EXECUTIVE SUMMARY

AllRock Consulting Limited (AllRock) was retained by PRITEC Management (Client) to conduct a Phase I Environmental Site Assessment (ESA) of the property located at 64 Jamie Avenue, Ottawa, Ontario (hereinafter referred to as the 'Site' or 'Project Area'). The Site is currently developed with a single-storey industrial building, with a proposed addition along the west portion of the building.

AllRock was advised by Client that the purpose of the Phase I ESA was to assess actual or potential issues of environmental concern at the Site. It is AllRock's understanding that this Phase I ESA is required as part of the due diligence requirements in relation to the potential addition development of the Site.

The Phase I ESA carried out by AllRock was completed in general accordance with the Canadian Standards Association (CSA) document entitled "*Phase I Environmental Site Assessment, CSA Standard Z768-01*" dated November 2001 (reaffirmed 2016). The scope of work for the Phase I ESA consisted of a review of readily available historical information, an examination of regulatory records, a reconnaissance of the Site, interviews, a review of surrounding properties (within a 250-meter 'study area'), an evaluation of information and the preparation of a report outlining evidence of actual or potential issues of environmental concern at the Site. The Phase I ESA does not include physical sampling or testing and is based solely on visual observations and a review of available or supplied factual data.

Based on the findings of the Phase I ESA completed by AllRock, twenty-three (23) potentially contaminated activities (PCAs) were identified. Ten (10) of which were assessed as having a potential to result in subsurface impacts at the Site. A summary of the identified potential subsurface impacts is provided below:

1 INTRODUCTION

AllRock Consulting Limited (AllRock) was retained by PRITEC Management (Client) to conduct a Phase I Environmental Site Assessment (ESA) of the property located at 64 Jamie Avenue, Ottawa, Ontario (hereinafter referred to as the 'Site' or 'Project Area').

The purpose of the Phase I ESA was to identify actual or potential environmental concerns at the Site, including potentially contaminating activities (PCAs) within the Project Area and surrounding properties. For the purpose of this Phase I ESA, the Study Area is the area within a 250 m radius of the Project Area boundaries.

It is AllRock's understanding that this Phase I ESA is required as part of the due diligence requirements in relation to the proposed addition.

Figures of the Project Area and surrounding area are included on Figure 1, located in ***Appendix A*.**

1.1 Scope of the Investigation

The Phase I ESA carried out by AllRock was completed in general accordance with the Canadian Standards Association (CSA) document entitled "*Phase I Environmental Site Assessment, CSA Standard Z768-01*" dated November 2001 (reaffirmed 2016). This report will not satisfy the requirements for the submission of a Record of Site Condition (RSC) in accordance with Ontario Regulation 153/04 (as amended).

The scope of work for the Phase I ESA included the following:

- Review readily available historical information and examine regulatory records;
- Contact government agencies regarding the status of the Site with respect to their files, to identify any tank registrations, incident reports, fuel oil spills or any other relevant information with respect to the Site;
- Review and evaluate documents provided from the Client or Site Representative;
- An environmental database review completed by Environmental Risk Information Services Ltd. (ERIS) covering the Site and the Phase I Study Area;
- Conduct a Site reconnaissance and interview person(s) knowledgeable of the Site; and
- Prepare a report based on the above, outlining evidence of actual or potential issues of environmental concern at the Site.

2 SITE SETTING

2.1 Location and Physical Description

The Site is a rectangular shaped parcel with an area of approximately 1.25 acres (5,100 square meters (m^2)) situated at the southeast corner of the intersection of Jamie Avenue and Sunderland

Street, in Ottawa, Ontario. The Site is currently developed with a single-storey industrial building. The proposed scope of work involves the construction of an addition connected to the west side of the existing structure.

The Site and surrounding area predominately consist of commercial and industrial land uses. Figures of the Project Area and surrounding area are included in ***Appendix A***.

