MASTER INFRASTRUCTURE REVIEW

FOR THE

BARRHAVEN CONSERVANCY DEVELOPMENT CORPORATION

BARRHAVEN CONSERVANCY

CITY OF OTTAWA

PROJECT NO.: 17-891

MARCH 2021
2ND SUBMISSION
© DSEL

EXECUTIVE SUMMARY

This Master Infrastructure Review (MIR) is prepared in support of the Barrhaven Conservancy development on behalf of Barrhaven Conservancy Development Corporation (BCDC).

The overall Barrhaven Conservancy lands are situated north of the Jock River, between Highway 416 and Greenbank Road. The subject property is approximately 103 ha and is located within the City of Ottawa urban boundary in the Barrhaven ward.

The proposed development concept consists detached single homes, townhomes, park blocks, stormwater management blocks, open space and road allowances.

The subject property is located in the Jock River watershed and is under the jurisdiction of the Rideau Valley Conservation Authority (RVCA). Per the existing topography characterized in the available City of Ottawa base mapping, all flows from the subject property are ultimately conveyed to the Jock River by a series of municipal drains and ditches. The O'Keefe Municipal Drain, the Foster Ditch, and the Fraser-Clarke Watercourse all run through the subject property.

The development area is outside of the Jock River 100-year limit as confirmed by the RVCA.

The site is subject to permissible grade raises per geotechnical recommendations, ranging from 1.4 m to 2.2 m. The site will be designed as low as possible, to have regard for the geotechnical constraints. Environmental reporting has been completed to confirm environmental constraints for the site. There are three watercourses, which are required to be maintained or enhanced.

The recommended water servicing option of those evaluated is to connect through the Nepean Town Centre development area to Zone SUC, which has recently been upgraded. The watermains will extend along the future Chapman Mills Drive extension and through the Claridge "Burnett Lands" development area.

Detailed modelling at the detailed design stage will confirm phasing of the extensions of trunk watermains and sizing of the local watermain network. The proposed water design supply will conform to all relevant City and MECP Guidelines and Policies.

Sanitary servicing will be provided to the subject property via the off-site South Nepean Collector (SNC) trunk sanitary sewer. The recommended connection to the SNC is at existing SANMH 8 at the future Chapman Mills Drive (CMD) Extension as the inverts are at the lowest, providing the optimal grading strategy on a grade raise restricted site. A sanitary pump station is proposed on the west side of the Foster Ditch due to a crossing constraint between the proposed sanitary trunk sewer and the Foster Ditch invert. With the inclusion of the subject property, and the update to current City of Ottawa design parameters for demands, the SNC sanitary sewer adequately conveys

© DSEL

the entirety of the subject property's proposed sanitary flows without impacting downstream properties.

The basis of the stormwater design is the Jock River Subwatershed study (Jock River SWS) and a summary of existing conditions, historical review of geology, hydrogeology, geomorphology, hydraulics and hydrology is presented. As well, the guidance of the stormwater criteria for the subject lands, north of the Jock River.

Stormwater service is to be provided by capturing stormwater runoff by an internal gravity sewer system that that will also have a parallel Modified Etobicoke Filtration System (including internal catchbasin features such as deeper 1.0 m sumps and Goss Traps) for quality control treatment. The storm sewers will discharge to naturalized wetlands prior to discharging to the Jock River. The proposed system will provide an Enhanced Level of Protection for stormwater runoff from the subject property before being discharged to the wetlands and Jock River. Previously, quantity control was not required for the Jock River and, based on high level review by JFSA, this will continue to be the case for the development area. Notwithstanding, some quantity control by means of erosion storage will be included.

A preliminary Hydraulic Grade Line (HGL) modelling analysis has been completed for the proposed Conservancy East system and has demonstrated that the HGL is kept below the ground surface. Due to the grade raise restrictions and the proposed storm and sanitary drainage schemes, the road centerlines do not allow for standard basements with a gravity connection to the storm sewer system. Because of the constraints on the subject property, sump pumps will be installed for all residential blocks, following City of Ottawa guidelines.

Erosion and sediment control measures will be implemented and maintained throughout construction. The Jock River, O'Keefe Drain, Foster Ditch and Fraser-Clarke Watercourse will all be protected from any negative impacts from construction.

The proposed servicing and grading plans will meet all City, RVCA, and MECP requirements as set out in background studies and current standards.

MASTER INFRASTRUCTURE REVIEW
FOR
BARRHAVEN CONSERVANCY DEVELOPMENT CORPORATION
BARRHAVEN CONSERVANCY

CITY OF OTTAWA
PROJECT NO: 17-891

1.0 INTRODUCTION

David Schaeffer Engineering Limited (DSEL) has been retained to prepare a Master Infrastructure Review (MIR) in support of the Draft Plan of Subdivision and Zoning applications for the Barrhaven Conservancy development on behalf of Barrhaven Conservancy Development Corporation (BCDC).

1.1 Study Area

The subject property is located within the City of Ottawa urban boundary in the Barrhaven ward. As illustrated in ***Figure 1***, the subject property is located north of the Jock River, east of Highway 416, west of Greenbank Road, and south of both McKenna Casey Drive and Strandherd Drive. Borrisokane Road bisects the subject property between Strandherd Drive and the Jock River. The subject property measures approximately 103.38 ha and is legally described as parts of Concessions 3 and 4, Lots 14 and 15.

The subject property is currently zoned Development Reserve (DR) Zone. The proposed development concept plan allows for the development of a mix of detached single homes, back-to-back townhomes, rear lane townhomes, park blocks, naturalized wetlands, and open space buffer blocks. It also includes a road network featuring 14 m, 16.5 m right-of-way (ROW) width local road network, 8.5 m ROW width laneways and a 24 m ROW width collector road. The proposed development concept plan is presented on ***Figure 2***.

The entirety of the subject property is within the Jock River Subwatershed and is under the jurisdiction of the Rideau Valley Conservation Authority (RVCA). The existing topography characterized in the available City of Ottawa base mapping indicates that all flows from the subject property are ultimately conveyed to the Jock River by way of the O'Keefe Municipal Drain, the Foster Ditch (former Municipal Drain), the Fraser-Clarke Watercourse (former Municipal Drain), and the Borrisokane roadside ditches, which all run through the subject property.

The development area is outside of the Jock River 100-year limit as confirmed by the Rideau Valley Conservation Authority (RVCA). Refer to the RVCA confirmation letter in

© DSEL

Appendix A. The 100-year regulatory flood line is demonstrated in Drawing 1 (Grading) and Drawing 3 (Stormwater) in the ***Appendix***.

1.2 Study Scope

The subject property has been considered as a part of the ***Official Plan*** (City of Ottawa, 2003) and the associated ***Secondary Plan*** (City of Ottawa, 2003). As presented on Schedule B of the ***Official Plan***, the subject property is considered to be primarily General Urban Area, with portions of the subject property Employment Area, and Major Open Space.

The objectives of this Master Infrastructure Review are to:

- Provide historical background information regarding the servicing of the subject property;
- Present servicing options explored while determining the recommended servicing strategy;
- Provide sufficient detail to demonstrate that development of the subject property will be adequately supported by municipal services;
- Define the course of subsequent detailed design, review, and acceptance of the proposed municipal services;
- Demonstrate how the proposed municipal services will conform with current Ministry of the Environment, Conservation and Parks (MECP) servicing design criteria and other applicable agency guidelines; and,
- Demonstrate good engineering practice for the protection of public safety, the environment, and sustainable operation.

1.3 Environmental Assessment Act

Per Ontario Regulation 345/93: Designation and Exemption Private Sector Developers under Environmental Assessment Act, works undertaken by private sector developers are exempt from the Environmental Assessment Act unless they are:

- Schedule C projects (e.g. new wastewater treatment plant, stormwater pond w. biological treatment, new well, etc.); and
- Providing the project for the residents of a municipality for roads, water or wastewater.

All works proposed as part of this MIR are to be undertaken by a private sector and are Schedule A or B projects as follows:

- Proposed Modified Etobicoke Filtration System – Schedule B;

© DSEL

- Proposed Sewers – Schedule A; and
- Proposed Roads – Schedule A

As such, the works described in this report are exempt from the requirements of the Environmental Assessment Act.

1.4 Development Plan

The proposed development concept is shown in ***Figure 2***. The subdivision consists of a mix of single detached homes, townhomes, park blocks, open space and a road network.

Table 1 summarizes the land use breakdown and predicted populations associated with the development concept.

Table 1: Development Statistics

Land Use - EAST	**Area (ha)**		**Projected Population**
Residential (Low/Medium Density)	31.7		4130
Residential (High Density)	0.44		210
Streets	18.39		
Rear Lanes	0.30		
Natural Heritage System	5.21		
Parks	4.83		
Open Space	0.39		
Jock River Open Space	23.7		
Land Use - WEST	**Area (ha)**		**Projected Population**
Residential	34.09		4052

The above statistics are used to inform the servicing design for the site.

3.0 EXISTING CONDITIONS AND SITE CONSTRAINTS

3.1 Geotechnical Conditions

Paterson Group (Paterson) was commissioned to complete geotechnical investigations for the Barrhaven Conservancy Lands. The following reports were prepared:

- Geotechnical Investigation – Proposed Residential Development, Conservancy Lands East (Paterson Group, September 24, 2019)
- Geotechnical Investigation – Proposed Residential Development, Conservancy Lands West (Paterson Group, September 27, 2019)

The Barrhaven Conservancy Lands East consist of vacant land and are bordered by the Foster Ditch to the west, lands under development to the north and east, and the Jock River to the south. The existing ground surface across the site is relatively level with approximate ground surface elevation varying between 91 m and 92 m. The subsurface profile generally consists of an approximate 50 mm to 460 mm thick layer of topsoil underlain by a silty clay deposit. Due to the presence of a silty clay deposit, the permissible grade raise varies between 1.4 m in the northwest and 2.2 m in the southeast. Figure PG5036-2 *Permissible Grade Raise Plan* by Paterson Group is enclosed in ***Appendix B*** for reference.

The Barrhaven Conservancy Lands West consist of vacant land and is bordered by Highway 416 to the west, a railroad to the northwest, a stormwater retention pond to the northeast, the Foster Ditch to the east, vacant City Lands to the southeast, and the Jock River to the southwest. The existing ground surface across the site is relatively level with approximate ground surface elevation varying between 91 m and 92 m. The subsurface generally consists of an approximate 50 mm to 360 mm thick layer of topsoil underlain by a silty clay deposit. Due to the presence of a silty clay deposit, the permissible grade raise varies between 1.2 m to 1.8 m. Figure 5036-5 *Permissible Grade Raise Plan* by Paterson Group is enclosed in ***Appendix B*** for reference

3.2 Drainage

The subject property is relatively flat with the existing elevations ranging from 92 m in the north to 91 m in the south. The subject property gradually slopes towards the Jock River.

The subject property is within the Jock River watershed and is under the jurisdiction of the RVCA. As noted in ***Section 1.0***. The development area is outside of the Jock River 100-year limit as confirmed by the Rideau Valley Conservation Authority (RVCA). Refer to the RVCA confirmation letter in ***Appendix A***.

© DSEL

The O'Keefe Municipal Drain, the Foster Ditch, and the Fraser-Clarke Watercourse all run through the subject property and convey stormwater to the Jock River.

3.2.1 Floodplain

On November 8th 2019 the RCVA gave permission to Barrhaven Conservancy Development Corporation to cut and fill on the subject property under permit RV5 44/19 pursuant to review under Section 28 of the Conservation Authorities Act, regulation 174/06. The application and approval by the RVCA was supported by a 2D HEC-RAS model prepared by JFSA. The JFSA model identified the existing and proposed 100-year water levels and permissible extent of fill placement.

The works pursuant to the above-mentioned permit were completed and accepted by the RVCA on May 31st 2020. Options to complete the fill area boundary as set by JFSA included building a structural face of fill (retaining wall) to the limits of the 100-year floodplain boundary, or, building a berm with the toe of slope at the 100-year floodplain boundary. A vertical structural face of fill was not seen as a desirable or practical outcome and a berm was thus constructed. As-builts for the top of berm were subsequently provided and approved by the RVCA, resulting in the May 31st approval noted above and the current 100-year floodplain boundary delineation. The toe of the berm as constructed corresponds to the approved JFSA 100-year floodplain line and the current top of berm corresponds to the as-built top of berm.

Barrhaven Conservancy Development Corporation is in the process of preparing a new permit application to the RVCA for the lands to permit revisions along some boundaries to accommodate the sloped berm and support the proposed development envelope, consistent with the JFSA 2D HEC-RAS model work. Once completed, all the development lands on the Draft Plan (development blocks, roads) shall be above the 100-year floodplain elevation and a new toe of berm (bottom of fill) will be established. This second cut/fill application will also permit cuts within the 100-year floodplain to create the environmental wetlands along the Jock River corridor for West and East as shown in the Environmental Impact Statement by Kilgour and Associates. ***Figure 9*** illustrates the rationale for this update.

