Attention: **Scott Stinson**

Subject: **Hydrogeological Assessment and Terrain Analysis**
Proposed Industrial Development
301 Somme Street, Ottawa, Ontario

INTRODUCTION

Further to your request, Paterson has conducted a Hydrogeological Assessment and Terrain Analysis in support of a Site Plan Control Application (hereby referred to as a Site Plan application) for the proposed industrial development located at 301 Somme Street in Ottawa. Please refer to the Figure 1 - Key Plan attached for the approximate site location.

The purpose of this work has been to determine the suitability of the water supply aquifer underlying the site to support the Site Plan application as well as determining the suitability of the subject site to attenuate sewage system impacts. A Hydrogeological Assessment for a different Site Plan application for the same property was competed in 2022 by GHD Ltd (GHD) and was titled Hydrogeological and Impact Assessment Report (HIAR) dated September 22, 2022. The GHD HIAR has been used to support this assessment. Supplemental hydrogeological fieldwork was performed by Paterson to confirm the water quality which was encountered in the GHD HIAR report.

The Subject Site consists of a 6.09 ha lot which is largely brush-covered, with a engineered pad extending across the central portion of the site. The property is generally flat until the northern and western property boundaries, where it then slopes into abutting ditches. A mapped watercourse (GeoOttawa) flows from southwest to northeast along the northern property boundary.

The suitability of the aquifer to supply the subject site was assessed using the methodology provided in City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG).

HYDROGEOLOGICAL PRE-CONSULTATION

A Hydrogeological pre-consultation was completed with a City of Ottawa Hydrogeologist on July 11, 2025. It was proposed to use the data collected as part of GHD's HIAR to support this site plan application. During the Hydrogeological pre-consultation, the City Hydrogeologist indicated that the collection and submission of a water quality sample would be required to confirm the water quality encountered in the GHD HIAR. The intent behind the additional sampling is to confirm that the water quality is still similar to the water quality from the pumping test completed in support of the GHD HIAR.

DESCRIPTION OF SUBJECT SITE

The subject site is an approximately 6.09 ha undeveloped lot which is covered with grassed areas and brush. An engineered pad is located in the area of the proposed building from the previous Site Plan application. Please refer to Figure-1 Key Plan and Hobin Architecture Drawing No. A1.00 Vehicle Service & Storage Yard Site Plan attached for the proposed site location and site layout.

The subject site is currently vacant and will be serviced by a private water supply and sewage system. A drilled well was installed onsite on July 27, 2022, and is hereafter referred to as Test Well 1 (TW1). TW1 is the well which will be the service well for the proposed development.

The site is bordered to the north by Rideau Road, to the east by vacant properties, and to the south and west by Somme Street. The properties to the west of Somme Street remain undeveloped, while the property south of Somme Street consist of an industrial development. The subject site itself and the surrounding industrial areas are zoned RH for Rural Heavy Industrial Zone (GeoOttawa).

POTENTIAL KARST

Based on available Ontario Geological Survey (OGS) mapping (GRS005), the subject site is not within an area of known, potential or inferred karst.

RAISIN-SOUTH NATION SOURCE PROTECTION PLAN

The Raisin-South Nation Source Protection Plan (RSNSPP) provides guidance as to which policies apply to a given property, municipality or specific activity and if there are specific designations that apply to the area. The subject site and surrounding areas have been designated as a Highly Vulnerable Aquifer (HVA within the RSNSPP), Significant Groundwater Recharge Area (SGRA) and Intake Protection Zone 3 (IPZ 3) and is identified as three of four groundwater related vulnerable areas identified within the Clean

Water Act (2006). The four vulnerable areas consist of SGRA, HVA, IPZ, and wellhead protection area (WHPA).

Based upon the designation, the RSNSPP provides a list of activities that are prohibited, managed or encouraged to change/educate dependent upon the vulnerable area type. There are no restrictions of land uses on the subject site based upon its proposed usage.

Therefore, there are no related requirements for an HVA, SGRA or IPZ 3 at this location.

FIELDWORK PROGRAM

Well Testing – GHD HIAR – August 9, 2022

As a means to demonstrate the adequacy of the aquifer underlying the subject lands with respect to water quality and quantity, TW1 was installed in July of 2022 and submitted to a pumping test as part of GHD's HIAR. TW1 has a Water Well Record (WWR) Well ID of A342117. TW1 has a 152.4 mm diameter steel casing that extends to 15.9 m below ground surface (bgs) with a 0.7 m stick up. The well itself extends to a depth of 42.7 m bgs. Based on available geological mapping, the drift thickness at TW1 varies from 0 to 2 m. Refer to Hobin Architecture Drawing A1.00 Vehicle Service & Storage Yard Site Plan, attached, for the approximate location of TW1 (referred to as existing well).

As a means to evaluate the water supply aquifer intercepted by the well, the well was subjected to a 12-hour constant rate pumping test at a rate of 38 L/min. The pumping test was conducted on August 9, 2022 by GHD. Details of the pumping test can be found in the Hydrogeological and Impact Assessment completed by GHD (September 22, 2022).

The selected rate of 38 L/min provides approximately 6.7 times the Total Daily Design Sanitary Sewage Flow (TDDSSF) volume of 4,077 L/day during the 12-hour pumping test performed by GHD. Recovery data was collected from the well following the completion of the pumping in 2022. The well was noted to have achieved 100% recovery approximately 7 hours after the completion of the 12-hour pumping test.

Supplemental Well Testing – August 12, 2025

On August 12, 2025, Paterson completed supplemental geochemical testing on TW1 where TW1 was purged at a rate of 38 L/min for 6 hours, after which a water sample was obtained. The purpose of the supplemental testing was to confirm that the water quality of the aquifer accessed by TW1 is consistent with the results from the pumping test performed by GHD in 2022.

A submersible pump was installed by Air Rock Drilling Co Ltd and used for the 6-hour purge. The well purge was carried out at a pumping rate of 38 L/min for a duration of 6 hours. The water was discharged in a manner where the discharge water would not flow back towards the well. During the well purging, the pumping rate was measured using the timed volume correlation method. The pumping rate was maintained within 5% of the

selected pumping rate. An electric datalogger (VanEssen TD-Diver) was installed in the test well prior to the start of the well purge, and the static water level was periodically recorded manually.

The selected rate of 38 L/min provides approximately 3.4 times the Total Daily Design Sanitary Sewage Flow (TDDSSF) volume of 4,077 L/day, and equates to approximately 22 well volumes.

A series of field tests of the pumped water were carried out at the well head at the end of the 6-hour well purge. The parameters tested at the well head included: pH, total dissolved solids, conductivity, turbidity, true colour, hydrogen sulfide, and temperature. Calibration / confirmation of calibration of all field-testing equipment was performed in Paterson's laboratory the day prior to the pumping test. Values are then confirmed again onsite prior to the start of the pumping test.

Groundwater samples were collected at 6 hours after the start of the purging. Prior to collection of the groundwater samples, the free chlorine residual was verified as non-detectable. The water samples were submitted for comprehensive testing of bacteriological, chemical, and physical water quality parameters consistent with the standard "Subdivision Supply" suite of parameters plus trace metals, and Volatile Organic Compounds (VOCs).

All samples were collected unfiltered and unchlorinated and were placed directly into clean bottles supplied by the analytical laboratory. Samples were placed immediately into a cooler with ice and were transported directly to Environmental Testing Canada Inc. (Eurofins) laboratory in Ottawa. All samples were received by the laboratory within 24 hours of collection.

Aquifer Analysis

The parameters encountered in the samples collected by Paterson after the well purge are similar to those found in GHD's HIAR (2022). Based on a comparison of the water quality results, there are no significant changes in water quality compared to the pumping test performed in 2022 by GHD as part of the HIAR, and therefore the pumping test completed by GHD in support of the HIAR can be considered representative for this assessment.

Water Quantity

Pumping test data was analyzed by GHD and is presented below:

Table 1: SUMMARY OF WATER SUPPLY AQUIFER CHARACTERISTICS OF TW1 GHD HIAR – AUGUST 9, 2022 PUMPING TEST	
AQUIFER PARAMETER	**RESULT OF ANALYSIS**
Transmissivity (m^2/day)	26.7
Pumping Rate (L/min)	38
Pre-test Static Water Level (m)	7.9
Post-test Static Water Level (m)	8.7
Available Drawdown (m)	31.5
% Drawdown During Pumping Test (%)	2.5
Specific Capacity (L/min/m drawdown)	48.5

The drawdown data was analyzed in GHD's HIAR and aquifer transmissivity was estimated to be 33.4 m^2/day based on the drawdown and 26.7 m^2/day based on the recovery.

The pumping test results from GHD's HIAR shows that TW1 has a high yield to support the water demands that may be required. Overall maximum drawdown at a constant pumping rate of 38 L/min, for a period of 12 hours was approximately 0.8 m (2.5% of the available drawdown). Full Recovery was attained within 7 hours after pumping ceased.

The total volume of water pumped during the 12-hour pumping event was approximately 27,360 L. This is approximately 6.7 times the maximum total daily design volume of water (4,077 L/d) required to support the Site Plan Control Application.

Based on the information summarized in Table 1, it is readily apparent that the water supply well has intercepted an adequately strong water supply aquifer which has sufficient quantity to service the proposed Site Plan Control Application.

The suitability of the aquifer to supply the proposed Site Plan Application for the proposed industrial development was assessed using the methodology provided in the City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG).

Given the analyses presented and summarized above, it is our opinion that there is an adequate supply of water to support the proposed Site Plan Control Application. Available water well records (WWR) of the neighboring properties on the MECP Well Record mapping website indicated that the wells were screened in limestone. Surrounding WWRs are attached to this report.

Water Quality

Laboratory Data

During Paterson's well purge, a total of 13,680 L was discharged. This is approximately 3.4 times the TDDSSF, and equates to approximately 22 well volumes.

A HACH Pocket Colorimeter II chlorine reader was used to measure the free chlorine residual level. No chlorine residual was detected in the discharge water prior to the collection of the water sample at the end of Paterson's well purge.

Hydrogen sulfide was not detected olfactorily during Paterson's well purge. Hydrogen sulfide levels were measured using the HACH Hydrogen Sulfide Test Kit, Model HS−C, (# 2537800).

The Subdivision Package suite of parameters and trace metals laboratory water quality obtained from the 12-hour pumping test sample collected by GHD (HIAR), along with the geochemical results from the sample collected at the end of Paterson's well purge (August 12, 2025), are presented in Tables 3a and 3b below. The laboratory analyses reports can be found attached. VOC laboratory analytical testing was completed on the sample collected at the end of Paterson's well purge and was found to be non-detect in the sample results. All laboratory test results can be found attached to this report.

1. ODWS identifies the following types of parameters:
   MAC = Maximum Acceptable Concentration
   IMAC = Interim Maximum Acceptable Concentration
   AO = Aesthetic Objective
   OG = Operational Guideline
2. Shaded Concentration Indicates an Exceedance of the ODWS Objective

The bacteriological test results from Paterson's Well purge (Certificate of Analysis – Report No. 4432589) indicated that the test samples at the 6-hour point were non-detect (0 ct/100 mL) for E.Coli and Total Coliforms.

