# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

### **1.0 INTRODUCTION**

---

#### **1.1 General**

In 2023, J.L. Richards & Associates Limited (JLR) was retained by 12714001 Canada Inc. (the Owner) to prepare the detailed design of municipal infrastructure for Site Plan Approval (SPA) of the Mixed-Use Site Plan (Block 17). This Site Servicing Report (SSR) presents the servicing constraints and strategies for water, wastewater, stormwater servicing, and stormwater management in accordance with the City of Ottawa Design Guidelines, the associated technical bulletins and relevant design excerpts.

#### **1.2 Site Description**

The Residential Site Plan (Block 17) is located within the City of Ottawa's Official Plan boundary and consists of a 0.55 ha parcel bounded by Navan Road to the south, Page Road to the west, an existing property to the north, and the proposed East Ridge Orleans Subdivision to the east (as per the Site Servicing Report prepared by J.L. Richards and Associates, dated December 2024). The legal description of the subject property can be found in the Draft Plan of Subdivision attached to Appendix A.

A topographical survey was completed by Stantec Inc. in August 2024 (Appendix A). The survey indicates that the existing topography generally slopes downwards towards the intersection between Page Road and Navan Road.

#### **1.3 Proposed Development**

The proposed development will consist of two 4-story condominium buildings. Each building has 48 residential units, for a total of 96 residential units. The Concept Plan for the Residential Site Plan (Block 17) is attached to Appendix A.

#### **1.4 Proposed Connections to Existing Infrastructure**

Block 17 is proposed to be serviced by the infrastructure that is part of the East Ridge Orleans Subdivision. One sanitary, storm and water service lateral will extend to the parking garage footprint from the subdivision as shown in the servicing drawings.

#### **1.5 Consultation and Permits**

A pre-consultation meeting was held on September 13, 2023, to discuss the planning process, design criteria, and servicing constraints. A copy of the pre-consultation meeting notes and the site servicing checklist has been provided in Appendix B.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

## **2.0 WATER SERVICING**

---

### **2.1 Water Supply Design Criteria**

A Hydraulic Network Analysis (HNA) was completed as part of the detailed design for the East Ridge Orleans subdivision to confirm that the proposed watermains could provide adequate supply while complying with both the Ottawa Design Guidelines for Water Distribution (July 2010) and Technical Bulletins ISDTB-2014-02, ISTB-2018-02 and ISTB-2021-03. These documents are herein referred to as the Design Guidelines and TB-2014-02, TB-2018-02, and TB-2021-03, respectively.

The HNA completed as part of the East Ridge Orleans Subdivision design included water demands for the Residential Site Plan (Block 17). The HNA has since been updated to reflect the proposed water service lateral for Block 17 but is based on the same demands and the boundary conditions used in the original East Ridge Orleans Subdivision HNA (refer to Appendix C for a copy of City correspondence for boundary conditions).

Section 4.2.2 of the Design Guidelines states the following criteria for development additions to the public water distribution system:

- Under maximum hourly demand conditions (peak hour), the residual pressures shall not be less than 276 kPa (40 psi);
- During periods of maximum day and fire flow demand, the residual pressure at any point in the distribution system shall not be less than 140 kPa (20 psi);
- In accordance with the Ontario Building Code (OBC) in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi);
- The maximum pressure at any point in the distribution system in unoccupied areas shall not exceed 689 kPa (100 psi); and
- Feedermains, which have been provided primarily for the purpose of redundancy, shall meet, at a minimum, the basic day plus fire flow demand.

### **2.2 Domestic Water Demands**

The water demands presented in this section are based on the site layout and unit count shown in the Site Plan (Appendix A). Domestic water demands were calculated for 52 one-bedroom apartment units, and 44 two-bedroom units as shown in the Site Plan. The total population for Block 17 is 165 people which is based on unit densities found in the City of Ottawa Design Guidelines.

The residential consumption rates for average day, maximum day, and peak hour demand were set in accordance with Table 4-2 of the Design Guidelines. Table 1 summarizes the water consumption rates and peaking factors used in the HNA.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

**Table 1: Water Demands**

| Demand Scenario    | Residential Water Consumption or Peaking Factor | Total Demands (L/s) |
|--------------------|---|---------------------|
| Average Day Demand | 280 L/c/d                                       | 0.54                |
| Maximum Day Demand | 2.5 x Avg Day                                   | 1.34                |
| Peak Hour Demand   | 2.2 x Max Day                                   | 2.94                |

### **2.3 Fire Flow Requirements**

The City has specified that the Fire Underwriters Survey (FUS) method shall be used for any public or private site where new fire hydrants are being designed. Specifically, the required fire flow (RFF) for each structure was calculated in accordance with TB-2018-02.

The required fire flow for the Residential Site Plan (Block 17) was calculated as 233 L/s for Building E and 250 L/s for Building F. Refer to Appendix C for the detailed RFF calculations for the critical fire area.

Both buildings within Block 17 will be equipped with a fully supervised automatic sprinkler designed and installed in accordance with NFPA 13. In the analysis, a sprinkler flow of 1500 L/min (25 L/s) was applied to each building as recommended by the Owner's Mechanical Engineer (refer to Appendix C).

### **2.4 Proposed Water Servicing, Boundary Conditions and Water Model**

#### **2.4.1 Proposed Water Servicing**

Water will be supplied to the Residential Site Plan (Block 17) by a 150 mm diameter water service that will connect to the 200 mm diameter watermain loop within the East Ridge Orleans subdivision. Fire protection will be provided by each building's sprinkler system, the proposed hydrants within the East Ridge Orleans Subdivision, and the existing hydrants on Navan Road and Page Road. The Siamese connection for each building is located no more than 45 m away from a hydrant as required by the OBC (refer to hydrant coverage markup in Appendix C).

#### **2.4.2 Boundary Conditions**

Hydraulic boundary conditions were provided by the City at the two proposed connection locations for the East Ridge Orleans subdivision (Connection 1 and Connection 2). Table 2 summarizes the hydraulic boundary conditions received (refer to Appendix C for a copy of the City correspondence).

The boundary condition for 250 L/s was used in this analysis since this is the maximum required fire flow for the site (refer to Section 2.3).

# Site Servicing Report

## Residential Site Plan (Block 17)

---

**Table 2: Hydraulic Boundary Conditions**

| Demand Scenarios                                       | Connection 1<br>Head (m) | Connection 2<br>Head (m) |
|--|--------------------------|--------------------------|
| Maximum HGL  | 130.7                    | 130.7                    |
| Peak Hour  | 127.0                    | 126.8                    |
| Max Day plus Fire Flow #4<br>15,000 L/min (250.00 L/s) | 124.4                    | 121.9                    |

### 2.4.3 Water Model

A hydraulic water model within the WaterCAD® software platform was used to carry out the HNA (refer to the overall schematics presented in Appendix C). The water demands from Table 1 and the boundary conditions from Table 2 were input into the model for each demand scenario. Table 3 summarizes the watermain diameters and roughness coefficients used in the model, based on Sections 4.2.12 and 4.3.5 of the Design Guidelines.

**Table 3: Watermain Internal Diameters and C-Factors**

| Nominal Diameter | Inside Diameter | C-Factor |
|------------------|-----------------|----------|
| 150 mm           | 155 mm          | 100      |
| 200 mm           | 204 mm          | 110      |
| 300 mm           | 297 mm          | 120      |

## 2.5 Simulation Results

The HNA was carried out under steady-state peak hour, maximum day plus fire flow, and maximum pressure conditions to confirm that the proposed water servicing can meet the design criteria outlined in Section 2.1.

### 2.5.1 Peak Hour

The simulation results found the minimum pressure at the site during the peak hour condition to be 433 kPa (62.8psi) (refer to Appendix C), which exceeds the minimum pressure criterion of 276 kPa (40 psi) per the Design Guidelines.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

### **2.5.2 Maximum Day Plus Fire Flow**

Fire water supply will be provided by the fully automatic sprinkler system, a proposed hydrant within the East Ridge Orleans subdivision, and existing hydrants on Page Road and Navan Road. To ensure adequate fire protection, the maximum day demand shown in Table 1 was analyzed simultaneously with the fire flow requirements. As mentioned in Section 2.3, a sprinkler system flow of 1,500 L/min (25 L/s) was assumed for Block 17, and it was assumed that only one (1) building would require fire flow at once.