3.3 Hydrogeology

As noted in the Jock River Reach 1 SWS, the hydrogeologic conditions have been well documented in the study limits. Previous terrain analysis and hydrogeological studies within the study limits were completed by Jacques Whitford Limited (JWL) and Golder Associates Limited (Golder) and Paterson Group (Paterson).

Based on Figure 3.4.1 of the Jock River Reach 1 SWS, the surficial soils for Barrhaven Conservancy are determined to be silty clay with underlying bedrock ranging from 80.0 m to 85.0 m below original ground. As shown on Figure 3.4.3, the *Interpreted Groundwater Flow Direction* is southerly across the Barrhaven Conservancy lands,

© DSEL

towards the Jock River. Figures 3.4.1, 3.4.2 and 3.4.3 are provided in ***Appendix B*** for reference.

3.4 Environmental Features / Natural Heritage

Kilgour & Associates Limited completed an Environmental Impact Statement for the Barrhaven Conservancy East Development dated July 29, 2020 *(Kilgour EIS)*. The purpose of the *Kilgour EIS* is to review the overall development concept for the site from a natural heritage perspective; however, as a result of pre-consultation with the City of Ottawa and RVCA, the report is more comprehensive than a typical EIS, with information and analysis that is consistent with an Environmental Management Plan (EMP). The *Kilgour EIS* was prepared for the Barrhaven Conservancy Lands East, which are situated within the larger Barrhaven Conservancy Community, bordered by the Jock River to the south, Foster Ditch to the west, and the Fraser-Clarke Watercourse to the east. An EIS will be required for the Barrhaven Conservancy Lands West when development is proposed, to determine appropriate impact assessment and mitigation. It is noted in the *Kilgour EIS* that the report is intended to determine potential impacts of proposed site development on existing natural heritage features, provide mitigation and/or design considerations to protect those elements, and highlight relevant regulations as detailed planning proceeds to allow the developer to remain compliant. Figure 3 – Current Existing Conditions from the *Kilgour EIS* is enclosed in ***Appendix C*** for reference.

3.4.1 Surface Water Features and Fish Habitat

As noted in the *Kilgour EIS,* the Jock River flows from west to east along the southern boundary of the Barrhaven Conservancy Community for approximately 3 km to its confluence with the Rideau River and the site is entirely within Reach 1 of the Jock River Subwatershed. The Jock River is classified as a warm/warm-cool water system that is home to fish habitat, as detailed in the *Kilgour EIS*.

As described in the *Kilgour EIS*, lands between 80 m and 400 m wide, adjacent to the Jock River, will be established as a Jock River open space corridor. The open space corridor will include the development of both wetland and forest cover, designed to protect or enhance aquatic life and fish habitat. The wetland facilities will receive water inputs from stormwater quality treatment units, as discussed in ***Section 6.2***. Figure 5 – Conceptual Plan for the Jock River Riparian Corridor from the *Kilgour EIS* is enclosed in ***Appendix C*** for reference.

As noted in the *Kilgour EIS,* one municipal drain and two decommissioned municipal drains occur in the overall Barrhaven Conservancy Community and flow to the Jock River: the Foster Ditch, the Fraser-Clarke Watercourse, and the O'Keefe Drain. The Foster Ditch and the Fraser-Clarke Watercourse occur within the Barrhaven Conservancy East Lands. The O'Keefe Drain is located in the Barrhaven Conservancy

© DSEL

West Lands and will be detailed in a future EIS when those lands proceed to development.

The Foster Ditch flows approximately 800 m through the site from an existing stormwater management pond to the Jock River. The Fraser-Clarke Watercourse is a former municipal drain that was decommissioned by the City of Ottawa. The O'Keefe Drain is a municipal drain, with approximately 770 m in length abutting the western border of the Barrhaven Conservancy Lands East. The watercourses through the proposed community will be retained and protected with 30 m setbacks from their normal high-water marks. The corridors will be revegetated and re-naturalized as part of the detailed design phase of the proposed development. Existing roadside ditches will be maintained but do not require setbacks.

The *Kilgour EIS* has noted that there are no predicted negative impacts to surface water features during site development given application of conventional construction-phase mitigations.

3.4.2 Trees / Significant Woodlands

The *Kilgour EIS* has noted that the site was historically agricultural lands with treed hedgerows between fields, a tree buffer along the southern boundary of the property, and some areas of regenerating scrubland in the south west. Most of the hedgerows have been removed. The *Kilgour EIS* notes that the narrow band of trees occurring directly along the banks of the Jock River, the Foster Ditch and the Fraser-Clarke Watercourse have been fully retained. No Provincially Significant Wetlands, wetlands found in association with Significant Woodlands, Significant Valley Lands, or Areas of Natural and Scientific Interest occur on or adjacent to the site. Other than the trees along the watercourses, the site currently consists of bare, flat soil, though the soil has been seeded with a grass mix to provide erosion control.

The *Kilgour EIS* has noted that there are few trees currently remaining on site, none anticipated to be impacted by development, and no unique treed habitats or tree species are present. Trees along the two watercourses were retained within the 30 m buffer surrounding them, as shown on Figure 3 – Current Existing Conditions from the *Kilgour EIS*, enclosed in ***Appendix C*** for reference. Further, riparian forest areas along the Jock River remain intact and are unlikely to be impacted by the project given conventional construction-phase mitigations.

3.4.3 Wildlife / Species at Risk

The *Kilgour EIS* has identified species at risk (SAR) with some potential to occur near, or to otherwise interact with the proposed development project (Bank Swallow, Northern Map Turtle, Snapping Turtle, and Blanding's Turtle); however, can be mitigated through appropriate and conventional mitigations. It is further noted that the proposed project is

© DSEL

not expected to impact species at risk and the restored open space corridor has the potential to provide some additional new habitat for turtle species.

The *Kilgour EIS* notes that the site is unlikely to support wildlife. Amphibian habitats occur in the Foster Ditch and Fraser-Clarke Watercourse, which will remain within a 30 m protected corridor. Migratory birds have limited potential to occur and nest on the site. Wildlife species common to the area may continue to use or cross the site and the riparian forest along the Jock River functions as a wildlife corridor and will remain in place during and after site development. The implementation of suitable mitigation measure will minimize the risk resulting in no impact to amphibians, migratory birds and wildlife.

3.5 Existing Land Use and Adjacent Land Uses

Under existing conditions, the majority of the subject property is vacant.

For the Barrhaven Conservancy Lands West, City owned lands and a rail corridor is to the north, Highway 416 is to the west and City owned open space and the Jock River are to the south.

For the Barrhaven Conservancy Lands East, the Jock River is to the south, existing development is to the east and development underway is to the north.

Due to the proximity to existing residential developments, there are services adjacent to the proposed development area. In addition to water servicing, wastewater servicing and storm servicing, there will also be access to utility servicing. It is expected that Hydro, telecommunications, and natural gas servicing will be easily accessible.

© DSEL

4.0 WATER SUPPLY SERVICING

4.1 Existing Water Supply Services

The subject property is located adjacent to the City of Ottawa's Pressure Zone 3SW (previously known as Pressure Zone BARR). Pressure Zone SUC services the land found to the east of the subject property, as well as south of the Jock River.

The City of Ottawa has recently started reconfiguring the pressure zones servicing Barrhaven and the South Urban Community (SUC) in order to improve reliability and efficiency and to increase pumping capacity to accommodate for future growth in the area.

The populations and demands attributed to the Barrhaven Conservancy Lands have not been included in the recent City of Ottawa reconfiguration works.

The Fallowfield Road Pumping Station (FRPS), previously known as Barrhaven Reservoir Pumping Station and Barrhaven Pumping Station (BPS), will continue to service Zone 3SW. The new FRPS is commissioned and in operation while the BPS is currently undergoing pumping tests on the newly installed pumps as part of its commissioning process.

The BPS is changing from a single zone station to a dual zone pump station and will operate in conjunction with the Ottawa South Pumping Station (OSPS) to service the newly expanded Zone SUC. It will also continue to service the smaller / reduced Zone 3SW with one of its pumps. The OSPS is currently undergoing detailed design for its upgrade.

Future watermains in the vicinity of the subject property have been identified at the following locations, as shown on ***Figure 3***.

- 400 mm 3SW watermain trunk within Strandherd Drive ROW;
- 300 mm 3SW watermain within the future Chapman Mills Drive extension;
- 600 mm SUC watermain trunk within the future Greenbank Road realignment;
- 300 mm SUC watermain within a future local road to the east of Greenbank Road; and,
- 300 mm SUC watermains within the future road network in new developments south of the Jock River.

© DSEL

4.2 Water Supply Servicing Design

Stantec Consulting Limited was retained to perform a hydraulic assessment for the Barrhaven Conservancy Lands. The ***Hydraulic Potable Water Assessment for Barrhaven Conservancy Development Corporation (Stantec Hydraulic Analysis)*** prepared by Stantec on March 2021 is enclosed in ***Appendix D*** for reference. This report is prepared for both the Conservancy East Phase 2 (east of the Foster Ditch) and Conservancy West (west of the Foster Ditch) and is referred to overall as the Barrhaven Conservancy Lands.

Adequacy of sizing of the trunk watermain infrastructure was considered in the ***Stantec Hydraulic Analysis***. The subject property was deemed serviceable and offered multiple servicing alternatives that could adequately service the subject property conforming to all relevant City and MECP Guidelines and Policies.

4.2.1 Water Supply Servicing Alternatives

To supply water to the entirety of the subject property, a local watermain network will follow the road network and ultimately connect to off-site trunk watermains based on one of the following alternatives, presented in the ***Stantec Hydraulic Analysis***:

<u>Alternative 1 – Servicing from Zone 3SW</u>

As shown on Figure 1 of the ***Stantec Hydraulic Analysis***, Alternative 1 is to connect at two locations to Kennedy-Burnett watermains that are fed by the future 3SW watermain trunk within Strandherd Drive.

Based on the *Kennedy-Burnett Potable Water Master Servicing Study (Stantec, 2014)*, it is likely that the Barrhaven Conservancy Lands would experience pressures greater than the City of Ottawa's objective pressure of 80 psi during basic day demands if operating at the Zone 3SW pressure. Pressure mitigation measures such as pressure reducing valves (PRVs) at individual service connections would need to be considered.

Pumping capacity upgrades at the FRPS and/or BPS would be required to service the Barrhaven Conservancy Lands from Zone 3SW on a permanent basis. Another alternative would be to service the initial phase of development (refer to Figure 1 of the ***Stantec Hydraulic Analysis*** for the boundary line) from Zone 3SW on a temporary basis, to be switched to Zone SUC at a later time. Although technically feasible, this alternative essentially borrows capacity from existing approved areas within Zone 3SW until such time that the borrowed capacity is replaced through system upgrades. Through informal discussions, the City has indicated that this is not a desirable option and is disregarded.

© DSEL

Alternative 2 – Servicing from Zone SUC

Alternative 2 is to connect at two locations to Zone SUC. Figures 2, 3, 4 and 5 of the ***Stantec Hydraulic Analysis*** present the connections presented in Alternatives 2a, 2b, 2c and 2d, respectively.

Based on the *Barrhaven South Urban Expansion Area Master Servicing Study (Stantec, 2017),* it is likely that the Barrhaven Conservancy Lands can anticipate maximum pressures greater than 75 psi and potentially be greater than 80 psi during basic day demands if operating at Zone SUC pressure. If they were to exceed 80 psi, PRVs would need to be considered.

Alternatives 2a and 2b propose the primary feed to be a new SUC watermain running parallel to the Strandherd watermain, connecting to the Kennedy-Burnett (KB) watermains. These options are now not desirable due to the advancement of the Strandherd Road widening project.

Alternative 2c proposed both the primary and secondary feed from the NTC as shown on Figure 4 of the ***Stantec Hydraulic Analysis*** to service the first stages of development in the Barrhaven Conservancy Lands. One connection is through the future Chapman Mills Drive (CMD) and one is through the future Claridge development southeast of the Kennedy-Burnett Pond. Servicing these lands with a 300 mm diameter watermain from CMD and a 200mm diameter from Claridge's development is possible; however, ultimate optimization of sizing would have to be completed at a later phase. This option also presents challenges due to limited land access or crossing at a body of water.

Alternative 3 – Servicing from Zone SUC with an Automated Valve from Zone 3SW

Alternative 3 is to service the Barrhaven Conservancy Lands by a new Zone SUC watermain running parallel to the Strandherd Drive watermain and a secondary feed from Zone 3SW for emergency conditions. This alternative proposes a secondary feed from Zone 3SW via an automated valve off the future Strandherd Drive watermain, as shown on Figure 5 of the ***Stantec Hydraulic Analysis***. With this design, water would flow from the high-pressure Zone 3SW to the low-pressure Zone SUC if there is a pressure drop on the Zone SUC side of the valve. This alternative requires an inter-zonal valve connection that is not typically used or accepted in the City of Ottawa and would present both operational challenges and costs to operate and maintain. This would also require installation of an additional separate watermain along Strandherd Drive so is therefore not feasible at this time as noted previously.