The water quality of the subject water supply well meets all the Ontario Drinking Water Standards Maximum Acceptable Concentrations (MAC). The water meets all of the Aesthetic Objectives (AO) and Operational Guidelines (OG) with the exception of the following:

- ❑ Hardness (as $CaCO_3$)
- ❑ Fluoride (F)
- ❑ Total Dissolved Solids (TDS)
- ❑ Iron (Fe)
- ❑ Manganese (Mn)

Each of these groundwater parameters are discussed in detail below. Should any water treatment be desired by the owner, it is recommended that a water treatment specialist be retained to ensure that water treatment occurs in a safe manner.

Hardness as $CaCO_3$

Hardness, expressed as calcium carbonate, is an operational guideline and does not appear in the ODWS. Rather, it appears in the Technical Support Documents for Ontario Drinking Water Standards, Objectives and Guidelines as a parameter with an operational guideline at 100 mg/L. At the measured concentrations of 567 mg/L, the water is considered to be very hard, and it is above the Ontario Drinking Water Objective (ODWO) of 500 mg/L specified in Table 3 of the MOECC guidance document Procedure D-5-5 (1996).

The Langelier Saturation Index (LSI) calculation provided an LSI of 0.5. Based on the evaluation of the result, the water is super saturated and tends to precipitate a scale layer of calcium carbonate (slightly scale forming and slightly corrosive). Based on the range of stability in the positive direction, there are no mitigative measures needed. See Langelier Saturation Index Calculation attached for calculation details.

It is recommended that water hardness be treated using conventional technologies such as water softening or reverse osmosis, if desired by the owner. Without treating hardness, scaling can occur which can result in discolouration and residue buildup on water fixtures, or reduction in boiler efficiency due to scale build-up. According to Health Canada's *Guidelines for Canadian Drinking Water Quality - Summary Tables,* "Although hardness may have significant aesthetic effects, a guideline has not been established because public acceptance of hardness may vary considerably according to the local conditions; major contributors to hardness (calcium and magnesium) are not of direct public health concern".

Fluoride

Fluoride can be naturally occurring in groundwater and has been added to drinking water in concentrations of 0.5 to 0.8 mg/L to control tooth decay. Fluoride was present in concentrations of 2.2 mg/L. The MAC for fluoride is 1.5 mg/L, however, concentrations up to 2.4 mg/L are considered acceptable where the fluoride is naturally occurring.

According to the Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines (TSDODWSOG), when fluoride concentrations are above 1.5 mg/L but less than 2.4 mg/L the Ministry of Health and Long Term Care recommends that an approach through local boards of health be used to raise public and professional awareness to control for excessive exposure to fluoride. Although no treatment is required for fluoride, it must be reported to the local Medical Officer of Health.

Total Dissolved Solids (TDS)

Total Dissolved Solids (TDS) refers to the concentration of inorganic substances dissolved in water. The main constituents are typically chloride, sulphates, calcium, magnesium, and bicarbonates. The TDS concentration of 787 mg/L exceeds the Aesthetic Objective of 500 mg/L. At concentrations above 500 mg/L, some consumers may find the taste objectionable, however, as the objective is an aesthetic objective, no treatment is required. It is recommended that a point of use reverse osmosis unit be installed, if the owner desires, for drinking purposes. As such, no taste problems will occur when the system is used.

The Langelier calculation provided an LSI of 0.5. Based on the evaluation of the result, the water is super saturated and tends to precipitate a scale layer of calcium carbonate (slightly scale forming and slightly corrosive). Based on the range of stability in the positive direction, there are no mitigative measures needed for TDS. See Langelier Saturation Index Calculation attached for calculation details.

Iron

Concentrations of iron above 0.3 mg/L can contribute to staining of fixtures and a metallic taste at higher concentrations. Precipitation of iron can promote the growth of iron bacteria in pipes. The concentration of iron in the groundwater in TW1 was measured to be 0.55 mg/L. The concentration of iron in the groundwater is considered to be reasonably treatable in accordance with Procedure D-5-5. It is recommended that a water softener or manganese greensand filter be used to reduce the levels of iron and reduce the potential for excessive precipitate occurring in the water supply system, if desired by the property owner. If treatment is not used, negative impacts such as discolouration of water fixtures, precipitation of iron and staining may occur.

Manganese

The manganese concentration results from the laboratory test samples yielded a value of 0.18 mg/L in the onsite well, which is above the aesthetic objectives in the ODWSOG of 0.05 mg/L. The Health Canada Federal Drinking Water Guidelines have suggested a health related MAC of 0.12 mg/L due to potential adverse effects on the central nervous system primarily in infants due to chronic exposure, however this guideline has not been implemented by Ontario as of the writing of this report. Furthermore, this is an industrial development that is not raising infants.

According to the Guidelines for Canadian Drinking Water Quality: Guideline Technical Document – Manganese, section 3: “Specific guidance related to the implementation of drinking water guidelines should be obtained from the appropriate drinking water authority in the affected jurisdiction.”. The applicable regulations which apply to the development approval process for this site are the HTAG and MECP Procedure D-5-5, which does not have a MAC for manganese.

Procedure D-5-5 gives a maximum concentration considered reasonably treatable for manganese as 1.0 mg/L. It is recommended that a reverse osmosis system, ion exchange, water softeners and / or an oxidizing filter be used to reduce the manganese concentration, if desired by the owner.

As the concentration of manganese is elevated above the Health Canada Federal Drinking Water Guidelines, a notice regarding the elevated levels of manganese in the aquifer accessed by TW1 is recommended to be registered on title so that future owners are made aware.

The City of Ottawa (Ottawa Public Health) has prepared a Manganese in drinking Water Factsheet, which can be found attached to this report.

Sodium

Sodium (Na), an aesthetic parameter, was detected in the laboratory test sample at concentrations of 65 mg/L, which does not exceed the ODWS aesthetic objective of 200 mg/L. Although sodium is not toxic and no maximum acceptable concentration has been set, concentrations above 20 mg/L require that the Medical Officer of Health be notified of the water quality results, so that this information may be passed on to local physicians for use in treatment of those requiring a sodium-restricted diet. It should be noted that some water treatment technologies, such as water softeners, can increase the sodium concentration so care should be given if such treatment technologies are used.

Terrain Analysis

Surficial Geology

A series of boreholes were put down on the subject parcel to delineate the subsurface soil conditions. Onsite investigations were completed by Paterson in 2025, 2021 and 2019 with further investigations completed by others in 2021, 2020, and 2008. The boreholes were distributed in a manner to provide general coverage of the subject site, taking into consideration underground services and available site access. The locations of the test holes on the property are delineated on the Test Hole Location Plan, drawing PG7327-1, attached.

The borehole locations were recorded and the subsurface conditions, including the soil morphology and depth to the groundwater table (if encountered), were carefully observed and recorded. The soils encountered were classified texturally in the field and later reviewed in the laboratory.

Generally, the subsurface profile at the borehole locations were observed to consist of topsoil followed by an approximate 2.3 to 10 m thickness of fill material followed by a layer of clayey silt to silty clay and/or silty sand. Generally, the fill material consisted of silty sand and/or silty clay with varying amounts of organics, gravel, asphalt, concrete and bedrock fragments. The boreholes were advanced to a maximum depth of 14.3 m below ground surface (bgs).

Reference should be made to the test pit logs appended to this report for the details of the soil profiles encountered at each test hole location. The client should be aware that any information pertaining to soils are furnished as a matter of general information only and borehole descriptions are not to be interpreted as descriptive of conditions at locations other than those described by the boreholes themselves.

Hydrogeological Sensitivity of the Site

The subject site is currently vacant and undeveloped aside from an engineered pad. The subject site is to be serviced by a private well and sewage system. The site is bordered by Rideau Road to the north, by vacant lands to the east, and by Somme Street to the west and south. All surrounding properties are on private services.

The overburden at the test hole locations generally consists of topsoil followed by an approximate 2.3 to 10 m thickness of fill material followed by a layer of clayey silt to silty clay and/or silty sand overlying bedrock. The WWR for TW1 indicates that bedrock was encountered at 14.0 m bgs. According to available geological mapping, the drift thickness within the site varies from 0 to 2 m bgs.

According to the geotechnical field investigation, the overburden thickness was observed to be greater than 2 m. As such, the site is not considered to be hydrogeologically sensitive and, therefore, mitigating measures are not required.

Conceptual Lot Development Plan

A vehicle service building, a storage building, a cardlock fueling area and propane storage tanks along with infrastructure is proposed to be constructed onsite. The location of the proposed structure can be found on the attached Hobin Architecture Drawing A1.00 Vehicle Servicing & Storage Yard Site Plan, attached to this report.

Proposed Sewage System

A sewage system design was completed by Paterson and submitted to the Ottawa Septic System Office (OSSO) for a Sewage System Installation Permit (SSIP). The sewage flows for the proposed development are based on Part 8 of the Ontario Building Code (OBC). The Total Daily Design Sanitary Sewage Flow (TDDSSF) volume was calculated to be 4,077 L/day.

The approved OSSO SSIP includes an Advantex AX25-RT treatment system, which is an NSF 245 approved sewage treatment system capable of reducing total nitrogen levels by at least 50 %.

The OSSO approved SSIP will be submitted separately as part of the Site Plan application.

Predictive Nitrate Impact Assessment

Nitrate is considered to be a critical parameter of concern when assessing impacts to groundwater quality downgradient of an onsite sewage system. The City's HTAG, including the annotated MECP Procedure D-5-4 applies for the proposed development. For the purpose of this guideline, the Ontario Drinking Water Objective of 10 mg/L of nitrate is used as an indicator of groundwater impact potential.

Under this guideline, where the average lot size is one hectare or larger and the minimum lot size is 0.8 ha or greater, a detailed impact assessment may not be required. It has been the City of Ottawa's policy that where the lot size of 0.8 ha or larger, a detailed assessment is typically not required since it is considered to be a low-risk development.

The subject site is located within the Hawthorne Industrial Park industrial subdivision (Golder Associates 08-1122-0215-3, September 2011). The subject site is 6.09 ha in size, while the industrial subdivision has an average lot size of 3.15 ha, with lot sizes ranging from 0.8 – 11.04 ha. As such, a detailed nitrate impact assessment (NIA) would not typically be necessary. An NIA was completed below to corroborate our opinion that the property can adequately support the proposed development without having adverse impacts on the underlying bedrock aquifer should the minimum separation distances, well construction, and sewage system be completed as per the recommendations of this report and the OBC. The values shown in the Predictive Nitrate Impact Assessment attached to this report are summarized below.

- ❑ Site area 6.09 ha
- ❑ Impervious area (%) 80 %
- ❑ Daily sewage flow 4.1 m^3/d
- ❑ Concentration of nitrate in effluent with treatment 20 mg/L
  (Value based on nitrate reduction system (Advantex AX25RT Series) with 50 % nitrate reduction)
- ❑ Surplus Water 361 mm/yr
  (The surplus water value was estimated based on Environment Canada Climate Office values with a soil type comprised of clay (Urban Lawns) and anthropogenic sources.)
- ❑ Combined infiltration factor based on: 0.50
- Topography infiltration factor 0.20
- Soil texture infiltration factor 0.20
- Cover infiltration factor 0.10

The topography infiltration factor of 0.20 is based upon a rolling land with an average slope of 2.8 to 3.8 m/km. The soil texture infiltration factor was based upon a material which consisted of a silty sand to silty clay, which is a medium combination of clay and loam with a value of 0.2. This is a reasonable generalization of the overburden. The “cover infiltration factor” was calculated at 0.10 based upon a conservative cultivated land type cover.

