Ottawa Sivan Temple
2104 Roger Stevens Drive
Ottawa, Ontario
K0A 2T0

Attention: **Kula Sellathurai**

Subject: **Hydrogeological Assessment and Terrain Analysis**
Proposed Temple Redevelopment
2104 Roger Stevens Drive Ottawa, Ontario

INTRODUCTION

Further to your request, Paterson Group (Paterson) has conducted a Hydrogeological Assessment and Terrain Analysis in support of a Site Plan Control Application for the proposed redevelopment of the temple located at 2104 Roger Stevens Drive in Ottawa, Ontario. Please refer to the Key Plan (attached) for the approximate site location. The subject site refers to the parcel at 2104 Roger Steven Drive.

The purpose of this work has been to determine the suitability of the water supply aquifer underlying the site to support the Site Plan Application for the proposed redevelopment.

The proposed Site Plan Application is for the construction of a new temple and priest residence that is replacing the currently existing temple. Details of the proposed temple redevelopment can be found in the attached P^2 Concepts drawing SP01 - Site Plan – dated May 13, 2025.

The Subject Site consists of a 2.04 hectares (ha) lot and is currently occupied by the existing temple with associated private infrastructure. The ground surface is generally flat at the location of the temple and is sloped to the south behind the temple and towards the rear of the property. The surficial groundwater flow is anticipated to be towards the southeast, while general groundwater flow is anticipated to be to the east towards an unnamed tributary which eventually drains into Stevens Creek.

The Subject Site is situated in a rural area which is serviced by private water supplies and private on-site septic fields. The site is bordered to the north by Roger Stevens Drive, followed by a residential dwelling and agricultural land, to the west by residential dwellings, and to the south and east by agricultural land.

Description of Subject Site

The subject site is approximately 2.04 ha in size and is currently occupied by a one-storey commercial building; Ottawa Sivan Temple. The Site Plan application is for a proposed redevelopment. The proposed redevelopment includes the construction of a new temple and a priest residence. Please refer to Figure-1 Key Plan and P^2 Concepts Site Plan Drawing SP01 dated May 13, 2025, attached, for the proposed site location and site layout.

The subject site is currently serviced by an onsite sewage system and a private drilled well. A new drilled well was installed onsite to support the redevelopment. A new sewage system is proposed to be located on the western side, behind the priest residence. D.B Gray Engineering Inc. (hereby referred to as DBG Engineering) has designed a new sewage system due to the nitrate reduction required as part of the Nitrate Impact Assessment (NIA). A septic flow calculation was completed by DBG Engineering and resulted in a total daily water demand calculation of 7,250 L/day. Please refer to DBG Engineering Sewage System design, attached, for full details.

The existing well is currently servicing the existing building, however, a new drilled well, hereafter referred to as Test Well 1 (TW1) was installed on September 9, 2024 and is intended to service the proposed temple and priest residence following the completion of the proposed redevelopment. The existing well will be decommissioned in accordance with O.Reg.903 once it is no longer required.

The suitability of the aquifer to supply the subject site was assessed using the methodology provided in City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG).

Karst Mapping

Available Karst mapping (OGS GRS005) was reviewed as part of this assessment. The available mapping does not indicate the presence of any inferred or potential karstic features. Furthermore, no indication of karstic features were observed during the site visits completed by Paterson personnel.

Mississippi-Rideau Source Protection Plan

The Mississippi-Rideau Source Protection Plan (MRSPP) provides guidance as to which policies apply to a given property, municipality or specific activity and if there are specific designations that apply to the area. The subject site has not been designated as any of the four groundwater related vulnerable areas identified within the Clean Water Act

(2006). The four vulnerable areas consist of Significant Groundwater Recharge Area (SGRA), Highly Vulnerable Aquifer (HVA), Intake Protection Zone (IPZ) and Wellhead Protection Area (WHPA).

As the subject site has not been designated as aby of the four groundwater related vulnerable areas, there is no prohibition of land uses on the subject site based upon its existing or proposed usage.

HYDROGEGOLOICAL ASSESSMENT

The purpose of this work has been to determine the suitability of the water supply aquifer underlying the site to support the Site Plan Application for the proposed temple redevelopment for potable supply usage. Specifically, the intent of this report is to review the availability of a safe and reliable water supply having sufficient quantity and quality to provide potable water for the proposed redevelopment.

Fieldwork Program

Geotechnical Program

A geotechnical investigation was carried out on September 19, 2023, and consisted of a total of 3 boreholes excavated to a maximum depth of 6.7 m below ground surface (bgs). Practical refusal to DCPT was encountered at a depth of 10.8 m bgs in BH3-23. The boreholes were distributed in a manner to provide general coverage of the proposed redevelopment, taking into account underground utilities and site features. The locations of the boreholes are shown on Drawing PG6832-1 – Test Hole Location Plan (attached). The geotechnical analysis is completed under report no. PG6832-1.Revision 2, dated October 15, 2024.