Once the maximum day demands, the sprinkler demands, and the 15,000 L/min (250 L/s) boundary condition provided by the City (refer to Table 2) were input in the model, the fire flow simulation was carried out by allowing WaterCAD® to calculate the available fire flow that can be drawn from a hydrant without allowing any part of the system to experience pressures less than 140 kPa (20 psi).

From the simulation results, the system is expected to deliver a minimum of 15,000 L/min (250 L/s) to the site through the contribution of the sprinkler system and the nearby hydrants. Attached to Appendix C is a map of the hydrant coverage for Block 17 which confirms that both buildings within the block meet the RFF of 250 L/s through the aggregate sum of hydrant flows. Based on Appendix I of TB-2018-02 hydrants within 75 m of a building can provide 95 L/s of fire flow and hydrants within 75 to 150 m of a building can provide 63 L/s of fire flow.

### **2.5.3 Maximum Pressure**

Based on a zero (0 L/s) demand condition, the simulation results found the maximum pressure at the site to be 468 kPa (67.9 psi). This value is below the maximum pressure constraint of 552 kPa (80 psi), therefore pressure reducing valves are not anticipated to be required.

## **2.6 Summary and Conclusions**

Based on the water simulation results, the proposed development can be serviced by the proposed 150 mm water service lateral connected to the 200 mm watermain loop within the East Ridge Orleans Subdivision. Furthermore, adequate water supply can be achieved from the proposed hydrants within the East Ridge Orleans Subdivision, and existing hydrants on Page Road and Navan Road.

# Site Servicing Report

## Residential Site Plan (Block 17)

### 3.0 WASTEWATER SERVICING

#### 3.1 Design Criteria

The sanitary sewer system within the Residential Site Plan (Block 17) is designed in accordance with the Ottawa Sewer Design Guidelines and subsequent technical bulletins. The design parameters are applied under two scenarios as per ISTB Technical Bulletin 2018-01. The key design parameters have been summarized in Table 4.

**Table 4: Wastewater Key Design Parameters**

| Design Parameter                    | Design Value                              |
|-------------------------------------|---|
| Average Apartment                   | 1.8 ppu                                   |
| Residential Average Flow            | 280 L/Cap/Day                             |
| Residential Peaking Factor          | Harmon's Formula                          |
| Harmon's Correction Factor (K)      | 0.8                                       |
| Infiltration Allowance              | 0.33 L/s/ha                               |
| Manning's Roughness Coefficient (n) | 0.013                                     |
| Allowable Slopes                    | Varies (Refer to Section 6.1.2.2 of ODSG) |
| Allowable Velocities                | 0.6 m/s – 3.0 m/s                         |
| Allowable Freeboard                 | -   |

#### 3.2 Proposed Sanitary Servicing and Design Flows

Wastewater generated from the Residential Site Plan (Block 17) will be conveyed via a proposed 200 mm diameter sanitary service lateral, which will then discharge into the East Ridge Orleans Subdivision as shown in the Servicing Drawing.

Wastewater flows from the proposed development are presented in the Residential Site Plan (Block 17) Sanitary Design Sheet (refer to Appendix E). Based on the design criteria (Table 4) and the site constraints, a total design peak flow of 2.16 L/s is calculated for the development. Table 5 summarizes the results from the sanitary design sheet.

**Table 5: Sanitary Design Flow Summary**

| Area     | Site Area | Unit Count | Unit Density | Pop.        | Harmon's Peaking Factor | Res. Peak Flow | Comm. Peak Flow | Infilt. Flow | Total Flow |
|----------|-----------|------------|--------------|-------------|-------------------------|----------------|-----------------|--------------|------------|
| Block 17 | 0.55 ha   | 96         | 1.8 ppu      | 173 persons | 3.54                    | 1.98 L/s       | 0.0 L/s         | 0.18 L/s     | 2.16 L/s   |

A 200 mm diameter sanitary service lateral is expected to have sufficient capacity to convey the wastewater flows for the site. The flows from this block were already incorporated in the design of the sanitary sewer for the subdivision (refer to the East Ridge Orleans Subdivision Site Servicing Report prepared by J.L. Richards and Associates, dated December 2024). As shown in this report, the subdivision will consist of 200 mm diameter pipes which will have, at minimum,

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

20.24 L/s of capacity. Furthermore, the overall subdivision inclusive of the Site Plan Blocks 14, 15 and 17 is expected to generate 12.98 L/s of wastewater flows which is less than the minimum expected capacity of the pipes by 35%. Therefore, it is anticipated that the sanitary sewer system downstream will have sufficient capacity for the 2.16 L/s of wastewater flows generated by Block 17.

Furthermore, it has been confirmed by the Owner's Mechanical Engineer that a 200mm diameter service will be sufficient to convey the flows generated by the mechanical fixtures (refer to Appendix E).

### **3.3 Summary and Conclusions**

Wastewater servicing for Block 17 will be designed in accordance with the City of Ottawa Sewer Design Guidelines, the associated technical bulletins, and various background documents as highlighted throughout this section. Wastewater will be conveyed via a proposed 200 mm diameter sanitary service lateral which will then discharge into the East Ridge Orleans Subdivision. It is recommended that this wastewater servicing plan be implemented to provide adequate sanitary servicing for the proposed development.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

## **4.0 STORM SERVICING AND STORMWATER MANAGEMENT**

---

### **4.1 Design Criteria**

Storm and stormwater management servicing for the Residential Site Plan (Block 17) was developed in accordance with the City of Ottawa 2012 Sewer Design Guidelines (OSDG) and the more recent Technical Bulletin PIEDTB-2016-01 (September 6, 2016). These two documents are herein referred to as the Design Guidelines in this section. A summary of the key storm and stormwater management criteria follows:

- Control minor system flows to the allowable release rates of 48 L/s as identified in Table 5-4 Site Servicing Report 2983, 3053 and 3079 Navan Road & 2690 Pagé Road, Ottawa, Ontario (JLR December 2024);
- Proposed Storm sewers are designed to capture the 1:2-year storm event and the 1:10-year peak flows on Navan Road as a minimum using the Rational Method and using the regressions derived from Intensity-Duration-Frequency (IDF) equations as per the Design Guidelines;
- Provide a freeboard in the sewer network to the underside of footing (USF) of 300 mm during the 1:100-year storm where weeping tile connections are present;
- The runoff coefficients (C-factors) to be calculated based on the ratio of pervious and impervious surfaces depicted on proposed site plans;
- ;
- Minimum roadway slope of 0.1% from crest-to-crest for overland flow route;
- Minimum rear yard slope in the absence of perforated pipe system of 1.5% along with swale side slopes of 3 horizontal to 1 vertical;
- Maximum parking ponding depth of 350 mm (static and dynamic) as per the Design Guidelines and maximum depth of rear yard flow to be 300 mm;
- Minimum vertical clearance of 0.15 m between the spill elevation on the street and the finished grade (garage elevation);
- Minimum vertical clearance of 0.30 m between the rear yard spill elevation and the ground elevation at the building in the rear yards;
- Major system flows, up to and including the 1:100-year design storm event, are contained within the site using the parking lot area and surface drainage;
- Peak flows estimated based on an inlet time of ten (10) minutes, as per the Technical Bulletin ISDTB-2012-4.
- Quality control will be accommodated by Pond #3 to meet an MECP Enhanced Level of Protection (80% TSS removal).
- Provide measures to ensure that site preparation and construction is in accordance with the current Best Management Practices for Erosion and Sediment Control.

### **4.2 Proposed Stormwater Management Approach**

In order to achieve the allowable release rates, the stormwater management of the site will include:

- Rooftop control with rooftop storage and released at a cumulative controlled release rate of 2 L/s for each building; per WATTS RD-200 detail for Small Area Roof Drain (Appendix D) and as recommended by the landowner's mechanical engineer.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

- Surface storage within the parking lots in greater than a 1:2-year event with captured flows conveyed to the building plumbing system and internal cistern;
- Ramp runoff captured and conveyed to the building plumbing system and internal cistern;
- Storage in the building cistern with flows pumped at a controlled rate to the minor system with a backwater valve at the connection; and,
- Controlled release of the flows captured in the ditch drainage system for the surrounding landscaped areas.

Foundation drains will be connected to the internal building plumbing system therefore no HGL analysis is required.