© DSEL

Recommended Alternative:

Refer to Table 5: Potable Water Servicing Alternatives & Limitations of the ***Stantec Hydraulic Analysis*** for a summary of the alternatives. Prior coordination with City staff (and further discussion at a February 11, 2021 meeting) has indicated that an acceptable approach would be for service to be provided from the recently reconfigured South Urban Community (SUC) pressure zone (identified as Alternative '2C' in the ***Stantec Hydraulic Analysis***). The water supply network will be expanded through neighboring properties within the PZ SUC Nepean Town Centre (NTC) development area (i.e. Claridge's "Burnett Lands" development at 3370 Greenbank Road – a current General Plan of services is provided in ***Appendix D*** for reference) with ultimate watermain concepts in line with the prior Stantec study completed titled *"Kennedy-Burnett Potable Water Master Servicing Study (April 2014)"* (excerpt provided in ***Appendix D***). Preliminary coordination with landowners has been undertaken in order to ensure appropriate watermain sizes will be available when those developments are advanced. At the time of detailed design, detailed hydraulic modelling will be undertaken to verify that the proposed on-site and off-site watermains are in conformance with all relevant criteria.

The proposed water servicing layout is presented on ***Drawing 2***. As detailed designs progress, timing, alignment, and sizing of local watermains will be confirmed. The subdivision's local watermain network will be sized to meet maximum hour and maximum day plus fire flow demands, with consideration given to proposed phasing plans. ***Table 2*** summarizes the Water Supply Design Criteria employed in the preparation of the preliminary water demand estimate

Table 2: Water Supply Design Criteria

Design Parameter	Value
Extracted from Section 4: Ottawa Design Guidelines, Water Distribution (July 2010)	
Residential - Single Family	3.4 p/unit
Residential – Townhome/ Semi	2.7 p/unit
Residential – High Density	2.1 p/unit
Minimum Watermain Size	150 mm diameter
Minimum Depth of Cover	2.4 m from top to finished grade
Normal operating conditions desired operating pressure is within	350kPa and 480kPa
During fire flow operating pressure must not drop below	140kPa
Stantec Hydraulic Analysis, Stantec, July 20, 2017 for Population Exceeding 3000 Persons	
Residential – Detached Single	180 L/cap/day
Residential – Rear Lane Town	198 L/cap/day
Residential – Back-to-Back	198 L/cap/day
Residential – High Density	219 L/cap/day
Outdoor Water Demand	1049 L/unit/day (single detached)
Basic Day	Population x Demand
Max Day	Basic Day + Outdoor Demand

© DSEL

4.2.2 Fire Flow Demand

Fire Flow requirements are to be confirmed in accordance with Local Guidelines (Fire Underwriters Survey), City of Ottawa Water Supply Guidelines, and the Ontario Building Code, upon development of detailed concepts for the detached single homes, townhouses, and the park. For planning purposes, fire flow estimates are provided in the preliminary water demand estimate (***Appendix D*** and ***Table 3***) based on the information available in the preliminary concept plan and comparable recent developments in the City of Ottawa.

4.2.3 Boundary Conditions

To support the future development of a hydraulic analysis for the subdivision, boundary conditions are expected to be provided by the City of Ottawa for the preliminary water demands.

4.2.4 Water Demand Calculations

A summary of water demands for the subject site is presented in ***Table 3*** as derived from the criteria above and the Stantec Hydraulic Analysis found in ***Appendix D***.

Table 3: Water Demand Estimate (1)

	Unit Count			Pop	L/c/d	BSDY (MLD)	MXDY (MLD)
	Conservancy East	Conservancy West	Total				
Single Family	730	775	1,505	5,117	180	0.92	2.50
Townhouse	445	525	970	2,619	198	0.52	0.52
Rear-Lane Townhouse	165	-	165	446	198	0.09	0.09
High Density	100	-	100	210	219	0.05	0.05
Total	***1,440***	***1,300***	***2,740***	***8,392***		***1.58***	***3.16***

Notes: (1) Water demand details derived from Stantec Hydraulic Analysis. See Appendix D for report details.

4.3 Water Supply Conclusion

Stantec was retained to evaluate water servicing options for the subject lands. Through analysis and consultation, it was determined that the preferred option is to connect through the Nepean Town Centre development area to Zone SUC, which has recently been upgraded. The watermains are recommended to extend along the future Chapman Mills Drive extension and through the Claridge “Burnett Lands” development area. Detailed modelling at the designed design stage will confirm phasing of the extensions of trunk watermains and sizing of the local watermain network. The proposed water design supply will conform to all relevant City and MECP Guidelines and Policies.

© DSEL

5.0 WASTEWATER SERVICING

5.1 Existing Wastewater Services

Per the ***South Nepean Collector (SNC) Wastewater Servicing Study and Functional Design Report*** by Dillon in October 2003 ***(Dillon SNC Report)***, the subject property is tributary to the South Nepean Collector (SNC) sewer as urban development land.

The SNC (previously called the Jock River Collector) sewer operates north of the subject property within Strandherd Drive prior to travelling south down Chapman Mills Drive (CMD) and then turns eastward within the future CMD right-of-way (ROW).

The SNC was designed to be constructed in three phases. Phase 1 of the SNC was completed in 2005, terminating at a 2400 mm maintenance hole located east of Longfields Drive, north of Bren-Maur Road. Phase 2 was recently extended to Strandherd Drive via the proposed extension of Chapman Mills Drive from its previous termination. Phase 3 will extend the trunk sewer along Strandherd Drive to the intersection of Maravista Drive. The wastewater is ultimately conveyed to the intersection of Jockvale Road and Longfields Drive where it then passes underneath the Jock River.

The ***South Nepean Collector Phase 2: Hydraulics Review / Assessment*** memo was prepared by Novatech Engineering Consultants on August 20, 2015 ***(Novatech SNC Memo)*** to provide an update to the sanitary design flows for Phase 2 of the South Nepean Collector, as previously documented in the ***South Nepean Collector (SNC) – Functional Design Report and Update*** by Dillon in 2012 ***(Dillon SNC Report and Update)***. In addition, Novatech is also currently the engineer of record for the design and implementation of the Phase 3 extension of the SNC, noted above.

The location of the SNC sewer is shown on ***Figure 4.***

5.2 South Nepean Collector Phase 3 – Preliminary Design

The 2015 ***Novatech SNC Memo*** contemplated that the Conservancy Phase 1 development area (north of the Fraser-Clarke Watercourse) would be serviced by the 900 mm diameter SNC sewer running adjacent to the property within the future extension of CMD. This is represented by area “A6-E” within the “*Sanitary Drainage Areas and Land Use – Fig.1”* plan within the 2015 Novatech memo (note that the actual tributary area and population varied slightly).

For the Phase 3 extension of the SNC, Novatech has prepared another review of sanitary flows within their technical memorandum titled “***Strandherd Drive Widening Project***, ***South Nepean Collector Phase 3: Sanitary Flow Calculations***” May 30, 2019 ***(2019 Novatech SNC Memo).*** The memorandum along with the design sheet

© DSEL

calculations from the Novatech memo are provided in ***Appendix E*** for reference along with DSEL annotations on key items in the figure and design sheets. The updated "*Sanitary Drainage Areas and Land Use – Fig.1" (May 2019)* plan is essentially reflective of the same tributary information that was provided in the 2015 study (the plan has been marked up to reflect the Conservancy areas as a frame of reference). The associated design sheet also reflects updated City wastewater design criteria that was not accounted for in the 2015 study and is discussed further in the following section.

Report excerpts are provided in ***Appendix E*** for the SNC Phase 2 analysis as well as draft information associated with the Phase 3 extension.

The location of the SNC sewer is shown on ***Figure 4*** in ***Figures***.

5.3 Wastewater Design

The subject property is planned to be serviced by an internal gravity sanitary sewer system that is to generally follow the local road network, with select servicing easements identified to achieve efficiencies in servicing and grading designs. The wastewater servicing plan can be seen in ***Drawing 4***. As detailed designs progress, alignment and sizing of local sanitary sewers will be confirmed and additional servicing easements may be required, which may trigger minor amendments to the proposed fabric in the concept plan.

The ***Novatech SNC Memo*** contemplated that portions of the subject property would be serviced by the 900 mm diameter SNC sewer, running adjacent to the property within Strandherd Drive and the future extension of Chapman Mills. This ***Master Infrastructure Review*** proposes that the drainage area of the SNC sanitary sewer be expanded to include the entirety of the subject property.

Table 4 presents the wastewater design criteria applied in the design of this site.

© DSEL

Table 4: Wastewater Design Criteria

Design Parameter	Value
Current Design Guidelines	
Residential - Single Family	3.4 p/unit
Residential – Townhome/ Semi	2.7 p/unit
Residential – Apartment	1.8 p/unit
Average Daily Demand	350 L/d/per
Peaking Factor	Harmon's Peaking Factor. Max 4.0, Min 2.0
Commercial / Institutional Flows	50,000 L/ha/day
Commercial / Institutional Peak Factor	1.5
Infiltration and Inflow Allowance	0.28 L/s/ha
Park Flows	28,000 L/ha/d
Park Peaking Factor	1.0
Sanitary sewers are to be sized employing the Manning's Equation	$Q = \frac{1}{n} AR^{2/3} S^{1/2}$
Minimum Sewer Size	200mm diameter
Minimum Manning's 'n'	0.013
Minimum Depth of Cover	2.5m from crown of sewer to grade
Minimum Full Flowing Velocity	0.6m/s
Maximum Full Flowing Velocity	3.0m/s
Extracted from Sections 4 and 6 of the City of Ottawa Sewer Design Guidelines, October 2012, and recent residential subdivisions in City of Ottawa.	
Operational Parameters on Monitoring Data ***(Example Only, Values to be Reviewed on Case-by-Case Basis with City of Ottawa)***	
Average Daily Demand	300 L/d/per
Harmon – Correction Factor	0.4 to 0.6
Institutional / Industrial Flows	10,000 L/ha/day
Commercial Flows	17,000 L/ha/day
Commercial / Institutional Peak Factor	1 (non-coincident peak)
Extracted from Sections 4 and 6 of the City of Ottawa Sewer Design Guidelines, October 2012, and recent residential subdivisions in City of Ottawa.	

5.3.1 Wastewater Design Servicing Alternatives

Alternative 1 – Connect to existing Ph 2 South Nepean Collector at Chapman Mills Drive

A total area of 107.81 ha is proposed to drain into the SNC trunk sewer from the subject property, including the Conservancy East lands and the Conservancy West lands. The sanitary drainage area information is shown in ***Drawing 4*** and the design sheets are enclosed in ***Appendix E.***

Applying the City of Ottawa's wastewater design criteria to the overall development concept, the estimated peak sanitary flow from the subject property, including external flows, is ~106.58 L/s. The proposed internal gravity sanitary trunk sewer adequately services the subject property and does not exceed 82% capacity throughout the network.

© DSEL

The proposed peak sanitary flow from the subject property (including Conservancy East and Conservancy West) to the existing SNC sanitary sewer (SANMH 8 in Novatech Drawing No. 20) is ~106.58 L/s. The addition of the Conservancy Land's peak flow to the peak design flows from the ***2019 Novatech SNC Memo*** results in an updated peak flow of 399.65 L/s to SNC sewer installations downstream of existing SANMH 8. With the inclusion of the subject property, the SNC sanitary sewer along the Conservancy Phase 1 frontage would be at approximately 95% capacity and downstream sections (based on SNC as-built information which had a minimum slope of 0.05%) and can adequately handle the entirety of the Conservancy property's proposed sanitary flows.

When reviewing the projected flows to the SNC, as derived from the *Novatech Phase 2 and Phase 3* SNC data, along with Conservancy Lands design flows, the following is summarized:

Table 5: South Nepean Collector – Projected Flow Updates

Report Reference	Projected Flows at Strandherd/CMD intersection (L/s)	Flow at Conservancy Lands Connection Point (L/s)	Difference From Original 2015 SNC Capacity Design (L/s)
2015 Novatech SNC Memo	384.7(1)	423.6	0
2019 Novatech Preliminary Phase 3 Design	282.5(2)	308.6(3)	-115
DSEL inclusion of Conservancy Lands tributary of ~107.81ha	282.5	399.65(4)	-23.95

(1) See annotated Novatech design sheet "South Nepean Collector – Phase 2 & 3" (August 2015) in Appendix C and associated "Sanitary Drainage Areas and Land Use" Figure 1 dated August 2015.
(2) See annotated Novatech design sheet "South Nepean Collection Phase 3" (September 2019) in Appendix C and associated "Sanitary Drainage Areas and Land Use" Figure 1 dated May 2019
(3) Incorporating the new Phase 3 flows into the 2015 Novatech analysis
(4) See DSEL sanitary flow spreadsheet review of Novatech's SNC Phase 2 and 3 design sheet data.