Well Testing

As a means to demonstrate the adequacy of the aquifer underlying the subject lands, with respect to water quality and quantity, the newly drilled well (TW1) on the subject site was tested. TW1 has a Water Well Record (WWR) Well ID of A395525. TW1 has a 158.7 mm diameter steel casing that extends to 17.67 m below ground surface (bgs) with a 0.62 m stick up. The well itself extends to a depth of 54.9 m bgs. Based on available geological mapping, the drift thickness at TW1 varies from 15 to 25 m. According to the Water Well Record (WWR) for the newly drilled well, the overburden generally consists of sand and gravel, boulders, clay and hardpan to a depth of 15.84 m, where limestone bedrock was encountered. Refer to P^2Concepts - Site Plan Drawing-SP01 attached, for the approximate location of TW1.

As a means to evaluate the water supply aquifer intercepted by the well, the well was subjected to an 8-hour constant rate pumping test. The pumping test was conducted on September 24, 2024 under the full-time supervision of Paterson personnel. Prior to the

pumping test the well was disinfected as per the MECP Disinfection Instruction Sheet (attached), and a data-logger was installed to monitor the background groundwater levels.

The submersible pump was rented from and installed by a licensed well technician (Air Rock Drilling Inc.) and used for the 8-hour pumping test. A licensed water well technician (Air Rock) completed the necessary plumbing related activities. The discharge line was placed at a sufficient distance to ensure that the discharge water was being directed away from the well as well as any septic systems in the area. Upon completion of the test, the system was returned to its normal configuration.

The pumping test was carried out at a pumping rate of 58 L/min for a duration of 8 hours. During the pumping test, the pumping rate was periodically measured using the timed volume correlation method. The pump rate was maintained within 5% of the selected pump rate. The static water level was recorded manually and an electric datalogger (VanEssen TD-Diver) was installed in the test well prior to the start of the pumping test. The selected rate of 58 L/min provides approximately 3.8 times the maximum total daily design volume for the septic system during the 8-hour pumping test. The rate was determined to be representative of a flow rate which would be in excess of what the proposed redevelopment would require.

The data logger recorded water levels at 30 second intervals. In addition, manual water level readings were taken at periodic intervals during the test.

Recovery data was collected from the well following the completion of the pumping. The well was noted to have fully recovered within 2 minutes after the end of pumping.

Groundwater samples were collected 4 hours and 8 hours after the start of pumping. Prior to collection of the groundwater samples, the free chlorine residual was verified as non-detectable. The water samples were submitted for comprehensive testing of bacteriological, chemical, and physical water quality parameters consistent with the standard “Subdivision Supply” suite of parameters plus trace metals, and volatile organic compounds (VOCs).

All samples were collected unfiltered and unchlorinated and were placed directly into clean bottles supplied by the analytical laboratory. Samples were placed immediately into a cooler with ice and were transported directly to Environmental Testing Canada Inc.(Eurofins) laboratory in Ottawa. All samples were received by the laboratory within 24 hours of collection.

A series of field tests of the pumped water were carried out at the well head during the 8-hour pumping test. The parameters tested at the well head included: pH, total dissolved solids, conductivity, turbidity, apparent colour, and temperature.

Well Inspection

A visual inspection of TW1 was performed by Paterson personnel and confirmed that the well casing and well cap are in good condition. The grading around the well was noted to be sufficiently graded to direct surface water away from the wellhead, as required by O.Reg 903. The stickup was measured to be 0.62 m above ground surface. Based on a visual inspection by Paterson personnel, the well was deemed to be in good condition.

Aquifer Analysis

Water Quantity

Pumping test data was analyzed using AQTESOLV Pro Version 4 aquifer analysis software package by HydroSOLVE Inc. Drawdown data was measured using an electronic water level tape and an electronic datalogger unit.

Table 1: SUMMARY OF WATER SUPPLY AQUIFER CHARACTERISTICS OF TW1

AQUIFER PARAMETER	RESULT OF ANALYSIS
Transmissivity (m^2/day)	1971
Pumping Rate (L/min)	58
Pre-test Static Water Level (m)	4.62
Post-test Static Water Level (m)	4.88 (4.98 max)
Available Drawdown (m)	50.28
% Drawdown During Pump Test (%)	0.7
Specific Capacity (L/min/m drawdown)	161

The drawdown data was analyzed using the Cooper Jacob method of analysis. Aquifer transmissivity is estimated to be 1971 m^2/day. Refer to the Cooper Jacob method of analysis data sheet attached to this report. Note that there was very little draw down during the pumping test at the associated pumping rate.

The pumping test results show that TW1 has a high yield to support the water demands that may be required. Overall maximum drawdown at a constant pumping rate for a period of 8 hours was approximately 0.36 m (0.7% of the available drawdown). It should be noted that full recovery was achieved within 2 minutes after the end of pumping.

The total volume of water pumped during the 8-hour pumping event was approximately 27,840 L. This is approximately 3.8 times the maximum total daily design volume of water required (7,250 L/day) to support the proposed redevelopment.

The suitability of the aquifer to supply the proposed Site Plan Application for the proposed commercial modification was assessed using the methodology provided in the City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG).