### **4.3 Proposed Minor System Servicing**

A minor system connection will be provided from the building envelope to the minor system within the subdivision. The connection will be sized based on the 1:2-year release from the site. The runoff coefficient is based on the ratio of impervious surfaces and grassed or landscaped areas. The breakdown between pervious and impervious surfaces is shown on the figure entitled Overall Site Imperviousness in Appendix D. A design sheet for sizing of the connection and sizing of pipes internal to the site is provided in Appendix D.

### **4.4 Stormwater Management Modelling Approach**

#### **4.4.1 Dual Drainage Model**

The analysis of both major and minor drainage systems was carried out to demonstrate their compliance with respect to the design criteria described in Section 4.1. The performance of the major overland system and minor storm sewer system was analyzed with PCSWMM. This software is a dynamic model which allows both hydrologic and hydraulic components to be simulated in the same platform and also allows the simulation of the interaction between the major and minor systems. The PCSWMM software platform was used to:

- Generate the surface runoff hydrograph for each sub-area under various recurrences.
- Subdivide each inflow hydrograph into its minor and major system components based on the proposed inlet capture rates and roadway sag storage.
- Assess cascading, if any, and carry out dynamic routing of storm flows to determine flow depths along the roadways. As previously stated, the maximum major overland flow depths within the parking lot areas are to be limited to 350 mm or less, as per Technical Bulletin PIEDTB-2016-01.

PCSWMM was set-up to evaluate the proposed servicing as detailed on Drawing C01 and C02. Subcatchments were delineated for the structure roof areas, parking lot low points and landscaped low points. Model schematics are prepared in Appendix D.

# Site Servicing Report

## Residential Site Plan (Block 17)

---

### 4.4.2 Boundary Conditions

Boundary conditions are taken from the downstream subdivision model issued as part of the Site Servicing Report 2983, 3053 and 3079 Navan Road & 2690 Pagé Road, Ottawa, Ontario (JLR December 2024).

The downstream 1:100-year HGL at the connection to the Subdivision at MH504 is identified as 78.75 m which is lower than any minor system within the site and therefore there is no backflow from the boundary condition and no impacts on HGL.

## 4.5 Modelling Parameters

### 4.5.1 Hydrological Parameters

The following parameters were used in the hydrologic component of PCSWMM:

- **Areas and Imperviousness:** Catchment ID and drainage areas used by PCSWMM match those shown on either Drawing DST or Figure E-1 (Appendix E1).
- **Catchment Width:** The catchment width is estimated at the width of overland sheet flow based on the grading of the catchment and slope direction.
- **Manning's Roughness Coefficient:** Manning's Roughness Coefficients of 0.013 and 0.25 were used for the impervious and pervious surfaces, respectively.
- **Horton Infiltration parameters:** City of Ottawa OSDG Horton Infiltration Parameters have been used in the modelling.
- **Initial Abstraction:** Initial abstraction of 4.67 mm and 1.57 mm was used for the pervious and impervious surfaces respectively, consistent with the OSDG.

### 4.5.2 Simulation of Storm Distributions

To assess peak flow rates and peak volume storage requirements the 3-hour Chicago storm has been simulated for the site for the 1:2-year event and 1:100-year event and the 24-hour SCS storms for the 1:100-year event.

## 4.6 Simulation Results

### 4.6.1 Low Point Ponding Analysis

Ponding depths in the low points in the parking area and landscaped areas are shown in Table 6.

# Site Servicing Report

## Residential Site Plan (Block 17)

---

**Table 6: Catchbasin Ponding Depths**

| Low Point ID | Top of Grate (m) | Maximum Static Depth (mm) | 3-hour Chicago 1:2 year Depth (mm) | 3-hour Chicago 1:100 year Depth (mm) | 24-hour SCS 1:100 year Depth (mm) |
|--------------|------------------|---------------------------|------------------------------------|--------------------------------------|-----------------------------------|
| 1            | 82.10            | 300                       | 29*                                | 101                                  | 52                                |
| 2            | 82.28            | 300                       | 13*                                | 65                                   | 47                                |
| 3            | 80.80            | 250                       | 0                                  | 162                                  | 169                               |
| 4            | 81.05            | 200                       | 0                                  | 0                                    | 0                                 |
| 5            | 82.00            | 200                       | 0                                  | 180                                  | 162                               |

Those values marked with \* are greater than 0 mm in the 2-year event due to the model setup. In order to represent the Zurn inlet control device, the orifice has been set at the top of grate elevation as the control is at the surface. Therefore, the model requires a head buildup over the structure for simulation of flows.

The simulation results compiled in Table 6 shows that:

- No ponding nor dynamic flow will occur in the 1:2-year event;
- Maximum ponding depth of 180 mm during the 1:100-year event; and,
- There is no spill from the site in the 1:100-year event.

### 4.6.2 Roof Drainage

The roof drainage system is to be designed by the Mechanical Engineer to achieve a flow rate of 2 L/s from each roof structure. The maximum depth of ponding required, assuming storage across 66% of the rooftop area, is 77 mm.

### 4.6.3 Parking Lot Drainage

The parking lot drainage system connects to the building cistern and is controlled by the ZURN\_Z150F-6NH (detail provided in Appendix D) to allow the 1:2-year event to drain and for the surface to provide storage during greater events up to the 1:100 year. Capture rates are shown in the table below.

**Table 7: Parking Area ICD Capture Analysis**

| Low Point | ICD Type       | 1:2 year Rational Flow (l/s) | 1:100 year 3-hour Chicago Flow (l/s) | 1:100 year 3-hour Chicago Head (mm) |
|-----------|----------------|------------------------------|--------------------------------------|-------------------------------------|
| 1         | ZURN_Z150F-6NH | 14                           | 43                                   | 101                                 |
| 2         |                | 8                            | 40                                   | 65                                  |

The table shows that the parking lot ICDs capture the 1:2-year design flow.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

### **4.6.4 Landscaped Drainage**

The landscaped drainage consists of typical rear yard system of swales and perforated pipes. The rear-yard system is connected to the building internal piping, upstream of the cistern. Flows are controlled using inlet control devices sized to ensure that the ponding criteria is met and sizing of the cistern is optimized. Capture rates and ponding depths are shown in Table 8.

**Table 8: Landscaped Area ICD Capture Analysis**

| <b>Low Point</b> | <b>ICD Type</b> | <b>1:2 year Rational Flow (l/s)</b> | <b>1:100 year 3-hour Chicago Flow (l/s)</b> | <b>1:100 year 3-hour Chicago Head (mm)</b> |
|------------------|-----------------|-------------------------------------|---|--|
| 3                | Vortex_ICD_70   | 2                                   | 6   | 160  |
| 4                |                 | 1                                   |   | 0  |
| 5                | Vortex_ICD_70   | 2                                   | 6   | 180  |

The table above demonstrates that the landscaped area ICDs capture the 1:2-year design flow.

### **4.6.5 Building Release Rates**

The allowable release rate from the site is calculated based on 85 L/s/ha for areas within the site extents and 43 L/s/ha for existing rear-yards draining into the site. In order to maintain the overall release rate from the site at the allowable flow rate of 48 L/s, the building drainage system must be controlled to 36 L/s, both roof drains will each account for an additional 2 L/s and the other 8 L/s will flow uncontrolled towards Pagé Road. Based on a pumped rate of 36 L/s a cistern size of 57 m<sup>3</sup> is required in the building basement.

## **4.7 Summary and Conclusions**

The stormwater servicing achieves a release rate from the site to the minor system limited to the allowable release rate and contains up to the 1:100 year on site.

# **Site Servicing Report**

## **Residential Site Plan (Block 17)**

---

### **5.0 Erosion and Sedimentation Control**

---

Erosion and sediment control measures, as outlined in the Ontario Ministry of Natural Resources (MNR) Guidelines on Erosion and Sediment Control for Urban Construction Sites, will be implemented to trap sediment on site. The following erosion and sediment control measures can be implemented during construction as shown on the Erosion and Sediment Control Plan (Drawing C04):

- Supply and installation of a silt fence barrier, as per OPSD 219.110.
- Supply and installation of siltsack or sentinel CB inserts between the frame and cover of catch basins and maintenance holes adjacent to the project area during construction, to prevent sediment from entering the sewer system.
- Stockpiling of material during construction is to be located along flat areas away from drainage paths. For material placed on sloped areas, stockpiles are to be enclosed with a silt fence to protect watercourses.
- All catch basins are to be equipped with sumps, inspected frequently, and cleaned as required.
- Temporary ICDs are to be placed blocking part of the sewer pipe in the connecting storm maintenance holes to eliminate construction debris from entering the existing storm sewer system. The ICDs are to be removed after the proposed storm sewers have been fully cleaned.

