May 23, 2025

City of Ottawa Planning and Infrastructure Approvals 110 Laurier Street West, 4<sup>th</sup> Floor Ottawa, ON, K1P 1J1

#### Attention: Eric Forhan, Planner, Development Review

#### Reference: Noise Impact Feasibility Report – 254 Argyle Avenue Our File No.: 123062

Please find enclosed the 'Noise Impact Feasibility Report' for the above-noted development located at 254 Argyle Avenue in the City of Ottawa. This report is being submitted in support of the site plan application.

This report evaluates the environmental impact of noise from traffic and assesses the feasibility of mitigation measures to attenuate noise to acceptable levels.

Please contact the undersigned should you have any questions or comments pertaining to the enclosed report.

Yours truly,

NOVATECH

27 Marchul

Greg MacDonald, P. Eng. Director, Land Development and Public Sector Infrastructure

#### 1.0 INTRODUCTION

Novatech has been retained to prepare a Noise Impact Feasibility Report on behalf of Azure Urban Developments for the proposed site development located at 254 Argyle Avenue within the City of Ottawa. The purpose of this report is to support the site plan application for the subject development and predict and mitigate excess noise. **Figure 1** Key Plan shows the site location.

The subject site is surrounded by the following roads:

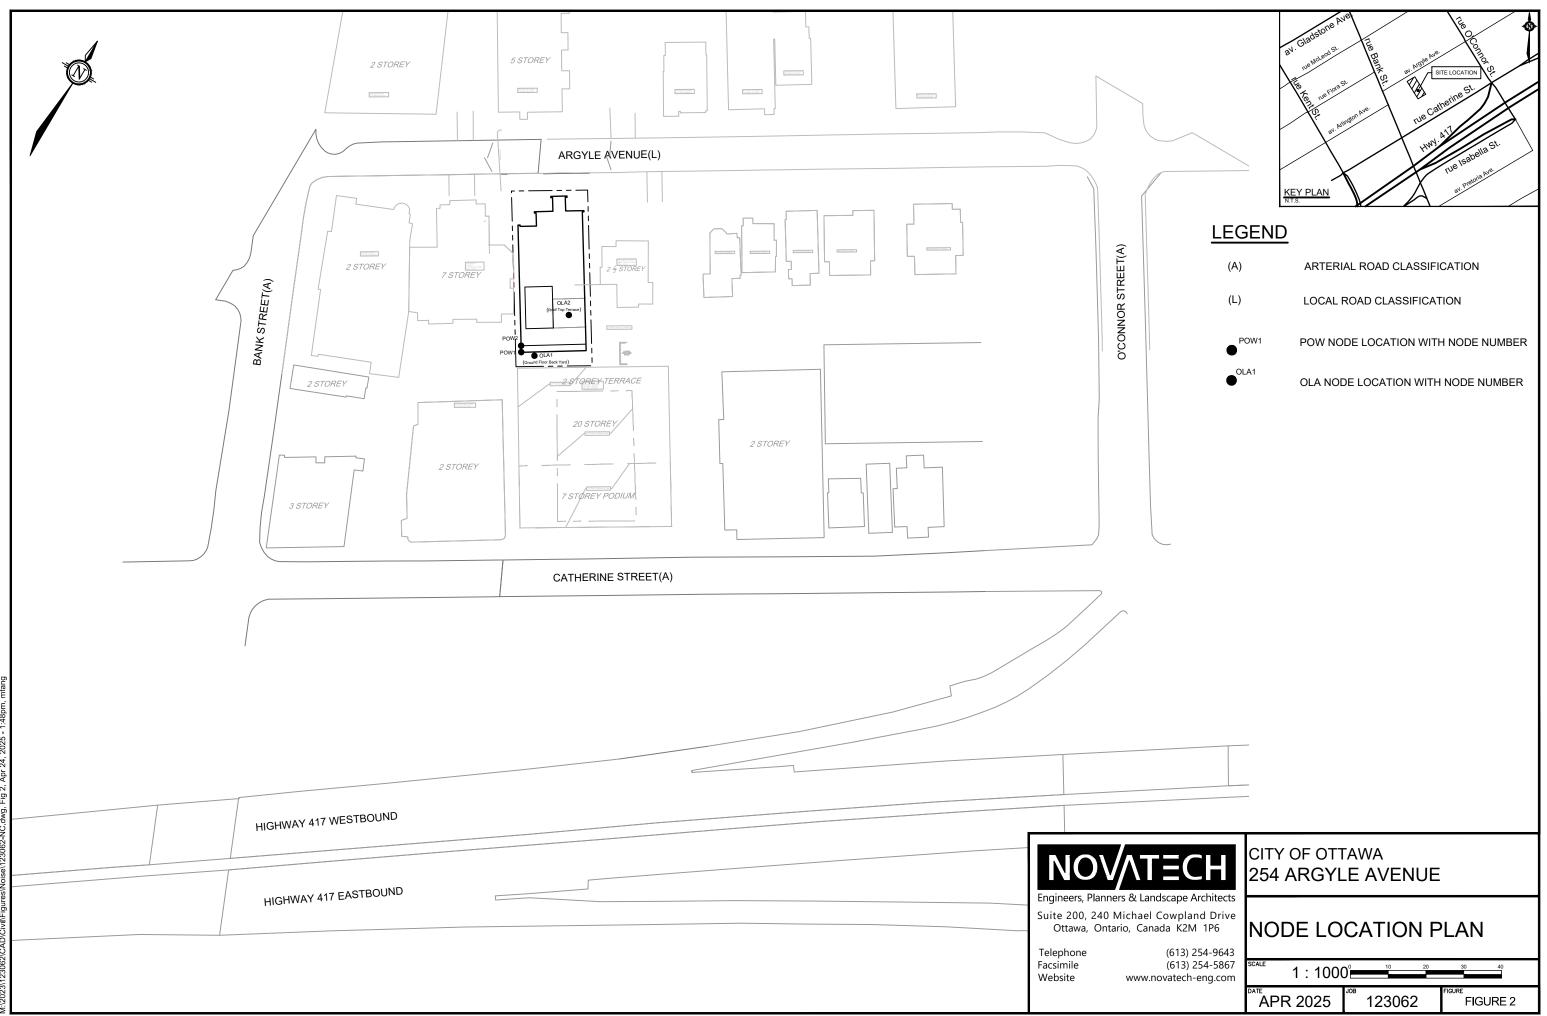

- Argyle Avenue to the north
- Bank Street to the west
- O'Connor Street to the east, and
- Catherine Street, and Highway 417 to the south

An aerial of the subject site is provided in Figure 1 – Key Plan – 254 Argyle Avenue.

Figure 1: Key Plan – 254 Argyle Avenue

The proposed development will include a nine (9) storey apartment building, complete with two (2) levels of underground parking, and with roof top terraces. As the existing church on the property is of historical significance the existing building is to be incorporated into the ground level of the proposed structure as a wine bar. The proposed building will have a footprint of 556.9m<sup>2</sup>, with a total of 84 residential units, a gym, bike workshop, and a pet wash station. The locations of the nodes which stand for the worst noise scenario used to assess the noise levels at the building are included in **Figure 2 – Receiver Location Plan**.

This report follows the recommendations of the City of Ottawa's Environmental Nosie Control Guidelines (ENCG) and MOEE NPC-300 Environmental Noise Guideline.

#### 2.0 NOISE CRITERIA, NOISE SOURCES AND NOISE ATTENATION METHODS

The City of Ottawa is concerned with noise from aircraft, roads, transitways, and railways, as expressed in Tables 2.2a: Sound Level Limit for Outdoor Living Areas – Road and Rail, Table 2.2b: Sound Level Limit for Indoor Living Areas Road and Rail, and Table 2.2c: Supplementary Sound Level Limits for Indoor Spaces – Road and Rail of the ENCG. The maximum suggested sound levels for outdoor and indoor living areas between 7am and 11pm are 55 dBA and 45 dBA, respectively. The maximum suggested sound level for indoor bedrooms is 40dBA between 11pm and 7am. For reference, Tables 2.2a, 2.2b and 2.2c of the ENCG are included in Appendix A.

Outdoor Living Area and Plane of Window receivers are defined as:

- Outdoor Living Area (OLA): The outdoor amenity area provided for quiet enjoyment of the outdoor environment during the daytime period (i.e., backyards, terraces, and patios). OLA noise levels are considered 3.0m from the building façade, 1.5m above grade.
- Plane of Window (POW): The indoor living space where the sound levels will affect the living room area during daytime hours and bedrooms during nighttime hours. POW noise levels are considered inside the building, 1.5m above the ground.