The above table demonstrates that with the updates to the SNC design parameters and incorporation of the Conservancy Lands sanitary flows there is a net reduction of 23.95 L/s to the SNC sewer at this location. As such this translates into no impacts downstream of this connection point to the SNC sewer network.

Alternative 2 – Connect to existing Phase 3 South Nepean Collector at Strandherd Dr.

In this alternative, the wastewater servicing design reviewed a connection into the off-site SNC sanitary sewer within Strandherd Drive at Borrisokane Road. The sanitary sewer is shown on the *Strandherd Drive Widening – Maravista Drive to Jockvale Road - Grading & Drainage 7, Strandherd Drive STA 12+200 to STA 12+500 Drawing No. 59,*

© DSEL

Rev 1 (Issued for Construction) dated 26/06/20, provided in ***Appendix E*** for reference (City contract number CP000217)

Although the capacity for the Conservancy Lands within the system can be confirmed, there are some issues with connecting to this upstream location. The invert in the proposed SNC sanitary sewer at Borrisokane Road is at 87.75 m, which is approximately 1.25 m higher than the invert proposed in Alternative 1. If the sanitary connection was made at this location, the proposed sanitary within the Conservancy Lands would not work with the grading. Due to the grade raise restrictions across the site, it is not feasible to raise the site further to accommodate this sanitary connection.

Alternative 3 – Connect to future Phase 3 SNC at McKenna-Casey Drive

Sanitary servicing for the Conservancy West development area was reviewed for potential conveyance to the future alignment of the SNC at Strandherd Drive where it crosses the present McKenna Casey Drive. The proposed SNC sanitary sewer is shown on the *Strandherd Drive Widening – Maravista Drive to Jockvale Road - Grading & Drainage 5, Strandherd Drive STA 11+625 to STA 11+900 Drawing No. 56, Rev 1 (Issued for Construction) dated 26/06/20*, provided in ***Appendix E*** for reference (City contract number CP000217). At SNC manhole "SA14" the 750mm diameter sewer obvert is 89.14m. By analyzing a minimal sewer slope of 0.15% back into the site (which in reality would likely need to be steeper at the upstream ends as the pipe size would likely be too small to achieve minimum velocities), the result is only having approximately 1.1m of sewer cover on the sanitary at the low points based on preliminary grading design. This would require lifting the roadway low points around +/- 1.9m to set the sanitary below the storm sewers to provide sufficient room for crossings and connections, which would increase the grade raise exceedances (permissible ranging from 1.2 to 1.8m) in this area significantly.

Diversion of a portion of flows eastward through Conservancy East (without a pump station) is constrained by a conflict with the invert of the existing Foster Ditch.

Recommended Alternative

Alternative 1 is recommended, which has the lower and further downstream connection to the SNC sanitary sewer at future CMD at existing manhole '*SANMH 8*'. This connection is recommended as it will not lead to the requirement to lift the grades on the grade raise restricted site. Capacity in the SNC sanitary sewer has been confirmed.

The design of the gravity sewers for the Conservancy East area does not have any exceptional requirements up to the boundary of the Foster Ditch which is the westernmost limit of the East draft plan; however, the Foster Ditch does impart a constraint due to the bottom elevation of the watercourse. This constraint will necessitate the inclusion of a pump station, west of the Foster Ditch, in order to provide sanitary service upstream. The pump station overflow will connect to the downstream

© DSEL

sewer. The upstream sanitary HGL will be controlled by the pump station failure which is controlled by the downstream HGL. The pump station information is schematic only and more detailed parameters will be available at the time of advancement of the draft plan for those Conservancy West lands that are west of the Foster Ditch.

The preliminary sanitary servicing design, along with a conceptual location of the pump station is shown on ***Drawing 2 & 4*** in ***Drawings***. The preliminary sanitary and storm trunk profiles are shown on ***Drawing 5*** and ***Drawing 6*** in ***Drawings***.

5.4 Wastewater Servicing Conclusion

The subject property will be serviced by local sanitary sewers, an on-site trunk sanitary sewer and the off-site existing SNC sanitary sewer as defined in previous reports. This MIR proposes the expansion of the drainage areas from the *South Nepean Collector: Phase 2 Hydraulics Review / Assessment Technical Memorandum* (Novatech, August 2015), to include the entirety of the subject property. Residual capacity exists downstream in the SNC after the addition of the subject property's wastewater flows to the SNC sanitary sewer, therefore the proposed servicing does not have a negative impact on neighboring landowners.

Three alternatives were considered as it relates to connections to the SNC sanitary sewer, with the recommended alternative being at the existing SNC *SANMH 8* at the future CMD extension adjacent to Conservancy Phase 1. This alternative was chosen as the inverts are lower providing a better grading strategy for the grade raise restricted Conservancy Lands.

There is a requirement for a sanitary pump station to be incorporated into the design for lands west of the Foster Ditch due to the constraint imposed by the invert elevation of the watercourse. The upstream HGL will be controlled by the pump station failure which is controlled by the downstream HGL.

© DSEL

6.0 STORMWATER CONVEYANCE

6.1 Existing Stormwater Drainage

The subject lands are within the Jock River Subwatershed. The existing drainage features and patterns are illustrated on ***Figure 5***. Per the existing topography characterized in available City of Ottawa base mapping, all flows from the subject property are ultimately conveyed to the Jock River by a series of watercourses. The O'Keefe Municipal Drain, the Foster Ditch (former Municipal Drain), the Fraser-Clarke Watercourse (former Municipal Drain) and the Borrisokane roadside ditches all run through the subject property and convey stormwater to the Jock River. ***Section 6.1.1*** of this report provides a summary of background information from the Jock River Reach 1 Subwatershed Study (Stantec, June 2007) as it relates to the subject site. As ***Section 6.1.1*** is based on a summary of historical information and documentation, the Fraser-Clarke Watercourse and Foster Ditch are referred to as a Municipal Drains. It is noted that the Fraser-Clarke Watercourse and Foster Ditch did previously have status as Municipal Drains under the provincial *Drainage Act* but the drains were officially abandoned, pursuant to Section 84 of the *Act*, at the request of the landowner(s). Additional information regarding the meander belt for the Jock River and municipal drains and ditches that cross the subject site is contained in ***Section 6.1.2***.

6.1.1 Jock River Reach 1 Subwatershed

The following information provides a background summary from the Jock River Subwatershed Study (Stantec, June 2007) focusing on the subject site. The Jock River Reach 1 Subwatershed study also covered the Barrhaven South Community, south of the Jock River; however, that area was subject to its own Community Design Plan (CDP) and Master Servicing Study (MSS).

In January 2005, the Jock River Reach 1 Subwatershed Study was initiated to identify the existing environmental condition of the river and associated natural resources and to recommend strategies for the management of the natural environment in order to address growing development pressure in Barrhaven and the surrounding area.

The subwatershed is approximately 2300 hectares and when the study was completed in June 2007, approximately 1070 ha (47%) was developed. The Jock River Reach 1 subwatershed study provides the environmental and conceptual stormwater management requirements for the Barrhaven South community and the undeveloped urban lands north of the Jock River. The undeveloped urban lands north of the Jock River are the Barrhaven Conservancy Lands.

The existing natural resources within the subwatershed were identified and assessed to determine significant features and functions within the study area. The main tributaries noted within the Barrhaven Conservancy Lands are the O'Keefe Drain, Foster Ditch and

© DSEL

Fraser-Clarke Watercourse. The O'Keefe Drain is a Municipal Drain. All the tributaries to the Jock River support fisheries and are considered fish habitat.

The holistic understanding of the health and state of the subwatershed's ecosystem led to the preparation of the preferred management strategy for the areas north and south of the Jock River. The Jock River Reach 1 management strategy consisted of three main components: Conceptual Stormwater Management Plan, Natural Environment Plan and Conceptual Fish Habitat Compensation Plan.

Stormwater Management Design Criteria

The following criteria were established for all future stormwater management facilities within Reach 1, applicable to the subject site:

Jock River:

- No quantity control storage required for flood control purposes as the hydrograph from the subwatershed will peak before the upstream peak in the Jock River.
- No erosion control storage required to maintain the pre-development in-stream erosion condition.
- Quality control volume as per the Ministry of the Environment, Conservation and Parks Enhanced Treatment (80% TSS removal), following the integrated SWM approach recommended in the Lower Rideau Watershed Strategy.

North of the Jock River:

- Quantity control storage as required to meet constraints within existing channels and/or at existing crossings (quantity control/level of control requirements to be determined through future detailed study).
- Erosion control storage as required to maintain stability and geomorphic function of the existing tributaries, as determined through further detailed study.
- Quality control storage as per the Ministry of the Environment, Conservation and Parks Enhanced Treatment (80% TSS removal).
- All stormwater management facility outlets will be designed to augment low flows to the extent possible.

6.1.1.1 Existing Conditions Summary

It is noted in the Jock River Reach 1 SWS that the area was the subject of numerous studies over many years as it was long identified for urban development. Prior to development, the subject site was primarily cropped land and wide shallow floodplain.

© DSEL

6.1.1.1.1 Geology and Hydrogeology

As noted in the Jock River Reach 1 SWS, the geologic and hydrogeologic conditions have been well documented in the study limits. Previous terrain analysis and hydrogeological studies within the study limits were completed by Jacques Whitford Limited (JWL) and Golder Associates Limited (Golder) and Paterson Group (Paterson).

Based on Figure 3.4.1 of the Jock River Reach 1 SWS, the surficial soils for Barrhaven Conservancy are determined to be silty clay. Based on Figure 3.4.2 of the Jock River Reach 1 SWS, the underlying bedrock ranges from 80.0 m to 85.0 m. As shown on Figure 3.4.3, the Interpreted Groundwater Flow Direction is southerly across the Barrhaven Conservancy, toward the Jock River. Figures 3.4.1, 3.4.2 and 3.4.3 from the Jock River Subwatershed Study are enclosed in ***Appendix F***.

6.1.1.1.2 Geomorphology

Reach Delineation

Parish Geomorphic Ltd evaluated the Jock River Reach 1 from a fluvial geomorphology perspective, dividing it into four distinct reaches. The reaches were delineated based on the changes in channel sinuosity, augmented by geological, topographical and land use information. The Barrhaven Conservancy lands are adjacent to Reach JR-3 and Reach JR-4, as identified on Figure 3.5.1 in the Jock River Reach 1 SWS, enclosed in ***Appendix F***. These upstream reaches flow through a well-established riparian zone, consisting of a scrubland and deciduous forest. They are controlled by underlying clay material and bedrock of low relief so that the valley is unconfined.

The following provides a summary of the two reaches adjacent to Barrhaven Conservancy, from the Jock River Reach 1 SWS.

- Reach JR-3 is located between Cedarview and the meander bend of Half Moon Bay (in the Jock River). The reach was characterized by deep, turbid, slow moving water and low sinuosity. The relief contrasts strongly with the lower reaches due to a transition from glacial till deposits to clay and exposed bedrock. This results in an unconfined valley floodplain. Approximate bankfull width is 70 – 110 m. Reach JR-3 does not demonstrate significant evidence of geomorphic instability.

- Reach JR-4 is between Highway 416 and Cedarview Road and ranges from 70 - 120 m wide, with still, turbid water and moderate sinuosity. In stream vegetation is abundant. Reach JR-4 does not demonstrate significant evidence of geomorphic instability.

© DSEL

Meander Belt Widths

The meander pattern for the reaches is divided in two. JR-3 and JR-4 consist of similar-shaped, low amplitude meanders. Meander belt quantification is used to identify and appropriate corridor that indicates the maximum lateral extent of the channel. Delineation of these corridors can then be used to implement specific developmental constraints at the planning level in order to avoid future remediation measures associated with channel erosion.

The following preliminary meander belt widths are determined to be conservative. For the upper reaches, JR-3 has a preliminary meander belt width of 198 m (218 m with a 10% buffer) and JR-4 has a meander belt width of 210 m (231 m with a 10% buffer).

Tributaries North of the Jock River

The presence of drains and tributaries was noted during the field reconnaissance for the Jock River Reach 1 SWS. The more defined drains were selected for geomorphic assessment and the ones through Barrhaven Conservancy (north of the Jock River) are identified as the Foster Ditch, O'Keefe Drain and the Fraser-Clarke Watercourse.

The Foster Ditch originates south of Fallowfield Road, west of Borrisokane Road and flows south until it converges with the Jock River south of McKenna Casey Drive. The ditch is approximately 3200 m long and has been artificially straightened. The surrounding land use is agricultural. Riparian vegetation is very sparse but mostly grasses with few shrubs. Due to the unnatural alignment of the ditch, a sinuosity value and the calculation of migration rates are not applicable. Top of the valley meander belt widths for the ditch derived using empirical formula are 28.16 and 37.18 m for a discharge of 0.5 and 2.0 m^3/s, respectively.