The proposed removal and reinstatement measures as well as the erosion control measures shall conform to the following documents:

- "Guidelines on Erosion and Sediment Control for Urban Construction Sites" published by Ontario Ministries of Natural Resources, Environment, Municipal Affairs, and Transportation & Communication, Association of Construction Authorities of Ontario and Urban Development Institute, Ontario, May 1987.
- "MTO Drainage Manual", Chapter F: "Erosion of Materials and Sediment Control", Ministry of Transportation & Communications, 1985.
- "Erosion and Sediment Control" Training Manual by Ministry of Environment, Spring 1998.
- Applicable Regulations and Guidelines of the Ministry of Natural Resources.

Pre Consultation Meeting  
Notes and Site Servicing Report  
Checklist

File No.: PC2023-0226

Carmine Zayoun  
12714001 Canada Inc (Zayoun Group)  
Via email: carmine@zayoungroup.com

**Subject:** Pre-Consultation: Meeting Feedback  
Proposed Site Plan Application – 2983 Navan Road  
Four residential and two mixed-use buildings – PC2023-0226

Please find below information regarding next steps as well as consolidated comments from the above-noted pre-consultation meeting held on September 13, 2023.

### **Pre-Consultation Preliminary Assessment**

|                            |                            |                            |                                       |                            |
|----------------------------|----------------------------|----------------------------|---------------------------------------|----------------------------|
| 1 <input type="checkbox"/> | 2 <input type="checkbox"/> | 3 <input type="checkbox"/> | 4 <input checked="" type="checkbox"/> | 5 <input type="checkbox"/> |
|----------------------------|----------------------------|----------------------------|---------------------------------------|----------------------------|

One (1) indicates that considerable major revisions are required while five (5) suggests that the proposal appears to meet the City's key land use policies and guidelines. This assessment is purely advisory and does not consider technical aspects of the proposal or in any way guarantee application approval.

### **Next Steps**

1. A review of the proposal and materials submitted for the above-noted pre-consultation has been undertaken. Please proceed to complete a Phase 2 / Phase 3 Pre-consultation Application Form and submit it together with the necessary studies and/or plans to [planningcirculations@ottawa.ca](mailto:planningcirculations@ottawa.ca).
2. In your subsequent pre-consultation submission, please ensure that all comments or issues detailed herein are addressed. A detailed cover letter stating how each issue has been addressed must be included with the submission materials. Please coordinate the numbering of your responses within the cover letter with the comment number(s) herein.
3. Please note, if your development proposal changes significantly in scope, design, or density before the Phase 3 pre-consultation, you may be required to complete or repeat the Phase 2 pre-consultation process.

### **Supporting Information and Material Requirements**

1. The attached **Study and Plan Identification List** outlines the information and material that has been identified, during this phase of pre-consultation, as either required (R) or advised (A) as part of a future complete application submission.
  - a. The required plans and studies must meet the City's Terms of Reference (ToR) and/or Guidelines, as available on [Ottawa.ca](http://Ottawa.ca). These ToR and Guidelines outline

the specific requirements that must be met for each plan or study to be deemed adequate.

## **Consultation with Technical Agencies**

1. You are encouraged to consult with technical agencies early in the development process and throughout the development of your project concept. A list of technical agencies and their contact information is enclosed.

## **Planning**

Comments:

1. In the Official Plan the subject site is designated as Neighbourhood is modified with the Evolving Neighbourhood overlay. Brian Coburn Boulevard is also designated as a Minor Corridor. The property is further identified as Low-density residential in the EUC – Phases 1 Community Design Plans (CDP). The subject lands are currently zoned GM[2546]H(14.5) General Mixed-Use, Exception and DR Development Reserve.
2. Committee of Adjustment

No variances have been identified at this point. I would be supportive of reducing the parking requirement for the residential units if it will result in addition landscaping and tree cover. Staff will set up a meeting with a Committee of Adjustment Plan if any required.

3. Design guidelines

The following guidelines are meant as a starting place to help guide the design. I realize that they are specifically related to your project. [Urban Design Guidelines for Low-rise Infill Housing](#)

4. Landscape requirements

All required yards are to be landscaped with parking located between the buildings. Green spaces and tree canopy needs to be maximized.

5. Parking requirements

Parking should comply with Sections 100, 101, 106, 109 and 111

Vehicle and bicycle parking should be situated with easily access while minimizing pavement.

6. Easements

Will there be any easements required?

7. Commercial units should be orientated to the streets as much as possible.
8. Provide locations of signage and ensure that space is made available for tree planting

### **Urban Design**

9. This proposal does not run along or does not meet the threshold in one of the City's Design Priority Areas and need not attend the City's UDRP. Staff will be responsible for evaluating the Urban Design Brief and providing design direction.
10. An Urban Design Brief is a required submittal Re-zoning applications. The Urban Design Brief should be structured by generally following the headings highlighted under Section 3 – Contents of these Terms of Reference. Please see the Urban Design Brief Terms of Reference provided.
11. We recommend further detail be provided about the low-rise apartments to better understand their relationship to the surrounding buildings and properties.
12. If this site is located outside the greenbelt, a shadow analysis will be required.
13. We recommend the low-rise buildings fronting City streets consider grade related units accessed from the street to further 'fit-in' with the surrounding low-rise residential community where feasible.
14. We recommend additional landscaping detail be provided around the low-rise apartments to better understand how the buildings relate to their context.
15. We recommend additional detail be provided of the front yards of the townhouse units facing City streets to better understand how they will integrate with the public realm.
16. We recommend tree planting in front yards facing public right-of-way.
17. When a wind and/or shadow studies are required please refer to the Terms of Reference for the wind analysis and shadow analysis to conduct the studies and evaluate the impacts.
18. Note. The Urban Design Brief submittal should have a section which addresses these pre-consultation comments.

This is an exciting project in an area full of potential. We look forward to helping you achieve its goals with the highest level of design resolution. We are happy to assist and answer any questions regarding the above. Feel free to contact the Urban Design Planner, Christopher Moise, at [Christopher.Moise@ottawa.ca](mailto:Christopher.Moise@ottawa.ca), for follow-up questions.

## **Engineering**

Comments:

19. The Stormwater Management Criteria, for the subject site, is to be based on the following:

- a. The 5-yr storm event using the IDF information derived from the Meteorological Services of Canada rainfall data, taken from the MacDonald Cartier Airport, collected 1966 to 1997.
- b. For separated sewer system built pre-1970 the design of the storm sewers are based on a 2 year storm.
- c. The pre-development runoff coefficient or a maximum equivalent 'C' of 0.5, whichever is less (§ 8.3.7.3).
- d. A calculated time of concentration (Cannot be less than 10 minutes).
- e. Flows to the storm sewer in excess of the 5-year storm release rate, up to and including the 100-year storm event, must be detained on site.
- f. For a combined sewer system the maximum C= 0.4 or the pre-development C value, whichever is less. In the absence of other information the allowable release rate shall be based on a 2 year storm event.

20. Deep Services (Storm, Sanitary & Water Supply)

- a. Provide existing servicing information and the recommended location for the proposed connections. Services should ideally be grouped in a common trench to minimize the number of road cuts.
- b. Connections to trunk sewers and easement sewers are typically not permitted.
- c. Provide information on the monitoring manhole requirements – should be located in an accessible location on private property near the property line (ie. Not in a parking area).
- d. Review provision of a high-level sewer.

- e. Sewer connections to be made above the springline of the sewermain as per:
  - i. Std Dwg S11.1 for flexible main sewers – connections made using approved tee or wye fittings.
  - ii. Std Dwg S11 (For rigid main sewers) – lateral must be less than 50% the diameter of the sewermain,
  - iii. Std Dwg S11.2 (for rigid main sewers using bell end insert method) – for larger diameter laterals where manufactured inserts are not available; lateral must be less than 50% the diameter of the sewermain,
  - iv. Connections to manholes permitted when the connection is to rigid main sewers where the lateral exceeds 50% the diameter of the sewermain. – Connect obvert to obvert with the outlet pipe unless pipes are a similar size.
  - v. No submerged outlet connections.