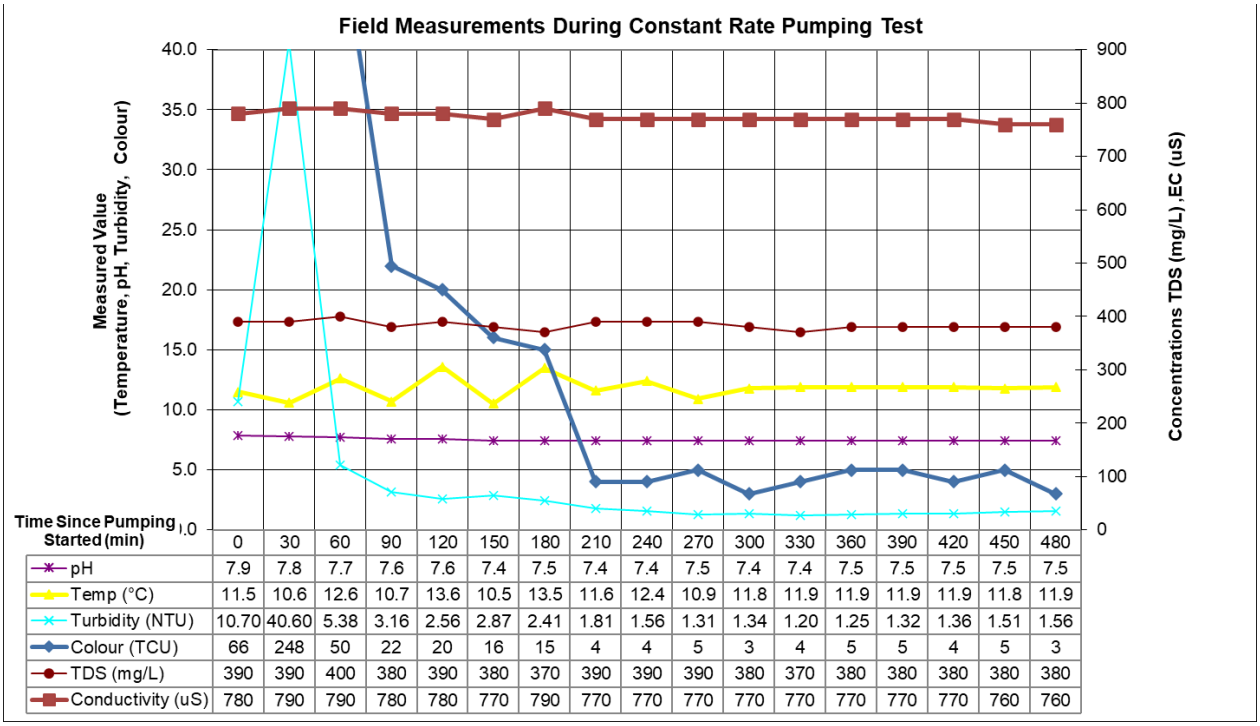
Based on the information summarized in Table 1, it is readily apparent that the water supply well has intercepted an adequately strong water supply aquifer which has sufficient quantity to service the proposed Site Plan Control Application.

Given the analyses presented and summarized above, it is our opinion that there is an adequate supply of water to support the proposed redevelopment as well as the neighbouring lots. Available water well records (WWR) of the neighboring properties on the MECP Well Record mapping website indicated that the wells were screened in limestone and sandstone. Surrounding WWR's are attached to this report.

Water Quality

Field Data

Turbidity, electrical conductivity, total dissolved solids (TDS), pH, apparent color and temperature were measured at the wellhead during the pumping test. The measurements and time intervals for each of these parameters are summarized on the graphical representation below. In addition, a HACH Pocket Colorimeter II chlorine reader was used to measure the free chlorine residual level. No chlorine residual was detected in the discharge water prior to the collection of the water samples.



Time Since Pumping Started (min)	0	30	60	90	120	150	180	210	240	270	300	330	360	390	420	450	480

Figure 1: Field Measurements

Laboratory Data

The Subdivision Package suite of parameters and trace metals laboratory water quality obtained from the pumping test of TW1 is provided in Table 2a, 2b, and 2c below and the laboratory analyses reports can be found attached. VOC laboratory analytical testing were completed and measured to be non-detect in the sample results. All laboratory test results can be found attached to this report.

The bacteriological test results (Certificate of Analysis – Report No. 4102006) indicated that the test samples at the 4 and 8 hour interval were non-detect (0 ct/100 mL) for E.Coli and Total Coliforms.

The water quality of the subject water supply well meets all the Ontario Drinking Water Standards maximum acceptable concentrations (MAC). Furthermore, the water meets all of the Aesthetic Objectives (AO) and Operational Guidelines (OG) with the exception of the following.

- ❑ Hardness (as $CaCO_3$)
- ❑ Turbidity
- ❑ Iron (Fe)

Exceedances of the above parameters are not uncommon of the water supply in the subject aquifer. Each of these groundwater parameters are discussed in detail below.