2.2 Topographic, Geological and Hydrogeological Conditions

A summary of the topography of the Site and surrounding areas, as well as relevant geological and hydrogeological information are included in the following table:

Table 2-1: Topographic, Geological and Hydrogeological Condition Summary

Subject	Description
Topography of the Site and Surrounding Area	The ground surface elevation of the site is approximately 89.57 m above sea level (masl), relatively flat and gradually slopes towards north.
Fill Materials	No evidence of fill material was apparent on Site, however, given the current Site development, it is inferred fill materials were utilized beneath the parking area, and structure.
Subsurface Soils	According to the 2025 AllRock Geotechnical Report, the subsurface conditions consist of asphalt pavement, sub-base, and silty sand to a depth of 8.0 meters below ground surface (mbgs).
Bedrock Type	Based on Bedrock Geology of Ontario Map, the bedrock in the Site consists of dolostone and sandstone.
Inferred Depth to Bedrock	Unknown based on the information reviewed.
Inferred Depth to Groundwater	Based on the 2025 AllRock Geotechnical Investigation Report, water levels were taken from an existing monitoring well on March 20th, 2025. Depth of groundwater was recorded at 6.5 meters below ground surface (mbgs).
Nearest Open Water Body	Nepean Creek is located approximately 1 kilometre (km) north of the Site.
Inferred Groundwater Flow Direction	North towards Nepean Creek.

3 HISTORICAL RECORDS REVIEW

3.1 Aerial Photographs

AllRock contacted Environmental Risk Information Services Ltd. (ERIS) to obtain aerial photographs for the Site and surrounding area. Copies of aerial photographs dated 1953, 1965, 1973, 1985, 1991, and 2023 were provided by ERIS and reviewed by AllRock. Copies of satellite imagery dated 2004, 2016, and 2024 were obtained from Google Earth™ and were also reviewed

by AllRock. A summary of inferred information with respect to the Site is provided in the following table:

Table 3-1: Aerial Photographs Summary for the Project Area and Study Area

Year	Project Area	Study Area
1953	The Site appears to be vacant and inferred agricultural land.	The Study predominantly consists of undeveloped vacant land, and inferred agricultural land, followed by industrial development to the north portion of the Study Area.
1965	Similar to 1965. No significant changes observed.	Similar to 1953, however, an inferred auto storage yard is apparent north to northwest of the Site. Along with further inferred commercial development to the west. Present day Bentley Ave is apparent south-southeast of the Site.
1973	A building is apparent similar in location to the present-day Site Building is apparent on Site.	Similar to 1965, however, the inferred auto storage yard has expanded further south towards the Site. Additionally, further commercial and industrial development is apparent west, east, and south of the Site. Present-day Jamie Avenue was apparent adjacent north of the Site.
1985	Similar to 1973, however the parking lot is evident surrounding the Site building.	Similar to 1973, however, further commercial development is apparent, adjacent east, and south of the Site. Additionally, the inferred auto storage yard appears to have been replaced by further commercial development. Present-day Sunderland Street is located immediately west of the Site. Additionally, Hunt Club Road is present to the north of the Site, consistent with its current alignment.
1991	Similar to 1965, however, the parking lot appears to have been further expanded to the northwest portion of the Site.	Similar to 1985, however, further inferred industrial and commercial development is apparent south, east and west of the Project Area.
2004	Similar to 1965, however, the Site Building appears to have been extended towards the south portion of the Project Area, similar in size and configuration to present-day.	Similar to 1991, however further inferred industrial and commercial development is apparent east, and north of the Site.
2016, and 2024	Similar to 2004. No significant changes observed.	Similar to 2004, however further inferred industrial and commercial development is apparent east, and north of the Site.

3.2 Verisk Information Intelligence

AllRock contacted Verisk Information Intelligence (Verisk) to obtain copies of Fire Insurance Plans pertaining to the Site and surrounding area. Verisk provided a written response dated April 16, 2025, indicating two (2) inspection reports dated circa 1977. A summary of the provided inspection reports are provided below:

Table 3-2: Summary of the Fire Insurance Reports

1977 Commercial Property Fire Rating Form Report
▪ The Site was occupied by a single-storey 344 m^2 building ▪ The operation consists of an auto-body shop equipped with a spray booth. ▪ The building was heated with a hot air gas unit.
Survey For Rating Fire-Resistive Risks Report – Unknown Date
▪ The Site was occupied by Tony Graham Motors Ltd. ▪ The Site functioned as an auto body repair shop, with spray painting ▪ 15 gallons of flammable solvents were identified on-Site. ▪ The building was heated by a hot air natural gas unit.