The noise level criteria are summarized in **Table 1**:

| Time Period |                 | Receiver Location                                     | Noise Level<br>Criteria (Leq) |
|-------------|-----------------|---|-------------------------------|
| Daytime     | (07:00 – 23:00) | Outdoor Living Area (OLA)                             | 55 dBA                        |
| Daytime     | (07:00 – 23:00) | Plane of Window (POW) at<br>Living/Dining Rooms       | 45 dBA                        |
| Nighttime   | (23:00 – 07:00) | Plane of Window (POW) at<br>Bedrooms/Sleeping Quarter | 40 dBA                        |

#### 2.1 Noise Sources

The City of Ottawa Official Plan stipulates that a noise study shall be prepared when a new development is proposed within 100 metres of an arterial, major collector or collector roadway, or a rapid-transit corridor. The proposed site is subject to noise pollution from nearby Highway and arterial roadways. There are no railway, airport, or stationary noise sources that affect this site. **Table 2** details the road noise sources for the site.

|  | Bank Street                           | Catherine Street*                     | Hwy 417                     |
|--|---------------------------------------|---------------------------------------|-----------------------------|
| Roadway Classification                 | 4-Lane Urban<br>Arterial<br>Undivided | 3-Lane Urban<br>Arterial<br>Undivided | 6-Lane<br>Highway           |
| Annual Average Daily<br>Traffic (AADT) | 30,000<br>vehicles/day                | 22,500<br>vehicles/day                | 18,333/lane<br>vehicles/day |
| Day/Night Split (%)                    | 92/8                                  | 92/8                                  | 92/8                        |
| Medium Trucks (%)                      | 7                                     | 7                                     | 7                           |
| Heavy Trucks (%)                       | 5                                     | 5                                     | 5                           |
| Posted Speed                           | 50 km/hr                              | 50 km/hr                              | 100 km/hr                   |

| Table 2: Traffic and Roadway Paran | neters |
|------------------------------------|--------|
|------------------------------------|--------|

\*The average Catherine Street AADT assumed in this report is based on average each lane AADT = 7,500.

Catherine Street is a 3-lane one-way arterial road and can not be best identified as any one road type in Table B of Appendix B: "Table of Traffic and Road Parameters to Be Used for Sound Predictions" of the ENCG. The 4 Lane Urban Arterial Undivided (4-UAU) with an AADT of 30,000 vehicles per day and the 2 Lane-Urban Arterial-Undivided (2-UAU) with an AADT of 15,000 vehicles per day, both average AADT=7,500 vehicles per day per lane. This report assumes the AADT of the 3 lane Catherine Street is 3 X 7,500 = 22,500 vehicles per day.

#### 2.2 Methods for Noise Attenuation

When OLA or POW sound levels are predicted to be approximately equal to or less than the maximum suggested levels in ENCG, attenuation measures are not required. If the predicted noise levels are found to exceed the limits, noise mitigation and /or warning clauses are required. Warning clauses are discussed in Section 2.5. The City of Ottawa's preferred noise mitigation methods are:

- Increasing the amount of soft ground between the noise sources and noise receptor,
- Inserting noise insensitive land between the noise source and the noise receptor,
- Orientating the building to provide shelter to noise sensitive areas,
- Installing acoustic (noise) barriers,
- Installing air conditioning and forced air ventilation, and
- Enhancing construction techniques and construction quality.

#### 2.3 Noise Barrier Requirements

Acoustic (noise) barriers are typically the most effective noise mitigation measure listed in Section 2.2. However, acoustic barriers are also typically visually unappealing, expensive to install and maintain, and reduce outdoor living space. Acoustic barriers are typically only considered when all other noise mitigation techniques listed in Section 2.2 are not available or sufficient to reduce predicted noise levels below the maximum allowable. For this site noise mitigation measures that are economically and administratively feasible will be considered.

Acoustic barriers, if required, must conform to Part 3 of the City of Ottawa's Environmental Noise Control Guidelines, and include the following characteristics:

- Minimum height of 2.2m; Maximum height of 2.5m, unless approved by the City,
- Situated 0.30m inside the private property line,
- A surface mass density not less than 20kg/m<sup>2</sup>, and
- No holes or gaps.

#### 2.4 Ventilation Requirements

A forced air heating system with provisions for a central air conditioning system is required if the plane of window daytime noise levels are between 55 dBA and 65 dBA and/or the nighttime noise levels are between 50 dBA and 60 dBA.

The installation of a central air conditioning system is required when the daytime noise level exceeds 65 dBA and/or the nighttime noise level exceeds 60 dBA.

#### 2.5 Warning Clauses

When predicted noise levels exceed the specified criteria, the City of Ottawa and the MOE recommend warning clauses be registered as a notice on title and incorporated into the lease/rental/sale agreements to warn potential purchaser/buyers/tenants of the possible elevated noise levels.

Typical warning clauses should be registered as shown below. Warning clauses are extracted from Part 4, Appendix A the City of Ottawa ENCG and excerpts have been provided in **Appendix A** of this report. As stated in the City of Ottawa ENCG, due to the variation of noise impacts for any given site, it may be necessary to amend the example warning clauses to recognize the site conditions in each development.

It is recommended that the following noise clauses be registered on title and incorporated into the agreement of purchase and sales as required. Results can be found in **Table 4&5** from **Section 3.0** of this report:

#### <u>Type A</u>

"Purchasers/tenants are advised that sound levels due to increasing road traffic may occasionally interfere with some outdoor activities as the sound levels may exceed the sound level limits of the City and Ministry of the Environment."

"To help address the need for sound attenuation this development has been designed so as to provide an outdoor amenity area and indoor environment that is within provincial guidelines. Measures for sound attenuation include:

An acoustic barrier"

"To ensure that provincial sound level limits are not exceeded it is important to maintain sound attenuation features."

"The acoustic barrier shall be maintained and kept in good repair by the property owner. Any maintenance, repair or replacement is the responsibility of the owner and shall be with the same material or to the same standards, having the same colour, appearance and function of the original." Additionally, if a tolerance of 5 dBA is being considered in some areas, it is recommended an additional noise clause be registered on title and incorporated into the agreement of purchase and sales:

#### <u>Type B</u>

"Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road/rail/Light Rail/transitway traffic may, on occasion, interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the City and the Ministry of the Environment by up to 5 dBA."

"To help address the need for sound attenuation this development has been designed so as to provide an outdoor amenity area and indoor environment that is within provincial guidelines. OLA1 (e.g. Ground level back yards) is shielded from noise by adjacent buildings, which acts as an acoustical barrier. For OLA2 (e.g. Roof top) noise levels exceed 60 dBA by 5 dBA, however acoustical barrier on roof top is not feasible."

#### <u>Type C</u>

"Purchasers/tenants are advised that sound levels due to increasing road traffic may occasionally interfere with some outdoor activities as the sound levels may exceed the sound level limits of the City and Ministry of the Environment."

"To help address the need for sound attenuation this development has been designed so as to provide an outdoor amenity area and indoor environment that is within provincial guidelines. Measures for sound attenuation may include:

- Multi-pane glass
- Double brick veneer"

"To ensure that provincial sound level limits are not exceeded it is important to maintain sound attenuation features."

"This dwelling unit has also been designed with the provision for adding central air conditioning at the occupant's discretion. Installation of central air conditioning will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the City and the Ministry of the Environment"

#### <u>Type D</u>

"Purchasers/tenants are advised that sound levels due to increasing road traffic may occasionally interfere with some outdoor activities as the sound levels may exceed the sound level limits of the City and Ministry of the Environment."

"To help address the need for sound attenuation this development has been designed so as to provide an outdoor amenity area and indoor environment that is within provincial guidelines. Measures for sound attenuation may include:

- Multi-pane glass
- Double brick veneer
- High sound transmission class walls"

"To ensure that provincial sound level limits are not exceeded it is important to maintain sound attenuation features."

"This dwelling unit has also been supplied with a central air conditioning system and other measures which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the City and the Ministry of the Environment"

For units with multiple types of warning clauses, similar/identical wording can be combined as to not duplicate wording/information.

#### 2.6 Building Component Assessment

When plane of window noise levels exceeds 65 dBA (daytime) or 60 dBA (nighttime) the exterior cladding system of the building envelope must be acoustically assessed to ensure indoor sound criteria are achieved. This includes analysis of the exterior wall, door, and/or glazing system specifications as appropriate.

The NRC research Acoustic Insulation Factor: A Rating for the Insulation of Buildings against Noise (June 1980, JD Quirt) is used to assess the building components and the required acoustic insulation factor (AIF). This method is recognized by the City of Ottawa.

The required AIF is based on the Outside  $L_{eq}$ , Indoor  $L_{eq}$  required, and the number of exterior façade components.

Minimum Required AIF = Outside  $L_{eq}$  – Indoor  $L_{eq}$  + 10 log<sub>10</sub> (Number of Components) + 2dBA

Where, N = Number of components (walls, windows, and roof).

L = Sound Level expressed on a common decibel scale.