Hardness as $CaCO_3$

Hardness, expressed as calcium carbonate, is an operation guideline and does not appear in the ODWS. Rather, it appears in the Technical Support Documents for Ontario Drinking Water Standards, Objectives and Guidelines (ODWS) as a parameter with an operational guideline at 100 mg/L. At the measured concentration of 226 mg/L, the water is considered to be hard, however, it is below the reasonable treatable limit of 500 mg/L specified in Table 3 of the MOECC guidance document Procedure D-5-5 (1996). The hardness concentration can be treated using conventional softening technologies, if desired by the owner.

Turbidity

Turbidity, which is generally an aesthetic parameter, was detected in the laboratory test samples at values of 1.6 and 2.3 NTU in the 4- and 8-hours tests, respectively. Field testing of the samples detected values of 1.56 NTU in the 4- and 8-hour field tests, respectively. It is expected that continued use of the well would further reduce turbidity values. The elevated turbidity in the laboratory analyzed samples is attributed to the precipitation of iron.

The ODWS maximum acceptable concentration for turbidity in drinking water entering the distribution system is 1 NTU. The health-related Ontario Drinking Water Objective (ODWO) is 1 NTU. The Aesthetic Objective for turbidity in drinking water reaching the consumer is 5 NTU. The City's HTAG has a Maximum Concentration Considered Reasonably Treatable (MCCRT) of 5 NTU.

The field test parameters are below the 5 NTU objective. Furthermore, total coliforms and E.Coli were non-detect (0 ct/100 mL) in both the 4 and 8-hour samples, which meets the health requirements of the City's HTAG when the sample results are above the health-related ODWO of 1 NTU. Therefore, treatment for turbidity is not required

Iron

Concentrations of iron above 0.3 mg/L can contribute to staining of fixtures and a metallic taste at higher concentrations. Precipitation of iron can promote the growth of iron bacteria in pipes. The concentration of iron in the groundwater in TW1 was measured to be 0.33 mg/L at the 8-hour mark. The concentration of iron in the groundwater in the test well is considered to be reasonably treatable in accordance with Procedure D-5-5. It is recommended that an iron filter be used to reduce the levels of iron and reduce the potential for excessive precipitate occurring in the water supply system, if desired by the owner.

Colour

Colour may occur in drinking water for several reasons. It may be due to organic substances from the decay of vegetation, or the presence of metals such as iron, manganese, and copper, which are abundant in nature. The provincial aesthetic objective for colour in drinking water is 5 True Colour Units (TCU). The federal (Health Canada) guideline aesthetic objective limit for colour is 15 TCU (Guidelines for Canadian Drinking Water Quality, Health Canada June 2019). Procedure D-5-5 gives a maximum concentration considered reasonably treatable for colour as 7 TCU. As colour is a strictly aesthetic parameter, it can be reduced from the water supply, if desired, through the use of a manganese greensand treatment.

During the field pumping test, a DR900 colorimeter was used to measure apparent colour in the groundwater at regular intervals. Apparent colour in the groundwater was measured as 4 and 3 TCU at the 4- and 8- hour marks, which are below the aesthetic guideline of 5 TCU, whereas apparent colour from laboratory measurements was 6 and 7 TCU which is above the guideline but within treatable limits. The elevated colour levels detected in the lab samples is attributed to the precipitation of iron out of the groundwater.

Total Dissolved Solids (TDS)

TDS refers to the concentration of inorganic substances dissolved in water. The main constituents are typically chloride, sulphates, calcium, magnesium, and bicarbonates. The TDS concentration of 508 mg/L at the 4-hour mark exceeds the Aesthetic Objective of 500 mg/L. At concentrations above 500 mg/L, some consumers may find the taste objectionable, however, as the objective is an aesthetic objective, no treatment is required. At the 8-hour mark, the TDS concentration was 498 mg/L which is below the Aesthetic Objective. As the TDS concentration was decreasing with time and was below the Aesthetic Objective no taste problems are anticipated to occur and treatment is not likely to be required. If desired by the owner, a point of use reverse osmosis unit can be installed to reduce TDS levels for drinking purposes.

The Langelier calculation provided an LSI of 0.0. Based on the evaluation of the result, the water is saturated and does not precipitate a scale layer of calcium carbonate or dissolve calcium carbonate (neither scale forming nor corrosive). Based on the stable

value, there are no mitigative measures needed. See Langelier Saturation Index Calculation attached for calculation details.

Sodium

Sodium (Na), an aesthetic parameter, was detected in the laboratory test sample at concentrations of 81 and 78 mg/L, which does not exceed the ODWS aesthetic objective of 200 mg/L. Although sodium is not toxic and no maximum acceptable concentration has been set, concentrations above 20 mg/L require that the Medical Officer of Health be notified of the water quality results, so that this information may be passed on to local physicians for use in treatment of those requiring a sodium-restricted diet.

O.Reg 903

All wells must be maintained in accordance with O.Reg 903. If a well is no longer in use, it must be decommissioned in accordance with O.Reg 903.