The O'Keefe Drain is located east of and runs parallel to Highway 416. The drain extends from south of Fallowfield Road and enters the Jock River south of McKenna Casey Drive. The drain is approximately 3100 m in length and has been artificially straightened to follow the depression between agricultural lands. The predominant land use is agricultural. The riparian vegetation consists mainly of grasses and some shrubs with thicker forested patches as the reach approaches the Jock River. Due to the unnatural alignment of the drain, a sinuosity value and the calculation of migration rates are not applicable. Top of the valley meander belt widths for the drain derived using empirical formula are 24.37 and 33.39 m for a discharge of 0.5 and 2.0 m^3/s, respectively.

The Fraser-Clarke Watercourse is located east of and parallel to Highway 416 and south of Strandherd Drive. The watercourse begins east of Borrisokane Road and enters the Jock River west of Greenbank Road. It is approximately 1900 m in length. Historically the land was predominantly agricultural which remained consistent throughout the time periods observed. After 1954, urban development increased north of the drain with the development of a subdivision located north of Strandherd Drive. As

© DSEL

a result, the Kennedy-Burnett stormwater ditch was added and enters the Fraser-Clarke Watercourse, approximately 300 m from its confluence with the Jock River. Riparian vegetation consists mainly of grasses with few shrubs. A slight change in riparian vegetation is evident with a forested corridor located in the upstream limits of the watercourse. The watercourse is relatively straight with a sinuosity value of approximately 1.04. Although this watercourse is relatively natural, migration rates were unable to be calculated due to the small size of the channel.

The morphological characteristics of tributaries to the north of the Jock River are presented in Table 3.5.5 of the Jock River Reach 1 SWS.

Erosion Thresholds

Erosion thresholds established based on the particle size distribution of the bed materials. The critical depth and erosion threshold for the Foster Ditch are 0.35 m and 0.79 m^3/s, respectively. The parameters for the O'Keefe Drain are 0.49 m and 1.86 m^3/s respectively.

6.1.1.1.3 Hydrology and Hydraulics

The Jock River is a tributary of the Rideau River and the watershed is mainly rural, river slopes <0.5% and with some passive flow regulation. Its 556 km^2 drainage area forms roughly 15% of the Rideau River watershed. Although the Jock River carries high flows during the spring freshet, summer flows are documented to be quite low.

A number of drains and tributaries of the Jock River exist in Reach 1 and most are small-scale channels that tend to be less defined upstream with greater definition at the confluence with the Jock River. The tributaries collect runoff from areas north and south of the river and discharge into the Jock River during rain events and spring snowmelt; however, all drains dry up during summer months with the exception of some pools of water in the drains.

The tributary channels to the north of the Jock River, which are within the Barrhaven Conservancy Lands, are as follows:

The Foster Ditch originates south of Fallowfield Road, west of Cedarview Road (now Borrisokane Road) and flows south until it converges with the Jock River South of McKenna Casey Drive. The ditch is approximately 3200 m long and has been artificially straightened. This non-municipal drain is a fish bearing tributary of the Jock River with approximately 335 ha of catchment area. The surrounding land use is urban, vacant lands. Riparian vegetation is very sparse consisting of mostly grasses with a few shrubs.

The O'Keefe Drain is located east of and runs parallel to Highway 416. The drain extends from north of Fallowfield Road, with a small drainage area to the west of Highway 416 and enters the Jock River south of McKenna Casey Drive. The drain is

© DSEL

approximately 4620 m in length and had been artificially straightened to follow the depression between vacant lands. This municipal drain is a fish bearing tributary of the Jock River with approximately 531 ha of catchment area. The predominant land use of the drainage areas is agricultural. The riparian vegetation consists mainly of grasses and some shrubs with thicker forested patches as the reach approaches the Jock River.

The Fraser-Clarke Watercourse (former Drain) is located north of the Jock River, south of Strandherd Drive. The watercourse begins east of Cedarview Road (now Borrisokane Road) and enters the Jock River west of Greenbank Road. It is approximately 1900 m in length. This watercourse is a fish bearing tributary of the Jock River with approximately 90 ha of catchment area. The predominant land use of the drainage area is vacant. With the urbanization of the lands north of the watercourse, the Kennedy-Burnett stormwater ditch was added and enters the Fraser-Clarke Watercourse, approximately 300 m from its confluence with the Jock River. Riparian vegetation consists mainly of grasses with a few shrubs. A slight change in riparian vegetation is evident with a forested corridor located at the upstream limits of the drain.

RVCA Hydrologic Model

As part of a flood risk mapping update, the RVCA updated the hydrology and hydraulics of the Jock River in 2004/2005.

Storm Drainage

Two major communities exist within the subwatershed north of the Jock River (Fallowfield Estates and the Barrhaven community). Ultimate modifications to the existing Foster Ditch and Kennedy-Burnett ponds have been identified in previous studies, with upgrades to better protect the Jock River and Rideau River.

Water Balance

As part of the Jock River Reach 1 SWS Study, a detailed water budget analysis was prepared. Marine clay is the predominant soil in the study area and, as such, based on the suggested permeability, it is shown that only a minor fraction (14%) of the proposed Barrhaven South Community will be suitable for infiltration practices due to the limited areas with sandy soil. It is further noted that the majority of the Reach is within tight-natured soils thereby limiting the recharge potential.

Natural Environment

There were no woodlots identified within Barrhaven Conservancy.

North of the Jock River, the existing Foster Ditch has been identified as fish habitat. The entire length of the O'Keefe Drain as well as a small unnamed tributary running

© DSEL

parallel to the O'Keefe Drain were identified as fish habitat. The Fraser-Clarke Watercourse is also a fish bearing tributary, especially downstream of confluence with Kennedy-Burnett facility, the discharge from which contributes to the habitat.

6.1.1.1.4 Jock River Reach 1 – Subwatershed Objectives

The following represent the proposed combined objectives for Reach 1:

- Surface water quality
- Surface water quantity
- Aquatic communities and habitat
- Terrestrial communities and habitats
- Groundwater quality and quantity
- Sustainable land use and development
- Community education and awareness

6.1.1.1.5 Opportunities and Constraints to Development

Jock River Flow and Drainage Network

For the lands north of the Jock River, any proposed harmful alteration, disruption or destruction of fish habitat (HADD) would require DFO approval per the Fisheries Act. An integrated SWM planning approach consistent with the Lower Rideau Watershed Strategy will need to be demonstrated through further detailed study.

Water Quality

The proposed urban developments must ensure that net reduction in phosphorus loading to the Jock River is achieved through the combination of structural and non-structural BMPs.

Meander Belt Width

The meander belt widths are the limits to potential river migration; hence, future developments should not encroach into the meander belt width limits for the Jock River and the tributaries. Conservative meander belt widths for the tributaries north of the Jock River have been derived. Additional analysis of the meander belt width as part of detailed stormwater management planning is recommended for the tributaries.

© DSEL

6.1.2 Jock River and Municipal Drains Erosion Hazards

In 2018 a review of the meander belt widths and erosions threshold analyses from previous studies were completed for the Jock River and the three watercourses which cross the site (O'Keefe Drain, Foster Ditch and Fraser-Clarke Watercourse). The analysis is detailed in the ***Erosion Hazard Assessment and Erosion Threshold Analysis, Jock River, Barrhaven Conservancy*** by GEO Morphix, dated January 11, 2018 and contained in ***Appendix G***.

As discussed in the ***Erosion Hazard Assessment and Erosion Threshold Analysis***, most watercourses have a natural tendency to develop and maintain a meandering planform, provided there are no spatial constraints. A meander belt width assessment estimates the lateral extent that a meandering channel has historically occupied and will likely occupy in the future, which is useful to determine the potential limit of development for proposed activities in the vicinity of the stream.

It was noted that the watercourses within the study site are all within unconfined valley systems, which are those with poorly defined valleys or slopes well-outside where the channel could realistically migrate. The meander belt width is an important factor as it is one of the potential factors which could define the development setbacks from the watercourses.

Erosion threshold analyses were also completed for the reaches OKD1, FD1, and FCD2 to determine flow conditions under which channel bed and bank materials can potentially be entrained and transported. Erosion thresholds are established to provide targets for any of the stormwater management facilities or oil and grit separators which may discharge to the watercourses. This will ensure that post-development erosion rates into the receiving watercourses do not exceed natural pre-development rates.

6.1.2.1 Jock River

The Jock River meander belt widths within the ***Jock River SWS*** were reviewed to assess suitability. The meander belt widths for reaches JR-3 and JR-4 are 218 and 231 m, respectively, which includes a 10% buffer. GEO Morphix noted that they were generally in agreement with the scale of the meander belt widths. They further note that the general tendency of the watercourse generally follows the overall trend of the channel passing through riffles or runs. GEO Morphix recommended a minor refinement for the downstream reach, JR-2, as the geologic feature at Half Moon Bay is not technically a meander. The proposed meander belt for reach JR-2 is 150 m, which is smaller than that proposed in the ***Jock River SWS***.

As noted in the ***Jock River SWS***, the setback from the watercourse is to be the greatest setback limit of the following environmental factors: 1) regulatory floodplain; 2) meander belt width; 3) aquatic setback limit of 15 m from top-of-bank or 30 m from normal high water marks, whichever is greater; and 4) slope stability. In most areas along the Jock

© DSEL

River, the greater setback requirement is defined by the regulatory floodplain or the meander belt width.

6.1.2.2 O'Keefe Drain

As noted in the ***Erosion Hazard Assessment and Erosion Threshold Analysis***, the meander belt width for reaches OKD1 and OKD2 is 34 m and 32 m, respectively.

As noted in the ***Jock River SWS***, to ensure protection of the aquatic habitat north of the Jock River, a development setback should be provided for all of the tributaries. Further studies will determine the development setback, which will be the greater of: 1) regulatory floodplain; 2) meander belt width; and 3) aquatic setback, whichever is greater.

As detailed in the GEO Morphix study, the critical discharge of the bed and bank materials for the O'Keefe Drain at reach OKD1 is 0.80 m^3/s.

6.1.2.3 Foster Ditch

As noted in the ***Erosion Hazard Assessment and Erosion Threshold Analysis***, the meander belt width for reaches FD1, FD 2 and FD3 is 32 m for all three. It is noted that since the Foster Ditch was previously ditched, the bankfull dimensions are compromised. Therefore, GEO Morphix completed a detailed assessment was completed at reach FD1, which has more accurate bankfull dimension measurements. The calculated meander belt width for reach FD1 is used for reaches FD2 and FD3.

As noted in the ***Jock River SWS***, to ensure protection of the aquatic habitat north of the Jock River, a development setback should be provided for all of the tributaries. Further studies will determine the// development setback, which will be the greater of: 1) regulatory floodplain; 2) meander belt width; and 3) aquatic setback, whichever is greater.

As detailed in the GEO Morphix study, the critical discharge of the bed and bank materials for the Foster Ditch at reach FD1 is 0.68 m^3/s.

6.1.2.4 Fraser-Clarke Watercourse

As noted in the ***Erosion Hazard Assessment and Erosion Threshold Analysis***, the Fraser-Clarke Watercourse, reaches FCD2 and FCD3, consisted of a wetland feature with no channel centerline. Therefore, there is no erosion hazard associated with these features and the same applies to the swale features for reaches FCD3-1, FCD3-2, and FCD5.

As noted in the ***Jock River SWS***, to ensure protection of the aquatic habitat north of the Jock River, a development setback should be provided for all of the tributaries. Further studies will determine the development setback, which will be the greater of: 1)

© DSEL

regulatory floodplain; 2) meander belt width; and 3) aquatic setback, whichever is greater.
As detailed in the GEO Morphix study, the critical discharge of the bed and bank materials for the Fraser-Clarke Watercourse at reach FCD2 is 0.33 m^3/s.

6.2 Proposed Stormwater Management Strategy

Stormwater flows will be conveyed through the subject property via an underground sewer network. The stormwater runoff will be treated to provide an Enhanced Level of Protection (80% TSS removal) before ultimately being released into the Jock River as per the ***Jock River Reach 1 SWS***.

6.2.1 Stormwater Management Servicing Alternatives

The proposed stormwater management design is shown on ***Drawing 3***. Several stormwater alternatives were considered for the drainage areas, while determining the optimal strategy.