#### 2.7 Summary of Attenuation Requirements

**Table 3** summarizes the required noise attenuation measures and warning clauses should sound criteria be exceeded. Excerpts from the MOE NPC-300 and City of Ottawa ENCG documents are included in **Appendix A** for reference.

| Accession                         |                          | Outdoor   | Indoor Control Measures   |  |  |
|-----------------------------------|--------------------------|---|---|--|--|
| Assessment<br>Location            | L <sub>eq</sub><br>(dBA) | Control<br>Measures   | Ventilation<br>Requirements   | Building<br>Components   | Warning Clause   |
|                                   | Less than<br>55          | None required   | N/A   | N/A  | None required  |
| Outdoor<br>Living Area<br>(OLA)   | Between<br>55 and 60     | Control<br>measures<br>(barriers) may<br>not be required<br>but should be<br>considered | N/A   | N/A  | Required if resultant<br>L <sub>eq</sub> exceeds 55 dBA<br>Type A* or Type B** |
|                                   | More than<br>60          | Barriers required   | N/A   | N/A  | Required if resultant<br>L <sub>eq</sub> exceeds 55 dBA<br>Type A* or Type B*  |
|                                   | Less than<br>55          | N/A   | None Required   | None Required  | None Required  |
| Plane of<br>Living Room<br>Window | Between<br>55 and 65     | N/A   | Forced air heating<br>with provision for<br>central air<br>conditioning | None Required  | Required Type C  |
| (POW)                             | More<br>Than 65          | N/A   | Central Air<br>Conditioning   | Acoustical<br>performance of the<br>windows and walls<br>should be specified | Required Type D  |
|                                   | Less than<br>50          | N/A   | None Required   | None Required  | None Required  |
| Plane of<br>Bedroom<br>Window     | Between<br>50 and 60     | N/A   | Forced air heating<br>with provision for<br>central air<br>conditioning | None Required  | Required Type C  |
| (POW)                             | More than<br>60          | N/A   | Central Air<br>Conditioning   | Acoustical<br>performance of the<br>windows and walls<br>should be specified | Required Type D  |

\*Type A warning clause refers to units requiring a noise barrier that mitigates noise below 55dBA. \*\*Type B warning clause refers to units requiring a noise barrier but is technically or economically not feasible to reduce levels below 55dBA and a tolerance of up to 5dBA can be granted by the City.

#### 3.0 PREDICTED NOISE LEVELS

Noise levels were analyzed using Version 5.03 of the STAMSON computer program. The predicted noise levels are listed in Table 4&5.

| Receiver  | Calculated Noise Level (dBa)<br>7:00-23:00 |            | Outdoor Mitigation                         |  |
|-----------|--|------------|--|--|
| Location* | Un-attenuated                              | Attenuated | Method                                     |  |
| OLA 1     | 58.23                                      | -          | Warning Clause Type B<br>(Modified)        |  |
| OLA 2     | 64.90                                      | 61.58      | 3m Noise Wall and Warning<br>Clause Type B |  |

Table 4: Simulation Results – Outdoor Living Areas

\*Locations found on Figure 2 – Receiver Location Plan

As per C7.1.1 of the EPC-300, OLA noise levels up to 60dBA are permitted if noise control measures are not feasible to reduce noise level below 55dBA. OLA1 is in a very narrow backyard and is shielded by existing buildings. Therefore, an additional barrier is not suggested. OLA2 is on a roof top terrace located in the City environment. Noise levels were predicted to be 64.90dBA which can be lowered to 61.58dBA with a 3.0 meter high noise wall located on the roof top. In order to lower the level further to 60dBA would require a wall 4.5 meter high along the south and east which is not practical, expensive, and aesthetically unappealing.

| Receiver<br>Location<br>*     | Calculated<br>Noise Level<br>7:00-23:00<br>(dBa)<br>Un-attenuated | Calculated<br>Noise Level<br>23:00-7:00<br>(dBa)<br>Un-attenuated | Mitigation Method   |
|-------------------------------|---|---|---|
| POW1<br>1 <sup>th</sup> floor | 59.64   | 52.66   | <ul> <li>Installation of Forced Air Heating with<br/>provision for Central Air Conditioning</li> <li>Warning Clause Type C</li> </ul> |
| POW2<br>9 <sup>th</sup> floor | 72.42   | 64.82   | <ul> <li>Installation of Air Conditioning</li> <li>Warning Clause Type D</li> <li>Building Façade Analysis</li> </ul>                 |

\*Locations found on Figure 2 – Receiver Location Plan

Based on the results in **Table 5**, we recommend Central Air Conditioning and the inclusion of Noise Clause Type D be registered as a notice on title and incorporated into the lease/rental/sale agreements of all units. As well a building façade analysis is required to assess performance of walls and windows.

Refer to Figure 3 – Noise Mitigation Plan and Figure 4 – Roof Top Amenity Area Noise Mitigation Plan for all proposed noise mitigation measures. Refer to Appendix B for all noise calculations.

#### 4.0 BUILDING FAÇADE ANALYSIS

The City of Ottawa ENCG requires that wall & window construction be reviewed when noise levels exceed minimum requirements outlined in **Table 3.** The Acoustical Insulation Factor (AIF) method recognized by the City of Ottawa is used to assess the wall and window requirements.

The Acoustic Insulation Factor (AIF) is used as a measure of the reduction of outdoor noise provided by the elements of the outer surface of a building. The difference between the indoor noise criterion and the outdoor noise level establishes the acoustical insulation requirement for the exterior shell. The exterior shell is comprised of primarily two components; windows and walls (patio doors are treated as windows).

Mathematically, this Acoustical Insulation Factor can be expressed as:

Required AIF =  $L_{eq}$  (Outside) –  $L_{eq}$  (Inside) + 10 log<sub>10</sub> (N) +2dBA

Where, N = Number of components; L = Sound Level expressed on a common decibel scale. The worst-case scenarios are selected for the AIF and building façade analysis as bellow:

POW2 9th Floor are calculated as follows:

- AIF Residential(day) = 72.4 dBA 45 dBA + 10log<sub>10</sub> (2) dBA + 2dBA = 32 dBA
- AIF Residential(night) = 64.8 dBA 40 dBA + 10log<sub>10</sub> (2) dBA + 2dBA = 30 dBA
- .

```
*10log<sub>10</sub>(2) =3.0
```

Tables from the document entitled "Acoustic Insulation Factor: A Rating for the Insulation of Buildings Against Outdoor Noise", produced by the Division of Building Research, National Research Council of Canada, June 1980 (J.D. Quirt) were used to assess the exterior façade against the required AIF. This reference material is included in **Appendix C**.

To assess the façade against the required AIF respective Leq values, the number of components, the calculated required AIF, percentage of window to room areas and exterior wall to room areas are required. Exterior façade analysis data is presented in **Tables 6**.

| Description   | Residential Bedroom               |
|---|-----------------------------------|
| Number and Type of Components<br>Forming Building Envelope. | 2 – Windows and<br>Exterior Walls |
| Percentage of Window Area to<br>Total Floor Area of Room.   | 21%                               |
| Percentage of Wall Area to Total<br>Floor Area of Room.     | 130%                              |

| Table 6: Exterior Façade Ar | nalysis Data – POW2 |
|-----------------------------|---------------------|
|-----------------------------|---------------------|

Architect floor plans were reviewed to calculate the window and wall to floor ratios (as seen above). The architect plans are included in **Appendix A**.

Using the percentage of window area to room area, and the required acoustical insulation factor (AIF), **Table 5** in **Appendix C** was used to identify the various window assemblies needed to satisfy the required AIF. Similarly, **Table 6.3** in **Appendix C** was used to select the typical wall assembly needed to satisfy the required AIF.

**Table 7** bellow lists the results of the analysis requiring assemblies to mitigate the indoor noise levels.

 Table 7: Selected Window and Wall Assemblies to Meet Maximum Attenuation Requirements

| Descrip | tion   | AIF | Triple Pane Window<br>Assembly Options               | Typical Wall<br>Assembly |
|---------|--|-----|--|--------------------------|
| POW2 ·  | – 9 <sup>th</sup> Floor  | 32  | <ul> <li>3 mm – 6mm – 3 mm -<br/>6mm -3mm</li> </ul> | EW2                      |
| Notes:  |  |     |  |                          |
| I.      | Refer to Appendix C for calculations for walls and windows.  |     |  |                          |
| II.     | EW2 type wall consisting of 12.7mm gypsum board, vapour barrier, 38x89mm studs with 50mm (or thicker) mineral wool or glass fibre batts in inter-stud cavities. Plus, rigid insulation (25-30mm), and wood siding or metal siding and fibre backer board |     |  |                          |
| III.    | "3mm – 6 mm – 3mm – 6mm – 3mm" denotes 3 mm triple glazing glass, 6 mm air space   |     |  |                          |

