Water Quality - Summary Tables* "Although hardness may have significant aesthetic effects, a guideline has not been established because public acceptance of hardness may vary considerably according to the local conditions; major contributors to hardness (calcium and magnesium) are not of direct public health concern".

Total Dissolved Solids (TDS)

TDS refers to the concentration of inorganic substances dissolved in water. The main constituents are typically chloride, sulphates, calcium, magnesium, and bicarbonates. The TDS concentration of 944 and 959 mg/L, at the 4- and 8-hour points, respectively, exceeds the Aesthetic Objective of 500 mg/L. At concentrations above 500 mg/L, some consumers may find the taste objectionable, however, as the objective is an aesthetic objective, no treatment is required. It is recommended that a point of use reverse osmosis unit be installed to remove taste issues, if the owner desires, for drinking purposes. As such, no taste problems will occur when the recommended treatment technology, or equivalent, is used.

The Langelier calculation provided an LSI of 0.0. Based on the evaluation of the result, the water is saturated and does not tend to precipitate a scale layer of calcium carbonate (non-scale forming and non-corrosive). Based on the range of stability in the positive direction, there are no mitigative measures needed. See Langelier Saturation Index Calculation attached for calculation details.

Iron

Concentrations of iron above 0.3 mg/L can contribute to staining of fixtures and a metallic taste at higher concentrations. Precipitation of iron can promote the growth of iron bacteria in pipes. The concentration of iron in the groundwater in TW1 was measured to be 0.68 and 0.44 mg/L. The concentration of iron in the groundwater in the test well is considered to be reasonably treatable in accordance with Procedure D-5-5. It is recommended that a water softener or manganese greensand filter be used to reduce the levels of iron and reduce the potential for excessive precipitate occurring in the water supply system, if desired by the property owner. If treatment is not used, negative impacts such as discolouration of water fixtures, precipitation of iron and staining may occur.

Total Sulphides

Total sulphides were reported to be present within the water supply aquifer at concentrations of 0.95 and 1.16 mg/L. These can present as compounds such as iron sulphide or hydrogen sulphide, but are not limited to these forms. The value noted is for the **total sulphides** within the sample as there is no laboratory test for only hydrogen sulphide. Total sulphides should **not** be equated to a result for hydrogen sulphide.

Hydrogen sulphide is a gas that is heavier than air and has a very distinct “rotten egg” odour. Through the latter portion of the test, a faint odour was detected periodically. The aesthetic objective for hydrogen sulphide, which is incidentally also the threshold of the average human olfactory detection, is 0.05 mg/L. Field testing (olfactory only) estimated values in the range of 0 to 0.1 mg/L, which is in line with the intermittent olfactory observation. MECP Procedure D-5-5 does not indicate a maximum treatable limit for sulphide. One method to remove hydrogen sulphide, if desired, is a chlorine feeder and filter through oxidation or equivalent method recommended by a water treatment professional.

Aluminum

Aluminum was reported to be present within the water supply aquifer at concentrations of 0.43 and 0.32 mg/L at the 4- and 8-hour marks, respectively. Aluminum has an OG of 0.1 mg/L where an exceedance may cause coating of pipes in the distribution system and flocculation in the distribution system. Aluminum has a federal health related guideline MAC of 2.9 mg/L, which was not exceeded. During a revisit to the subject site and resample, the aluminum concentration was 0.02 mg/L, indicating that TW1 operating under normal usage meets the required guidelines.

Colour

Colour may occur in drinking water for several reasons. It may be due to organic substances from the decay of vegetation, or the presence of metals such as iron, manganese, and copper, which are abundant in nature. The provincial aesthetic objective for colour in drinking water is 5 True Colour Units (TCU). The federal (Health Canada) guideline aesthetic objective limit for colour is 15 TCU (Guidelines for Canadian Drinking Water Quality, Health Canada June 2019). Procedure D-5-5 gives a maximum concentration considered reasonably treatable for colour as 7 TCU. As colour is a strictly aesthetic parameter, a manganese greensand filter or a carbon filter can be used to reduced manganese from the water supply, if desired by the owner.

During the field pumping test, a DR900 colorimeter was used to measure apparent colour in the groundwater at regular intervals. Field testing for colour had values of 12 and 7 TCU. Laboratory testing showed colour values of 10 TCU during the field test and 12 TCU from the revisit. Apparent colour in the groundwater was measured as 0 TCU during regular usage which is below the aesthetic objective of 5 TCU. The elevated apparent colour levels detected in the lab samples is attributed to the precipitation of iron and manganese out of the groundwater.