There are numerous tertiary treatment technologies that are NSF/ANSI 245 and/or BNQ certified for 50% nitrate reduction, resulting in an effluent nitrate concentration of less than 20 mg/L. The proposed sewage system consists of an Advantex AX25-RT treatment system, which is NSF 245 certified and is therefore capable of providing a minimum of 50 % nitrate reduction. When using an effluent nitrate concentration of 20 mg/L, the predicted nitrate concentration at the property boundary is **8.09 mg/L**. This is below the limit of 10 mg/L of nitrate at the property boundary.

Based on the results of the predicted nitrate impact assessment, it is our opinion that the property can adequately support the proposed industrial development without having an adverse impact on the underlying bedrock aquifer, provided that a NSF/ANSI 245 and/or BNQ certified 50% nitrate reduction technology is used in the sewage system.

CONCLUSIONS

Based on the information contained within the body of this report the following conclusions can be drawn:

1. The water supply aquifer intercepted by the existing well is considered to be adequate to support the water quantity demands for the proposed industrial development.

2. The groundwater contains elevated concentrations of hardness, fluoride, TDS, iron and manganese. The noted parameters can be treated to functional concentrations with current readily available water conditioning equipment, if desired by the owner.

3. Elevated concentrations of manganese were encountered in the water supply intercepted by TW1. Although only regulated for aesthetic reasons in Ontario (AO of 0.05 mg/L), the federal government of Canada has a MAC of 0.12 mg/L due to potential adverse effects on the central nervous system primarily in infants due to chronic exposure. This guideline has not been implemented by Ontario as of the writing of this report. As the concentration of manganese is elevated above the Health Canada Federal Drinking Water Guidelines, a notice regarding the elevated levels of manganese in the aquifer accessed by TW1 is recommended to be registered on title so that future owners are made aware.

4. If desired by the property owner, a residential grade water softener can be used to facilitate the reduction of the hardness concentration and reduce scaling. If a water softener is used for the proposed development, the owner should be made aware that additional sodium will be added to the water to reduce hardness. Note that elevated hardness is above the MCCRT, however, the MCCRT for hardness is related to aesthetic reasons. If desired, a point-of-use reverse osmosis system can be used to provide a drinking tap source without increasing sodium levels.

5. The sodium concentration was measured to be above the 20 mg/L reporting limit and, as such, the Medical Officer of Health for the City of Ottawa should be informed to assist area physicians in the treatment of local residents on sodium reduced diets. It should be noted that some water treatment equipment may further increase the sodium concentration.

6. The predicted nitrate concentrations at the property boundary is calculated to be below the required 10 mg/L threshold when an NSF/ANSI 245 and/or certified BNQ system with a minimum of 50 % nitrate reduction tertiary treatment system is used.

7. A Sewage System Permit and Building Permit need to be issued prior to the commencement of construction on the proposed industrial building or the proposed sewage system.

8. The results of the Hydrogeological Assessment and Terrain Analysis have provided satisfactory evidence that the subject site can support the proposed building addition with respect to water quantity and sewage system placement.

We trust that the current submission satisfies your immediate requirements.

Best Regards,

Paterson Group Inc.

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Management Coordinator at 416-235-6203.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

OFFICIAL CERTIFICATE OF ANALYSIS : 4432589

WORK REQUEST : 100377108

Report Date : 2025-08-20

Paterson Group
9 Auriga Dr
Nepean, Ontario
K2E 7T9
Attention : Alex Schopf

Reception Date : 2025-08-12
Project : PH5075
Sampler : NA
PO Number : 63782
Temperature : 9 °C

Analysis	Quantity	External Method
Alkalinity (Water, Automated)	1	Modified from SM 2320 B
Ammonia, Total (Water, Colorimetry)	1	Modified from EPA 350.1
Chloride (Water, IC)	1	Modified from SM 4110 B and C
Colour, True (Water, Spectrophotometry)	1	Modified from SM 2120 C
Conductivity (Water, Automated)	1	Modified from SM 2510 B
DOC (Water, IR)	1	Modified from SM 5310 B
Escherichia coli (DC Plate)	1	Modified from MECP E3407
Fluoride (Water, Auto/ISE)	1	Modified from SM 4500-F A and 4500-F C
Hardness (Water, Calculation Only)	1	SM 2340 B
Ion Balance (Water, Calculation)	1	Modified from SM1030 E
Metals Scan (Water, ICP/MS)	1	Modified from EPA 200.8
Metals Scan (Water, ICP/OES)	1	Modified from SM 3120 B
Nitrate (Water, IC)	1	Modified from SM 4110 B and C
Nitrite (Water, IC)	1	Modified from SM 4110 B and C
pH (25°C) (Water, Automated)	1	Modified from SM 4500-H+ B
Phenols (Water, Colorimetry)	1	Modified from EPA 420.2
Sulphate (Water, IC)	1	Modified from SM 4110 B and C
Sulphide (Water, Colorimetry)	1	Modified from SM 4500-S2 D
Tannin and Lignin (Water, Spec)	1	Modified from SM 5550 B
TDS (Estimated)	1	Modified from SM 2510 A
Total Coliforms (DC Plate)	1	Modified from MECP E3407
Total Kjeldahl Nitrogen (Water, Colorimetry)	1	Modified from EPA 351.2
Turbidity (Water, Turbidimeter)	1	Modified from SM 2130 B
VOCs (Water, GC/MS)	1	Modified from EPA 8260

Criteria :
A : Ontario Regulation 169/03 (Non-Regulated Drinking Water)

Sample status upon receipt :
8908634
Compliant

Certificate Comments :
Revision 1: This is an amendment and supersedes certificate 4431403. Full VOC scan added as per client's request.

8908634
N-NO2 and N-NO3 MRL increased due to matrix interference, dilution was done.

Notes :
- All analysis is completed at Eurofins Environment Testing Canada Inc. (Ottawa, Ontario) unless otherwise stated.
- Eurofins Environment Testing Canada Inc. is accredited by CALA, Canadian Association for Laboratory Accreditation to ISO/IEC 17025 for tests which appear on the scope of accreditation. The scope is available at https://directory.cala.ca/
- Please note: Field data, where presented on the report, has been provided by the client and is presented for informational purposes only. Guideline or regulatory limits listed on this report are provided for ease of use (informational purposes) only. Eurofins recommends consulting the official guideline or regulation as required. Unless otherwise stated, measurement uncertainty is not taken into account when determining guideline or regulatory exceedances.

Legend :

RL : Reporting limit	N/A : Not applicable	* : Analysis conducted by external subcontracting
QC : Reference material (QC)	1 : Results in annex	^ : Analysis not accredited

Project : PH5075

Reception Date: 2025-08-12

						Eurofins Sample No :	8908634			
						Matrix :	Groundwater			
						Sampling Date :	2025-08-12			
						Client Sample Identification :	TW1 - GW1			
Volatile Organic Compounds	**RL**	**Unit**	**Criteria**							
			A	**B**	**C**					
Trichloroethylene (TCE)	0.3	ug/L	5			<0.3				
Trichlorofluoromethane	0.5	ug/L				<0.5				
Vinyl chloride	0.2	ug/L	1			<0.2				
Xylene (Total)	0.5	ug/L	90			<0.5				
1,2-dichloroethane-d4 (surrogate)	0	%				85				
4-bromofluorobenzene (surrogate)	0	%				111				
Toluene-d8 (surrogate)	0	%				115

REGULATION/GUIDELINE REQUIRED

- ☐ Sanitary Sewer, City: Ottawa
- ☐ Storm Sewer, City: Ottawa
- ☑ ODWSOG
- ☐ PWQO
- ☐ O. Reg 347/558
- ☐ Other: ______
- ☐ None

- ☐ O. Reg 153

Table # ___, Course / Fine, Surface / subsurface.
Type: Com-Ind / Res-Park / Agri / GW / All Other / Sediment

☐ Excess Soil, Table: ______ Type: ______

The sample results from this submission will form part of a formal Record of Site Condition (RSC) under O.Reg. 153/04
☐ Yes ☐ No

The optimal temperature conditions during transport should be less than 10°C. Sample(s) cannot be frozen, unless otherwise indicated or agreed upon with the Laboratory. Note that this COC is not to be used for drinking water samples. The COC must be complete upon submission of the samples, there will be a $25 surcharge if required information is missing (required fields are shaded in grey).

PH5075

MW1	inputs		
pH	8.2	A	0.19
TDS	787	B	2.35
Calcium	128	C	1.71
Alkalinity	306	D	2.49
Temp.	11.4		
		pHs =	7.651109829

Langelier Saturation Index (LSI) Calculation

(Langelier, 1936)

LSI = pH - pHs

pHs = (9.3 + A + B) - (C + D)

Where:

A = (Log10 [TDS] - 1) / 10

B = -13.12 x Log10 (oC + 273) + 34.55

C = Log10 [Ca2+ as CaCO3] - 0.4

D = Log10 [alkalinity as CaCO3]

LSI =	0.5

LSI	Effect
0.5 to 2	Water is super saturated and tends to precipitate a scale layer of calcium carbonate (scale forming but non-corrosive)
0 to 0.5	**Water is super saturated and tends to precipitate a scale layer of calcium carbonate (slightly scale forming and corrosive).**
0	Water is saturated (in equilibrium) with calcium carbonate. A scale layer of calcium carbonate is neither precipitated nor dissolved.
0 to -0.5	Water is under saturated and tends to dissolve solid calcium carbonate (slightly corrosivebut non-scale forming).
-0.5 to -2	Water is under saturated and tends to dissolve solid calcium carbonate (seriously corrosive).

Manganese in Drinking Water Fact Sheet

WHAT IS MANGANESE?

Manganese is a naturally occurring element that is an essential nutrient for humans and animals. It is found in many foods, as well as in air, water, soil, and rocks.[1] Manganese makes up 0.1% of the Earth's crust, and can be found as a component of other minerals like sulfides, oxides, carbonates, and silicates.[2] Manganese is used in the manufacture of various products including iron and steel alloys, batteries, glass, fireworks, fertilizers, cosmetics, paints, and cleaning and disinfection products.[1,2] Manganese can also be purchased as a nutritional supplement.[2]

HOW DOES MANGANESE GET INTO DRINKING WATER?

Manganese is naturally occurring in many surface and ground waters. Manganese can also be dissolved from soils, sand and rocks to enter surface and ground waters.[1] Human activities like mining, industrial discharges, or landfills may also contribute to manganese in surface and ground waters.[1,2] In general, manganese can be found at higher concentrations in groundwater compared to surface water.[2] Some lakes and reservoirs can also have higher levels of manganese due to natural water chemistry.[2]

Permanganate, a compound that contains manganese, may also be added to water during the treatment of drinking water to remove other chemicals (e.g., for the removal of iron).[2,3]

HOW DOES MANGANESE INTAKE AFFECT MY HEALTH?

Too much or too little manganese in your body can lead to health problems.