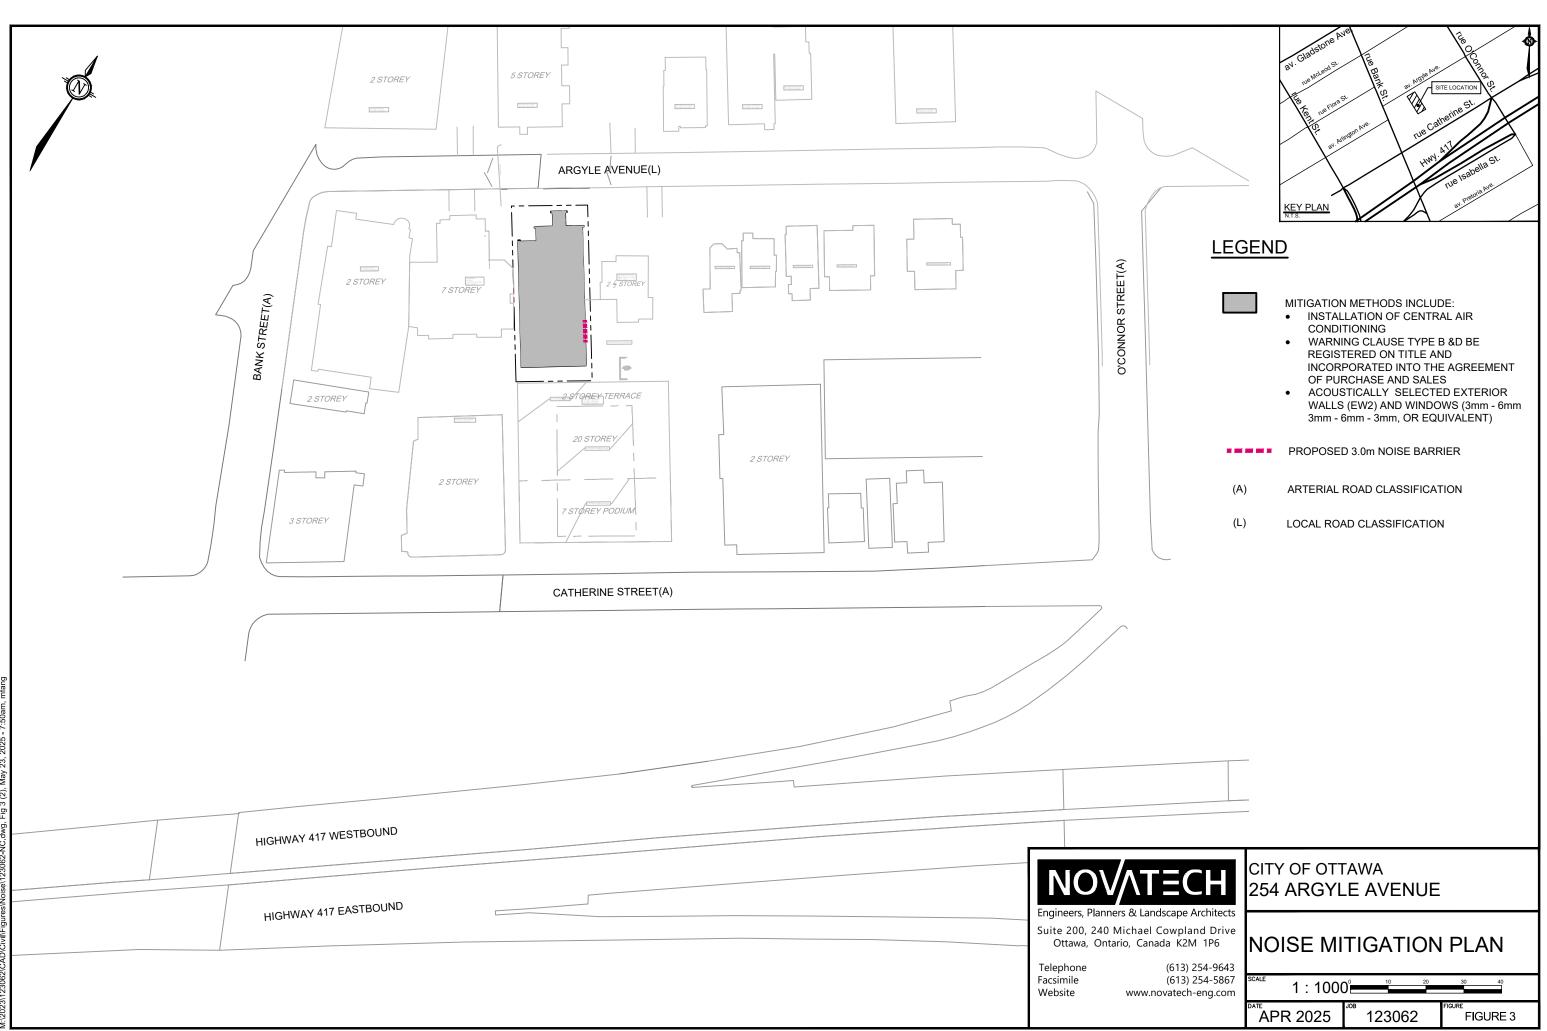

The proposed exterior wall is superior to the required EW2 wall required to mitigate the indoor sound levels. Refer to **Appendix C** for the exterior wall and EW2 wall details.

The proposed window is superior to the required 3mm/6mm/3mm/6mm/3mm window required to mitigate the indoor sound levels. Refer to **Appendix C** for the window details.

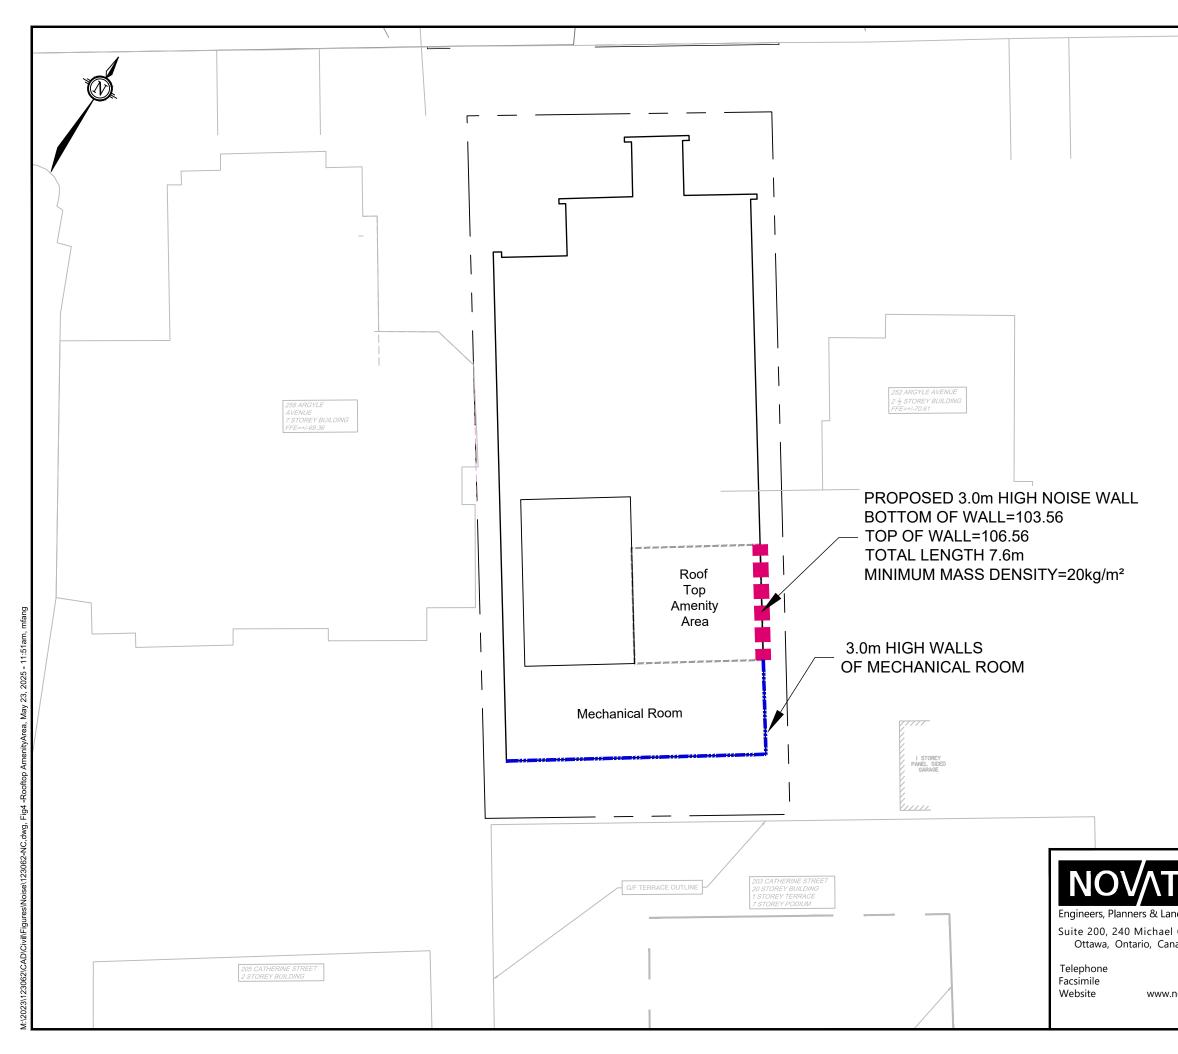

Table 11 and 12 in **Appendix C** were used to convert the AIF values to Sound Transmission Class (STC) values. The largest STC results for selected analyzed units are summarized in **Table 8** bellow. Window and wall assemblies should meet the STC values as a minimum.

| Table 8: Equivalen | t Sound Transmission | Class, STC Values |
|--------------------|----------------------|-------------------|
|--------------------|----------------------|-------------------|

|                              |     | Window      | S   | Walls       |     |

#### 5.0 CONCLUSION

This report recommends:

- The installation of 3m noise wall on roof top and inclusion of Warning Clause Type B to be registered as a notice on title and incorporated into the lease/rental/sale agreements.
- The inclusion of Central Air Conditioning and Warning Clause Type D to be registered as a notice on title and incorporated into the lease/rental/sale agreements for all units in the proposed development
- The construction of proposed exterior wall and windows are sufficient to mitigate the indoor noise levels.