Based on a review of the provided inspection reports, the Site operated as an auto body shop with spray booth from circa 1977. As such the presence of an auto body shop is considered a PCA with respect to the Project Area ***(Item #28 – Commercial Autobody Shop)***.

A copy of Verisk's report is provided in ***Appendix D***.

3.3 City Directories

AllRock obtained city directories from ERIS for the Site and surrounding area. AllRock notes that no city directories were available for the Site or surrounding area prior to 1960 and after 2023. Based on AllRock's review of the provided information, the following salient information was noted for the Site and Study Area.

3.4 Previous Reports

AllRock prepared a report entitled *"Geotechnical Investigation Report, 64 Jamie Avenue, Ottawa, Ontario"* for PRITEC Management, and dated April 17, 2025 (2025 AllRock Geotech Report).

On February 26, 2025, three (3) boreholes, numbered BH1-25 to BH3-25, were advanced to a depth of 8 mbgs, one (1) of which, was installed with a monitoring well. The subsurface conditions generally consisted, the subsurface conditions consist of asphalt pavement, sub-base, and silty sand.

4 REGULATORY RECORDS REVIEW

4.1 Site Regulatory Information

AllRock requested copies of permits, Certificates-of-Approvals and Environmental Compliance Approvals relating to the Site; however, the Site Representative reported that there is no regulatory information pertaining to the Site.

4.2 Technical Standards & Safety Authority

A request for information pertaining to the Site was submitted to the Technical Standards & Safety Authority (TSSA). The TSSA maintains a database containing incidents and occurrence reports, the presence, specifications and permitting of petroleum storage tanks and environmental reports.

AllRock requested the TSSA to complete a preliminary search of the database, and records were identified for adjacent properties located at 65 Bentley Avenue and 74 Jamie Avenue, Ottawa, ON. Pertinent information regarding the records is provided below:

Table 4-1: TSSA Database Search Summary

Address	Comment
65 Benley Avenue	An active fuel-system appliance was identified
74 Jamie Avenue	Two (2) expired liquid fuel tanks, and one (1) expired private fuel outlet was identified (**28. Gasoline and Associated Products in Fixed Tanks)**

A copy of AllRock's request to the TSSA is provided in ***Appendix C*** in this report.

4.3 Ministry of the Environment, Conservation and Parks

A Freedom of Information Request was submitted to the MECP for information on file with respect to the Site. The MECP maintains a database containing environmental concerns, orders, chemical spills and/or leaks at the Site, C-of-A, ECAs, and other environmental issues that may have impacts the Site's condition. At the time of writing this report, no response has been received by MECP. When a response is received, the information will be reviewed by AllRock and, if any evidence of actual or potential issues of environmental concern are noted, a copy of the response will be forwarded to Client under a separate cover. Our conclusions and recommendations may be amended based on this information. A copy of AllRock's request to MECP is provided in ***Appendix C*** of this report.

4.4 Historic Land Use Inventory (HLUI)

A HLUI report was requested from the City of Ottawa to obtain information on past land use activities at the Site and in the surrounding area. The purpose of the HLUI is to identify types and locations of historical land uses that may have the potential to cause contamination of soil, groundwater, or surface water within the City of Ottawa.

At the time of writing this report, no response has been received by the City of Ottawa. When a response is received, the information will be reviewed by AllRock and, if any evidence of actual or potential issues of environmental concern are noted, a copy of the response will be forwarded to Client under a separate cover. Our conclusions and recommendations may be amended based on this information.

4.5 Environmental Risk Information Service Ltd.

AllRock submitted a request to ERIS for a review of all federal, provincial, and private source databases relating to the Project Area and Study Area. A copy of the ERIS report is provided in ***Appendix D*** of this report.

Based on AllRock's review of the ERIS report, 1 record was identified for the Project Area, and a 969 were identified for the Study Area.

A summary of the findings within the Project Area is detailed below in *Table 4-2*:

Table 4-2: ERIS Summary of Project Area Findings

[2] Spills over >25 L are considered significant and were included in the database review

Additional records were identified in the ERIS database, however, based on the nature of the records, distance between these properties and the Site, as well as the inferred groundwater flow direction, these properties are unlikely to contribute to an APEC at the Project Area.