Manganese deficiency: Manganese deficiency is rare and symptoms are not well defined. Health effects observed in individuals with diets very low in manganese include skin rashes, slow nail growth, reduced bone density, loss of pigmentation in hair, and low cholesterol levels.[2]

Manganese excess: There are few reports of adverse health effects from people who ingest too much manganese from food and water.[1] Recent evidence reviewed by Health Canada indicates that high levels of manganese in drinking water may impact memory and learning, behaviour, and fine motor control in infants and young children.[2,4] Formula-fed infants may be more susceptible to health risks if water with high concentrations of manganese is used to prepare formula. This is because infant brains are rapidly developing, they drink more water in proportion to their body weight, and they absorb more manganese and are less able to remove

it from their bodies compared to other age groups.[3] For adults and older children, short term exposure to manganese in drinking water at levels slightly above the guideline is unlikely to cause negative health effects.[3]

Health Canada notes that exposure to manganese while showering (either through breathing in water vapour or absorption through skin) is likely to be negligible.[2]

WHAT ARE THE LEVELS OF MANGANESE FOUND IN CANADIANS?

For most Canadians, diet is the main source of manganese. The Canadian Health Measures Survey (CHMS) is a national survey that collects information about the general health of Canadians and includes measurements of chemicals in blood and urine samples.[5] The objective of the chemical measurements in the CHMS survey is to establish baseline levels in the Canadian population. Given that manganese is an essential trace element, its presence in the blood and urine of Canadians is expected. Manganese in blood and urine can be interpreted as an indicator of exposure, but does not necessarily mean that health effects will occur.[5] Data collected from 2007 to 2011 for the CHMS found that the average levels of manganese measured in the blood of people in the Canadian population (aged 3 to 79) ranged from 8.8 – 11 µg/L.[6] More information on the CHMS and the levels of manganese in Canadians can be obtained by visiting the Canadian Biomonitoring Dashboard.[6]

ARE THERE STANDARDS FOR MANGANESE IN DRINKING WATER?

The Ontario Drinking Water Standard (ODWS) published in 2006 sets an aesthetic objective for manganese in drinking water at 0.05 mg/L.[7] The aesthetic objective is not intended to prevent health effects (e.g., not a health-based standard), but instead is intended to prevent the discolouration and staining of fixtures, and the undesirable taste caused by higher levels of manganese in water.

The Canadian Drinking Water Guideline for manganese developed by Health Canada stipulates a maximum acceptable concentration (MAC) in drinking water of 0.12 mg/L and an aesthetic objective of 0.02 mg/L.[2] The MAC is a health-based value intended to be protective of neurological effects in infants, the most sensitive population, and therefore it is also protective for chronic exposure in children and adults.[2]

ARE THERE OTHER STANDARDS OR GUIDELINE VALUES FOR MANGANESE?

The main source of exposure to manganese is via food, with grains, nuts and vegetables contributing the most to a person's daily intake of manganese. The average dietary intakes of manganese across all age groups according to the Canadian Total Diet Study (TDS) were estimated to range between 44.0 to 61.3 µg/kg of bodyweight per day (based on data gathered from different Canadian cities for the TDS).[2] Health Canada has also established Adequate Intake Levels for manganese ranging with age or lifestage from 0.003 to 2.6 mg/day and Tolerable Upper Intake Levels ranging from 2 to 11 mg/day.[8]

Infant formula sold in Canada is regulated to contain a minimum of 5 µg of manganese per 100 available kilocalories (equivalent to 3.33 µg per 100 mL of ready-to-feed formula); a maximum amount of manganese has not been set for infant formula.[9]

HOW CAN I TELL IF MY DRINKING WATER HAS HIGH MANGANESE LEVELS?

Water testing is the only way to know if manganese is present. Although water with elevated levels of manganese may impart a bitter metallic taste, tint water purplish brown or black (water discolouration may occur at concentrations as low as 0.005 to 0.02 mg/L), and stain laundry and plumbing fixtures;[2,10,11] but these issues can also be caused by other chemicals.

WHAT SHOULD I DO IF A HIGH LEVEL OF MANGANESE IS FOUND IN MY WELL WATER?

For households who do not obtain their drinking water from a municipal source, a residential drinking water treatment device may be an option to reduce manganese concentrations in drinking water. Options can be explored with professionals specialized in water treatment, but examples of treatment processes effective at removing manganese include reverse osmosis, ion exchange (including water softeners and other cation exchange systems) and oxidizing filters.[2] As with any water treatment system, it is important to follow the manufacturer's recommendations for operation and maintenance (e.g., replacement of filter media).

Appendices

1. Introduction

GHD Limited (GHD) was retained by Consolidated Fastfrate (Ottawa) Holdings Inc. to conduct a hydrogeological impact assessment in support of a proposed commercial development at the intersection of Rideau Road and Somme Street in Ottawa (the Site). The municipal address is 301 Somme Street, Ottawa, Ontario and is geographically located at Lot 26, Gloucester Concession 6 from the Rideau River. The Site encompasses an area on the order of 7.0 ha (17.4 acres) and is currently vacant of structures. The development will be privately serviced with a well and septic system. The location of the Site is provided on the **Site Location Plan, Figure 1**.

The purpose of this hydrogeological and impact assessment was to assess the groundwater conditions to evaluate that sufficient drinking water supply exists for the proposed development in accordance with the City of Ottawa Hydrogeological and Terrain Analysis Guidelines (HTAG). Groundwater conditions were assessed through a constant rate pumping test and data collection to evaluate potential impacts to the local groundwater regime (quality and quantity).

The scope of work included a desktop review of available geological and groundwater mapping; a review of the Ministry of the Environment, Conservation and Parks (MECP) well records; a water well survey within 500 m of the development; and a 12-hour, constant rate pumping test with recovery measurements.

This report is organized into the following sections:

Section 1.0 – Introduction: Outlines the purpose, objectives and scope of work, and presents the report organization.

Section 2.0 – Background: Provides a description of the existing Site conditions, background information and surrounding land uses, as well as an outline of the proposed development. The regional environmental setting, including the physiography, topography, surface water features in the vicinity, and the surficial geology is presented.

Section 3.0 – Methodology: Describes the field activities and methodologies used to assess the groundwater supply and quality and to evaluate potential impacts associated with the undertaking.

Section 4.0 – Geology and Hydrogeology: Provides a detailed description of the Site geology, hydrogeology, and the hydraulic properties of the underlying stratigraphy and aquifer.

Section 5.0 – Water Quality Impact Assessment: Provides information regarding the water quality impact related to the proposed septic system.

Section 6.0 – Construction Dewatering: Provides a summary of the shallow groundwater quality compared to the Ottawa Storm Sewer Use By-Law 2003-514, which addresses discharge to the Municipal sewage system for potential construction dewatering.

Section 7.0 – Summary and Conclusions: Provides a summary of the assessment findings. Sections 8 and 9 provide a Statement of Limitations and References. The Figures and Appendices are provided following the text of this report, as indicated in the Table of Contents. Tabulated data is presented in tables within the text.

The factual data, interpretations and recommendations contained in this report pertain to a specific project as described in the report and are not applicable to any other project or site location. This report should be read in conjunction with the Statement of Limitations appended to this report. The reader's attention is specifically drawn to this information, as it is essential for the proper use and interpretation of this report.

2. Background

2.1 Site Description

The Site is located at the intersection of Rideau Road and Somme Street in Ottawa, Ontario. The parcel has the municipal address of 301 Somme Street and currently vacant of structures. Surrounding lots consisted of commercial / industrial lots to the west and south, undeveloped and forested lands and a few residential lots. The lands to the north, east and south are privately serviced for water and sanitary services; with municipally services lots located to the west of the Site. Findlay Creek flows from west to east along the northern Site boundary on the south side of Rideau Road.

The proposed development is to consist of a one-storey warehouse with office space and various amenities covering a total building area of 8,641 square metres (m^2) with a projected occupancy of 36 staff. The Site will also have asphalt parking, a stormwater pond and septic bed area as depicted in the **Concept Plan, Figure 2**. The drilled water well location is also shown on **Figure 2** and will service the development.

2.2 Regional Setting

The Site is relatively flat with the regional topography sloping generally towards the east / northeast. Topographic relief is on the order of 3 to 4 metres across the Site. Regional topography is provided as **Figure 3**. Excess surface water is directed towards ditches alongside the Site with drainage generally to the east / northeast.

The Site is situated within the physiographic region known as the Russell and Prescott Sand Plains. In the United Counties of Prescott and Russell, and the Regional Municipality of Ottawa-Carleton, there is a group of large sand plains separated by the clays of the lower Ottawa Valley. The plains cover an area of nearly 1500 square kilometers and a level surface of about 85 metres above sea level. The plains were originally a continuous delta that was built by the Ottawa River into the Champlain Sea. The plains are as thick as 6 to 10 m in some areas (Chapman and Putnam, 1984). The local physiography is illustrated on **Figure 4** showing the Site is within a sand plains with Peat and Muck to the north and Limestone Plains to the west.

Surficial geology mapping on **Figure 5** indicates the Site is a mix of organic deposits, coarse textured glaciolacustrine deposits and Paleozoic bedrock. Based upon GHD's previous geotechnical work (GHD, 2020), the upper soils are comprised of fill. Underlying the fill is native silty sand / sandy silt followed by a glacial till (GHD, 2020).

The Quaternary geology (**Figure 6**) suggests carbonate and clastic sedimentary rock exposed at surface or covered by a discontinuous thin layer of drift. Bedrock outcrops are common in the area; however, were not observed on the Site.

The bedrock is Dolostone / Sandstone of the Beekmantown group (**Figure 7**). Based upon water well records, bedrock was found varying from 8.5 metres below ground surface (mbgs) to 14.0 mbgs at the Site. Golder's report also outlined the Gloucester Fault, a major northwest-southeast trending, steeply dipping structural feature in close proximity and northeast of the Site.

2.3 Previous Investigations

GHD and others have completed various studies at the Site. GHD has considered them, where applicable, in this report. The studies include:

– GHD Limited, November 2, 2021. Hydrogeological Assessment – Large Sewage Disposal System. Rideau Road and Somme Street. Ottawa Ontario. Project No. 12565773-01

– GHD Limited, April 12, 2021. Terrain Analysis. Septic Assessment and Percolation Rate Evaluation. Proposed Commercial Development – Rideau Road and Somme Street. Gloucester Con 6 from Rideau River, Lot 26, Ottawa Ontario. Project No. 11220832-01

- Hydrogeological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision, Report Reference. No. 08-1122-0215, by Golder Associates, dated December 2008.

3. Methodology

To achieve the purpose and objectives of this assessment, the following activities were undertaken:

- Review of existing local water supplies by reviewing MECP water well records within 500 m of the Site;
- Completion of a Health and Safety Plan for field activities;
- Site inspection and well survey of local water wells within approximately 500 m of the pumping test wellhead;
- Aquifer performance testing and water level monitoring of observation wells

3.1 Existing Local Water Supplies

The Site and areas surrounding the Site are generally privately serviced with municipal services present to the west of the Site. Physical and hydraulic data are presented on MECP well records (**Appendix A**). The well records indicate a mix of overburden materials (fill, sand, clay, gravel etc.) overlying bedrock including shale, sandstone, limestone and quartz. Based upon the well records, there is one (1) primary bedrock aquifer in this immediate area that is tapped by drilled wells. Of the 17 records, seven (7) are for monitoring wells and will not be considered further within this discussion.

The groundwater was generally described as “fresh” in the well records reviewed. The information from the MECP data indicates that all ten (10) wells were drilled bedrock wells averaging a depth of about 41 m. The bedrock wells encountered water at an average depth of 31 m with pumping rates averaging nearly 100 L/min. No flowing artesian wells were reported.