TERRAIN ANALYSIS

The purpose of this study is to determine the site's suitability for private on-site wastewater systems. Specifically, the intent of this report is to provide design details for private septic servicing and lot development potential.

Surficial Geology

Paterson carried out a Geotechnical Investigation on September 19, 2023 where 3 boreholes were installed in a manner to provide general coverage of the subject site, with specific consideration to the redevelopment. The general overburden was observed to be a thin layer of topsoil followed by fill and/or glacial till. Fill, consisting of brown silty sand with gravel, was encountered in BH2-23 and BH3-23, to a maximum depth of 2.1 m bgs. Glacial till, consisting of silty sand to sandy silt with varying amounts of gravel and, cobbles and boulders, was found in each borehole to the maximum depth of the boreholes. Practical refusal to augering was observed at a depth of 5 m in BH1-23 and DCPT refusal was observed in BH3-23 at a depth of 10.8 m bgs. The results of the geotechnical program are generally consistent with available geological mapping provided by the Ontario Geological Survey (OGS MRD128) and with the available historical surrounding Water Well Records (WWR). Further details can be found in geotechnical report PG6832-1.Revision 2, dated October 15, 2024.

Available bedrock geological mapping provided by the Ontario Geological Survey (MRD 219) indicates that the bedrock underlying the subject site consists of dolostone, minor shale and sandstone of the Oxford Formation in the Beekmantown Group. Available overburden thickness mapping shows a drift thickness of 10 to 15 m across the subject site.

Hydrogeological Sensitivity of the Site

The subject site currently consists of a temple with associated infrastructure and private servicing. The subject site is serviced by a private potable well and septic system. The subject site is currently occupied by a one-story commercial building, specifically the Ottawa Sivan Temple. The site is bordered to the north by Roger Stevens Drive, followed by a residential dwelling and agricultural land, to the west by residential dwellings, and to the south and east by agricultural land. All surrounding properties are on private services. The adjacent properties are serviced by private wells and septic systems.

The overburden at the subject site and surrounding WWRs is recorded as a sand based glacial till.

According to the Ontario Building Code (OBC) Section 8.7.2.1 (1) (b)(i), highly permeable soils as it relates to sewage system design is defined by soils having a percolation rate of less than 1 minute per cm. According to the Ministry of Municipal Affairs and Housing (MMAH) Supplementary Standard SB-6 – Percolation time and soil descriptions dated January 1, 2024 only “Well graded gravels, gravel-sand mixtures, little or no fines” or “Poorly graded gravels, gravel-sand mixtures, little or no fines” have a percolation time of less than 1 minute per cm. The onsite soils were noted to be a glacial till consisting of silty sand to sandy silt with varying amounts of gravel and, cobbles and boulders. Due to the presence of silty sand to sandy silt (a high composition of fines), the percolation time is anticipated to be greater than 1 min/cm and therefore is not considered a highly permeable soil. As such, septic impacts due to observed soils are not anticipated onsite.

According to the Geotechnical Investigation, the overburden thickness was observed to be greater than 2 m.

As the proposed site does not have bedrock within 2 m of the ground surface and the site does not contain any highly permeable soils, the site is not considered hydrogeologically sensitive. Separation distances are not required to be increased between the septic components and the onsite well.

To corroborate our position in this matter, the water quality of the bedrock aquifer targeted by the onsite drilled potable supply well shows no indication of surface water or surface impacts.

Lot Development Plan

The Site Plan for the proposed redevelopment was produced by P^2 Concepts and is attached (Drawing-SP01). The location of the temple, priest residence, proposed sewage system, and related infrastructure are shown. Please note that although a “permeable parking area” was designated in the site plan drawing, the material was considered impermeable as a conservative approach for this Nitrate Impact Assessment.

Sewage System Volumes

The sewage system has been designed by D.B. Gray Engineering and can be found attached to this report. The maximum total daily design sanitary sewage flow volume (TDDSSF) was determined to be 7,250 L/day. An approved Ottawa Septic System Office (OSSO) permit will be submitted with the Site Plan Application.

Predictive Nitrate Impact Assessment

In order to demonstrate that private services would adequately support the proposed Site Plan application, a Predictive Nitrate Impact Assessment (NIA) for the subject site was completed. The values shown in the Predictive NIA attached to this report are summarized below.

- ❑ Site area — 2.04 ha
- ❑ Impervious area (%) — 27 %
- ❑ Daily sewage flow — 7.25 m^3/d
- ❑ Concentration of nitrate in effluent — 40 mg/L
  (Value based on typical effluent concentration)
- ❑ Concentration of nitrate in effluent with treatment — 20 mg/L
  (Value based on BNQ/NSF 245 certified nitrate reduction system with 50% nitrate reduction)
- ❑ Surplus Water — 378 mm/yr
  (The surplus water value was estimated based on Environment Canada Climate Office values with a soil type comprised of a fine sandy loam (Urban lawns / Shallow Rooted Crops) and anthropogenic sources.)
- ❑ Combined infiltration factor based on: — 0.70
  - Topography infiltration factor — 0.20
  - Soil texture infiltration factor — 0.40
  - Cover infiltration factor — 0.10

The topography infiltration factor of 0.20 is based upon a generally rolling land with an average slope between 2.8 to 3.8 m/km. The soil texture infiltration factor was based upon an “open sandy loam” with a value of 0.4 which is a reasonable generalization based upon the site investigations and available geological mapping. The “cover infiltration factor” was calculated at 0.10 based upon a cultivated land type cover.