4.6 Well Records

The Water Well Information System (WWIS) database provided by ERIS, along with records from the MECP Well Records, were reviewed. Based on the information obtained a no wells were identified on-Site, and sixty-six (66) wells were located within the Study Area. A summary of the inferred information related to the identified wells within 150 meters of the Site is provided below in Table 4-4:

5 SITE RECONNISANCE

5.1 Background

AllRock conducted a Site reconnaissance on April 17, 2025, to visually inspect the Site for the presence of environmental concerns, including but not limited to petroleum storage tanks, surface soil staining, hazardous materials, chemicals and waste storage, operations and adjacent properties. At the time of the Site reconnaissance, the ground surface was dry, and the weather was clear. The Site reconnaissance was documented with field notes and photographs, with selected photographs included in **Appendix B** of this report.

5.2 Site Interviews

As part of the Site reconnaissance completed on April 17, 2025, an on-Site interview was conducted with Ted Holly, the Operations Manager (Site Representative). The following information was noted:

- The Site Building was constructed in circa 1972;
- Historically the Site Building was utilized as an auto-body shop until circa 1990;

- The paint booth currently located within the Site Building is used for rust-proofing and is equipped with an air emission system that vents to the rooftop; and
- To the best of the Site Representatives knowledge, no spills, releases, or environmental related impacts have occurred on the Project Area that have caused known contamination.

5.3 Site Operations

The Site is developed with a single-storey industrial building (the "Site Building"), which operates as an automotive preparation facility for the Tony Graham Toyota Dealership. Typical activities conducted on-site include vehicle detailing, cleaning, inspections, and rust-proofing for both new and used vehicles.

During the Site Reconnaissance, typical equipment observed included a hydraulic above-ground vehicle hoist, various detailing tools, a paint booth, multiple air compressors, and an assortment of cleaning agents and supplies.

The exterior of the Site is primarily used for vehicle storage. A fixed generator was observed near the northwest corner of the Site Building, installed on a concrete pad. The generator appeared to be in good condition at the time of the Site visit.

5.4 Chemical Inventory and Hazardous Materials

A summary of chemicals, hazardous materials and compressed gases observed at the time of the Site reconnaissance and as reported by the Site Representative are presented in the following table:

Table 5-1: Chemical and Hazardous Materials Summary

Subject	Observations
Chemicals	Chemicals that are typically used in general cleaning and maintenance operations (e.g., deodorizers, general cleaners, paints, etc.) were observed in various locations throughout the Site Building.
Hazardous Materials and Waste	Chemicals that are typically used for rust-proofing operations (e.g., Terry-Sol, etc.) were observed in various locations throughout the Site Building and immediately adjacent to the paint booth.
Compressed Gases	None observed, and none reported by the Site Representative.

5.5 Staining and Stressed Vegetation

AllRock notes that a thorough assessment of the concrete floor surface at the interior of Site Building could not be completed at the time of the Site reconnaissance due to surface debris. However, where visible, only minor staining was observed on the concrete floor in the vicinity of select equipment (i.e. above-ground hydraulic hoist), and the concrete slab appeared to be in general good condition.

No stressed vegetation was observed, and none reported by the Site Representative.

5.6 Water and Wastewater

A summary of surface water features, wastewater or other liquid discharges observed at the time of the Site reconnaissance and as reported by the Site Representative are presented in the following table:

Table 5-2: Water and Wastewater Summary

Subject	Observations
Water Source	Water is supplied by the City of Ottawa.
Water Use	Water is primarily used in domestic-related activities.
Wastewater	Wastewater generated on-Site is discharged to the municipal sewer.
Subsurface Features	None observed and none reported by the Site Representative.
Oil/Water Separator	None observed and none reported by the Site Representative.
Watercourses, Ditches or Standing Water	None observed and none reported by the Site Representative.
Storm Water	A stormwater sump-pump is located in the basement of the Site Building A.
Current/Former wells	The former monitoring well, installed during the Geotechnical Investigation, appeared to be in good condition during the site reconnaissance.