No dug / bored well records were reviewed. Shallow dug / bored wells are susceptible to large seasonal fluctuations in the groundwater. The result is that shallow wells are also more prone to becoming dry in the winter and summer months. From a quality perspective, shallow dug / bored wells are generally difficult to seal at the surface and therefore considered to be susceptible to shallow sources of contamination and are not recommended for this commercial development.

Table 3.1 summarizes the data reviewed in the well records within 500 m of the Site:

Table 3.1 Summary of MECP Well Record Data

Total Number of Wells Inventoried:	17
Dug/Bored Wells:	0 (0%)
Drilled Wells (Overburden):	0 (0%)
Drilled Wells (Bedrock):	10 (59%)
NOT INCLUDED IN STATISTICAL SUMMARY:	
Abandonments, Monitoring Wells, Unknown Wells:	7 (41%)

Parameters	Statistical Summary			
	Drilled – Overburden		Drilled– Bedrock

Average	--	--	31.2 m	103.5 ft
WELL DEPTH				
Range	--	--	17.4 to 75.6 m	57 to 248 ft
Average	--	--	40.8 m	133.9 ft

Notes:
Data based on MECP well record information (refer to **Appendix A** for well information).
*Abandonments, well upgrades and unknown well records are not included in the statistical data summarized in **Table 3.1**

3.2 Health and Safety

A Site-specific Health and Safety Plan (HASP) was prepared for implementation during the field investigation program. The HASP presents the visually observed Site conditions to identify potential physical hazards to field personnel. Required personal protective equipment was also listed in the HASP. It is mandatory for all GHD personnel involved in the field program, to read and have a copy of the HASP available at the Site during the investigative work. Health and Safety requirements in the HASP were implemented during the field investigation program.

In addition to the abovementioned safety measures, GHD's safety protocol related to COVID-19 issues was implemented and preventive measures were reinforced.

3.3 Site Inspection and Well Survey

The field work was conducted on August 9 and 10, 2022 by GHD to observe the general surficial characteristics of the Site, neighbouring lands and complete the well survey and pumping test. The Site consists of undeveloped lands. Photographs are provided in **Appendix B**.

GHD observed the drilled water well and a monitoring well on the Site. Other water wells in the vicinity of the Site were also observed. No surface water was observed on the Site.

The well survey was conducted on August 9, 2022 and involved collecting water levels from local area wells. There is one home within 500 m of the Site located at 4885 Hawthorne Road. This residential dwelling utilizes a drilled well that was measured by GHD to be 15 metres deep. The owner did not indicate any issues with water quantity or quality. The owner also provided authorization to use the well for monitoring purposes during our pumping test.

GHD also collected information from commercial properties located at 3500 Rideau Road to the west (MECP tag no. A018916), 5213 Hawthorne Road to the south (MECP tag no. A342260) and 300 Somme Street to the south (MECP tag no. A305146). No issues were communicated to GHD regarding the wells from these commercial properties. These wells were also monitored during GHD' s pumping test. The locations of the various water wells / observation wells utilized for monitoring in this assessment and included in the well survey is provided on the **Well Location Plan, Figure 8**. The MECP tag numbers are referenced on **Figure 8**.

3.4 Aquifer Performance Testing

3.4.1 Test Well Information

An onsite drilled well was utilized for assessment of the local aquifer via a pumping test. The well was constructed by Air Rock Drilling Co Ltd with drilling completed on July 27, 2022. The well has a MECP well tag number of A342117 and its location is shown on **Figure 2**. The water well record and Certificate of Well Compliance is provided in **Appendix C**.

A summary of the information presented on the water well record, is as follows:

– Drilled to total depth of 42.7 m (140 feet). The well record indicates overburden materials consisting of gravel, hardpan and boulders to 14 m (46 feet) followed by grey and black limestone with white sandstone mix to the depth of the well. The well is considered to be a confined well within the sandstone;
– Water was encountered at 39 m and 40.8 m (128 and 134 feet) and was not tested. The static water level was 8.6 m resulting in an available drawdown of 34.1 m to the bottom of the well;
– Construction was completed on July 27, 2022. Constructed with steel casing to 15.8 m (52 feet) then open hole to the bottom of the well. From grade to 15.8 m, the annular space was grouted and sealed with neat cement slurry with a total volume of about 0.4 cubic metres (~12.5 cubic feet). As per previous recommendations, the well was constructed with greater than 6 m of casing and 2 m into the bedrock;
– The well was tested by the drillers at 75.6 litres per minute or L/min (20 gallons per minute or gpm) resulting in a drawdown of 0.7 m or about 2% of the available drawdown. The well is recommended for pumping at 75.6 L/min; and
– The well is drilled 4 m from the proposed building and 3 m from a proposed paved walkway. The ground surface is to be positively sloped away from the water well in all directions (refer to the inset illustrated on **Figure 2**).

Adjacent water wells, monitoring well MW22-1 and a residential well that were monitored during testing are illustrated on **Figure 8**.

3.4.2 Pumping Test Methodology

GHD completed a constant rate pumping test of well A342117 on August 9, 2022 to assess aquifer conditions and evaluate the availability of a suitable groundwater resource for the proposed commercial development. The pumping test was conducted for twelve (12) hours at a constant rate of 37.8 L/min (10 gpm). Recovery measurements were collected after the pumping was completed.

A submersible pump was installed in the well to conduct the testing. Water levels in the pumped water well, adjacent observation wells and an onsite shallow monitoring well were monitored throughout the aquifer performance testing. Measurements were collected manually and through the use of data loggers to evaluate drawdown, recovery and the potential of mutual interference with adjacent wells. The discharge water was directed away from the pumped well a distance of about 30 m downgradient and also away from observation wells. This practice safeguards against artificial recharge of the well from occurring during the pumping test.

The pumped water well was chlorinated in advance of the pumping test. Non-detect chlorine levels were confirmed in the field prior to bacteria sampling conducted at the water well.

Water samples were collected throughout the testing and submitted to SGS Environmental Laboratories (SGS), a CALA accredited analytical laboratory for the testing. Water samples were collected for the following parameters:

- Polycyclic aromatic hydrocarbons (sampled after 12 hours of pumping);
- Volatile organic compounds (sampled after 12 hours of pumping);
- Petroleum hydrocarbons fractions F1 – F4 (sampled after 12 hours of pumping);
- Trace metals (filtered) (sampled after 12 hours of pumping);
- Bacteriological parameters including total coliform; E.coli, fecal coliform (sampled after 1, 6 and 12 hours of pumping); and
- General chemistry, Ottawa subdivision package and D-5-5 parameters.

Field measurements of methane, pH, temperature, free chlorine, turbidity, and conductivity were completed with a turbidity meter, Hach Pocket Pro+ Multi 2 and chlorine meter. Water levels were collected from the pumped water well using a dedicated, audible water level meter and a data logger. Water levels were also collected from neighbouring wells using an audible water level meter. Calibration of these instruments / equipment was completed prior to the pumping test. The calibration records are provided in **Appendix D**.

4. Geology and Hydrogeology

The following sections provide a detailed description of the geology and hydrogeology of the Site, based on the results of the investigations completed and on the available background information.

4.1 Site Geology

Based upon information reviewed within GHD's geotechnical report, the following are the predominant surficial materials and geologic deposits that underlie the Site:

- Ground Cover and Fill (ground surface up to 6 m thick) – topsoil, silty sand to gravel to silty clay fill
- Native sandy silt / silty sand (depths ranging from 8.2 to 11.9 mbgs)
- Bedrock (8.2 to 14.0 mbgs)

The depths of the materials listed above vary within the Site and have been simplified for purposes of this report.

4.2 Site Hydrogeology

4.2.1 Hydrostratigraphic Units

The primary hydrostratigraphic units (i.e. aquifer/aquitard units) underlying the Site include the following:

- Shallow, unconfined unit of fill and native soil and upper bedrock zone
  - Shallow groundwater found within the fill
  - Shallow unit is not suitable as a water supply
- Deeper confined aquifer within the sandstone bedrock generally at depths between about 25 m and 40 mbgs. This is the aquifer tapped by the drilled well on the Site.

4.2.2 Groundwater Levels

Water levels were obtained from the new supply well (MECP tag no. A342117), a monitoring well installed on the Site (MW22-1), and the nearby commercial and residential wells shown in **Table 4.1** on August 9, 2022 prior to the commencement of the pumping test. The data is summarized in **Table 4.1**. Based upon the water levels obtained from these wells, the groundwater flow tapped by the drilled wells is generally in an easterly direction including northeast and southeast components (note: groundwater elevations are based upon regional topographic contours and are for the purposes of evaluation potentiometric elevations only). Shallow groundwater flow tapped by monitoring wells was not assessed.

Table 4.1 Water Level Summary

Location	Description	Ground Elevation* (m)	Depth of Well (mbgs)	Water Level (mbgs)	Potentiometric Elevation (masl)
				August 9, 2022	
A342117	New Site water well	91.1	42.7	7.31	85.8
MW22-1	New Site monitoring well	91.4	3.7	2.05	89.4
4885 Hawthorne Rd	Residential well	85	15.2	0.95	84.1
3500 Rideau Rd	A018916 – Commercial property	100	35.4	11.80	88.2
5213 Hawthorne Rd	A342260 – Commercial property	95	>30	10.60	84.4
TW-5	A295342	90	29.9	6.70	83.3
300 Somme St	A305146 – Commercial property	85	42.7	7.42	77.6

Notes:
masl = metres above sea level
*Elevations estimated from regional topographic contours provided on Figure 3; and elevations on the Site are based upon a topographic elevations provided to GHD. The elevations provided are for the purposes of evaluating potentiometric elevations and should not be relied upon as a legal survey or topographic elevation survey.

4.3 Aquifer Performance Assessment

The following sections discuss the pumping test results and coefficients, well interference and water quality.

4.3.1 Pumping Test

The pumping test was commenced on August 9, 2022. The results of the constant rate pumping test including field testing data are graphically presented in **Appendix E**.

The water level during the pumping test at A342117 is illustrated on **Figures E-1** and **E-2** showing water level versus time. The plot shows a slow, minimal drawdown of the water level over the course of the 12-hour test at 37.8 L/min. After 12 hours of pumping, the water level was 8.7 metres below top of pipe (mbtp). The maximum drawdown was about 0.8 m over the course of the testing with about 30.3 m of available drawdown above the pump remaining. Approximately 2.5% of the available drawdown was used during the pumping test. A total groundwater volume of about 27,215 L was pumped during the testing. Based upon the septic design flow calculations, about 12,000 L/day has been estimated. Actual groundwater usage is expected to be much less than 12,000 L/day for the warehouse and offices.

Recovery measurements were collected manually for 60 minutes after pumping ceased. The water level recovered about 50% in one (1) hour and fully recovered 100% in seven (7) hours. The estimated transmissivity for the pumped water well was 33.4 m^2/day (2238 gpd/ft) based on the drawdown and 26.7 m^2/day (1791 gpd/ft) based on the recovery period and represents a high transmissivity. The specific capacity for this well is calculated to be 48.5 L/min/m based upon the pumping test completed.

The plotted data indicates the aquifer that this well is tapped into can safely provide long-term quantities of groundwater at a pumping rate of 37.8 L/min (10 gpm) based upon the pumping test completed.