Turbidity

Turbidity, which is generally an aesthetic parameter, was detected in the laboratory test samples at values of 11.5 and 7.1 NTU at the 4 hour and 8 h mark of the pumping test, and at 3.3 NTU during regular usage. Field testing of turbidity showed values of 12, and 7.3 NTU at the 4- and 8-hour mark of the pumping test and 0.56 NTU during regular usage. The test during regular usage was completed during the resample visit. Continued pumping showed a gradual decrease towards the end of the pumping test. The rented pump would have disturbed any precipitate in the water column during its installation and removal of the existing pump. This is demonstrated by the reduction in turbidity and iron during the pumping test, further corroborated by the reduction in turbidity under normal usage.

The ODWS maximum acceptable concentration for turbidity in drinking water entering the distribution system is 1 NTU. In accordance with Procedure D-5-5, Table 2 does not reflect a maximum concentration considered reasonably treatable for Turbidity. The Aesthetic Objective and Maximum Concentration Considered Reasonably Treatable

(MCCRT) for turbidity in drinking water reaching the consumer is 5 NTU (Procedure D-5-5, Table 3). Rather, Procedure D-5-5 indicated that “particular care must be taken during testing to ensure that the bacteria requirements of Table 1 are met.” Based on the test results, the bacteria requirements of Table 1 of D-5-5 have been met (E.Coli = 0 and Total Coliforms = 0).

Sodium

Sodium (Na), an aesthetic parameter, was detected in the laboratory test sample at concentrations of 181 and 186 mg/L, which does not exceed the ODWS aesthetic objective of 200 mg/L. Although sodium is not toxic and no maximum acceptable concentration has been set, concentrations above 20 mg/L require that the Medical Officer of Health be notified of the water quality results, so that this information may be passed on to local physicians for use in treatment of those requiring a sodium-restricted diet. It should be noted that some water treatment technologies, such as water softeners, can increase the sodium concentration so care should be given if such treatment technologies are used.

Water Treatment

A water treatment specialist, PV Plumbing & Water Inc., was retained by the owner to provide a treatment train for the water supply. A quote outlining the treatment system has been attached. Based on the water treatment system, the aforementioned aesthetic objectives will be met. Although a specific water treatment system has been proposed, general water treatment recommendations for the aforementioned parameters are still provided.

Terrain Analysis

Surficial Geology

The subsurface conditions are mapped to be fine-textured glaciomarine deposits, mainly consisting of silt and clay, underlying the eastern side of the property; while the western side of the property is mapped to be underlain by stone-poor sandy-silt to silty-sand textured till (OGS MRD218, 2022). The bedrock geology is mapped to be limestone and shale of the Verulam formation of the Simcoe Group (OGS MRD219).

Drift thickness is mapped to be 15 to 25 m bgs, which coincides with neighbouring water well records. The WWR for TW1 showed an overburden thickness of 18m.

Hydrogeological Sensitivity of the Site

The subject site currently contains a two-storey residential dwelling, a commercial building to the south with associated parking and storage, a commercial building (Cidery), and agricultural lands to the east. The subject site is bordered on all sides by agricultural lands, with a church and dwelling located to the south of the site. The site fronts onto Bradley Side Road to the north-west, Huntmar Drive to the north-east and Richardson Side Road to the south-east. All surrounding properties are on private services. The adjacent properties are serviced by private wells and septic systems.

According to available mapping and WWRs, the overburden thickness was observed to be greater than 2 m. As the proposed site does not have bedrock within 2 m of the ground surface, the site is not considered hydrogeologically sensitive. Separation distances are not required to be increased between the septic components and the onsite well.

To corroborate our position in this matter, the water quality of the bedrock aquifer accessed by the onsite drilled potable supply well shows no indication of surface water or surface impacts from sewage system effluent.

Conceptual Lot Development

This Terrain Analysis is completed to support a Re-zoning Application and a Site Plan Control Application. See the attached Site Plan titled “1818 Farm and Cidery – Site Plan” by Vandenberg & Wildeboer Architects, dated March 20, 2024. The place of assembly will consist of a cidery and open air assembly area along with associated parking.

Sewage System Design and Total Daily Design Sewage Flow

This Terrain Analysis has been completed to support a Re-zoning Application and Site Plan Control Application. The associated Ontario Septic System Office permit and sewage treatment system design by D.B. Grey Engineering Inc has been included in the

overall application submission. The TDDSSF for the place of assembly was provided to be 7,125 L/day. A maximum predicted nitrate concentration will be determined for the site as a whole, and the current assessment will be completed based on existing conditions that include the existing residence. Any associated flows with the residence will be counted towards the total site capacity in the site plan application. The total volumes for the site, including the place of assembly and on-site residence, are less than 10,000 L/day per review and design by others.