The Province also provides for supplementary indoor sound level limits for land uses not generally considered noise sensitive (see Table 2.2c below). These good practice design objectives should be addressed in any noise study prepared for the City. These supplementary sound level limits are based on the windows and doors to an indoor space being closed.

## Table 2.2c: Supplementary Sound Level Limits for Indoor Spaces - Road and Rail (adaptedfrom NPC-300 Table C-9)

|  |                                   | Require | ed L <sub>eq</sub> (dBA) |

| 20-30            | 2-Lane Urban<br>Collector (2-UCU)   | 8,000                | 40-50                    | 92/8                 | 7                  | 5                              |

<sup>1</sup> The MOE Vehicle Classification definitions should be used to estimate automobiles, medium trucks and heavy trucks.

 $^{2}\,$  The number of lanes is determined by the future mature state of the roadway.

Environmental Noise Control Guidelines Part 4: Technical Requirements For Environmental Noise Control Studies And Implementation

# Environmental Noise Guideline

Stationary and Transportation Sources – Approval and Planning Publication NPC-300

| Table C-10                                 |
|--|
| Supplementary Indoor Aircraft Noise Limits |
| (Applicable over 24-hour period)           |

| Type of Space   | Indoor NEF/NEP* |
|---|-----------------|
| General offices, reception areas, retail stores, etc.   | 15              |
| Individual or semi-private offices, conference rooms, etc.  | 10              |
| Living/dining areas of residences, sleeping quarters of hotels/motels, theatres, libraries, schools, daycare centres, places of worship, etc. | 5               |
| Sleeping quarters of residences, hospitals, nursing/retirement homes, etc.  | 0               |

\* The indoor NEF/NEP values listed in Table C-10 are not obtained from NEF/NEP contour maps. The values are representative of the indoor sound levels and are used as assessment criteria for the evaluation of acoustical insulation requirements.

#### C7 Noise Control Measures

The following sections provide MOE guidance for appropriate noise control measures. These sections constitute requirements that are applied to MOE approvals for stationary sources. This information is also provided as guidance which land use planning authorities may consider adopting.

The definition in Part A describes the various types and application of noise control measures. All the noise control measures described in the definition are appropriate to address the impact of noise of transportation sources (road, rail and aircraft) on planned sensitive land uses. Only some of the noise control measures described in the definition are appropriate to address the noise impact of stationary sources on planned sensitive land uses.

#### C7.1 Road Noise Control Measures

#### C7.1.1 Outdoor Living Areas

If the 16-Hour Equivalent Sound Level,  $L_{eq}$  (16) in the OLA is greater than 55 dBA and less than or equal to 60 dBA, noise control measures may be applied to reduce the sound level to 55 dBA. If measures are not provided, prospective purchasers or tenants should be informed of potential noise problems by a warning clause Type A.

If the 16-Hour Equivalent Sound Level,  $L_{eq}$  (16) in the OLA is greater than 60 dBA, noise control measures should be implemented to reduce the level to 55 dBA. Only in cases where the required noise control measures are not feasible for technical, economic or administrative reasons would an excess above the limit (55 dBA) be acceptable with a warning clause Type B. In the above situations, any excess above the limit will not be acceptable if it exceeds 5 dBA.

#### C7.1.2 Plane of a Window – Ventilation Requirements

#### C7.1.2.1 Daytime Period, 07:00 - 23:00 Hours

Noise control measures may not be required if the  $L_{eq}(16)$  daytime sound level in the plane of a bedroom or living/dining room window is less than or equal to 55 dBA. If the sound level in the plane of a bedroom or living/dining room window is greater than 55 dBA and less than or equal to 65 dBA, the dwelling should be designed with a provision for the installation of central air conditioning in the future, at the occupant's discretion. Warning clause Type C is also recommended.

If the daytime sound level in the plane of a bedroom or living/dining room window is greater than 65 dBA, installation of central air conditioning should be implemented with a warning clause Type D. In addition, building components including windows, walls and doors, where applicable, should be designed so that the indoor sound levels comply with the sound level limits in Table C-2. The location and installation of the outdoor air conditioning device should comply with sound level limits of Publication NPC-216, Reference [32], and guidelines contained in Environmental Noise Guidelines for Installation of Residential Air Conditioning Devices, Reference [6], or should comply with other criteria specified by the municipality.

#### C7.1.2.2 Nighttime Period, 23:00 - 07:00 Hours

Noise control measures may not be required if the  $L_{eq}$  (8) nighttime sound level in the plane of a bedroom or living/dining room window is less than or equal to 50 dBA. If the sound level in the plane of a bedroom or living/dining room window is greater than 50 dBA and less than or equal to 60 dBA, the dwelling should be designed with a provision for the installation of central air conditioning in the future, at the occupant's discretion. Warning clause Type C is also recommended.

If the nighttime sound level in the plane of a bedroom or living/dining room window is greater than 60 dBA, installation of central air conditioning should be implemented, with a warning clause Type D. In addition, building components including windows, walls and doors, where applicable, should be designed so that the indoor sound levels comply with the sound level limits in Table C-2. The location and installation of the outdoor air conditioning device should comply with sound level limits of Publication NPC-216, Reference [32], and guidelines contained in Environmental Noise Guidelines for Installation of Residential Air Conditioning Devices, Reference [6], or should comply with other criteria specified by the municipality.

#### C7.1.3 Indoor Living Areas – Building Components

If the nighttime sound level outside the bedroom or living/dining room windows exceeds 60 dBA or the daytime sound level outside the bedroom or living/dining area windows exceeds 65 dBA, building components including windows, walls and doors, where applicable, should be designed so that the indoor sound levels comply with the

sound level limits in Table C-2. The acoustical performance of the building components (windows, doors and walls) should be specified.

#### C7.2 Rail Noise Control Measures

#### C7.2.1 Outdoor Living Areas

Whistle noise is not included in the determination of the outdoor daytime sound level due to railway trains. All the provisions of Section C7.1.1 apply also to noise control requirements for rail noise.

#### C7.2.2 Plane of a Window – Ventilation Requirements

Whistle noise is not included in the determination of the sound level in the plane of a window. All the provisions of Section C7.1.2 apply also to noise control requirements for rail noise.

#### C7.2.3 Indoor Living Areas – Building Components

The sound level,  $L_{eq}$ , during the daytime (16-hour) and nighttime (8-hour) periods is determined using the prediction method STEAM, Reference [34], immediately outside the dwelling envelope. Whistle noise is included in the determination of the sound level.

If the nighttime sound level outside the bedroom or living/dining room windows exceeds 55 dBA or the daytime sound level outside the bedroom or living/dining area windows exceeds 60 dBA, building components including windows, walls and doors, where applicable, need to be designed so that the indoor sound levels comply with the sound level limits in Table C-2. The acoustical performance of the building components (windows, doors and walls) needs to be specified.

In addition, the exterior walls of the first row of dwellings next to railway tracks are to be built to a minimum of brick veneer or masonry equivalent construction, from the foundation to the rafters when the rail traffic  $L_{eq}$  (24-hour), estimated at a location of a nighttime receptor, is greater than 60 dBA, and when the first row of dwellings is within 100 metres of the tracks.

#### C7.3 Combination of Road and Rail Noise

The noise impact in the OLA and in the plane of a window, and the requirements for outdoor measures, ventilation measures and warning clauses, should be determined by combining road and rail traffic sound levels.

The assessment of the indoor sound levels and the resultant requirement for the acoustical descriptors of the building components should be done separately for road

In Class 4 areas, where windows for noise sensitive spaces are assumed to be closed, the use of central air conditioning may be acceptable if it forms an essential part of the overall building designs.

#### C7.9 Verification of Noise Control Measures

It is recommended that the implementation of noise control measures be verified by qualified individuals with experience in environmental acoustics.

#### C8 Warning Clauses

The use of warning clauses or easements in respect of noise are recommended when circumstances warrant. Noise warning clauses may be used to warn of potential annoyance due to an existing source of noise and/or to warn of excesses above the sound level limits. Direction on the use of warning clauses should be included in agreements that are registered on title to the lands in question. The warning clauses would be included in agreements of Offers of Purchase and Sale, lease/rental agreements and condominium declarations. Alternatively, the use of easements in respect of noise may be appropriate in some circumstances. Additional guidance on the use of noise warning clauses is provided in Section C7.1.1, Section C7.1.2.1, Section C7.1.2.2, Section C7.3 and Section C7.4.

#### **C8.1** Transportation Sources

The following warning clauses may be used individually or in combination:

TYPE A: (see Section C7.1.1)

"Purchasers/tenants are advised that sound levels due to increasing road traffic (rail traffic) (air traffic) may occasionally interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment."