Pumping tests were completed previously within a test well located on the Site (i.e. TW2) within the same sandstone aquifer. The test well, TW2, was pumped in 1994, 2008 and in 2020 at 67 L/min, 55 L/min, and 60 L/min, respectively. The drawdowns of these tests were similar to our drawdown at the new well ranging from about 1.1 m to 1.2 m. Static water levels from TW-2 were also similar ranging from 3.15 mbgs in 1994 to 6.90 mbgs in 2020, indicating that development in this area including quarries on nearby properties has not resulted in significant negative effects to the underlying water supply aquifer.

4.3.2 Summary of Aquifer Performance

The following **Table 4.2** summarizes the data and coefficients obtained from the pumping test.

Table 4.2 Aquifer Performance Testing Summary

Well No.	Step No.	Yield		Test Type	Time	Maximum drawdown		Available Drawdown*		Specific Capacity		Estimated Transmissivity	
		gpm	L/min		min	feet	metres	feet	metres	gpm/ft	L/min/m	gpd/ft	m^2/day
A342117	1	0	0	Static	0	0	0	103.3	31.5	--	--	--	--
	2	10	37.8	Const.	720	2.6	0.8	100.7	30.7	3.9	48.5	2238	33.4
	3	0	0	Recvy.	50% recovery in 1 hour; 100% recovery in 7 hours							1791	26.7

Notes:
gpm = gallons per minute; gpd/ft = gallons per day per foot
"Recvy" refers to Recovery measurements; "Const" refers to the Constant Rate test conducted for 720 minutes.
*Available Drawdown refers to the height of water in the well above the pump.
Static water level at the pumped well A342117 was 7.96 metres below top of pipe (7.31 metres below ground surface) at the start of the testing.

4.3.3 Water Quality

Groundwater samples from the pumped well were obtained for laboratory testing during the course of the pumping test for the purpose of water quality analyses. The well was sampled after one (1) hour; at six (6) hours; and at the end of the constant rate test on August 9, 2022. The water samples were delivered to SGS laboratories in Lakefield, ON. Certificates of chemical analyses are presented in **Appendix F**. The water quality data are summarized and compared with the Ontario Drinking Water Standards (ODWS)[1] in **Table 4.3**. Regulation 153/04 parameters are also compared with the Table 2 Standards in a Potable Ground Water Condition for all property uses including a commercial property use[2]. For the Regulation 153/04 parameters, the most stringent standard was used for comparison purposes.

Notes:
"1' denotes that PHC F4 gravimetric returned to baseline
"<" indicates concentrations are less than laboratory reporting limits
MAC = maximum acceptable concentration; IMAC – Interim MAC; AO / OG = aesthetic objective / operational guideline
Bold / shaded indicates the concentration exceeds the ODWS AO / OG. There are no exceedances of MAC or IMAC (health related).
*The aesthetic objective for sodium in drinking water is 200 mg/L. When the sodium concentration exceeds 20 mg/L, this information should be communicated to those on sodium restricted diets.

The laboratory analyses confirmed that there were no health-related parameter exceedances of the ODWS. VOCs, PAHs and PHCS were reported below detection limits and meet all Ontario Regulation Table 2 Standards for the parameters tested in a potable groundwater condition for all property uses.

In general, the test results indicate the majority of parameters meet the ODWS with the exception of the aesthetic objectives for:

– Hardness;
– Total Dissolved Solids;
– Manganese; and
– Iron.

Elevated hardness is related to the overburden materials containing calcium and to a lesser extent, magnesium. Elevated hardness, iron and manganese are common traits of groundwater supplies in Southern Ontario and can be

treated using commercially available treatment equipment such as a water softener. The iron and manganese are within treatable limits. Although hardness in excess of 500 mg/L is considered very hard, a maximum treatable value is not provided within the D-5-5 Guideline. Treatment for hardness (and other parameters) is provided in the following sub-section.

Total dissolved solids (TDS) were also elevated above its aesthetic objective of 500 mg/L. TDS may be the result of hard water including calcium and/or magnesium as well as other constituents such as sodium and chloride. Treatment consideration is provided in the following sub-section. The Ryznar Stability Index was calculated to be between 6.2 and 6.4 which is within the neutral range and therefore incrustation and corrosion are not considered to be problematic due to the elevated TDS.

Turbidity was reported as less than 5 NTU in the laboratory samples and ranged from 3.25 to 1.2 NTU at the wellhead. These values indicated acceptable turbidity.

The bacteriological results were three (3) colony forming units per 100 mL (CFU) for total coliform which is acceptable for raw water as fecal coliform and E.coli are zero CFU. The residual chlorine residual was measured in the field at the wellhead prior to testing and confirmed to be non-detect.

As a proactive measure, GHD recommends that bacteriological treatment (i.e. ultraviolet (UV) treatment) be used at a minimum. As it is anticipated that this well system will be regulated and will require treatment to meet appropriate standards to ensure potable water is available to employees and visitors.

To supplement the analytical data, field measurements were obtained throughout the pumping test by GHD. At the end of the pump test, the groundwater at the well head had a conductivity of 1.35 mS/cm, a water temperature of 16.0 degrees Celsius, a pH of 7.82, a chlorine residual of 0 mg/L and turbidity of 1.2 NTU. There was no methane detected within the water.

4.3.3.1 Water Treatment

MacLellan Water Treatment (MacLellan) was contacted to provide water treatment based upon the pumped well chemistry. Based upon the chemistry provided from the pumping test, MacLellan provided recommendations for water treatment. Their report is provided in **Appendix G** and summarized below:

a. Installation of a filtration system for iron that utilizes a manganese greensand filter with chlorine regeneration. This filter would also remove a certain amount of manganese.
b. Installation of an activated carbon filter to remove residual chlorine and organically-complexed metals.
c. Install a water softener to soften the water to improve the aesthetics of the water and protect the water disinfection system and water-using appliances (hot water tanks, etc.) in the facility from fouling due to hard water scale. A twin alternating system was recommended to ensure that softening is uninterrupted.
d. Disinfection of the water will be provided with ultraviolet (UV) disinfection. The unit will be sized to allow adequate flow to the facility and will be equipped with turbidity-reducing cartridge-style prefilters to screen out particles that bacteria might shelter behind while passing through the UV light.
e. As the concentration of sodium in the water is already slightly high, the use of a water softener will increase the sodium content of the treated water by about 300 mg/L. Therefore, one or more point of use reverse osmosis (RO) units will be installed to remove sodium at locations (like lunch rooms) where staff will actually consume the water. The RO units will be equipped with small storage tanks so that pre-treated water will be ready on demand.

Based upon the MacLellan report, the water can be treated for use at the proposed commercial facility.

4.3.4 Well Interference

In order to assess the potential for hydraulic connection between the pumped water well A342117 and neighbouring wells were monitored during the pumping test. Data logger water levels were installed at each of the observation wells during the pumping test and the data is provided in **Appendix H**. Manual water levels at TW-5, A305146, A342260

and A018916 were collected prior to and after the pumping test was conducted between August 3 and August 18, 2022. The data illustrates the water level conditions during this time as well as during the pumping test.

The approximate linear distances between the pumped water well and observation wells are provided in **Table 4.4** based upon the locations plotted on **Figure 8**.

Table 4.4 Distance Between Pumping Well and Observation Wells

Location	Distances between Pumped Water Well A342117 and Observation Wells (metres)					
	MW22-1	4885 Hawthorne Rd.	TW-5	A305146	A018916	A342260
Pumped well A342117	45	630	570	140	475	640

Notes:
Distances based upon locations identified on **Well Locations, Figure 8**.
MW = monitoring well

The following table provides the manual water levels collected during the pumping test at the observation wells monitored during the pumping test.

Table 4.5 Maximum Drawdowns in Pumping and Observation Wells

Location	Water Level (start of test) mbgs	Water Level (end of test) mbgs	Drawdown (m)
A342117 (pumped water well)	7.31	8.11	-0.80
MW22-1	2.05	1.95	**+0.10**
4885 Hawthorne Road	0.95	0.93	**+0.02**
TW-5	6.70	6.71	-0.01
A305146	7.42	7.69	-0.27
A018916	11.85	11.81	**+0.04**
A342260	10.62	10.59	**+0.03**

Notes:
Negative drawdown (denoted by minus sign and RED text) indicates water level lowered during the testing
Positive drawdown (denoted by plus sign and BLACK text) indicates water level was rising during the testing

4.3.4.1 Interference Assessment

Prior to the pumping test, data loggers were installed within the adjacent wells including TW-5, A305146, 4885 Hawthorne Road, A342260 and A018916 to collect background water levels. Water levels were also collected from these locations during the pumping test and after the pumping test was completed. The data was collected was used to evaluate groundwater level trends and to aid in assessing hydraulic connection between the overburden and bedrock aquifer, and, within the bedrock aquifer itself.

There was no drawdown attributable to pumping at the pumped well within the monitoring well MW22-1 indicating that there is no vertical hydraulic connection between the overburden groundwater and confined bedrock aquifer that A342117 draws from.

There was no drawdown measured at water wells A018916, A342260 or 4885 Hawthorne Road and minimal drawdown within TW-5 throughout the duration of the pumping test. The drawdown at TW-5 was about one (1) cm based upon the data logger readings and is considered negligible. No impacts are expected at these wells as a result of future usage of the water well on the Site.

The results of the interference monitoring did illustrate a hydraulic connection between the pumping well A342117 and A305146 about 140 m to the south. Both wells are drilled to 42.7 m (140 feet) and are expected to tap into the same aquifer unit. The drawdown at this well was manually measured to be about 27 cm during the pumping test and the

data logger shows a similar water level response in A305146, albeit to a lower magnitude, as the pumped well. The data confirms that these wells are confined within the same aquifer unit and are hydraulically connected. With the drawdown of 27 cm (less than 1% of the available drawdown within this well), about 35 m of available drawdown remains within the well.

The testing showed that the pumping of nearly 30,000 L resulted in the usage of about 2.5% of the available drawdown of the pumped well. As daily usage is expected to be below 10,000 L/day, the pump test results indicate that there is sufficient water quantity below the Site for the planned development with without significant interference to future and existing neighbouring wells. In our professional opinion, the risk of interference is minimal.

4.4 Septic Waste Disposal

The septic waste disposal system is being designed by others. The septic will be about 25 m from the water well, maintaining the minimum 15 m horizontal buffer as per the Ontario Building Code.

5. Water Quality Impact Assessment

Procedure D-5-4 provides a methodology for assessing potential impact to downgradient groundwater resources as a result of the installation of private sewage disposal systems on a development property. The procedure is to consider the following:

- Lot Size Considerations
- System Isolation Considerations
- Contaminant Attenuation Considerations

Using D-5-4 as a guide, the proponent is to determine the background nitrate concentration in the receiving groundwater; demonstrate that the area is not hydrogeologically sensitive; and, demonstrate that the maximum nitrate limit prescribed by the procedure will not be exceeded in the receiving groundwater at the downgradient site boundary.

However, this guideline does not apply to Large Subsurface Sewage Disposal Systems (i.e. septic effluent of greater than 10,000 L/day). The projected design septic effluent for this Site is on the order 12,000 L/day. If the septic effluent from the Site was to be less than 10,000 L/day, then the Procedure would also not be applicable as the development area is greater than one (1) hectare

GHD completed a hydrogeological assessment for a large subsurface septic system (GHD report dated November 2, 2021). Based upon the impact assessment, tertiary treatment will be required. Based upon the impact assessment, the proposed sewage system will have no significant impact on the groundwater aquifer, shallow water or any downgradient receptors that utilize groundwater.