The proposed property will be analysed as part of the Re-zoning Application and Site Plan Control Application to ensure the theoretical impacts are below the Ontario Drinking Water Objective maximum allowable concentration of 10 mg/L of nitrate in the groundwater prior to the property line.

Predictive Nitrate Impact Assessment

Nitrate is considered to be a critical parameter of concern when assessing impacts to groundwater quality downgradient of an onsite sewage system. The City of Ottawa annotated MECP Procedure D-5-4 in the Hydrogeological and Terrain Analysis Guidelines (HTAG) applies for the proposed development. For the purpose of this guideline, the Ontario Drinking Water Objective of 10 mg/L of nitrate is the maximum allowable concentration detectable in the groundwater prior to the property line.

A detailed impact assessment is required due to the proposed zoning of the site. In order to demonstrate that private services would adequately support the proposed Re-zoning Application, a predictive nitrate impact assessment for the subject site was completed. This calculation was completed to determine the maximum sewage flow volume which could be applied to the subject site with the current site conditions and without the use of tertiary treatment systems (nitrate reducing systems). Furthermore, to support the Site Plan Control Application, a maximum TDDSSF of 10,000 L/day will be examined to determine the nitrate concentration at the property boundary. The values shown in the Predictive Nitrate Impact Assessment calculation attached to this report are summarized below:

- ❑ Site area — 11.68 ha
- ❑ Impervious area (%) — 7 %
- ❑ Concentration of nitrate in effluent — 40 mg/L
  (Value based on typical effluent concentration)
- ❑ Surplus Water — 329 mm/yr
  (The surplus water value was estimated based on Environment Canada Climate Office values with a soil type comprised of a mixture between clay loam (Urban Lawns), fine sandy loam (Mature Forest) and anthropogenic sources.)

- ❑ Combined infiltration factor based on: 0.45
  - Topography infiltration factor 0.10
  - Soil texture infiltration factor 0.20
  - Cover infiltration factor 0.15

The topography infiltration factor of 0.10 is based upon a hilly land with an average slope of 28 to 47 m/km. The soil texture infiltration factor was based upon “medium combinations of clay and loam” with a value of 0.2 which is a reasonable generalization based upon the site investigations and available geological mapping. The “cover infiltration factor” was calculated at 0.15 based upon the mix of tree cover and cultivated land.

The predicted nitrate concentration calculation for a conventional sewage system (system without nitrate reduction) results in a maximum of **14.16 m^3/day** of an effluent using a nitrate concentration of 40 mg/L. This maximum is significantly more than the proposed maximum daily usage of 10 m^3/d. Therefore, using a conventional sewage system, the maximum TDDSSF of 10,000 L/day (10 m^3/d) is less than the maximum volumes that the site can support.

Based on the results of the predicted nitrate impact assessment, it is our opinion that the property can adequately support the proposed re-zoning and development without having an adverse impact on the underlying bedrock aquifer.

CONCLUSIONS

Based on the information contained within the body of this report the following conclusions can be drawn:

1. The water supply aquifer intercepted by the existing well is considered to be adequate to support the water quantity demands for the proposed building usage.

2. Based on a visual inspection performed by Paterson personnel of TW1, the well casing, stickup, and well cap are in compliance with O.Reg 903. The final grading around the well will be sufficiently graded to direct surface water away from the wellhead at the time of the new sewage system installation. The water supply well should be protected from traffic.

3. The preferred water supply intercepted by TW1 contains a water supply that is potable, and contains only elevated concentrations of hardness, TDS, total sulphides, and iron. The noted parameters can be treated with current readily available water conditioning equipment. A water treatment specialist has been retained by the owner to provide treatment for the building water supply.

4. Colour, turbidity, and aluminum were measured to be elevated in initial laboratory testing. A resample was completed at a later date. The field testing of the re-sample showed 0 TCU for colour and 0.56 NTU for turbidity. Laboratory testing for aluminum was under the operational guideline at the resample. These values represent typical usage of TW1.

5. If desired by the property owner, a residential grade water softener can be used to facilitate the reduction of the hardness concentration and reduce scaling. If a water softener is used for the proposed development, the owner should be made aware that additional sodium will be added to the water to reduce hardness. If desired, a point-of-use reverse osmosis system can be used to provide a drinking tap source without increasing sodium levels.

6. The sodium concentration was measured to be above the 20 mg/L reporting limit and, as such, the Medical Officer of Health for the City of Ottawa should be informed to assist area physicians in the treatment of local residents on sodium reduced diets. It should be noted that some water treatment equipment may further increase the sodium concentration.

7. A water treatment specialist has been retained by the owner and a water treatment system has been proposed. The water treatment system to be used by the proposed development can be found attached. The treatment system is proposed to treat the aesthetic exceedances.