TYPE B: (see Section C7.1.1 and Section C7.4)

"Purchasers/tenants are advised that despite the inclusion of noise control features in the development and within the building units, sound levels due to increasing road traffic (rail traffic) (air traffic) may on occasions interfere with some activities of the dwelling occupants as the sound levels exceed the sound level limits of the Municipality and the Ministry of the Environment."

TYPE C: (see Section C7.1.2.1, Section C7.1.2.2 and Section C7.4)

"This dwelling unit has been designed with the provision for adding central air conditioning at the occupant's discretion. Installation of central air conditioning by the occupant in low and medium density developments will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment."

TYPE D: (see Section C7.1.2.1, Section C7.1.2.2 and Section C7.4)

"This dwelling unit has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment."

#### C8.2 Stationary Sources

It is not acceptable to use warning clauses in place of physical noise control measures to identify an excess over the MOE sound level limits. Warning clause (Type E) for stationary sources may identify a potential concern due to the proximity of the facility but it is not acceptable to justify exceeding the sound level limits.

TYPE E: (see Section C7.6)

"Purchasers/tenants are advised that due to the proximity of the adjacent industry (facility) (utility), noise from the industry (facility) (utility) may at times be audible."

#### C8.3 Class 4 Area Notification

TYPE F: (see Section B9.2 and Section C4.4.2)

"Purchasers/tenants are advised that sound levels due to the adjacent industry (facility) (utility) are required to comply with sound level limits that are protective of indoor areas and are based on the assumption that windows and exterior doors are closed. This dwelling unit has been supplied with a ventilation/air conditioning system which will allow windows and exterior doors to remain closed."

19

#### Appendix A: Warning Clauses

Under the Official Plan and this guideline warning clauses may be required to be incorporated into development through development agreements, registration on title and inclusion in Agreements of Purchase and Sale. This requirement may be included in any development, regardless of whether it is considered a noise sensitive land use.

A warning clause provides recognition for the City, Province landowner or tenants that noise may be a concern, that noise may be audible at times or even quite loud, and, depending on the type of development, provincial guidelines for noise may be exceeded. Warning clauses also recognize that environmental noise is a potential health hazard that does impact people and neighbourhoods. It is for this reason that, unless a non-noise sensitive land use is established, a warning clause should also include noise mitigation.

A warning clause is not considered a form of noise mitigation. It is not acceptable therefore to use warning clauses in place of physical noise control measures to identify an excess over the MOE or City noise limits. The reason for a warning clause on all development is twofold. Firstly, it is important to note that a land use that although the development may not be considered noise sensitive it may include employees or tenants that are personally sensitive to noise. A warning clause provides protection against complaints to the ministry of Environment should provincial guidelines be exceeded. Secondly, a warning clause on title could obviate the need for a new noise study in the future. In a redevelopment scenario the warning clause would provide recognition of the extent noise conditions.

Given the variation in potential intensity and impact of noise it will often be necessary to amend warning clauses to recognize the site specific conditions in each development. Final wording of any warning clause is to be approved by the City.

The following subsections provide example text to be adapted into warning clauses.

Environmental Noise Control Guidelines Part 4: Technical Requirements For Environmental Noise Control Studies And Implementation

## Surface Transportation Warning Clauses

#### Table A1 Surface Transportation Warning Clauses

| TypeExampleNotesGenericPurchasers/tenants are advised that sound<br>levels due to increasing road/rail/Light<br>Rail/transitway traffic may occasionally<br>interfere with some outdoor activities as the<br>sound levels may exceed the sound level<br>limits of the City and the Ministry of the<br>Environment.The generic warning<br>clause outlines that<br>MOE sound levels may<br>be exceeded but the<br>indoor amenity areas<br>are within guidelines.To help address the need for sound<br>attenuation this development has been<br>designed so as to provide an outdoor amenity<br>area that is within provincial guidelines.<br>Measures for sound attenuation include:<br>• An acoustic barrier.Mitigation measures<br>are described including<br>urban design features.To ensure that provincial sound level limits are<br>not exceeded it is important to maintain sound<br>attenuation features.Mention is also made of<br>landscaping to screen<br>the development<br>visually from the source<br>of noise.The acoustic barrier shall be maintained and<br>kept in good repair by the property owner. Any<br>maintenance, repair or replacement is the<br>responsibility of the owner and shall be with<br>the same material or to the same standards,<br>having the same colour, appearance and<br>function of the original.The warning clause<br>makes reference to<br>MOE sound levelsExtensive<br>mitigation of<br>indoor and"Purchasers/tenants are advised that despite<br>the inclusion of noise control features in the<br>development and within the building units,The warning clause<br>makes reference to<br>MOE sound levels |            |   |  |

#### Table A1 Surface Transportation Warning Clauses

| Туре                    | Example   | Notes  |
|-------------------------|---|--|
| outdoor<br>amenity area | sound levels due to increasing road/rail/Light<br>Rail/transitway traffic may, on occasion,<br>interfere with some activities of the dwelling<br>occupants as the sound levels exceed the<br>sound level limits of the City and the Ministry<br>of the Environment.   | being exceeded from<br>time to time and that<br>there are sound<br>attenuation features<br>and landscaping within<br>the development that<br>should be maintained. |
|                         | <ul> <li>To help address the need for sound attenuation this development includes:</li> <li>multi-pane glass;</li> <li>double brick veneer;</li> <li>an earth berm; and</li> <li>an acoustic barrier.</li> </ul>  | An option for air<br>conditioning is noted as<br>well as landscaping to<br>screen the source of<br>noise.  |
|                         | To ensure that provincial sound level limits are not exceeded it is important to maintain these sound attenuation features.   |  |
|                         | The acoustic barrier shall be maintained and<br>kept in good repair by the property owner. Any<br>maintenance, repair or replacement is the<br>responsibility of the owner and shall be with<br>the same material or to the same standards,<br>having the same colour, appearance and<br>function of the original.  |  |
|                         | This dwelling unit has also been designed with<br>the provision for adding central air conditioning<br>at the occupant's discretion. Installation of<br>central air conditioning will allow windows and<br>exterior doors to remain closed, thereby<br>ensuring that the indoor sound levels are<br>within the sound level limits of the City and the<br>Ministry of the Environment. |  |

Environmental Noise Control Guidelines Part 4: Technical Requirements For Environmental Noise Control Studies And Implementation