21. Water Boundary condition requests must include the location of the service (map or plan with connection location(s) indicated) and the expected loads required by the proposed development, including calculations. Please provide the following information:

no BCR will be requested for res site  
plans, no watermains built, navan  
connection already provided as part  
of subdivision

- a. Location of service
- b. Type of development and the amount of fire flow required (as per FUS).
- c. Average daily demand: \_\_\_\_ l/s.
- d. Maximum daily demand: \_\_\_\_ l/s.
- e. Maximum hourly daily demand: \_\_\_\_ l/s.

22. An MECP Environmental Compliance Approval [Industrial Sewage Works or Municipal/Private Sewage Works] will be required for the proposed development. Please contact the Ministry of the Environment, Conservation and Parks, Ottawa District Office to arrange a pre-submission consultation:

- a. Charlie Primeau at (613) 521-3450, ext. 251 or Charlie.Primeau@ontario.ca
- b. Emily Diamond at (613) 521-3450, ext. 238 or Emily.Diamond@ontario.ca

General Comments:

23. Review of the Phase 3 submission for this application will not occur until the detailed design of the subdivision that it is within (D07-16-21-0027) is approved.
24. At the stage of site plan approval, a condition will be imposed detailing that a commencement work notification will not be issued until the subdivision's infrastructure is in-service.

#### 25. Engineering Studies:

26. All engineering studies (detailed in the Study and Plan Identification List form) are to follow the to be approved draft plan of subdivision D07-16-21-0027

Feel free to contact Derek Unrau, Infrastructure Project Manager, for follow-up questions.

#### **Noise**

Comments:

27. Noise report is required to identify and mitigate traffic noise from Brian Coburn Boulevard and Navan Road

Feel free to contact the Senior Transportation Engineer, Mike Giampa, at [Mike.Giampa@ottawa.ca](mailto:Mike.Giampa@ottawa.ca) , for follow-up questions.

#### **Transportation**

Comments:

- a. A full TIA is not required as this site is covered under the recent subdivision TIA.
- b. A memo including the pertinent subdivision trips is sufficient.
- c. The right of way protection on Brian Coburn and Navan Roads is 40m and 37.5m, respectively

Feel free to contact the Senior Transportation Engineer, Mike Giampa, at [Mike.Giampa@ottawa.ca](mailto:Mike.Giampa@ottawa.ca) , for follow-up questions.

#### **Planning Forestry**

Comments:

28. A Tree Conservation Report and Landscape Plan must be submitted with both SPC applications
29. A permit is required prior to any tree removal on site. The tree permit will be released upon site plan approval. Please contact the File Lead or the Planning Forester, Hayley Murray ([hayley.murray@ottawa.ca](mailto:hayley.murray@ottawa.ca)) for information on obtaining the tree permit.
30. If marine clay soils are present, setbacks on City properties must adhere to the 2017 SMC guidelines (attached). The Geotechnical report must address the implications of these soils, if present, on tree planting in relation to private land.
31. If underground parking is planned, a design must be provided for the site to support tree planting
32. We expect a very strong landscape plan to re-establish canopy cover across the properties. Tree planting and protecting existing urban forest canopy is imperative to reach the City's target of 40% canopy cover.

Feel free to contact Hayley Murray, Planning Forester, for follow-up questions.

### **Parkland**

Comments:

33. Parkland contributions were made through the Subdivision process.

Feel free to contact Jessica Button, Parks Planner, for follow-up questions

### **Conservation Authority**

Comments:

34. The Rideau Valley Conservation authority will be commenting on this application

Feel free to contact RVCA, for follow-up questions.

### **Other**

35. The High Performance Development Standard (HPDS) is a collection of voluntary and required standards that raise the performance of new building projects to achieve sustainable and resilient design. The HPDS was passed by Council on April 13, 2022.

- a. At this time, the HPDS is not in effect and Council has referred the 2023 HPDS Update Report back to staff with direction to bring forward an updated report to Committee with recommendations for revised phasing timelines, resource requirements and associated amendments to the Site Plan Control By-law by no later than Q1 2024.
- b. Please refer to the HPDS information attached and ottawa.ca/HPDS for more information.

### **Submission Requirements and Fees**

1. Outlines the application type/subtype required and the associated fees
  - a. Additional information regarding fees related to planning applications can be found [here](#).
2. The attached **Study and Plan Identification List** outlines the information and material that has been identified as either required (R) or advised (A) as part of a future complete application submission.
  - a. The required plans and studies must meet the City's Terms of Reference (ToR) and/or Guidelines, as available on [Ottawa.ca](#). These ToR and Guidelines outline the specific requirements that must be met for each plan or study to be deemed adequate.
3. All of the above comments or issues should be addressed to ensure the effectiveness of the application submission review.

Should there be any questions, please do not hesitate to contact myself or the contact identified for the above areas / disciplines.

Yours Truly,  
Steve Belan

Fire Underwriters Survey (FUS) Fire Flow Calculations  
In accordance with City of Ottawa Technical Bulletin ISTB-2018-02 dated March 21, 2018