The calculation for a conventional septic system results in a predicted nitrate concentration of 16.05 mg/L nitrate for the subject site, using a value of 40 mg/L nitrate concentration within the effluent. This value was based upon a daily sewage flow of 7,250 L/day. It is expected that the actual usage should be lower. The inclusion of nitrate reduction technology (50 % nitrogen reduction of the effluent nitrate, with a BNQ or NSF

245 certified technology) would result in a nitrate concentration of 8.03 mg/L at the property boundary using a value of 20 mg/L nitrate within the effluent, which is below the maximum property value of 10 mg/L nitrate by the property boundary.

Based on the results of the predictive NIA, it is our opinion that the property can adequately support the proposed Site Plan application without having an adverse impact on the underlying bedrock aquifer, provided that an BNQ/NSF 245 certified nitrate reduction system with a minimum of 50% nitrate reduction is used in the sewage system.

CONCLUSIONS

Based on the information contained within the body of this report the following conclusions can be drawn:

1. The water supply aquifer intercepted by the existing well is considered to be adequate to support the water quantity demands for the proposed redevelopment.

2. Based on a visual inspection performed by Paterson personnel, the well casing, stickup, well cap, and surrounding grading around the well are of sufficient standard to meet O.Reg 903. It is a requirement that the well continue to adhere to and be maintained in accordance with O.Reg 903.

3. The preferred water supply intercepted by TW1 contains a water supply that is potable, and contains only elevated concentrations of hardness, turbidity, iron, and apparent colour. The noted parameters can be treated with current readily available water conditioning equipment if desired by the owner.

4. A residential grade water softener is recommended to facilitate the reduction of the hardness concentration. If a water softener is used for the proposed redevelopment, the owner should be made aware that additional sodium will be added to the water to reduce hardness. If desired, a point-of-use reverse osmosis system can be also used to provide a drinking tap source.

5. If desired, the owner can use an iron filter to treat the potential iron values.

6. The sodium concentration was measured to be above the 20 mg/L reporting limit and, as such, the Medical Officer of Health for the City of Ottawa should be informed to assist area physicians in the treatment of local residents on sodium reduced diets.

7. The site is not considered hydrogeologically sensitive.

8. The predicted nitrate concentrations at the property boundary is calculated to be below the required 10 mg/L threshold when a standard denitrification system (50% nitrate reduction) using BNQ/NSF 245 certified nitrate reduction technology is used.

9. A Sewage System Permit and Building Permit need to be issued prior to the commencement of construction on the proposed redevelopment or the proposed septic system.

10. The existing well will be decommissioned in accordance with O.Reg.903 once it is no longer needed.

11. The results of the Hydrogeological Assessment and Terrain Analysis have provided satisfactory evidence that the subject site can support the proposed redevelopment with respect to water quality, quantity and sewage system placement.

We trust that the current submission satisfies your immediate requirements.

Best Regards,

Paterson Group Inc.

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Help Desk (Toll Free) at 1-888-396-9355.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

Ministry Use Only

☐ Abandoned, Poor Water Quality
☐ Abandoned, other, *specify*
☐ Other, *specify*

Results of Well Yield Testing

After test of well yield, water was:
☐ Clear and sand free
☐ Other, *specify* Not tested

If pumping discontinued, give reason: X

Pump intake set at (m/ft): 150

Pumping rate (l/min / GPM): 20

Duration of pumping: 1 hrs + 0 min

Final water level end of pumping (m/ft): 77

If flowing give rate (l/min / GPM): X

Recommended pump depth (m/ft): 100 (3/4HP - 15GPM)

Recommended pump rate (l/min / GPM): 20

Well production (l/min / GPM): 20

Disinfected? ☒ Yes ☐ No

OFFICIAL CERTIFICATE OF ANALYSIS : 4102006

WORK REQUEST : 100315477

Report Date : 2024-10-01

Paterson Group
9 Auriga Dr
Nepean, Ontario
K2E 7T9
Attention : Alex Schopf

Reception Date : 2024-09-25
Project : PH4905
Sampler : NA
PO Number : 61375
Temperature : 15 °C