#### Table A1 Surface Transportation Warning Clauses

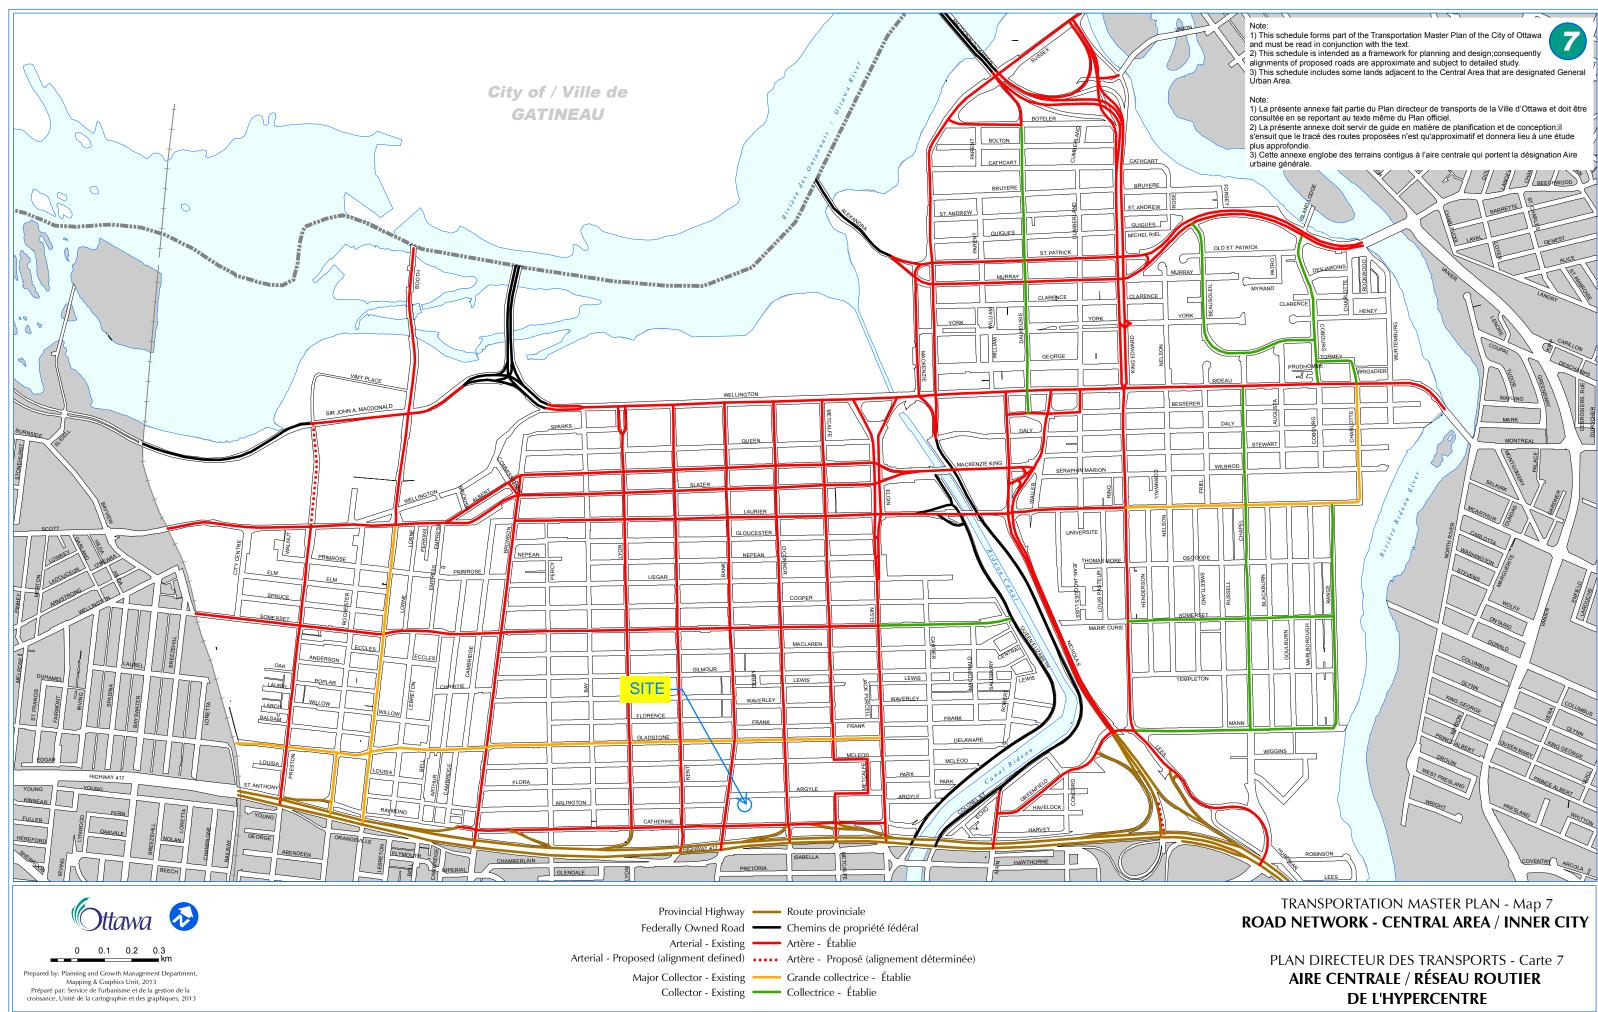

| Туре                       | Example  | Notes   |
|----------------------------|--|---|
|                            | Additionally this development includes trees<br>and shrubs to screen the source of noise from<br>occupants.  |   |
| No outdoor<br>amenity area | Purchasers/tenants are advised that sound<br>levels due to increasing road/rail/Light<br>Rail/transitway traffic will interfere with outdoor<br>activities as the sound levels exceed the<br>sound level limits of the City and the Ministry<br>of the Environment.  | This warning clause<br>notes that only an<br>indoor environment is<br>being provided for. |
|                            | <ul> <li>To help address the need for sound attenuation this development includes:</li> <li>multi-pane glass;</li> <li>double brick veneer;</li> <li>high sound transmission class walls.</li> </ul>   |   |
|                            | To ensure that provincial sound level limits are<br>not exceeded it is important to maintain these<br>sound attenuation features.  |   |
|                            | This dwelling unit has been supplied with a<br>central air conditioning system and other<br>measures which will allow windows and<br>exterior doors to remain closed, thereby<br>ensuring that the indoor sound levels are<br>within the sound level limits of the City and the<br>Ministry of the Environment |   |

#### **Stationary Source Warning Clauses**

The Province notes that it is not acceptable to use warning clauses in place of physical noise control measures to identify an excess over the MOE sound level limits for stationary sources. The generic warning clause for stationary sources (called Type E in NPC-300) may identify a potential concern due to the proximity of the facility but it is not possible to justify exceeding the sound level limits. The wording of the generic stationary noise warning clause may also be used as the basis for new development adjacent to areas licensed for mineral aggregate extraction.

### **DEMOLITION SITE PLAN KEYNOTES:**

- 1 EXISTING SIDEWALK TO REMAIN
- 2 EXISTING ASPALT PAVING TO REMAIN
- 3 EXISTING CURB TO REMAIN
- 4 EXISTING SIGN TO REMAIN
- 5 EXISTING LANDSCAPING TO REMAIN.
- BRICK BY BRICK. REFER TO 254 ARGYLE AVENUE CHURCH RELOCATION OPTIONS ANALYSIS OPTION 3, PREPARED BY REMISZ, DATED MARCH 28, 2024. DEMOLISH REMAINDER OF BUILDING.
- 22 REMOVE EXISTING LANDSCAPING AT AREA OF WORK
- 23 REMOVE EXISTING SIDEWALK
- 24 REMOVE EXISTING ASPHALT DRIVEWAY
- 25 REMOVE EXISTING CURB
- 26 REMOVE AND REINSTATE EXISTING ROAD ASSEMBLY AS REQUIRED FOR TRENCHING AND UTILITY SERVICE CONSTRUCTION. CUT PAVING IN STRAIGH LINES. MATCH
- 27 TRENCH AS REQUIRED FOR UTILITY SERVICE REMOVAL AND NEW CONSTRUCTION. FILL TRENCHES PER GEOTECHNICAL.
- 28 REMOVE AND RELOCATE EXISTING FIRE HYDRANT PER CIVIL

21 REMOVE AND PRESERVE CHURCH WALLS AND STEEPLE

EXISTING PAVING ASSEMBLY AND ELEVATIONS.

MATCH ADJACENT SITE LEVELS AND CONDITIONS

#### **DEMOLITION SITE PLAN GENERAL NOTES:**

1. ALL GENERAL SITE INFORMATION AND CONDITIONS COMPILED FROM EXISTING PLANS AND SURVEYS 2. DO NOT SCALE THIS DRAWING

REPORT ANY DISCREPANCIES PRIOR TO COMMENCING WORK. NO RESPONSIBILITY IS BORN BY THE CONSULTANT FOR UNKNOWN SUBSURFACE CONDITIONS

- 4. CONTRACTOR TO CHECK AND VERIFY ALL DIMENSIONS ON SITE AND REPORT ANY ERRORS AND/OR OMISSIONS TO THE CONSULTANT
- 5. REINSTATE ALL AREAS AND ITEMS DAMAGED AS A RESULT OF CONSTRUCTION ACTIVITIES TO THE SATISFACTION OF THE CONSULTANT 6. CONTRACTOR TO LAYOUT PLANTING BEDS, PATHWAYS ETC.
- TO APPROVAL OF CONSULTANT PRIOR TO ANY JOB EXCAVATION 7. THE ACCURACY OF THE POSITION OF UTILITIES IS NOT
- GUARANTEED CONTRACTOR TO VERIFY PRIOR TO EXCAVATION INDIVIDUAL UTILITY COMPANY MUST BE CONTACTED FOR
- CONFIRMATION OF UTILITY EXISTENCE AND LOCATION PRIOR TO DIGGING
- ALL DISTURBED AREAS TO BE RESTORED TO ORIGINAL 9 CONDITION OR BETTER UNLESS OTHERWISE NOTED

#### **GENERAL REFERENCE PLAN NOTES:**

#### A. DO NOT SCALE DRAWINGS.

- B. DIMENSIONS ARE FOR LOCATION ONLY. REFER TO STRUCTURAL DRAWINGS FOR FOOTINGS, COLUMNS AND FOUNDATION WALL SIZES.
- C. REFER TO MECHANICAL + ELECTRICAL DRAWINGS FOR DETAILS OF UNDERGROUND SERVICES.
- D. ALL EXTERIOR FOUNDATION WALLS ARE DIMENSIONED TO
- EXTERIOR FACE OF ASSEMBLY UNLESS OTHERWISE NOTED. E. ALL INTERIOR FOUNDATION WALLS + FOOTINGS ARE DIMENSIONED FROM GRIDLINE TO FACE UNLESS OTHERWISE
- NOTED. F. ALL WINDOWS ARE DIMENSIONED TO CENTERLINE OF
- WINDOW OPENING, UNLESS OTHERWISE NOTED. G. ALL DOORS ARE DIMENSIONED TO CENTERLINE OF DOOR OPENING, INCLUDING SIDELIGHT FRAMING, UNLESS
- OTHERWISE NOTED H. ALL EXTERIOR WALLS ARE DIMENSIONED TO THE EXTERIOR
- FINISHED FACE, UNLESS NOTED OTHERWISE. I. ALL INTERIOR DIMENSIONS ARE DIMENSIONED FROM INTERIOR FINISHED FACES OF EXTERIOR WALLS, UNLESS
- OTHERWISE NOTED. J. ALL INTERIOR WALLS ARE DIMENSIONED TO CENTERLINE OF PARTITION, UNLESS OTHERWISE NOTED. CONSIDER OFFSET FROM PARTITION CENTERLINE TO STUD FRAMING CENTER BASED ON WALL ASSEMBLY.
- K. ENSURE 25mm MINIMUM THICKNESS OF CONCRETE COVER OVER VERTICAL STEEL REINFORCEMENT TO ALL REINFORCED CONCRETE STRUCTURAL COLUMNS AND WALLS.