Alternative 1 – Oil and Grit Separators to Naturalized Wetlands

In this alternative, the stormwater management design consists of:

- A storm sewer system designed to capture at least the minimum design capture events in accordance with the amendment to the storm sewer and stormwater management elements of the Ottawa Design Guidelines – Sewer (Technical Bulletin PIEDTB-2016-01);
- Multiple oil and grit separators (OGS) designed to provide an Enhanced Level of Protection per MECP guidelines, via treatment of the stormwater captured by the storm sewer network (estimated to be ten units for Conservancy East and six units for Conservancy West);
- Oil and grit separators (providing required TSS removal before discharge) will outlet to naturalized wetlands within the natural heritage corridor, connecting via channels to support hydration of the wetlands and ultimately outletting to the Jock River;
- In anticipation of future MECP requirements, wherein OGS units (unless Environmental Technology Verified (ETV)) will only be considered to be accounting for 50% TSS removal, additional treatment train requirements will need to be incorporated such as deep sump catchbasins, catchbasin inserts such as CB Shield™ and/or curb cuts with outlets to grassed swales;
- Inverts of outlets of oil and grit separators (OGS) are set at, or above, the 2-year summer water levels of the Jock River with a bypass design for the 100-year storm event;

© DSEL

- An on-site road network designed to maximize the available surface storage within ROWs for the 100-year design event; where possible, with controlled release of stormwater to the minor storm sewer system;
- An overland flow route designed to safely convey stormwater runoff flows in excess of the on-site road storage to the desired outlets;
- It is anticipated that quantity control is not required for this segment of the Jock River; however, the quantity of stormwater runoff existing from the subject property will be minimized by optimizing on-site storage in the sags of the proposed road network, which in turn minimizes the size of downstream storm sewer infrastructure. JFSA has prepared a memorandum (*Review of Quantity Control Requirement for Jock River Reach 1 (March 2021)* in ***Appendix H***) summarizing the expectation that quantity control will still not be required for this section of the Jock River based on the extents of existing and proposed development conditions.

This alternative provides a treatment train consisting of OGS units discharging to naturalized wetlands within the floodplain prior to discharging to the Jock River. The implementation of OGS units has been used increasingly within Ottawa. Multiple OGS units have been proposed in order to maintain smaller storm sewer sizes, minimize standing water and keep grades low due to the presence of sensitive clay and the associated grade raise restrictions. The proposed grades will be set at a minimum of 0.50 m above the 100-year floodplain elevation. Although the OGS units can be subject to head losses, the design will include a bypass for the 100-year flow such that the head losses are negligible in the 100-year storm.

It is expected that the OGS units will require straightforward maintenance via mobile vacuum truck units, being cleaned out regularly as part of the routine City maintenance program, as compared to traditional stormwater management ponds which requires the mobilization of heavy equipment and dedicated sediment management land areas for the handling (dewatering) of sediments removed.

With this alternative, the existing drains/watercourses will not be an outlet for the stormwater flows and will remain in their natural state, with recommended setbacks implemented for surrounding development.

Alternative 2 – Stormwater Management Wetland Facilities in the Floodplain

In this alternative, the stormwater management design consists of:

- A storm sewer system designed to capture at least the minimum design capture events in accordance with the amendment to the storm sewer and stormwater management elements of the Ottawa Design Guidelines – Sewer (Technical Bulletin PIEDTB-2016-01);
- Multiple Stormwater Management (SWM) Wetland facilities in the floodplain, designed to provide Enhanced Level of Protection per MECP guidelines, via treatment of the stormwater captured in the storm sewer network;

© DSEL

- An on-site road network designed to maximize the available storage in the on-site road network for the 100-year design event, where possible, with controlled release of stormwater to the minor storm system; and,
- An overland flow route designed to safely convey stormwater runoff flows in excess of the on-site road storage.
- It is anticipated that quantity control is not required for this segment of the Jock River (see JFSA memorandum in ***Appendix H***); however, the quantity of stormwater runoff existing from the subject property will be minimized by optimizing on-site storage in the sags of the proposed road network, which in turn minimizes the size of downstream storm sewer infrastructure.

This alternative provides separate stormwater management wetland facilities within the regulatory floodplain with the provision of traditional forebays. Multiple facilities are required in order to maintain smaller storm sewer sizes, minimize standing water and keep grades low due to the presence of sensitive clay soils and the associated grade raise restrictions. The multiple facilities impose additional maintenance requirements which would be undertaken by typical City procedures with mobilization of heavy equipment and dedicated sediment management land areas for the handling (dewatering) of sediments removed prior to export. Although this is an efficient use of land for the facilities themselves, any required sediment management areas would have to be outside of the floodplain area as is typically desired by the City of Ottawa. Additional challenges are encountered when proposing infrastructure within the floodplain.

With this alternative, it is anticipated that there would be minimal standing water within the proposed storm sewers.

With this alternative, the existing drains/watercourses will not be an outlet for the stormwater flows and will remain in their natural state, with recommended setbacks implemented for surrounding development.

Alternative 3 – Stormwater Management Wetland Facilities outside of the Floodplain

In this alternative, the stormwater management design consists of:

- A storm sewer system designed to capture at least the minimum design capture events in accordance with the amendment to the storm sewer and stormwater management elements of the Ottawa Design Guidelines – Sewer (Technical Bulletin PIEDTB-2016-01);
- Multiple (a minimum of three) Stormwater Management (SWM) facilities, designed to provide Enhanced Level of Protection per MECP guidelines, via treatment of the stormwater captured in the storm sewer network;

© DSEL

- An on-site road network designed to maximize the available storage in the on-site road network for the 100-year design event, where possible, with controlled release of stormwater to the minor storm system; and,
- An overland flow route designed to safely convey stormwater runoff flows in excess of the on-site road storage.
- It is anticipated that quantity control is not required for this segment of the Jock River (see JFSA memorandum in ***Appendix H***); however, the quantity of stormwater runoff existing from the subject property will be minimized by optimizing on-site storage in the sags of the proposed road network, which in turn minimizes the size of downstream storm sewer infrastructure.

This alternative provides multiple traditional stormwater management facilities and dedicated sediment management areas situated outside of the regulatory floodplain. Multiple facilities are required in order to maintain smaller storm sewer sizes, minimize standing water and keep grades low due to the presence of sensitive clay and the associated grade raise restrictions. The multiple facilities impose additional maintenance requirements which would be undertaken by typical City procedures with mobilization of heavy equipment and dedicated sediment management land areas for the handling (dewatering) of sediments removed prior to export. This option is the least efficient use of developable land and creates multiple facilities requiring extensive maintenance requirements.

As with the other alternatives, it is anticipated that there would be minimal standing water within the proposed storm sewers. Multiple stormwater management facilities would have a significant impact on efficient land usage.

With this alternative, the existing drains/watercourses will not be an outlet for the stormwater flows and will remain in their natural state, with recommended setbacks implemented for surrounding development.

Alternative 4 – Modified Etobicoke Filtration System Outletting to Naturalized Wetlands

In this alternative, the stormwater management design consists of:

- A storm sewer system designed to capture at least the minimum design capture events in accordance with the amendment to the storm sewer and stormwater management elements of the Ottawa Design Guidelines – Sewer (Technical Bulletin PIEDTB-2016-01);
- A Modified Etobicoke Filtration System (MEFS) alongside all mainline storm sewers with multiple outlets along the southern boundary of the development area, discharging to naturalized wetlands within the natural heritage corridor, connecting via channels to support hydration of the wetlands and ultimately outletting to the Jock River. The proposed system is derived from the filtration system demonstration project within Braecrest Avenue in the City of Etobicoke (see excerpt from A.M. Candaras Associates publication "*City of Etobicoke*

© DSEL

Exfiltration and Filtration Systems Pilot/Demonstration Project (1995)" in ***Appendix H***). In conjunction with the MEFS, as part of the treatment train approach, 1.0m deep sump catchbasins will be equipped with Goss Traps to reduce catchbasin sump sediment re-suspension and optimize TSS removal. An evaluation of the proposed treatment train for quality control is provided in the JFSA memorandum *BCDC Phase 2 – Preliminary Water Balance & Water Quality Controls (March 2021)* provided in ***Appendix H***;

- Inverts of storm outlets are set at, or above, the 2-year summer water levels of the Jock River;
- An on-site road network designed to maximize the available surface storage within ROWs for the 100-year design event; where possible, with controlled release of stormwater to the minor storm sewer system;
- An overland flow route designed to safely convey stormwater runoff flows in excess of the on-site road storage to the desired outlets;
- It is anticipated that quantity control is not required for this reach of the Jock River (see JFSA memorandum in ***Appendix H***); however, the quantity of stormwater runoff existing from the subject property will be minimized by optimizing on-site storage in the sags of the proposed road network, which in turn minimizes the size of downstream storm sewer infrastructure.

This alternative provides a treatment train consisting of an MEFS system discharging to multiple naturalized wetlands within the natural heritage corridor, connecting via channels to support hydration of the wetlands and ultimately outletting to the Jock River. The implementation of Etobicoke-type system variations have been used previously within Ottawa (i.e. Barrhaven South Urban Expansion Area and the Deer Run Subdivision (Stittsville)). Multiple outlet locations have been proposed in order to maintain smaller storm sewer sizes, minimize standing water and keep grades low due to the presence of sensitive clay and the associated grade raise restrictions. The proposed grades will be set at a minimum of 0.50 m above the 100-year floodplain elevation.

It is expected that the MEFS system will require straightforward maintenance via mobile vacuum truck units, being inspected/cleaned out regularly as part of a routine City maintenance program. The maintenance approach has been previously documented for a similar type of system in the Barrhaven South Urban Expansion Area Master Servicing Study (see J.L. Richards' memorandum *BSUEA Infiltration System Maintenance Requirements, June 22, 2017*) of general system maintenance requirements and recommendations (provided in ***Appendix H*** for reference).

© DSEL

Recommended Alternative

The recommended alternative is Alternative 4, where a Modified Etobicoke Filtration System (MEFS) parallels the storm sewer network (along with deep sump catchbasins with Goss Trap inserts in the outlet) and the storm system has multiple outlets discharging to naturalized wetlands and the Jock River. This is determined to provide the best quality treatment strategy for the stormwater, prior to release to the Jock River. While providing the best treatment strategy, it also presents an efficient use of land and conservation of the existing drains/watercourse in their natural state.

The MEFS will require routine maintenance that will be greatly reduced compared to the maintenance requirements of multiple stormwater management facilities. This strategy may be more desirable to the City of Ottawa from a maintenance perspective as opposed to many OGS units (potentially sixteen) or multiple stormwater management ponds (minimum of three). Stormwater is pre-treated prior to outletting to the naturalized wetlands and it is expected that the wetlands will have minimal maintenance requirements.

Multiple outlets are proposed in order to minimize storm sewer size, standing water within the sewers, the reliance on sump pumps for foundation drainage and to keep the grades as low as possible, which is a key element due to the presence of sensitive clays and associated grade raise restrictions.

For the remainder of this document, it is assumed that the recommended Alternative 4 is to be implemented.

6.3 Post-Development Stormwater Management Targets

Stormwater management requirements for the proposed alternative Stormwater management scheme have been adopted from the ***Jock River Reach 1 Subwatershed SWS***, City of Ottawa ***Sewer Design Guidelines*** and the ***MECP SWMP Manual***.

Given the general criteria mentioned above, the following specific standards are applied for stormwater management within the subject property:

- Enhanced quality treatment will be provided for stormwater runoff from the subject property, corresponding to a long-term average Total Suspended Solid removal efficiency of 80%, as defined by the MECP prescribed treatment levels.
- Downstream receiving watercourses will be assessed for responses to planned stormwater management outflows, and stabilization mitigation measures will be planned as required.
- Storm sewers on local roads are to be designed to provide at least a 2-year level of service without any ponding per the City's latest Technical Bulletin PIEDTB-2016-01.

© DSEL

- Storm sewers on collector roads are to be designed to provide at least a 5-year level of service without any ponding per the City's latest Technical Bulletin PIEDTB-2016-01.
- For less frequent storms (i.e. larger than 2-year or 5-year), the minor system sewer capture will be restricted with the use of inlet control devices to prevent excessive hydraulic surcharges.
- Under full flow conditions, the allowable velocity in storm sewers is to be no less than 0.80 m/s and no greater than 6.0 m/s.
- For the 100-year storm and for all roads, the maximum depth of water (static and/or dynamic) on streets, rear yards, public space and parking areas shall not exceed 0.35 m at the gutter.
- The major system shall be designed with sufficient capacity to allow the excess runoff of a 100-year storm to be conveyed within the public ROW or adjacent to the right-of-way provided that the water level must not touch any part of the building envelope, must remain below all building openings during the stress test event (100-year + 20%), and must maintain 15 cm vertical clearance between spill elevation on the street and the ground elevation at the nearest building envelope.
- Flow across road intersections shall not be permitted for minor storms (generally 5-year or less).
- When catch basins are installed in rear yards, safe overland flow routes are to be provided to allow the release of excess flows from such areas. A minimum of 30 cm of vertical clearance is required between the rear yard spill elevation and the ground elevation at the adjacent building envelope.
- The product of the maximum flow depths on streets and maximum flow velocity must be less than 0.60 m^2/s on all roads.

6.3.1 Quality Control

Per the ***Jock River Reach 1 SWS***, prior to discharge to the Jock River, quality treatment of stormwater runoff from the subject property is to be provided to meet the MECP Enhanced Protection criteria, corresponding to a long-term average Total Suspended Solid removal efficiency of 80%. See Section 6.4.1 for quality control approach and discussion.