Analysis	Quantity	External Method
Alkalinity (Water, Automated)	2	Modified from SM 2320 B
Ammonia, Total (Water, Colorimetry)	2	Modified from EPA 350.1
Chloride (Water, IC)	2	Modified from SM 4110 B and C
Colour, Apparent (Water, Spectrophotometry)	2	Modified from SM 2120 C
Conductivity (Water, Automated)	2	Modified from SM 2510 B
DOC (Water, IR)	2	Modified from SM 5310 B
Escherichia coli (DC Plate)	2	Modified from MECP E3407
Fluoride (Water, Auto/ISE)	2	Modified from SM 4500-F A and 4500-F C
Hardness (Water, Calculation Only)	2	SM 2340 B
Ion Balance (Water, Calculation)	2	Modified from SM1030 E
Metals Scan (Water, ICP/MS)	2	Modified from EPA 200.8
Metals Scan (Water, ICP/OES)	2	Modified from SM 3120 B
Nitrate (Water, IC)	2	Modified from SM 4110 B and C
Nitrite (Water, IC)	2	Modified from SM 4110 B and C
pH (25°C) (Water, Automated)	2	Modified from SM 4500-H+ B
Phenols (Water, Colorimetry)	2	Modified from EPA 420.2
Sulphate (Water, IC)	2	Modified from SM 4110 B and C
Sulphide (Water, Colorimetry)	2	Modified from SM 4500-S2 D
Tannin and Lignin (Water, Spec)	2	Modified from SM 5550 B
TDS (Estimated)	2	Modified from SM 2510 A
Total Coliforms (DC Plate)	2	Modified from MECP E3407
Total Kjeldahl Nitrogen (Water, Colorimetry)	2	Modified from EPA 351.2
Turbidity (Water, Turbidimeter)	2	Modified from SM 2130 B
VOCs (Water, GC/MS)	1	Modified from EPA 8260

Criteria :
A : Ontario Regulation 169/03 (Non-Regulated Drinking Water)

Sample status upon receipt :
8059996 8059998
Compliant

Notes :
- All analysis is completed at Eurofins Environment Testing Canada Inc. (Ottawa, Ontario) unless otherwise stated.
- Eurofins Environment Testing Canada Inc. is accredited by CALA, Canadian Association for Laboratory Accreditation to ISO/IEC 17025 for tests which appear on the scope of accreditation. The scope is available at https://directory.cala.ca/
- Please note: Field data, where presented on the report, has been provided by the client and is presented for informational purposes only. Guideline or regulatory limits listed on this report are provided for ease of use (informational purposes) only. Eurofins recommends consulting the official guideline or regulation as required. Unless otherwise stated, measurement uncertainty is not taken into account when determining guideline or regulatory exceedances.

☐ Excess Soil, Table: ______ Type: ______

The sample results from this submission will form part of a formal Record of Site Condition (RSC) under O.Reg. 153/04
☐ Yes ☐ No

The optimal temperature conditions during transport should be less than 10°C. Sample(s) cannot be frozen, unless otherwise indicated or agreed upon with the Laboratory. Note that this COC is not to be used for drinking water samples. The COC must be complete upon submission of the samples, there will be a $25 surcharge if required information is missing (required fields are shaded in grey).

Sample Details: Sample Matrix, # of Containers. Field Filtered -->
Sample Analysis Required: O.Reg.153 parameters (PHC F1 - F4, BTEX, VOCs, PAHs, PCBs, Metals + Inorganics, Metals only); See attached paper; Subdivision Supply Bacti 2 (Ec/TC only); TSS; pH; Total Metals; Hg

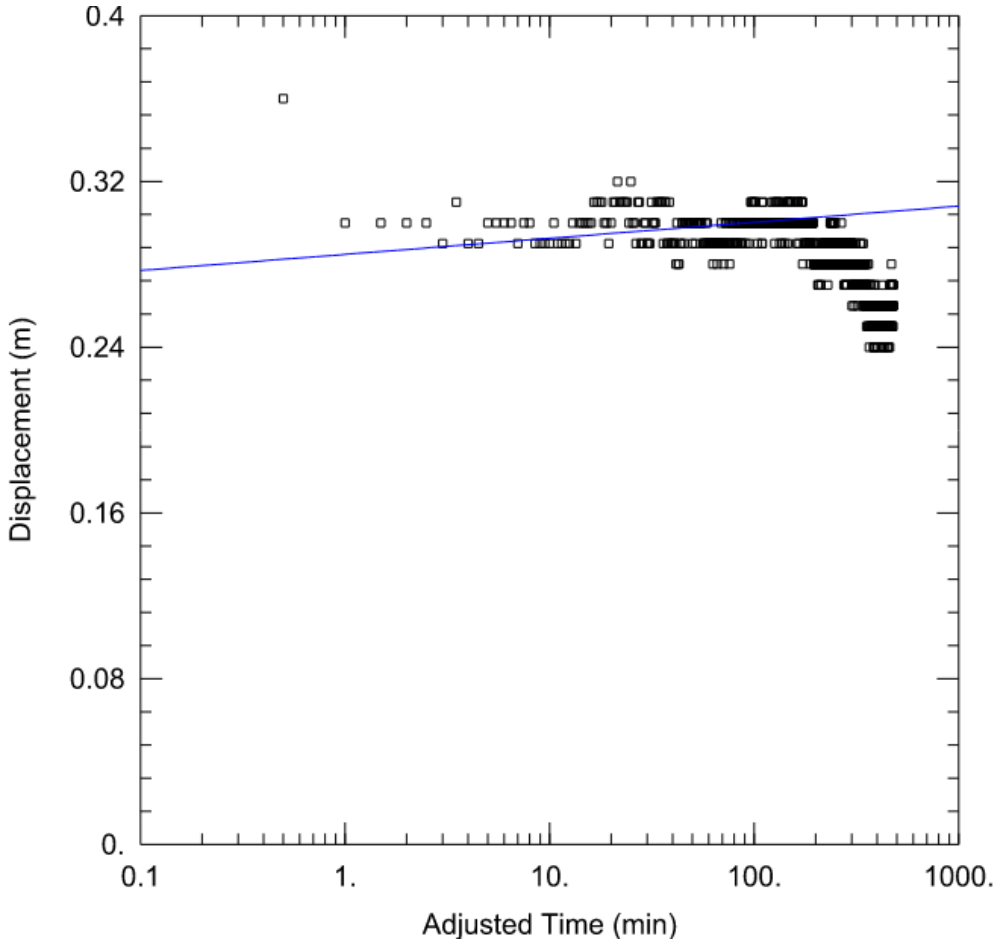
Client:	Ottawa Sivan Temple	Transmissitivity (m2/day):	1970.7
Site Address:	2104 Roger Stevens Road	Discharge Rate (L/min)	58
Project:	Proposed Redevleopment	Analysis performed by:	AS