#### **REFERENCE PLAN KEYNOTES:**

- 1 CISTERN OVERFLOW AND HATCH / VENTED CISTERN LID
- 2 EXTENT OF DROPPED SLAB ABOVE
- 3 DOUBLE TEAR BICYCLE STORAGE SPACES
- 4 EXIT ONLY
- 5 EXTENT OF FOUNDATION WALL BELOW

#### **GENERAL REFERENCE PLAN NOTES:**

#### A. DO NOT SCALE DRAWINGS.

- B. DIMENSIONS ARE FOR LOCATION ONLY. REFER TO STRUCTURAL DRAWINGS FOR FOOTINGS, COLUMNS AND FOUNDATION WALL SIZES.
- C. REFER TO MECHANICAL + ELECTRICAL DRAWINGS FOR DETAILS OF UNDERGROUND SERVICES.
- D. ALL WINDOWS ARE DIMENSIONED TO CENTERLINE OF
- WINDOW OPENING, UNLESS OTHERWISE NOTED. E. ALL DOORS ARE DIMENSIONED TO CENTERLINE OF DOOR
- OPENING, INCLUDING SIDELIGHT FRAMING, UNLESS OTHERWISE NOTED
- F. ALL EXTERIOR WALLS ARE DIMENSIONED TO THE EXTERIOR FINISHED FACE, UNLESS NOTED OTHERWISE.
- G. ALL INTERIOR DIMENSIONS ARE DIMENSIONED FROM INTERIOR FINISHED FACES OF EXTERIOR WALLS, UNLESS OTHERWISE NOTED.
- H. ALL INTERIOR WALLS ARE DIMENSIONED TO CENTERLINE OF PARTITION, UNLESS OTHERWISE NOTED. CONSIDER OFFSET FROM PARTITION CENTERLINE TO STUD FRAMING CENTER BASED ON WALL ASSEMBLY.
- ENSURE 25mm MINIMUM THICKNESS OF CONCRETE COVER OVER VERTICAL STEEL REINFORCEMENT TO ALL REINFORCED CONCRETE STRUCTURAL COLUMNS AND WALLS.

#### **REFERENCE PLAN KEYNOTES:**

- 1 LOWER LEVEL ROOF
- 2 UPPER ROOF
- 3 ELVATOR SHAFT ROOF
- 4 ROOF SCREEN AND GATE

#### **REFERENCE PLAN LEGEND:**

Source : National Research Gouncil, Division of Building Research, December 1980.

Explanatory Notes ;

- 1) Where the calculated percentage wall area is not presented as a column heading, the nearest percentage column in the table should be used.
- 2) The common structure of walls EWl to EW5 is composed of 12.7 mm gypsum board, vapour barrier, and 38 x 89 mm studs with 50 mm (or thicker) mineral wool or glass fibre batts in inter-stud cavities.
- 3) EW1 denotes exterior wall as in Note 2), plus sheathing, plus wood siding or metal siding and fibre backer board. EW2 denotes exterior wall as in Note 2), plus rigid insulation (25-30 mm), and wood siding or metal siding and fibre backer board. EW3 denotes simulated mansard with structure as in Note 2), plus sheathing, 28 x 89 mm framing, sheathing, and asphalt roofing material. EW4 denotes exterior wall as in Note 2), plus sheathing and 20 mm stucco. EW5 denotes exterior wall as in Note 2), plus sheathing, 25 mm air space, 100 mm brick veneer. EW6 denotes exterior wall composed of 12.7 mm gypsum board, rigid insulation (25-50 mm), 100 mm back-up block, 100 mm face brick. EW7 denotes exterior wall composed of 12.7 mm gypsum board, rigid insulation (25-50 mm), 140 mm back-up block, 100 mm face brick. EW8 denotes exterior wall composed of 12.7 mm gypsum board, rigid insulation (25-50 mm), 200 mm concrete. 4) R signifies the mounting of the interior gypsum board on resilient clips.
- 5) An exterior wall conforming to rainscreen design principles and composed of 12.7 mm gypsum board, 100 mm concrete block, rigid insulation (25-50 mm), 25 mm air space, and 100 mm brick veneer has the same AIF as EW6.
- 6) An exterior wall described in EWl with the addition of rigid insulation (25-50 mm) between the sheathing and the external finish has the same AIF as EW2.

P.OW 2 9th Floor

TABLE 12: Approximate conversion from STC to AIF for exterior walls:

|                   | And the second |
|-------------------|--|
| Exterior wall     | Acoustic   |
| area expressed as | Insulation   |
| percentage of     | Factor   |
| room floor area   | (AIF)  |
| 200               | STC-10   |
| 160               | STC-9  |
| _125              | STC-8  |
| 100               | STC-7  |
| 80                | STC-6  |
| 63                | STC-5  |
| 50                | STC-4  |
| 40                | STC-3  |
| 32                | STC-2  |
| 25                | STC-1  |
| 20                | STC  |
| 16                | STC+1  |
| 12.5              | STC+2  |
| 10<br>8           | STC+3  |

Note: For area percentages not listed in the table use the nearest listed value.

Example: For a wall whose area = 120% of room floor aree and STC = 48 the AIF is 48 = 8 = 40.

SIC = AIF + 8 = 32 dBA + 8 = 40 dBA

Explanatory Notas:

1) Where the calculated percenters window area is not presented as a column heading, the nearcat percentage column in the table values

- 2) AIP data listed in the table are for well-fitted meatherstripped units that can be opened. The AIP values apply only when the

  - windows are closed. For windows fixed and sealed to the frame, add three (3) to the AIF given in the table. 3) If the interpene specing of glass thickness for a specific Couble glazed window is not listed in the table, the nearest listed
- The AIF ratings for 9mm and 12mm glass are for lominated gless unly: for coild glass subtract two (2) from the AIF values listed 2 Ŧ
  - If the interpane spacings for a specific triple-glazed window are not listed in the table, use the listed case whose combined 9
- Aphcings are nearest the actual combined specing. The AIF data listed in the table are for typical windows, but details of glaus mounting, window souls, etc. may result in slightly different performence for some manufacturers' products. If laboratory sound transmission loss date (conforming to ASTM test method E-90): are aveilable, these should by used to calculate the AIR.

TABLE 11: Approximate conversion from STC to AIF for windows and doors:

POWZ genfloor

| Acoustic   |
|------------|
| Insulation |
| Factor     |
| (AIF)      |
|            |
| STC-5      |
| STC-4      |
| STC-3      |
| STC-2      |
| STC-1      |
| STC        |
| STC+1      |
| STC+2      |
| STC+3      |
| STC+4      |
| STC+5      |
| STC+6      |
| STC+7      |
| STC+8      |
|            |

Note: For area percentages not listed in the table use the nearest listed value.

Examples: For a window whose area = 20% of the room floor area and STC = 32 the AIF is 32 + 1 = 33.

For a window whose area = 60% of the room floor area and STC = 29 the AIF is 29 - 4 = 25.

STC = AIF-1 = 32-1 = 31 dBA

Ming, see below regarding window and wall assemblies. I believe these are more than adequate. Can you finalize the report

Greg MacDonald, P. Eng.

Hello Greg,

Please see below the assemblies from Winona that we intend to use as a starting point for Argyle, for your reference. The set was established for a 40% greater energy efficiency target. A change to the window glazing was made during a value engineering exercise to suit a 25% greater energy efficiency target. These reduced glazing assemblies would be the minimum assemblies to be implemented at Argyle.

## Exterior Wall with Brick Veneer R-31 - U=0.032 btu/h\*sqft\*oF, FRR 45 min per SB-2

90 brick veneer c/w shelf angle with fero fast support @ 915mm o/c
25mm air space
140mm semi-rigid mineral wool continuous insulation
Vapour permeable air barrier membrane: Siga, Soprema, Henry
13mm exterior grade gypsum sheathing
92mm LGS stud at 406mm o/c c/w mineral wool batt insulation filled cavity (10 min per SB-2)
6mil poly vapour retarder membrane
16mm interior Type X gypsum board (40 min per SB-2)

## Exterior Wall with Panel Cladding R-32 U=0.031 btu/h\*sqft\*oF frr 45min per SB-2

25mm aluminum composit panel 13mm air space c/w cladding support system 152mm semi-rigid mineral wool continuous insulation Vapour permeable air barrier membrane: Siga, Soprema, Henry 13mm exterior grade gypsum sheathing 92mm LGS stud at 406 mm o/c c/w mineral wool batt insulation filled cavity (10 min per SB-2) 6mil poly vapour retarder membrane 16mm Type X interior gypsum board (40 min per SB-2)

# Window and Curtain Wall Glazing

Triple glazed thermal unit. Tempered glass, low-e coatings (surface 2 and 4), argon filled cavities.

Reductions made for 25% target:

Window Glazing (Curtain Wall Glazing remained as detailed above) Double glazed thermal unit. Tempered glass, low-e coating (surface 2), argon filled cavity.