6.3.2 Quantity Control

As noted in the ***Jock River SWS***, quantity control is not anticipated to be required for outlets to the Jock River, however, some quantity control may be provided by erosion storage, as erosion thresholds for any watercourses/outlets will be respected where required. As noted in Section 5.2 JFSA has reviewed the current/future development conditions contributing to this reach of the Jock River and concludes that quantity

© DSEL

control will still not be required. See *Review of Quantity Control Requirement for Jock River Reach 1 (March 2021)* provided in ***Appendix D***.

6.4 Stormwater Management Design

The preferred stormwater management approach is comprised of a mainline storm sewer network, with a parallel Modified Etobicoke Filtration System (MEFS), with multiple stormwater outlets along the southern boundary of the development area, discharging to the Jock River via proposed naturalized wetlands. In conjunction with the MEFS, as part of the treatment train approach, 1.0 m deep sump catchbasins will be equipped with goss traps in order to reduce catchbasin sump sediment re-suspension and optimize TSS removal.

6.4.1 Modified Etobicoke Filtration System

The proposed MEFS has been derived from the Braecrest Avenue filtration system that is found in the A.M. Candaras Associates publication "*City of Etobicoke Exfiltration and Filtration Systems Pilot/Demonstration Project (1995)*". An excerpt from the report and MEFS configuration is provided in ***Appendix H*** for reference. Figure 25.3 of the Candaras study illustrates the general configuration of the perforated pipe system as well as the filtration trench surrounding the mainline storm sewer network. Generally, road catchbasins have a lower and upper sewer lead. The lower lead (for first flush flows) is connected to the filtration system while the upper lead will manage higher flows during larger events and is connected to the storm main. The full description of the system is in Section 25.2.2 of the study excerpt. The proposed configuration for the Conservancy East development and example cross-sections for the MEFS can be found in ***Figure 5*** of the ***Figures*** section.

As noted previously an evaluation of the proposed treatment train for quality control to achieve the required 90% TSS removal in the JFSA memorandum *BCDC Phase 2 – Preliminary Water Balance & Water Quality Controls (March 2021)* provided in ***Appendix H***.

6.4.1.1 Groundwater

Paterson Group has reviewed the anticipated long term groundwater condition for the development area. Paterson drawing PG5036-10A in ***Appendix H*** demonstrates the long term groundwater elevation across the Conservancy East development area. This elevation is also reflected in the trunk sewer profile Drawings No. 5 and 6 in the ***Drawings*** section.

6.4.1.2 MEFS Maintenance

The proposed maintenance approach for the MEFS would be similar to that as recommended for the Etobicoke Exfiltration System (EES) that is currently being implemented as part of the Barrhaven South Urban Expansion Area (BSUEA) within the

© DSEL

City of Ottawa. As part of the Master Servicing Study review of that EES system, J.L. Richards prepared a memorandum (*BSUEA Infiltration System Maintenance Requirements, June 22, 2017*) of general system maintenance requirements and recommendations (provided in ***Appendix H*** for reference). The proposed MEFS system has similar characteristics and therefore similar requirements. The exception being that in order to treat all stormwater for TSS removal the system is proposed along all roadways (including collectors) within the development. This would therefore include roadways which may have additional deicing materials such as salt and sand during the winter season. As such, per Table 6.1 (see ***Appendix H***) of the MOECC Stormwater Management Planning and Design Manual, it would be recommended to plug the MEFS system along the 24m ROW road section during winter months. At the detailed design stage the opportunity to omit the collector ROWs from having the MEFS can be further assessed to determine if the capture in all other local ROWs will meet the required objectives and therefore avoid the salting concerns noted above.

6.5 Proposed Minor System

The subject property will be serviced by an internal gravity storm sewer system that is to generally follow the local road network and proposed servicing easements as required. The drainage will be conveyed within the underground piped sewer system to outlets located along the natural heritage corridor, providing hydration to wetlands. There will also be proposed outlets to the Fraser Clarke Watercourse in order to provide some baseflow to that feature (per City comments) along with rear yard sheet flow from lots backing onto the watercourse.

Street catchbasins will collect drainage from the streets and front yards, while rear yard catchbasins will capture drainage from backyards. Perforated catch basin leads will be provided in rear yards, except the last segment where they connect to the right-of-way which will be solid pipe, per City standards.

The preliminary rational method design of the minor system captures drainage for storm events up to and including the 2-year (local), 5-year (collector) and 10-year (arterial) event assuming the use of inlet control devices (ICD) for all catch basins within the subject property. The following table summarizes the standards that will be employed in the detailed design of the storm sewer network, meeting the requirements in ***Section 6.3***. The drainage area plans and rational method design sheets are provided in ***Appendix H***.

Table 6: Storm Sewer Design Criteria

Design Parameter	Value
Minor System Design Return Period	1:2 year (PIEDTB-2016-01) for local roads, without ponding 1:5 year (PIEDTB-2016-01) for collector roads, without ponding 1:100 year (PIEDTB-2016-01) for arterial road, without ponding
Major System Design Return Period	1:100 year
Intensity Duration Frequency Curve (IDF) 2-year storm event: A=732.951 | B=6.199 | C=0.810 5-year storm event: A = 998.071 | B = 6.053 | C = 0.814	$i = \frac{A}{(t_c + B)^C}$
Minimum Time of Concentration	10 minutes
Rational Method	$Q = CiA$
Storm sewers are to be sized employing the Manning's Equation	$Q = \frac{1}{n} A R^{2/3} S^{1/2}$
Runoff coefficient for paved and roof areas	0.9
Runoff coefficient for landscaped areas	0.2
Minimum Sewer Size	250 mm diameter
Minimum Manning's 'n' for pipe flow	0.013
Minimum Depth of Cover	1.5 m from crown of sewer to grade
Minimum Full Flowing Velocity	0.8 m/s
Maximum Full Flowing Velocity	6.0 m/s
Clearance from 100-Year Hydraulic Grade Line to Building Opening	0.30 m
Max. Allowable Flow Depth on Municipal Roads	35 cm above gutter (PIEDTB-2016-01)
Extent of Major System	To be contained within the municipal right-of-way or adjacent to the right-of-way provided that the water level must not touch any part of the building envelope and must remain below the lowest building opening during the stress test event (100-year + 20%) and 15cm vertical clearance is maintained between spill elevation on the street and the ground elevation at the nearest building envelope (PIEDTB-2016-01)
Stormwater Management Model	DDSWMM (release 2.1), SWMHYMO (v. 5.02) and XPSWMM (v. 10)
Model Parameters	Of = 76.2 mm/hr, Fc = 13.2 mm/hr, DCAY = 4.14/hr, D.Stor.Imp. = 1.57 mm, D.Stor.Per. = 4.67 mm
Imperviousness	Based on runoff coefficient (C) where Percent Imperviousness = (C - 0.2) / 0.7 x 100%.
Design Storms	Chicago 3-hour Design Storms and 24-hour SCS Type II Design Storms. Maximum intensity averaged over 10 minutes.
Historical Events	July 1st, 1979, August 4th, 1988 and August 8th, 1996
Climate Change Street Test	20% increase in the 100-year, 3-hour Chicago storm
Extracted from City of Ottawa Sewer Design Guidelines, October 2012, and ISSU, based on recent residential subdivisions in City of Ottawa.	

© DSEL

The peak design flows are calculated based on an average predicted runoff coefficient (C-value) of 0.65 and 0.80 for the development areas, 0.40 for park areas and 0.25 for grassed areas. As detailed design progresses, the runoff coefficients will be refined to reflect the proposed building envelopes, driveways and other details.

There are several trunk sewers proposed and the peak flows are described for the trunk sewers which correspond to the stormwater management design areas as presented in the following table:

Table 7: Minor System Trunk Sewer Outlets

Area/Outlet # (from east to west)	Trunk Sewer Outlet to Headwall	Peak Flow (L/s)
1 (HW1)	900 mm diameter @ 0.15%	595
2 (HW2)	900 mm diameter @ 0.15%	481
3 (HW3)	675 mm diameter @ 0.15%	246
4 (HW4)	975 mm diameter @ 0.15%	647
5 (HW5)	975 mm diameter @ 0.15%	611
6 (HW6)	825 mm diameter @ 0.15%	368
7 (HW7)	1050 mm diameter @ 0.15%	572
8 (HW8	1050 mm diameter @ 0.15%	807
9 (HW9)	975 mm diameter @ 0.15%	624
10(HW10)	1050 mm diameter @ 0.15%	890
~~11 (HW11)~~	Omitted intentionally	-
12 (HW12)(1)	675 mm diameter @ 0.15%	215
13 (HW13)(1)	675 mm diameter @ 0.15%	244
14 (HW4)	825 mm diameter @ 0.15%	373
15 (HW15)	1050 mm diameter @ 0.20%	1066
16 (HW16)	1050 mm diameter @ 0.20%	689
17 (HW17)	975 mm diameter @ 0.15%	409
18 (HW18)	1050 mm diameter @ 0.20%	763
19 (HW19)	975 mm diameter @ 0.15%	258

(1) Outlet to the Fraser-Clarke Watercourse in the northern portion of the development to provide baseflow. All other stormwater outlets are to the south.

The storm sewers tributary to the various outlets and associated peak flows are detailed in the rational method design sheet, enclosed in ***Appendix H***.

The preliminary conceptual servicing plan is shown on ***Drawing 2*** and ***3*** in ***Drawings***. As detailed design progresses, alignment and sizing of local storm sewers will be confirmed and additional servicing easements may be required, potentially triggering minor amendments to the proposed lot fabric in the concept plan. The preliminary

© DSEL

sanitary and storm trunk plan and profiles are shown on ***Drawing 5*** and ***Drawing 6*** in ***Drawings***.

6.6 Hydraulic Grade Line Analysis

A preliminary hydraulic grade line (HGL) modelling analysis has been completed by JFSA for the Conservancy East land area to demonstrate that the HGL will be maintained below the ground surface. See the *BCDC Phase 2 – Preliminary HGL Analysis (March 2021) in* ***Appendix H*** for details/results. The analysis has been evaluated for various scenarios for the Jock River in order to assess the appropriate HGL boundary condition:

- 5-year water level in Jock River + 100yr rain event; or
- 100-year water level in Jock River + 5yr rain event (deemed to be the critical event).

The HGL results in JFSA's Table 2 demonstrate that the freeboard to the ground surface ranges from 0.40m to 1.11m for the critical event noted above. The HGL is shown on the profile ***Drawings 5 and 6*** for reference. An HGL review for the Conservancy West area was not completed due to the preliminary nature of that future draft plan area. All of the same stormwater servicing principles will be applied to the West area as they are for the East area so it is anticipated there will be no HGL issues in this area as well.

An updated HGL analysis will be completed for the proposed system at the detailed design stage, based on the above noted events, including historical design storms and climate change stress test as required. Detailed grading design and storm sewer design will be modified as required to achieve the freeboard requirements set out in ***Section 6.3*** (per PIEDTB-2016-01).

6.7 Proposed Major System

Major system conveyance, or overland flow (OLF), will be provided to accommodate flows in excess of the minor system capacity. OLF is accommodated by generally storing stormwater up to the 100-year design event in road sags then routing additional surface flow along the road network and service easements towards the proposed naturalized wetlands, discharging to the Jock River through the natural heritage corridors, as shown on ***Drawing 1*** in ***Drawings***.

The grading design described shown on ***Drawing 1*** includes a saw-toothed-road design with 0.10 % minimum grade from highpoint to highpoint, in order to maximize available surface storage for management of flows up to the 100-year design event where possible.

© DSEL

Given the elements above, the proposed drainage systems are expected to safely capture and convey all storms up to and including the 100-year event in accordance with the requirements of the City Standards.

6.8 Proposed Grading and Foundation Drainage

A site grading approach has been developed to optimize earthworks and provide major system conveyance to the receiving outlets – the proposed SWM wetland facilities, which outlet to the existing Jock River drainage network. The proposed grading plan can be seen on ***Drawing 1*** in ***Drawings***.

Paterson completed geotechnical investigations for the subject site, East lands and West lands as follows:

- Geotechnical Investigation – Conservancy Lands East (Paterson Group, February 3, 2021 Rev1); and
- Geotechnical Investigation – Conservancy Lands West (Paterson Group, September 27, 2019)

The geotechnical conditions are described in detail in ***Section 3.1.*** For the Barrhaven Conservancy Lands east, the grade raise restriction varies between 1.4 m and 2.2 m. For the Barrhaven Conservancy Lands West, the grade raise restriction varies between 1.2 m to 1.8 m. Paterson's permissible grade raise plans are contained in ***Appendix B*** for reference. ***Drawing 7*** has been prepared in order to illustrate areas where permissible grade raise may be exceeded by the conceptual grading. Although some minor exceedances areas are indicated within the roadways in this drawing, an updated review of the functional grading by Paterson has confirmed that the minor extent is acceptable. See Paterson memorandum "*Road Grade Exceedance Review*" (dated March 8, 2021) in ***Appendix B.*** Any actual exceedances will ultimately be determined at detailed design at which time review and signoff by a licensed Geotechnical Engineer will be required.