Pumping Test Analysis Report

File No.	PH4905
Date:	Tuesday, September 24, 2024
Client:	Ottawa Sivan Temple
Site Address:	2104 Roger Stevens Road
Project:	Proposed Redevleopment

Summary Table:		
Solution Method:	Well ID:	Transmissitivity (m2/day):
Cooper-Jacob	TW1	1970.7
Average:		**1970.70**

patersongroup

133 Blackberry Way
PH4905

MW1	inputs		
pH	7.95	A	0.17
TDS	498	B	2.09
Calcium	42	C	1.22
Alkalinity	236	D	2.37
Temp.	25		
		pHs =	7.961844256

Langelier Saturation Index (LSI) Calculation

(Langelier, 1936)

LSI = pH - pHs
pHs = (9.3 + A + B) - (C + D)
Where:

A = (Log10 [TDS] - 1) / 10
B = -13.12 x Log10 (oC + 273) + 34.55
C = Log10 [Ca2+ as CaCO3] - 0.4
D = Log10 [alkalinity as CaCO3]

LSI = 0.0

LSI	Effect
0.5 to 2	Water is super saturated and tends to precipitate a scale layer of calcium carbonate (scale forming but non-corrosive)
0 to 0.5	**Water is super saturated and tends to precipitate a scale layer of calcium carbonate (slightly scale forming and corrosive).**
0	Water is saturated (in equilibrium) with calcium carbonate. A scale layer of calcium carbonate is neither precipitated nor dissolved.
0 to -0.5	Water is under saturated and tends to dissolve solid calcium carbonate (slightly corrosivebut non-scale forming).
-0.5 to -2	Water is under saturated and tends to dissolve solid calcium carbonate (seriously corrosive).

PREDICTIVE NITRATE IMPACT ASSESSEMENT

Infiltration Factors		
Topography	0.20	
Soil	0.40	
Cover	0.10	
Total	**0.70**	
Site Characteristics		
Area of Site :	20405	m^2
Total of roof areas:	1040	m^2
Total area of paved driveway areas:	4448	m^2
Roof + paved driveway areas	5488	m^2
Impervious Area	5488	m^2
Percent Impervious Area =	27	%
Infiltration Area =	14917	m^2
Septic Effluent		
Concentration of Effluent (Cs) =	20	mg/L
Infiltration Calculation		
Nitrate concentration in precipitation (C_i) =	0	mg/L
Surplus Water (Environment Canada)	378	mm/yr
Factored Water Surplus =	265	mm/yr
Infiltration % due to stormwater management measures	-	%
Infiltration rate from stormwater management measures =	0	mm/yr
Infiltration Flow Entering the System (Q_i) =	11	m^3/day
Mass Balance Model (MOEE, 1995)		
$C_T = (Q_bC_b+Q_eC_e+Q_iC_i)/(Q_b+Q_e+Q_i)$ = Cumulative Nitrate Concentration		
Q_b = flow entering the system across the upgradient area	0	m^3/day
C_b = background nitrate concentration	0	mg/L
Q_e = flow entering the system from the septic drainfield	7.25	m^3/day
C_e = concentration of nitrates in the septic effluent	20	mg/L
Q_i = flow entering the system from infiltration	11	m^3/day
C_i = Concentration of nitrates in the infiltrate	0	mg/L
C_T =	**8.03**	**mg/L**
Sewage Flow Volume		
Daily Sewage Flow (Qs)=	**7.25**	**m^3**

Notes: Site characteristic values were measured as approximate values from the available site plans and GeoOttawa.
