Design Brief

The property located at 1600 James Naismith Drive is situated at the southwest corner of the Blair Road and the Queensway offramp.

The proposed development introduces a range of built forms that are arranged to provide a transition in scale and massing to the surrounding context.
Two six-storey mid-rise residential buildings are proposed along the eastern portion of the site, adjacent to an 8-storey residential building, with one level of underground parking below the mid-rises. Lower-scale 3.5-storey townhome blocks are proposed along the western edge of the site where they will transition to the adjacent single-family home residential neighbourhood. This gradation in height and density achieves a sensitive transition from the 8-storey building to the single-family home residential neighbourhood to the west, while utilizing an existing hardscape area of the site.

The layout places a strong emphasis on the public realm and shared outdoor spaces. Landscaped outdoor amenity areas are centrally located between the mid-rise buildings and townhomes, creating a cohesive pedestrian environment that supports walking, informal gathering, and passive recreation. These spaces are designed to function as a shared courtyard that visually and physically connects the various building types across the site. Additional amenity spaces include indoor common rooms within each mid-rise building, as well as private balconies and terraces for individual residential units in the mid-rise and townhome blocks, offering a balance of communal and private outdoor spaces.

Bicycle parking is distributed throughout the site to support active transportation, including secure bicycle parking within the underground garage, outdoor bicycle parking areas, and bicycle storage at select basement unit landings. This approach improves accessibility and encourages cycling as a viable mode of transportation for residents.

Each mid-rise building will contain 55 residential units, while the townhome blocks will provide 28 units per block. In total, Phase 2 will add 194 residential units to the neighbourhood, contributing to housing diversity through a range of unit types that respond to both the arterial road context and the adjacent low-rise residential area.

A cohesive architectural language across the site is established through a consistent palette of cladding materials, coordinated colour selections, and simple, legible building forms. Second-level overhangs and articulated volumes are used to reduce perceived massing and enhance the pedestrian experience at grade. While unified by this common expression, each building incorporates subtle variations in form and detailing to create visual interest across the development.

Sustainability Statement

The proposed development will incorporate multiple strategies to support sustainable design and energy efficiency. As a project located in Ontario, it will be subject to SB-10 of the Ontario Building Code, which mandates that energy performance exceeds the National Energy Code for Buildings (NECB) by at least 30% for buildings of this type. This regulation—effective since January 1, 2017—ensures that projects align with Ontario's progressive targets for greenhouse gas (GHG) emission reductions and energy conservation.

Situated on an existing asphalt parking lot, the project makes efficient use of previously developed land. It will revitalize the area while enhancing overall sustainability through more efficient land use and improved stormwater management opportunities. In addition, a portion of the site at the south-east corner of the property is dedicated to parkland and recreational spaces.

A key element of the design is the exterior pedestrian corridor, along with a network of interconnected paths woven between the buildings across the site. These new pedestrian routes and public spaces are intended to encourage healthier lifestyle choices, such as walking and cycling, while fostering everyday social interaction. The proposed exterior pedestrian corridor, enriched with a diverse range of vegetative cover, is not only a sustainable design strategy but also creates an enjoyable, inspiring, and human-scaled environment for residents and visitors alike.

Another sustainability feature will include bird-safe glazing treatments on large areas of glazing to mitigate bird collisions and enhance urban biodiversity.

These strategies reflect a commitment to responsible design, environmental stewardship, and alignment with both local and provincial sustainability objectives.