8. The predicted nitrate concentrations at the property boundary is calculated to be below the required 10 mg/L threshold when a conventional treatment system is used for greater than 10,000 L/day.
9. A Sewage System Permit and Building Permit need to be issued prior to the commencement of construction.

10. The results of the Hydrogeological Assessment and Terrain Analysis have provided satisfactory evidence that the subject site can support the proposed Re-Zoning Application and Site Plan Control Application with respect to water quality, quantity and sewage system effluent (>10k L/day) attenuation within the property boundary.

We trust that the current submission satisfies your immediate requirements.

Best Regards,

Paterson Group Inc.

Alexander Schopf, PhD, EIT

Well Tag Number (Place sticker and print number below): A054566 / A 054566

Well Record

Regulation 903 Ontario Water Resources Act

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Management Coordinator at 416-235-6203.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

Ministry Use Only: MUN | CON | LOT

Analysis	Quantity	External Method
Alkalinity (Water, Automated)	2	Modified from SM 2320 B
Ammonia, Total (Water, Colorimetry)	2	Modified from EPA 350.1
Chloride (Water, IC)	2	Modified from SM 4110 B and C
Colour, Apparent (Water, Spectrophotometry)	2	Modified from SM 2120 C
Conductivity (Water, Automated)	2	Modified from SM 2510 B
DOC (Water, IR)	2	Modified from SM 5310 B
Escherichia coli (DC Plate)	2	Modified from MECP E3407
Fluoride (Water, Auto/ISE)	2	Modified from SM 4500-F A and 4500-F C
Hardness (Water, Calculation Only)	2	SM 2340 B
Ion Balance (Water, Calculation)	2	Modified from SM1030 E
Metals Scan (Water, ICP/MS)	2	Modified from EPA 200.8
Metals Scan (Water, ICP/OES)	2	Modified from SM 3120 B
Nitrate (Water, IC)	2	Modified from SM 4110 B and C
Nitrite (Water, IC)	2	Modified from SM 4110 B and C
pH (25°C) (Water, Automated)	2	Modified from SM 4500-H+ B
Phenols (Water, Colorimetry)	2	Modified from EPA 420.2
Sulphate (Water, IC)	2	Modified from SM 4110 B and C
Sulphide (Water, Colorimetry)	2	Modified from SM 4500-S2 D
Tannin and Lignin (Water, Spec)	2	Modified from SM 5550 B
TDS (Estimated)	2	Modified from SM 2510 A
Total Coliforms (DC Plate)	2	Modified from MECP E3407
Total Kjeldahl Nitrogen (Water, Colorimetry)	2	Modified from EPA 351.2
Turbidity (Water, Turbidimeter)	2	Modified from SM 2130 B
VOCs (Water, GC/MS)	2	Modified from EPA 8260

Criteria :
A : Ontario Regulation 169/03 (Non-Regulated Drinking Water)

Sample status upon receipt :
7802343 7802344
Compliant

Certificate Comments :
7802344
Anions MRL increase due to matrix interference. B spike not available due to high native analyte concentration in the mother sample. B results were verified for this sample. DOC analyzed from plastic sample bottle.
7802343
Anions MRLs increased due to matrix interferences. B spike not available due to high native analyte concentration in the mother sample. B results were verified for this sample.

patersongroup

1811 Richardson Side Road
PM15625

MW1	inputs		
pH	8	A	0.20
TDS	952	B	2.36
Calcium	75	C	1.48
Alkalinity	225	D	2.35
Temp.	11		
		pHs =	8.03

Langelier Saturation Index (LSI) Calculation (Langelier, 1936)

LSI = pH - pHs

pHs = (9.3 + A + B) - (C + D)

Where:

A = (Log10 [TDS] - 1) / 10

B = -13.12 x Log10 (oC + 273) + 34.55

C = Log10 [Ca2+ as CaCO3] - 0.4

D = Log10 [alkalinity as CaCO3]

LSI =	0.0

LSI	Effect
0.5 to 2	Water is super saturated and tends to precipitate a scale layer of calcium carbonate (scale forming but non-corrosive)
0 to 0.5	**Water is super saturated and tends to precipitate a scale layer of calcium carbonate (slightly scale forming and corrosive).**
0	Water is saturated (in equilibrium) with calcium carbonate. A scale layer of calcium carbonate is neither precipitated nor dissolved.
0 to -0.5	Water is under saturated and tends to dissolve solid calcium carbonate (slightly corrosivebut non-scale forming).
-0.5 to -2	Water is under saturated and tends to dissolve solid calcium carbonate (seriously corrosive).