6. Construction Dewatering

A water sample was collected from the monitoring well (MW22-1) for purposes of establishing the water quality should excavations extend into the shallow groundwater and require dewatering. Depending upon the construction activities, dewatering to remove groundwater seepage, surface water runoff and precipitation may be required to ensure safe and dry working conditions.

6.1.1 Groundwater Sampling for Construction Dewatering

On August 9, 2022, a groundwater sample was collected from MW22-1 (referred to "Piezo" in the certificate of analysis). The sample was submitted to SGS for analysis of parameters described in City of Ottawa By Law 2003-514, which addresses discharge to the Municipal sewage system. The analytical results are summarized within the certificates of analysis in **Appendix I**.

Based upon the analytical results, and upon comparison with the City of Ottawa criteria, the following parameters exceeded the criteria:

– Total suspended solids; and,
– Manganese.

The results represent total concentrations including dissolved and sorbed particulate. Based on these observations, the water discharged from an excavation would require treatment (i.e. filtration) to minimize the particulate and reduce the total concentrations to meet the City of Ottawa criteria. The discharge would be expected to be a combination of groundwater, surface water runoff and precipitation into the excavation and would require further assessment to verify its quality. City of Ottawa approval, sewer-use discharge permit and pre-treatment will be required prior to discharge to a drainage ditch or sewer.

7. Summary and Recommendations

Supporting data upon which our conclusions and recommendations are based have been presented in the foregoing sections of this report. The following conclusions and recommendations are governed by the physical properties of the subsurface materials that were encountered at the Site and assume that they are representative of the overall Site conditions. It should be noted that these conclusions and recommendations are intended for use by the designers only. Contractors bidding on or undertaking any work at the Site should examine the factual results of the assessment, satisfy themselves as to the adequacy of the information for construction, and make their own interpretation of this factual data as it affects their proposed construction techniques, equipment capabilities, costs, sequencing, and the like. Comments, techniques, or recommendations pertaining to construction should not be construed as instructions to the contractor.

Based on the results of the hydrogeological and impact assessment, the pumped water well has sufficient water of good quality and quantity to provide ample supply of potable groundwater for the proposed commercial development while preserving the long-term water quality of the aquifer complex. In the certification letter WSP has indicated that the new water well, A342117, was properly constructed and adequately sealed in accordance with Ontario Regulation 903. The well will have adequate separation from the proposed building and future septic area. Based upon the pumping test, there was marginal interference between an adjacent well; however, the interference is not considered significant to impact the operation of the wells. Based on the data collected no vertical hydraulic connection between the shallow overburden groundwater and the bedrock aquifer unit was identified. In the long-term, it is our opinion that the bedrock aquifer tested can support the commercial development with minimal to negligible impact to neighbouring wells.

The water quality, as indicated in the MacLellan report, can be treated to meet the needs of the proposed facility. The treatment is to consist of filters, water softening, UV disinfection and RO at selected point(s) of consumption such as lunch room(s).

Based upon the impact assessment, water quality impacts are not expected provided that the waste disposal system is properly constructed. The waste disposal system will be a large subsurface system that, based upon the daily design, will exceed 10,000 L/day of septic effluent. The actual daily septic effluent is expected to be much less than 10,000 L/day. No impact is anticipated on downgradient baseline water quality functions or to the existing water bearing aquifers.

Should construction dewatering of shallow water be required, filtration of the pumped water will be required to remove particulate and ensure that total suspended solids and manganese concentrations meet the City of Ottawa storm sewer use by-law criteria. No significant impacts from construction dewatering are anticipated.

It is our opinion that the results of this hydrogeologic and impact assessment support the development of the proposed commercial development.

All of Which is Respectfully Submitted,

GHD

9. Statement of Limitations

This report is intended solely for Consolidated Fastfrate (Ottawa) Holdings Inc. in assessing the hydrogeological aspects of the Site (301 Somme Street, Ottawa, Ontario) and is prohibited for use by others without GHD's prior written consent. This report is considered GHD's professional work product and shall remain the sole property of GHD. Any unauthorized reuse, redistribution of or reliance on the report shall be at the Client and recipient's sole risk, without liability to GHD. Client shall defend, indemnify and hold GHD harmless from any liability arising from or related to Client's unauthorized distribution of the report. No portion of this report may be used as a separate entity; it is to be read in its entirety and shall include all supporting drawings and appendices.

The recommendations made in this report are in accordance with our present understanding of the project, the current site use, ground surface elevations and conditions, and are based on the work scope approved by the Client and described in the report. The services were performed in a manner consistent with that level of care and skill ordinarily exercised by members of hydrogeological engineering professions currently practicing under similar conditions in the same locality. No other representations, and no warranties or representations of any kind, either expressed or implied, are made. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties.

All details of design and construction are rarely known at the time of completion of a hydrogeological study. The recommendations and comments made in the study report are based on our subsurface investigation and resulting understanding of the project, as defined at the time of the study. We should be retained to review our recommendations when the drawings and specifications are complete. Without this review, GHD will not be liable for any misunderstanding of our recommendations or their application and adaptation into the final design.

Well Record A342117 and WSP Well Certificate

CERTIFICATE OF WELL COMPLIANCE

Ottawa

I (Jeremy Hanna) AIR ROCK DRILLING CO. LTD. - DO HEREBY CERTIFY

that I am licensed to drill water wells in the Province of Ontario, and that I have

supervised the drilling of the water well on the property of :

CONSOLIDATED FASTFRATE (OTTAWA)
OWNER: HOLDINGS INC.

Location: #301 SOMME STREET, GLOUCESTER

Part 26 & 27
LOT: CON: 6 R.F. PLAN # 4M-1388 S/L # X

Ottawa-Carleton / Geographical Township of GLOUCESTER

I CERTIFY FURTHER that, I am aware of the well drilling requirements, the guidelines, recommendations and regulations of the Ministry of the Environment governing well installations in the Province of Ontario, and the standards specified in any subdivision agreement and hydrogeological report applicable to this site and City Standards.

AND DO HEREBY CERTIFY THAT the said well has been drilled, cased, grouted (cement or bentonite) as applicable and constructed in strict conformity with the standards required.

Signed this 27TH Day of JULY, 2022

Jeremy Hanna (T3632) Air Rock Drilling Co. Ltd. (C-7681)

The Engineer on behalf of the Landowner set out above, Certifies that he/she has inspected the well and it was constructed in accordance with the specifications in O.Reg 903, this report and the Hydrogeological Report with regards to casing length and grouting requirements.

Signed this 16th day of Aug 2022

LICENSED PROFESSIONAL ENGINEER

Well Owner's Information

First Name	Last Name/Organization	E-mail Address	☐ Well Constructed by Well Owner
	Consolidated Fastfrate (Ottawa) Holdings Inc.		

Mailing Address (Street Number/Name)	Municipality	Province	Postal Code	Telephone No. (inc. area code)
333 Preston Street, 7th Floor,	Ottawa,	Ont	K1S 5N4	

Well Location

Address of Well Location (Street Number/Name)	Township	Lot	Concession
# 301 SOMME STREET	GLOUCESTER	P/L 26 & 27	6 R.F.

County/District/Municipality	City/Town/Village	Province	Postal Code
OTTAWA-CARLETON	GLOUCESTER	Ontario	

UTM Coordinates Zone	Easting	Northing	Municipal Plan and Sublot Number	Other
NAD 8 3	1845682	5017208	4M-1388	

Overburden and Bedrock Materials/Abandonment Sealing Record (see instructions on the back of this form)

General Colour	Most Common Material	Other Materials	General Description	Depth (m/ft) From	Depth (m/ft) To
	Gravel, Hard Pan, Boulders			0'	46'
Grey & Black	limestone	w/	White Sandstone Mix	46'	140'

Annular Space

Depth Set at (m/ft) From	Depth Set at (m/ft) To	Type of Sealant Used (Material and Type)	Volume Placed (m³/ft³)
52'	0'	Neat Cement Slurry	12.48

Method of Construction

☐ Cable Tool ☐ Diamond
☐ Rotary (Conventional) ☐ Jetting
☐ Rotary (Reverse) ☐ Driving
☐ Boring ☐ Digging
☒ Air percussion
☐ Other, specify

Well Use

☐ Public ☐ Commercial ☐ Not used
☒ Domestic ☐ Municipal ☐ Dewatering
☐ Livestock ☐ Test Hole ☐ Monitoring
☐ Irrigation ☐ Cooling & Air Conditioning
☐ Industrial
☐ Other, specify

Construction Record - Casing

Inside Diameter (cm/in)	Open Hole OR Material (Galvanized, Fibreglass, Concrete, Plastic, Steel)	Wall Thickness (cm/in)	Depth (m/ft) From	Depth (m/ft) To
6 1/4	Steel	.188"	+2'	52'
6"	Open Hole		52'	140'

Construction Record - Screen

Outside Diameter (cm/in)	Material (Plastic, Galvanized, Steel)	Slot No.	Depth (m/ft) From	Depth (m/ft) To

Status of Well

☒ Water Supply
☐ Replacement Well
☐ Test Hole
☐ Recharge Well
☐ Dewatering Well
☐ Observation and/or Monitoring Hole
☐ Alteration (Construction)
☐ Abandoned, Insufficient Supply
☐ Abandoned, Poor Water Quality
☐ Abandoned, other, specify
☐ Other, specify

Water Details

Water found at Depth (m/ft)	Kind of Water	Other, specify
128	☐ Fresh ☒ Untested ☐ Gas	
134	☐ Fresh ☒ Untested ☐ Gas	
	☐ Fresh ☐ Untested ☐ Gas	

Hole Diameter

Depth (m/ft) From	Depth (m/ft) To	Diameter (cm/in)
0'	52'	9 3/4"
52'	140'	6"

Results of Well Yield Testing

After test of well yield, water was:
☐ Clear and sand free
☐ Other, specify

If pumping discontinued, give reason: X

Pump intake set at (m/ft): 120'

Pumping rate (l/min / GPM): 20

Duration of pumping: 1 hrs + 0 min

Final water level end of pumping (m/ft): 30'7"

If flowing give rate (l/min/GPM): X

Recommended pump depth (m/ft): 100'

Recommended pump rate (l/min/GPM): 20

Well production (l/min/GPM): 20

Disinfected? ☒ Yes ☐ No

	Draw Down Time (min)	Draw Down Water Level (m/ft)	Recovery Time (min)	Recovery Water Level (m/ft)
Static Level	28'2"		30'4"	
1	29.3	1	29.2	
2	29.4	2	29.1	
3	29.5	3	29.1	
4	29.6	4	29.1

Appendix D

Calibration Records

Control number: **PET-TE-19**
Date (mm/dd/yyyy): **08/09/2022**
User (print name): **Jason Geraldi**

Project number: **12580314**
Project name: **Consolidated Fastfrate, HydroG Assessment**
Location: **301 Somme Street, Ottawa**

Additional equipment control numbers and descriptions: **Hach Pocket Colorimeter II (S/N 15100E283721)**

Field procedure before use:

	Check when completed
• Check batteries are charged. Replace AAA batteries if needed.	☒
• Review applicable MSDS sheets for the DPD foil pillows (21055-69 & 21056-69 – in equipment case).	☒
• Proceed with a Spec √ ™ Secondary Standard repeatability test if required. Please note that this test is done at the shop. Please see pages 1-43 and 1-44 (Pocket Colorimeter) or 1-47 and 1-48 (Pocket Colorimeter II) of instruction manual.	☒
• Proceed with a User-Entered Calibration if the project requires it. This is usually done at the shop. Please see pages 2-15 to 2-27 in instruction manual.	☒

Filing: Field file

Signature: 

Control number:	**PET-TE-25**	**Project number:**	**12580314**
Date (mm/dd/yyyy):	**08/09/2022**	**Project name:**	**Consolidated Fastfrate HydroG Assessment**
User (print name):	**Jason Geraldi**	**Location:**	**301 Somme Street, Ottawa**

Calibration solution(s): **AutoCal Standard**
Lot #(s): **1GJ470**
Supplier(s): **Maxim**
Expiration date(s): **OCT/22**

Additional information: **Horiba U-52 (S/N XPX0PRWK)**

Field procedure before use:

	Check when completed
• Wash the sensors in distilled water.	
• Fill the calibration beaker to line on the beaker with auto-cal solution.	
• Immerse the probe into the beaker, and turn the power on.	
• For the U-10: press the MODE key to put the unit into the MAINT mode, and set the lower cursor to AUTO.	☒
• For the U-22: press the CAL key in one of the measurement modes.	
• Press the ENT key to start the AUTO calibration. When calibration is complete, the readout will show END.	
• Switch to MEAS mode, and check the calibration in AUTO-CAL solution.	☒
• The instrument is ready for use.	
Note: Conductivity measured in mS/cm not μS/cm as commonly measured by pocket meters. Multiply value by 1,000 to convert to μS/cm.	