5.7 Storage Tanks

No tanks were observed within the Project Area at the time of the Site Reconnaissance, and none were reported by the Site Representative

5.8 Surrounding Properties

The Site and surrounding area predominately consisted of industrial and commercial land uses at the time of the Site reconnaissance. A summary of the adjacent properties and details obtained from publicly accessible areas, are described in the following table:

6.3 Special Attention Items

6.3.1 PCBs

Polychlorinated biphenyls (PCBs) were commonly used in transformers, light ballasts, circuit breakers, capacitors, and switch gears as synthetic insulating materials until Canada banned their manufacture and importation in 1977. The ban did not include PCBs that were already in-use for electrical applications and consequently some products manufactured prior to 1977 may contain PCBs. PCB Regulations (SOR/2008-273) came into force on September 5, 2009 (amended 2015) and consists of prohibitions, permitted activities, end-of-use dates, as well as storage, labelling, reports and record requirements. These regulations required the decommissioning of equipment containing PCBs in a concentration greater then 500 milligram/kilogram (mg/kg) in December 2009 and equipment containing PCBs in a concentration of at least 50 mg/kg will be decommissioned by December 31, 2025. Light ballasts, pole top electrical transformers and their pole-top auxiliary electrical equipment containing PCBs with a concentration of 50 mg/kg or more will also be decommissioned by December 31, 2025. Exemptions to the regulation include cables, pipelines, electrical capacitors, and other equipment used in pipelines that transport natural gas, petroleum, or petroleum products. Fusion sealed capacitors in communication or electronic control equipment are also exempt.

Given the year of construction of Site Building (circa 1972), PCBs could be associated with on-Site electrical equipment.

6.3.2 UFFI

Urea formaldehyde foam insulation (UFFI) is a low-density foam insulation that was widely used to insulation and retrofitting industrial, commercial, and residential buildings. UFFI was generally injected into wall cavities of existing buildings and was approved for use in Canada from 1977 until 1980. When UFFI is injected into the building envelop it releases an excess of formaldehyde gas which can cause overexposure to building occupants resulting in adverse health effects. Buildings constructed subsequent to 1980 have a low potential to contain UFFI.

Given the year of construction of Site Building (circa 1972) predates the approved use period, it is unlikely that UFFI are present within the Site Buildings.

6.3.3 Lead

Lead was commonly used as an additive in paints prior to 1950 to accelerate drying, increase durability, and make colours vibrant. Removing, repairing or disturbing the paint through normal wear-and-tear can expose individuals to adverse health effects. The Liquid Coating Materials Regulation was enacted under the Hazardous Products Act in 1976 to restrict the lead content of paints and other liquid coatings on furniture and products to 0.5% by weight. Through voluntary action between industry and government the amount of total lead in paints declined to 600 parts per million (ppm) in 1991, and in 2010 the limit was reduced further to 90 ppm. Buildings

constructed subsequent to 1990 have a low potential to contain lead-based paints. The assessment of lead in painted surfaces is beyond the scope of this Phase I ESA. The Site Representative informed AllRock that no surveys have been previously conducted at the Site. At the time of the Site reconnaissance, paint surfaces (where observed) appeared to be in good condition (i.e., no peeling or flaking).

6.3.4 Ozone-Depleting Substances

Chlorofluorocarbons (CFCs) and other ozone depleting substances (ODS) are typically used as refrigerants in rooftop HVAC units and air-conditioning units, as well as commercial and residential refrigeration systems. The main concern of these units is the prevention of leaks and the proper disposal of coolants during decommissioning. At the time of the Site reconnaissance the bulk storage of CFCs and ODSs were not observed, and the Site Representative reported that the bulk storage of CFCs and ODS have not been conducted at the Site.

6.3.5 Asbestos

Asbestos is a group of naturally occurring minerals that are commonly found in many building construction materials. Asbestos had historically been used because of its tensile strength and resistance to fire, heat, chemicals, and water damage. Production and use of asbestos have declined since the 1970's and was phased out in the 1990's. Regulations prohibiting the import, sale and use of asbestos and products containing asbestos came into effect December 2018.