Table 1. Maximum flow to be considered from a given hydrant

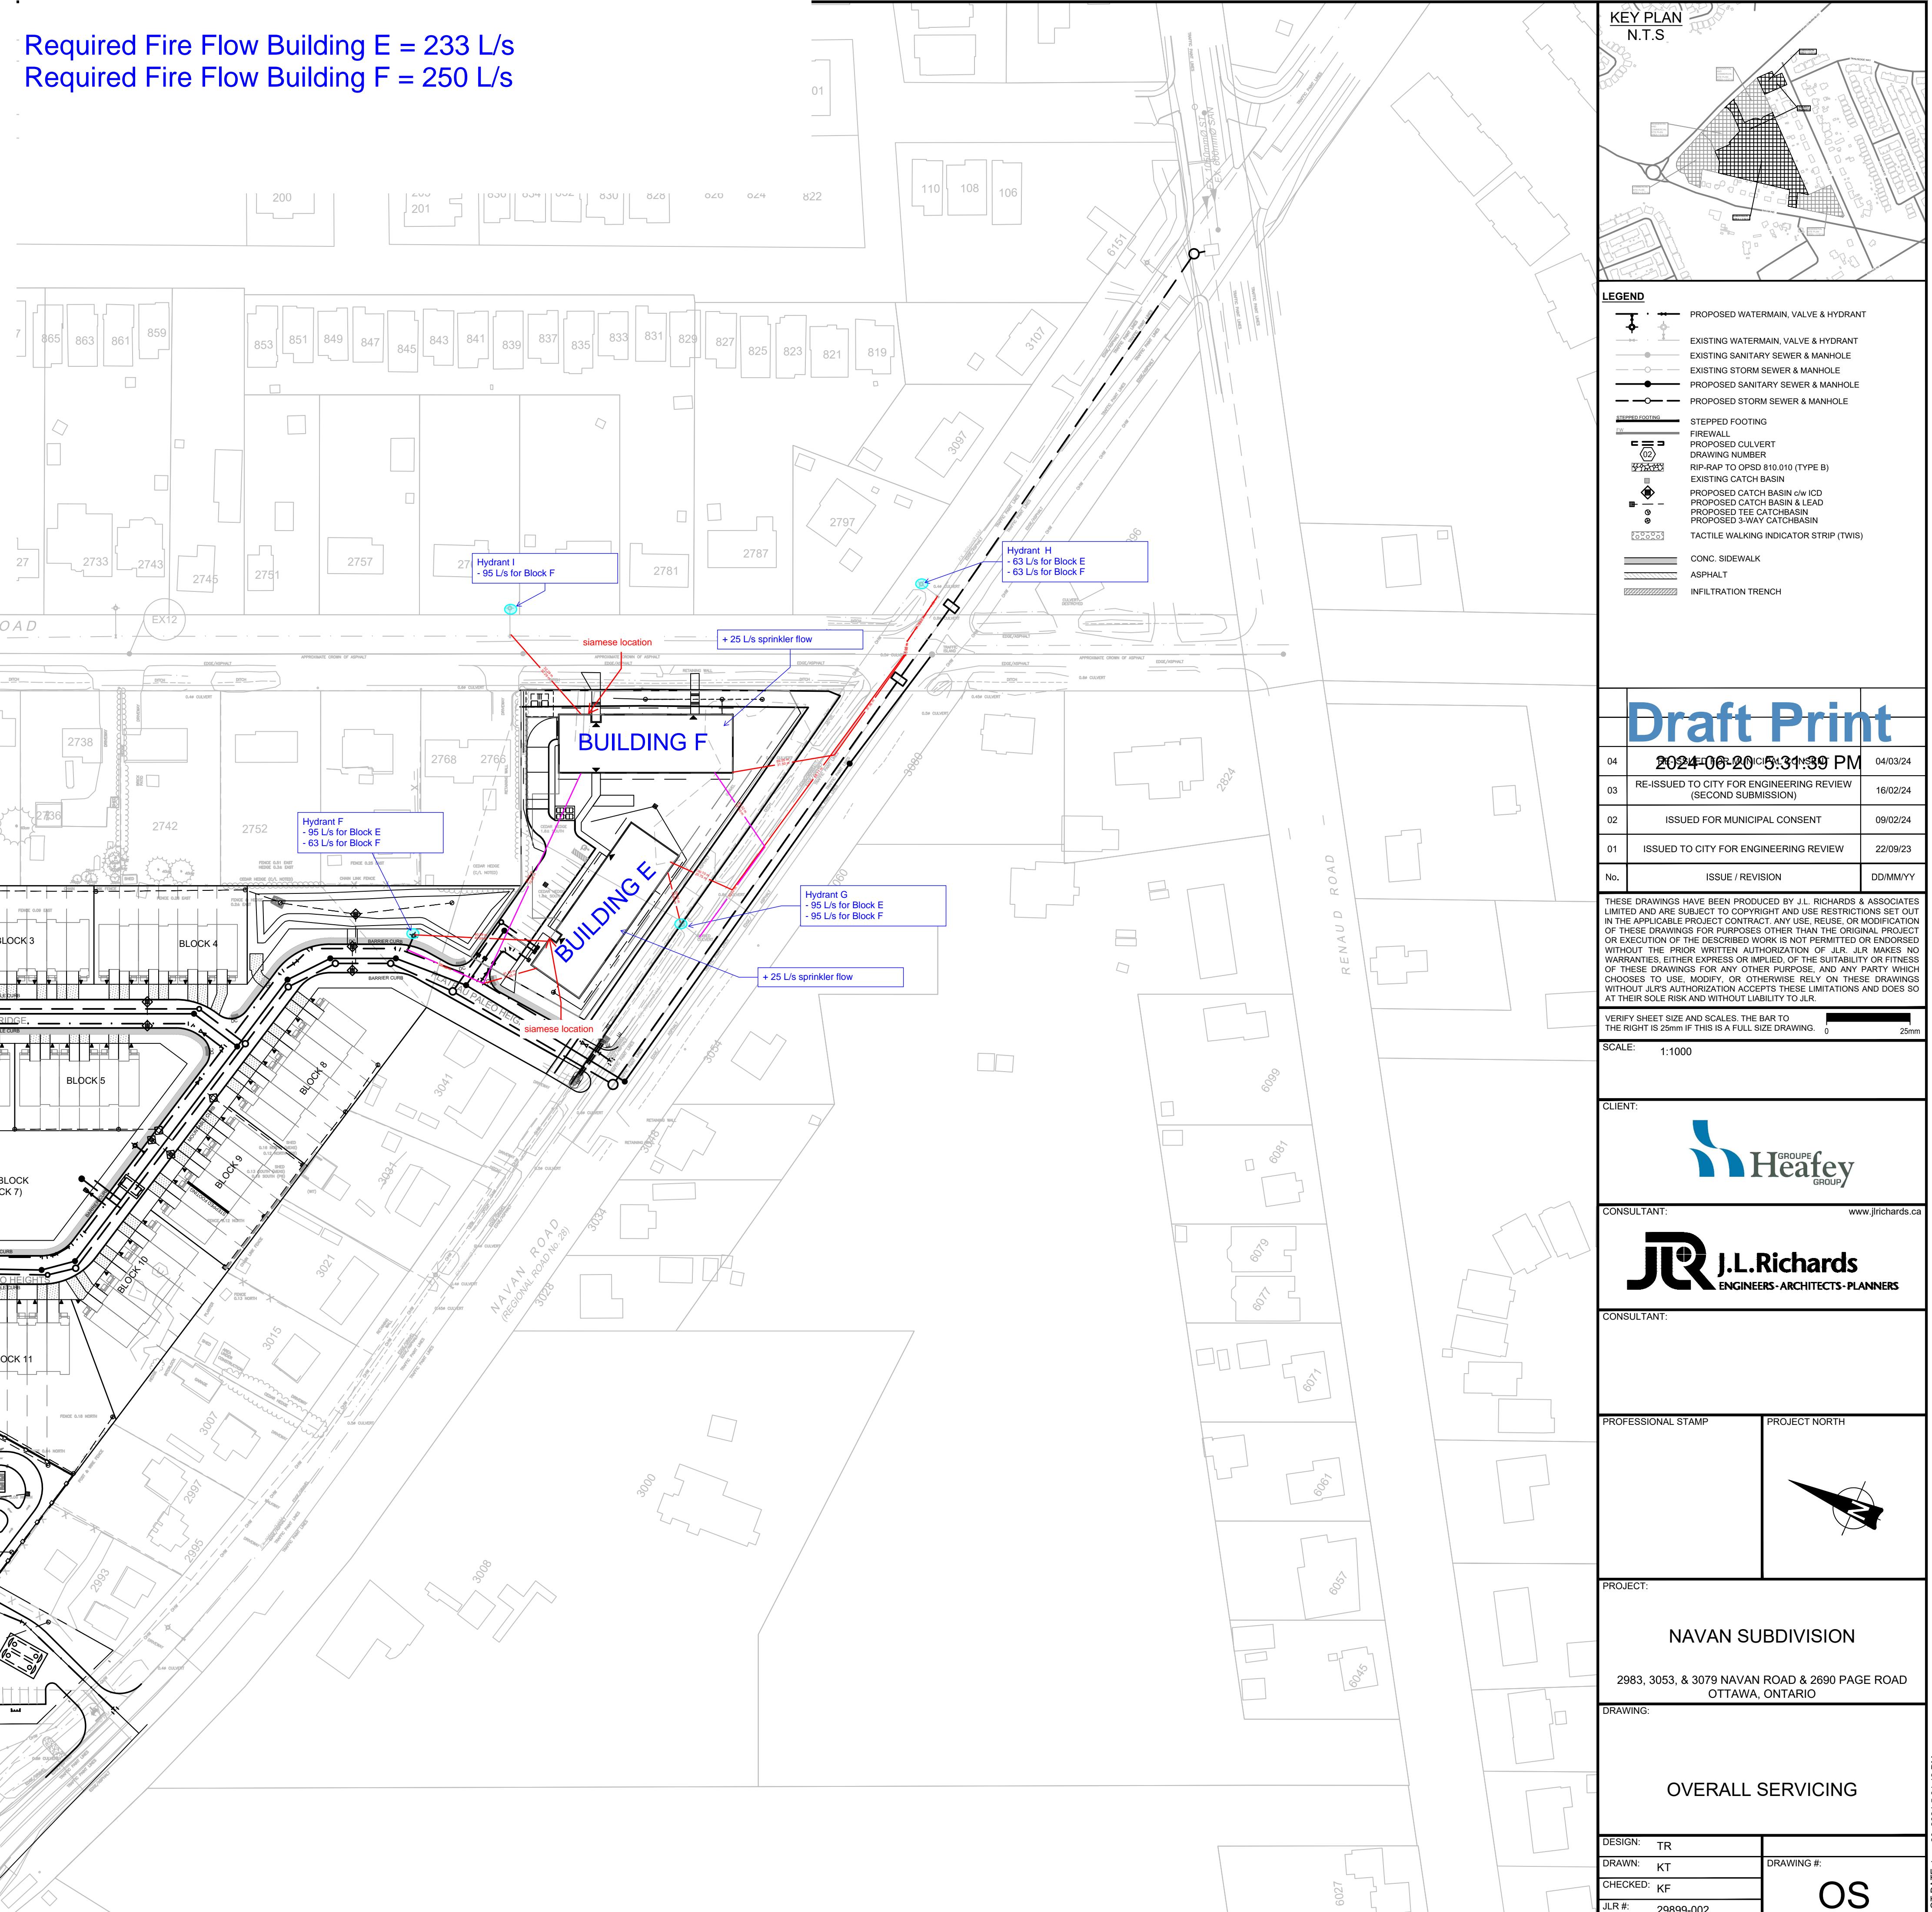

| Hydrant Class | Distance to asset/structure/building (m) <sup>a</sup> | Contribution to required fire flow (L/min) <sup>b</sup> |
|---------------|---|---|
| AA            | ≤ 75  | 5,700   |
|               | > 75 and ≤ 150  | 3,800   |
| A             | ≤ 75  | 3,800   |
|               | > 75 and ≤ 150  | 2,850   |
| B             | ≤ 75  | 1,900   |
|               | > 75 and ≤ 150  | 1,500   |
| C             | ≤ 75  | 800   |
|               | > 75 and ≤ 150  | 800   |

<sup>a</sup> Distance of contributing hydrant from the structure, measured in accordance with NFPA 1 (Appendix A).