Filing: Field file

Control number:	**PET-TE-3**	**Project number:**	**12580314**
Date (mm/dd/yyyy):	**08/09/2022**	**Project name:**	**Consolidated Fastfrate HydroG Assessment**
User (print name):	**Jason Geraldi**	**Location:**	**301 Somme Street, Ottawa**

Additional equipment control numbers and descriptions: **Gastech NP-204 natural gas detector used for methane detection at wellhead.**

Field procedure before use:

	Check when completed
• Check for damages	☒
• Ensure the instrument has been properly calibrated	☒
Note: The equipment does not require a data entry sheet, so only one page will print out.	

Filing: Field file

Control number:	**PET-WL-25**	**Project number:**	**12580314**
Date (mm/dd/yyyy):	**08/09/2022**	**Project name:**	**Consolidated Fastfrate HydroG Assessment**
User (print name):	**Jason Geraldi**	**Location:**	**301 Somme Street, Ottawa**

Additional equipment control numbers and descriptions: **Heron Instruments, Dipper-T 100 m, S/N 4009-T**

Field procedure before use:

	Check when completed
• Check for broken or missing parts.	
• Check battery	☒
• Check operation of buzzer.	☒
• Check operation of signal light.	☒
• Test probe in water to ensure unit operates, both visually and audibly.	☒
• Check cable.	☒

Filing: Field file

Signature:

Baseline at nC50 [Yes / No]	15-Aug-22	18-Aug-22		YES

CCME Method Compliance: Analyses were conducted using analytical procedures that comply with the Reference Method for the CWS for Petroleum Hydrocarbons in Soil and have been validated for use at the SGS laboratory, Lakefield, ON site.

Quality Compliance: Instrument performance / calibration quality criteria were met and extraction and analysis limits for holding times were met.
nC6 and nC10 response factors within 30% of response factor for toluene: YES
nC10, nC16 and nC34 response factors within 10% of the average response for the three compounds: YES
C50 response factors within 70% of nC10 + nC16 + nC34 average: YES
Linearity is within 15%: YES

Benzo(b)fluoranthene results for comparison to the standard are reported as benzo(b+j)fluoranthene. Benzo(b)fluoranthene and benzo(j)fluoranthene co-elute and cannot be reported individually by the analytical method used.

Temperature of Sample upon Receipt: 13 degrees C
Cooling Agent Present: Yes
Custody Seal Present: Yes

Chain of Custody Number: 024624

Methylene Chloride LCS; Recovery is outside control limits; the overall quality control for this analysis has been assessed and was determined to be acceptable.
Acetone matrix spike; recovery for this parameter is outside control limits; the overall quality control for this analysis has been assessed and was determined to be acceptable.

F3(C16-C34) Dup RPD is outside control limits. The average of the two duplicates is less than five times the RL, therefore greater uncertainty is expected.

QC SUMMARY

Method Blank: a blank matrix that is carried through the entire analytical procedure. Used to assess laboratory contamination.

Duplicate: Paired analysis of a separate portion of the same sample that is carried through the entire analytical procedure. Used to evaluate measurement precision.

LCS/Spike Blank: Laboratory control sample or spike blank refer to a blank matrix to which a known amount of analyte has been added. Used to evaluate analyte recovery and laboratory accuracy without sample matrix effects.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate laboratory accuracy with sample matrix effects.

Reference Material: a material or substance matrix matched to the samples that contains a known amount of the analyte of interest. A reference material may be used in place of a matrix spike.

RL: Reporting limit

RPD: Relative percent difference

AC: Acceptance criteria

Multielement Scan Qualifier: as the number of analytes in a scan increases, so does the chance of a limit exceedance by random chance as opposed to a real method problem. Thus, in multielement scans, for the LCS and matrix spike, up to 10% of the analytes may exceed the quoted limits by up to 10% absolute and the spike is considered acceptable.

Duplicate Qualifier: for duplicates as the measured result approaches the RL, the uncertainty associated with the value increases dramatically, thus duplicate acceptance limits apply only where the average of the two duplicates is greater than five times the RL.

Matrix Spike Qualifier: for matrix spikes, as the concentration of the native analyte increases, the uncertainty of the matrix spike recovery increases. Thus, the matrix spike acceptance limits apply only when the concentration of the matrix spike is greater than or equal to the concentration of the native analyte.

LEGEND

FOOTNOTES

NSS	Insufficient sample for analysis.
RL	Reporting Limit.
↑	Reporting limit raised.
↓	Reporting limit lowered.
NA	The sample was not analysed for this analyte
ND	Non Detect

Results relate only to the sample tested.
Data reported represent the sample as submitted to SGS. Solid samples expressed on a dry weight basis.
"Temperature Upon Receipt" is representative of the whole shipment and may not reflect the temperature of individual samples.
Analysis conducted on samples submitted pursuant to or as part of Reg. 153/04, are in accordance to the "Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act and Excess Soil Quality" published by the Ministry and dated March 9, 2004 as amended.

SGS provides criteria information (such as regulatory or guideline limits and summary of limit exceedances) as a service. Every attempt is made to ensure the criteria information in this report is accurate and current, however, it is not guaranteed. Comparison to the most current criteria is the responsibility of the client and SGS assumes no responsibility for the accuracy of the criteria levels indicated.

SGS Canada Inc. statement of conformity decision rule does not consider uncertainty when analytical results are compared to a specified standard or regulation.

This report supersedes all previous versions.

Report for GHD – Ottawa Warehouse Project

September 21, 2022

Introduction

This report has been prepared based on water quality information that was provided to MacLellan Water. The principal purpose of this report is to make recommendations for a water treatment system for the warehouse facility. Maximum was use is estimated at 10 000 L per day although 5000 L per day is expected to be a more typical use.

Water Quality

Several sets of water quality information were provided, corresponding to samples collected at different times during pumping of the well. Although there was some variation among the samples, the results were broadly similar. We have used the last set of samples when discussing specific numbers in this report. The following parameters returned noteworthy values:

Turbidity

Turbidity is a measure of the “cloudiness” of the water. Turbidity is a concern because the materials that cause turbidity can interfere with disinfection efforts. The operational limit for turbidity is 1 NTU. The turbidity of this water was measured at 4.21 NTU.

Hardness

Water is considered hard when the hardness exceeds 100 mg/L. This water was measured with a hardness of 689 mg/L.

Iron

The aesthetic limit for iron is 0.3 mg/L. Above this limit, it can cause problems with colour, staining, and taste in the water. The concentration of iron in this water was measured at 0.481 mg/L. A further 0.175 mg/L of iron was present in a form where it is bound up with organic matter.

Manganese

The aesthetic limit for manganese is 0.05 mg/L. Above this limit, it can cause problems with colour, staining, and taste similar to those caused by iron. The concentration of manganese in this water was measured at 0.171 mg/L.

Sodium

People consuming water with a sodium content above 20 mg/L are encouraged to inform their physician. This is so that the physician can take the sodium content of the drinking water into consideration should it ever become necessary to prescribe a low sodium diet for medical reasons.

Above 200 mg/L sodium has a negative aesthetic effect in that it imparts a disagreeable, salty tang to the water.

The concentration of sodium in this water was measured at 67.6 mg/L.

Langelier's Index

The Langelier's Index (LI) is a calculation that assesses the "character" of the water. Water with an LI below -0.5 is aggressive and will tend to corrode metal pipes, fixtures, and appliances. Water with an LI from -0.5 to +0.5 is neutral. Water with an LI of more than +0.5 will tend to form hard water scale at an appreciably accelerated rate.

The LI is temperature dependent. The LI of this water was calculated at +0.85 at 4ºC. It will actually be even higher for water that has warmed up to room temperature while sitting inside the building.

Recommendations

The following items are presented for your consideration. It is assumed that they would be carried out at the appropriate time in the construction of the facility. MacLellan Water would be happy to provide price estimates to carry out the recommended work.

1. A submersible pump should be installed in the well and connected to the building with pipe and wire that are run inside protective conduit. An appropriate pressure system will need to be installed inside the building.

2. A filtration system for iron should be installed. There are a number of options for this, but the best would be a manganese greensand filter with chlorine regeneration. The filter will also remove a certain amount of manganese.

3. An activated carbon filter should be installed to both remove residual chlorine and organically-complexed metals.

4. A water softener should be used to soften the water. This will improve the aesthetics of the water. More importantly, it will protect the water disinfection system and water-using appliances (hot water tanks, etc.) in the facility from fouling due to hard water scale.

A twin alternating softener system will be used. With this system, one tank remains in service until its capacity is exhausted. The second tank then takes over softening duties while the first tank regenerates. This ensures an uninterrupted supply of softened water and allows the use of smaller, less expensive softening equipment than a single tank model.

5. Disinfection of the water will be provided with ultra violet (UV) disinfection. Depending on preferences for redundancy, this may involve one or two units. Depending on preferences, these may be fairly straight forward units or units equipped with sensors and automatic fail-safe shutoffs.

Regardless, the unit(s) will be sized to allow adequate flow to the facility and will be equipped with turbidity-reducing cartridge-style prefilters to screen out particles that bacteria might shelter behind while passing through the UV light.

6. The concentration of sodium in the water is already slightly high. The use of a water softener will increase the sodium content of the treated water by about 300 mg/L to a total of about 360 mg/L.

One or more point of use reverse osmosis (RO) units will be installed to remove sodium at locations (like lunch rooms) where people will actually consume the water. This is done in preference to treating all the water in the facility because the output of RO units is slow. The RO units will be equipped with small storage tanks so that pre-treated water will be ready on demand.

7. MacLellan Water will arrange a servicing schedule to ensure that all the equipment remains in proper working order.

Conclusion

We hope that this report contains all the information you require. Please do not hesitate to contact me with any questions. We would be happy to provide price estimates for this work once a few additional details have been established.

Sincerely,

William Vander Wilp