Friable asbestos relates to a material that can be crumbled or turned to powder by touch, making it release breathable asbestos fibers. Friable asbestos was widely used in but not limited to thermal insulation, pipe lagging, insulation boards, spray on paints, and plasters. Non-friable asbestos relates to materials that have a low risk of inhalation and releasing fibers either due to its nature or being sealed in place. Non-friable asbestos was widely used in but not limited to vinyl floor tiles, vinyl sheet flooring, ceiling tiles, and roofing materials.

A comprehensive inspection for asbestos requires intrusive inspections and testing by an asbestos abatement contractor which is beyond the scope of this Phase I ESA. The Site Representative reported that no asbestos surveys have been conducted at the Site and that an asbestos management plan has not been implemented at the Site.

Given the year of construction of Site Building (circa 1972) it is unlikely for ACMs to be present within the Site Building.

6.3.6 Water Damage and Microbial Growth

No indication of water leaks, mould or other microbial growth were seen at the Site. Mould and microbial organisms can lead to structural deterioration of the affected building materials and exposure can contribute to poor indoor air quality and adverse health effects. A comprehensive inspection for mould requires intrusive inspections into walls and/or other cavities to detect the presence of hidden mould growth and in some circumstances air and/or surface testing may be

required. Intrusive testing and a mould investigation were beyond the scope of this Phase I ESA. However, AllRock did not observe any visible or suspected mould during the Site Reconnaissance.

6.3.7 Radon

Radon is a radioactive gas that is generated from the breakdown of uranium in soil and bedrock. Radon is invisible, odourless and tasteless. When is released from the ground into the outdoor air, it is diluted and not a concern; however, when radon accumulates in an enclosed space, it can cause adverse health effects. The air pressure inside a building is typically lower than that of the soil and the difference in pressure draws air and other gases (including radon) from the soil into the building through any openings (e.g., cracks in foundation floors and walls, construction joints, service pipes, floor drains, etc.). Radon testing was beyond the scope of this Phase I ESA.

7 CONCLUSION AND RECOMMENDATIONS

Based on the findings of the Phase I ESA completed by AllRock, twenty-three (23) PCAs, of which ten (10) were identified to result in potential subsurface impacts at the Site.

Based on the findings of this Phase I ESA, AllRock recommends completing a subsurface investigation (Phase II ESA) at the Site.

It is recommended that a designated substance and hazardous materials assessment (DSHMA) be conducted prior to any future building renovation or demolition being undertaken at the Site.

8 TERMS AND LIMITATIONS

This Phase I ESA Report was prepared for the exclusive use of PRITEC. This Phase I ESA was preformed to outline evidence of actual or potential issues of environmental concern for the Site located at 64 Jamie Avenue, Ottawa, Ontario, at the time of the Site reconnaissance. A Phase I ESA performed to the CSA document entitled "*Phase I Environmental Site Assessment, CSA Standard Z768-01*" dated November 2001 (reaffirmed 2016), is intended to reduce, but not necessarily eliminate, uncertainty regarding the potential for contamination of a property. The scope of work for this Phase I ESA did not include tasks for sample gathering, laboratory testing, or intrusive testing of any kind, including but not limited to designated substances, and therefore these materials may be present within concealed areas.

AllRock will not be held responsible for the use of this report by any third party, or reliance on or any decision to be made based on it without the prior written consent of AllRock. Any use a third party makes of this report, or any reliance on or decisions to be made based on it, is the sole responsibility of such third parties. AllRock accepts no liability or responsibility of loss, injury, claim or damages suffered by any third party as a result of decisions made or actions conducted.

The evaluation and conclusions contained within this report have been prepared based on readily available documents, records, and information furnished by individuals noted in the report, at the time of the Site reconnaissance. AllRock has relied in good faith on the information provided and has assumed that information provided is factual and accurate. AllRock accepts no responsibility of any deficiency or inaccuracy in this report as a result of omissions, misstatements, misrepresentation or fraudulent acts of persons interviewed or contacted.

The CSA document entitled "*Phase I Environmental Site Assessment, CSA Standard Z768-01*" dated November 2001 (reaffirmed 2016), does not apply to environmental auditing or environmental management systems. Therefore, with respect to Site operations and conditions, compliance with applicable Federal, Provincial or Municipal acts, regulations, laws and/or statutes was not evaluated as part of the Phase I ESA.