<sup>b</sup> Maximum flow contribution to be considered for a given asset/structure/building, at a residual pressure of 20 psi, measured at the location of the main, at ground level.

## Block 17

Required Fire Flow Building E = 233 L/s  
Required Fire Flow Building F = 250 L/s

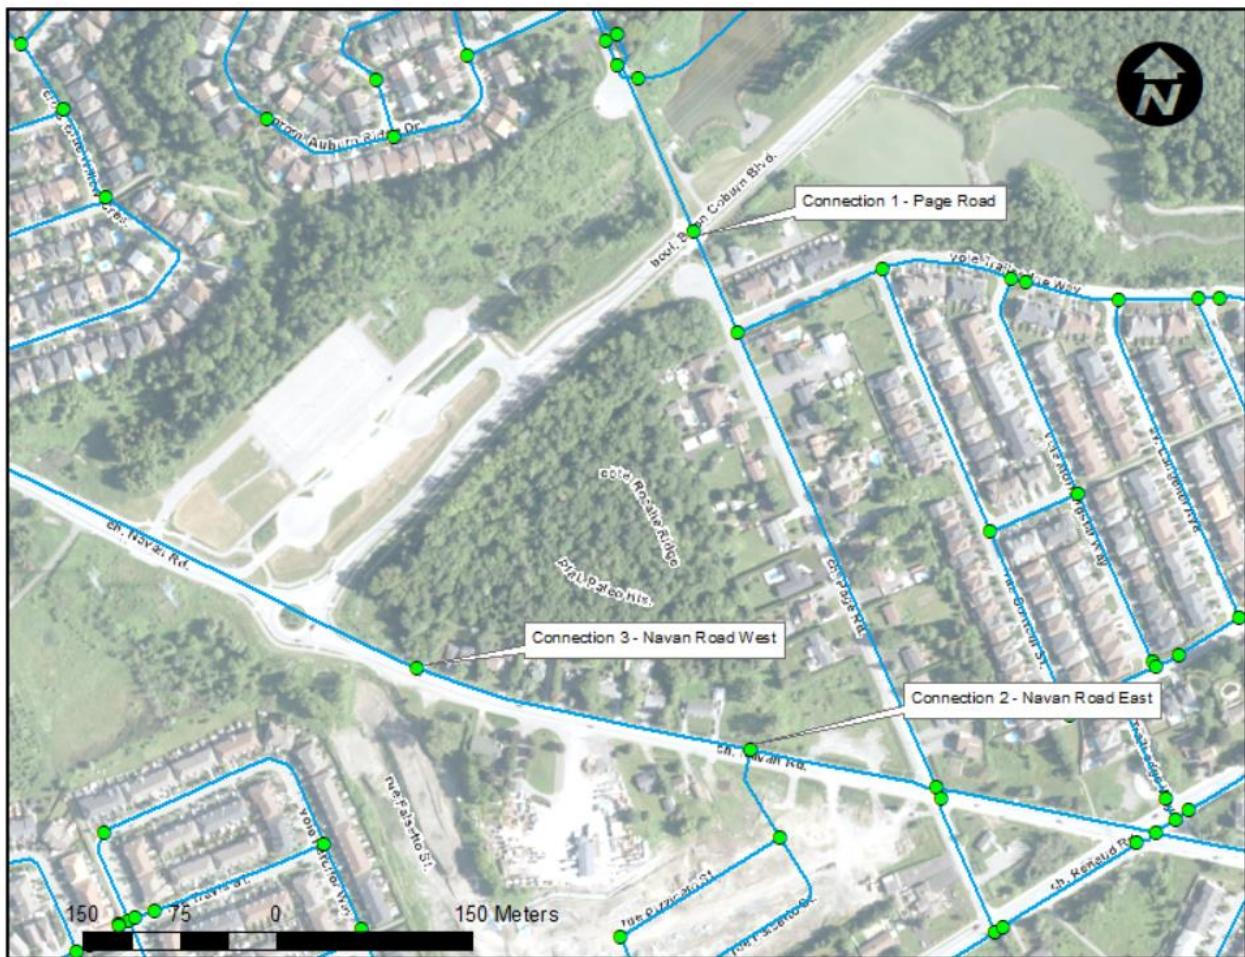

## Boundary Conditions Navan Subdivision

### Provided Information

| Scenario             | Demand |        |
|----------------------|--------|--------|
|                      | L/min  | L/s    |
| Average Daily Demand | 404    | 6.74   |
| Maximum Daily Demand | 632    | 10.53  |
| Peak Hour            | 1,090  | 18.17  |
| Fire Flow Demand #1  | 6,000  | 100.00 |
| Fire Flow Demand #2  | 10,000 | 166.67 |
| Fire Flow Demand #3  | 14,000 | 233.33 |
| Fire Flow Demand #4  | 15,000 | 250.00 |

### Location

## **Results**

### **Connection 1 - Page Road**

| Demand Scenario           | Head (m) | Pressure <sup>1</sup> (psi) |
|---------------------------|----------|-----------------------------|
| Maximum HGL               | 130.7    | 64.0                        |
| Peak Hour                 | 127.0    | 58.6                        |
| Max Day plus Fire Flow #1 | 128.2    | 60.4                        |
| Max Day plus Fire Flow #2 | 126.8    | 58.3                        |
| Max Day plus Fire Flow #3 | 124.9    | 55.7                        |
| Max Day plus Fire Flow #4 | 124.4    | 55.0                        |

<sup>1</sup> Ground Elevation = 85.7 m

### **Connection 2 - Navan Road East**

| Demand Scenario           | Head (m) | Pressure <sup>1</sup> (psi) |
|---------------------------|----------|-----------------------------|
| Maximum HGL               | 130.7    | 71.4                        |
| Peak Hour                 | 126.8    | 65.9                        |
| Max Day plus Fire Flow #1 | 127.7    | 67.1                        |
| Max Day plus Fire Flow #2 | 125.5    | 64.1                        |
| Max Day plus Fire Flow #3 | 122.7    | 60.1                        |
| Max Day plus Fire Flow #4 | 121.9    | 58.9                        |

<sup>1</sup> Ground Elevation = 80.5 m

### **Connection 3 - Navan Road West**

| Demand Scenario           | Head (m) | Pressure <sup>1</sup> (psi) |
|---------------------------|----------|-----------------------------|
| Maximum HGL               | 130.7    | 69.3                        |
| Peak Hour                 | 126.8    | 63.8                        |
| Max Day plus Fire Flow #1 | 127.3    | 64.5                        |
| Max Day plus Fire Flow #2 | 124.6    | 60.6                        |
| Max Day plus Fire Flow #3 | 120.9    | 55.3                        |
| Max Day plus Fire Flow #4 | 119.8    | 53.8                        |

<sup>1</sup> Ground Elevation = 81.9 m

## **Disclaimer**

*The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of water mains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.*

Hi Alex,

Just wondering if you have a status update for the boundary conditions for Navan.

Thanks  
Mahad

**Subject:** RE: Navan Subdivision - Boundary Condition Request

Good morning Alex,

As we discussed last week our Client is looking into the option of converting the row townhouse units into duplex units (townhouse units with apartments in the basement). As a result, this will increase the total demand on the site and we will therefore require new water boundary conditions. We'd like to note that the footprint of the blocks will not change and neither will their layout or any of the offsets.

As a summary:

- Domestic demands were calculated based on a daily consumption rate of 280 L/cap/day with peaking factors consistent with City of Ottawa Guidelines
- Required Fire Flow (RFF) was calculated in accordance to the Fire Underwriters Survey (FUS) Water Supply for Public Fire Protection and the City of Ottawa FUS protocol (Bulletin ISDTB-2014-02 & Bulletin ISDTB-2018-02), which considers material, expose distance & height. We have attached the calculation spreadsheet and the figure.

We request boundary conditions under high pressure, peak hour, and maximum day + fire flow conditions (for each of the below fire flows). Domestic demand and fire flow calculations are attached. Please provide the boundary conditions at the proposed connection locations as shown in the attached figure.

Average Day Demand: 6.74 L/s  
Maximum Day Demand: 10.53 L/s  
Peak Hour Demand: 18.17 L/s  
Required Fire Flow (per FUS): 6,000 L/min (100 L/s)  
Required Fire Flow (per FUS): 10,000 L/min (167 L/s)  
Required Fire Flow (per FUS): 14,000 L/min (233 L/s)  
Required Fire Flow (per FUS): 15,000 L/min (250 L/s)

For your reference, the previous boundary condition received from the City is attached and below is the email chain.

If you have any questions or comments please let us know.

Thanks  
Mahad

**Subject:** Navan Subdivision - Boundary Condition Request

Hello Alex.

To support our upcoming detailed design for the site, we are requesting updated boundary conditions for the 3079 Navan Road Development.

As a brief history, we received boundary conditions from the City in July 2021 (attached, but with incorrect connection locations) and again in April 2022 (also attached) in support of the functional servicing design. We understand from the April 2022 boundary conditions that the maximum available fire flow for the site is 250 L/s.

We are currently requesting updated boundary conditions for this site as we are commencing the detailed servicing design and this request will accommodate the recent site plan changes and proposed connection points. This request is also applicable to the upcoming site plan designs which will be submitted as separate applications.

We request boundary conditions under high pressure, peak hour, and maximum day + fire flow conditions (for each of the below fire flows). Domestic demand and fire flow calculations are attached. Please provide the boundary conditions at the proposed connection locations as shown in the attached figure.

**Average Day Demand: 6.44 L/s**

**Maximum Day Demand: 9.77 L/s**

**Peak Hour Demand: 16.50 L/s**

**Required Fire Flow (per FUS): 6,000 L/min (100 L/s)**

**Required Fire Flow (per FUS): 10,000 L/min (167 L/s)**

**Required Fire Flow (per FUS): 14,000 L/min (233 L/s)**

**Required Fire Flow (per FUS): 15,000 L/min (250 L/s)**

Thanks,  
Tatyana

Post-Development 24-hour SCS 1:100 year Event

March 2025

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.2 (Build 5.2.4)

\*\*\*\*\*  
Element Count  
\*\*\*\*\*

Number of rain gages ..... 2  
Number of subcatchments .. 10  
Number of nodes ..... 13  
Number of links ..... 9  
Number of pollutants ..... 0  
Number of land uses ..... 0

\*\*\*\*\*  
Raingage Summary  
\*\*\*\*\*

| Name     | Data Source | Data Type | Recording Interval |
|----------|-------------|-----------|--------------------|
| 24SCS100 | 24SCS100    | INTENSITY | 15 min.            |
| 3CHI100  | 3CHI100     | INTENSITY | 10 min.            |

\*\*\*\*\*

### **RD-200**

#### **Small Area Roof Drain**

#### **Specification**

Watts RD-200 epoxy coated cast iron roof drain with flashing clamp with integral gravel stop, self-locking polyethylene dome (standard), and no hub (standard) outlet.

**Adjustable Accutrol Weir**  
Tag: \_\_\_\_\_

**Adjustable Flow Control  
for Roof Drains**

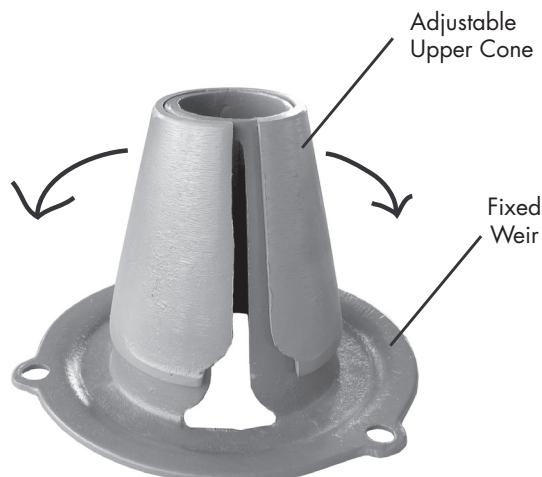

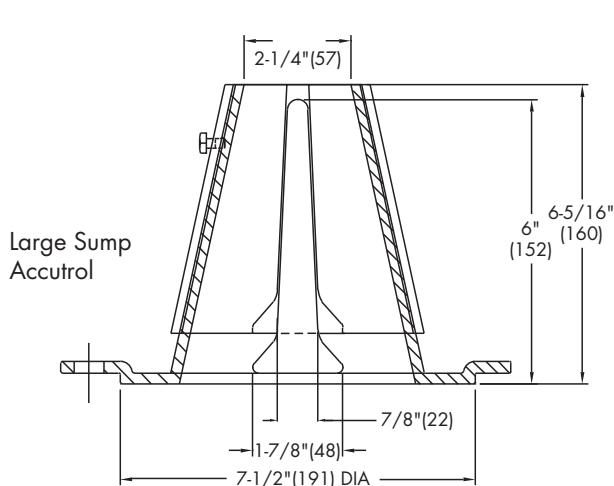

**ADJUSTABLE ACCUTROL (for Large Sump Roof Drains only)**

For more flexibility in controlling flow with heads deeper than 2", Watts Drainage offers the Adjustable Accutrol. The Adjustable Accutrol Weir is designed with a single parabolic opening that can be covered to restrict flow above 2" of head to less than 5 gpm per inch, up to 6" of head. To adjust the flow rate for depths over 2" of head, set the slot in the adjustable upper cone according to the flow rate required. Refer to Table 1 below.  
Note: Flow rates are directly proportional to the amount of weir opening that is exposed.

**EXAMPLE:**

For example, if the adjustable upper cone is set to cover 1/2 of the weir opening, flow rates above 2" of head will be restricted to 2-1/2 gpm per inch of head.

Therefore, at 3" of head, the flow rate through the Accutrol Weir that has 1/2 the slot exposed will be:  
[5 gpm (per inch of head) x 2 inches of head] + 2-1/2 gpm (for the third inch of head) = 12-1/2 gpm.

1/2 Weir Opening Exposed Shown Above

TABLE 1. Adjustable Accutrol Flow Rate Settings

| Weir Opening Exposed | 1"                             | 2" | 3"    | 4"   | 5"    | 6" |
|----------------------|--------------------------------|----|-------|------|-------|----|
|                      | Flow Rate (gallons per minute) |    |       |      |       |    |
| Fully Exposed        | 5                              | 10 | 15    | 20   | 25    | 30 |

**ENGINEERING SPECIFICATION: ZURN Z150F**

FLOFORCE™ High efficient flow performing roof drain for promenade deck roof drain applications. Drain incorporates a smooth funnel-shaped interior surface, providing a seamless transition to outlet connection and eliminating internal obstructions within the body. Complete with Dura-Coated cast iron body with membrane flashing clamp, rotatable square promenade frame, seepage openings, securing clamps, and heavy-duty ductile iron heel-proof grate.

**Subject:** Re-confirmation of Mechanical Items for Servicing Report

Hi Sarith/Chuck,

Thank you for the information below and in our meetings. I understand all these items have been discussed before but we need to submit something as part of our report. Can you just re-confirm the following questions below and then we will attach your confirmation to the Report.

1. Please confirm that the sanitary service size of 200mm diameter for the Site Plan Blocks (Block 14, 15 and 17) is preferred by the mechanical engineer on file;
2. Please confirm that a sprinkler flow of 25 L/s can be assumed for the Site Plan Blocks (Block 14, 15 and 17) at this stage.

Thanks  
Mahad