The following additional grading criteria and guidelines will be applied to detailed design, per ***City of Ottawa Guidelines***:

- Driveway slopes will have a maximum slope of 6%;
- Grading in grassed/landscaped areas to range from 2% to 3:1, with terracing required for slopes larger than 7%;
- Swales are to be 0.15m deep with 3:1 side slopes unless otherwise indicated on the drawings; and,
- Perforated pipe will be required for drainage swales if they are less than 1.5% in slope.

© DSEL

6.8.1 Sump Pumps

Due to the grade raise restrictions and the proposed storm and sanitary drainage schemes, the road centerlines do not allow for standard basements with a gravity connection to the storm sewer system. Because of the constraints on the subject property, sump pumps are proposed for all residential blocks and residential lots.

The City of Ottawa issued Technical Bulletin *ISTB-2018-04* and *2019-02* for the amendment of the *Ottawa Design Guidelines – Sewer, Second Edition,* October 2012 with respect to the screening criteria for the use of sump pump systems for foundation drainage in Greenfield developments on sites with clay soils. Similar to the development of Conservancy Phase 1, the Conservancy East site has also been assessed as meeting the required criteria for the use of sump pumps.

One of the screening criteria is with respect to the hydraulic grade line (HGL) for the development wherein the system should be reviewed to demonstrate that the HGL cannot reasonably be lowered any further due to outlet restrictions. The site grading is constrained by the close proximity of the Jock River, which is the receiver of stormwater outflows, and is also constrained by grade raise restrictions for the property.

For the Barrhaven Conservancy Lands East (Phase 2), the grade raise restriction varies between 1.4 m and 2.2 m. For the Barrhaven Conservancy Lands west, the grade raise restriction varies between 1.2 m to 1.8 m. Paterson's permissible grade raise plans are contained in ***Appendix B*** for reference. Further investigation of site and potential surcharging or lightweight fill (LWF) underneath garages could increase the permissible grade raise and is being investigated further.

The functional grading plans for the subdivision have been prepared with the grade raise restrictions in mind, with grades being kept as low as possible.

The proposed centerline of road grades, and subsequently the house grades, do not allow for standard basements with a gravity connection to the storm sewer system. As such, the subdivision will be serviced entirely by sump pumps due to site constraints imposed by grade raise restrictions, HGL elevations and the proximity to the Jock River stormwater outlet.

6.9 Low Impact Development (LID) - Infiltration

The following general Low Impact Development techniques should be considered for implementation, where possible, as part of detailed design:

- Rear-yard swales should be designed with minimum grades where possible, to promote infiltration;

© DSEL

- Rear-yard catchbasin leads should be perforated (except for the last segment connecting to the storm sewer within the right-of-way), to promote infiltration; and,
- Where eavestroughs are provided on residential units, they are to be directed to landscaped surfaces, to promote infiltration.
- Furthermore, the following techniques can be examined as part of detailed landscaping design of the park block:
- Amended topsoil (minimum 300mm thick) can be considered for use;
- Micro-grading can be considered to promote infiltration; and

Although Best Management Practices (BMPs) should be implemented, where feasible, the site is not conducive for infiltration based on the soil type being predominantly marine clay with limited sandy soil. This was stated in the Jock River Reach 1 SWS, summarized in ***Section 6.1.1.1.2 – Water Balance*** of this report. However, the MEFS discussed in Section 6.4 will contribute some limited infiltration benefits as first flush stormwater is run through the filtration trench. The amount of infiltration is dependent upon the surrounding soils.

6.10 Stormwater Servicing Conclusions

The stormwater runoff is designed to be captured by an internal gravity sewer system that will convey flows to multiple outlet locations. A proposed treatment train arrangement of 1.0 m deep sump catchbasins, to optimize catchbasin sump retention of solids, fitted with goss traps as well as a Modified Etobicoke Filtration System will provide the required quality control treatment to achieve the Enhanced Level of quality control protection treatment. Downstream of the storm outlets will be naturalized wetland areas where hydration with treated stormwater will occur in the natural heritage corridor prior to discharge to the Jock River. It is anticipated that quantity control is not required for the Jock River. Notwithstanding, some quantity control by means of erosion storage will be included.

A preliminary Hydraulic Grade Line (HGL) modelling analysis has been completed for the Conservancy East (Phase 2) development area at this time and demonstrates that the HGL is maintained below the ground surface with freeboards ranging from 0.40m to 1.11m. Further detailed HGL review will be completed for the proposed system at the detailed design stage. Due to the grade raise restrictions and the proposed storm and sanitary drainage schemes, the road centerlines do not allow for standard basements with a gravity connection to the storm sewer system. As such, because of the constraints on the subject property, sump pumps are proposed to be installed for all residential blocks and residential lots.

The Conservancy development areas will be outside of the Jock River's regulatory floodplain area. Appropriate setbacks from existing watercourse are incorporated into

© DSEL

the draft plan based on advancement/finalizing of studies to assess the various determining criteria.

7.0 UTILITIES

Utility services extending to the site may require connections to multiple existing infrastructure points: consultation with Enbridge gas, Hydro Ottawa, Rogers, and Bell is required as part of the development process to confirm the servicing plan for the subject lands.

8.0 EROSION AND SEDIMENT CONTROL

Soil erosion occurs naturally and is a function of soil type, climate and topography. The extent of erosion losses is exaggerated during construction where vegetation has been removed and the top layer of soil becomes agitated.

Preliminary erosion and sediment controls are currently in place as part of the cut/fill work completed on the property and will be monitored, updated and maintained throughout future construction as required.

The following specific recommendations to the Contractor will be included in contract documents.

- Limit extent of exposed soils at any given time.
- Re-vegetate exposed areas as soon as possible.
- Minimize the area to be cleared and grubbed.
- Protect exposed slopes with plastic or synthetic mulches.
- Install silt fence to prevent sediment from leaving the site and entering existing watercourses, and clean and maintain throughout construction.
- Install catchbasin inserts during construction to protect from silt entering the storm sewer system.
- Install mud mat in order to prevent mud tracking onto adjacent roads.
- No refueling or cleaning of equipment near existing watercourses.
- No material stockpiles within 30 m of existing watercourses, unless otherwise permitted by RVCA and City of Ottawa.
- Provide sediment traps and basins during dewatering.
- Plan construction at proper time to avoid flooding.

© DSEL

- The Contractor will, at every rainfall, complete inspections and guarantee proper performance.

- Erosion and sediment control will remain in place until the working areas have been stabilized and re-vegetated.

© DSEL

9.0 CONCLUSIONS AND RECOMMEDATIONS

This Master Infrastructure Review (MIR) provides historical background information regarding the servicing of the subject property and presents servicing options explored while determining the recommended servicing strategy. Sufficient detail is provided to demonstrate that the development of the subject property will be adequately supported by municipal services and demonstrate how the municipal services will conform to current guidelines and design criteria. The conclusions from this report are as follows:

- Paterson Group has completed geotechnical investigations of the development areas and has noted that the site is subject to grade raise restrictions varying from 1.4 m to 2.2 m.

- The development area will be outside of the Jock River 100-year limit.

- The recommended water servicing preferred option of those evaluated is to connect through the Nepean Town Centre development area to Zone SUC, which has recently been upgraded. The watermains are recommended to extend along the future Chapman Mills Drive extension and through the Claridge “Burnett Lands” development area.

- Detailed modelling at the designed design stage will confirm phasing of the extensions of trunk watermains and sizing of the local watermain network. The proposed water design supply is to conform to all relevant City and MECP Guidelines and Policies.

- Sanitary service will be provided to the subject property via the off-site South Nepean Collector (SNC) trunk sanitary sewer connecting at Chapman Mills Drive. For the Conservancy West development area a new sanitary pump station is proposed, west of the Foster Ditch, where the sanitary trunk sewer is constrained by the bottom of ditch elevation. With the inclusion of the subject property, the SNC sanitary sewer can adequately handle the entirety of the subject properties proposed sanitary flows.

- Stormwater service is to be provided by capturing stormwater runoff by an internal gravity sewer system that will convey flows to various outlets to proposed naturalized wetlands. Prior to discharge to the wetlands, any first flush stormwater will have passed through a proposed Modified Etobicoke Filtration System (MEFS) at all catchbasin connection points. The MEFS, along with 1.0 m deep catchbasin sumps as well as goss traps will provide for an Enhanced Level of Protection quality control treatment prior to discharge to naturalized wetlands and then the Jock River. It is anticipated that quantity control will not be required for discharges to the Jock River.

© DSEL

- The storm outlets will be set at, or above, the 2-year summer water level of the Jock River.

- A preliminary Hydraulic Grade Line (HGL) modelling analysis has been completed at this time for the Conservancy East (Phase 2) Lands and demonstrates that the HGL is maintained below the ground surface. An HGL analysis was not completed for the West lands due to the preliminary nature of that concept plan. However, all of the same principles are applied to the West area as the East area so it is anticipated there will be no issues in this regard given the East results. A detailed Hydraulic Grade Line (HGL) modelling analysis will be completed for the proposed system at the detailed design level. Due to the grade raise restrictions and the proposed storm and sanitary drainage schemes, the road centerlines do not allow for standard basements with a gravity connection to the storm sewer system. As such, because of the constraints on the subject property, sump pumps are proposed to be installed for all residential blocks following City of Ottawa guidelines.

- Erosion and sediment control measures will be implemented and maintained throughout construction. The Jock River and all municipal drains/watercourses will be projected from any negative impacts from during construction.

- The proposed servicing and grading plans are expected to meet all City, RVCA, and MECP requirements as set out in background studies and current standards.

LEGEND

- SITE BOUNDARY
- STORM OVERLAND FLOW ARROW
- PROPOSED CENTERLINE ELEVATION
- PROPOSED ELEVATION EXISTING ELEVATION
- EXISTING CONTOUR ELEVATION
- 2019 RVCA APPROVED FLOODLINE BOUNDARY
- PROPOSED FLOODLINE PER MARCH 2021 RVCA APPLICATION

CUT-FILL DEPTH ALONG CENTER LINE:

CUT DEPTH (m)	FILL DEPTH (m)
0 - 1	0 - 1
1 - 2	1 - 2
2 - 3	2 - 3
> 3	> 3

NOTES:

1. LOW FLOW CHANNEL ELEVATION TO BE VERIFIED IN THE FIELD AT ALL ROAD AND SEWER CROSSING LOCATIONS.
2. DETAILED DESIGN ROAD GRADES WILL BE NO LOWER THAN THE ELEVATIONS ILLUSTRATED ON THIS PLAN, AND WILL RISE AND FALL BY APPROXIMATELY 0.4m ABOVE THE TROUGH GRADES PRESENTED ON THIS PLAN.
3. EARTHWORKS VOLUMES ARE BASED ON THE MEDIAN ROAD GRADES, WHICH ARE ESTIMATED TO BE 0.2m HIGHER THAN THE TROUGH GRADES PRESENTED ON THIS PLAN.
4. ENGINEERED FILL VOLUMES ARE BASED ON THE MEDIAN ROAD GRADES, WHICH ARE ESTIMATED TO BE 0.2m HIGHER THAN THE TROUGH GRADES PRESENTED ON THIS PLAN.
5. MAXIMUM GRADE RAISE IS BASED ON THE CREST ROAD GRADES, WHICH ARE ESTIMATED TO BE 0.4m HIGHER THAN THE TROUGH GRADES PRESENTED ON THIS PLAN.
6. EXISTING ELEVATIONS SHOWN ARE FROM TOPOGRAPHIC SURVEY PROVIDED BY JD BARNES, DATED NOVEMBER 2019. HOWEVER, ALL LIGHTWEIGHT FILL TO DETERMINED FROM TOPOGRAPHIC SURVEY PROVIDED BY JD BARNES, DATED APRIL 2020.

MAX GRADE RAISE

NOTE:
THE ARCHITECTURAL CHARACTERISTICS ARE TAKEN FROM THE ORLEANS VILLAGE.

NOTES:
1. LOW FLOW CHANNEL ELEVATION TO BE VERIFIED IN THE FIELD AT ALL ROAD AND SEWER CROSSING LOCATIONS.
2. DETAILED DESIGN ROAD GRADES REPRESENT LOW POINTS. ACTUAL DESIGN GRADES WILL RISE AND FALL BY APPROXIMATELY 0.3m ABOVE THE TROUGH/SAG GRADES PRESENTED ON THIS PLAN.
3. EARTHWORKS VOLUMES ARE BASED ON THE MEDIAN ROAD GRADES, WHICH ARE ESTIMATED TO BE 0.09m HIGHER THAN THE TROUGH/SAG GRADES PRESENTED ON THIS PLAN.

EARTHWORKS DEPTHS AND VOLUMES ARE APPROXIMATE BASED ON USING ASSUMED MEDIAN VALUES FOR THE MANY VARIABLES THAT AFFECT EARTHWORKS. WHILE THE MEDIAN DEPTH AND VOLUME ARE GENERALLY REFLECTIVE OF THE SITE CHARACTERISTICS, THE ACTUAL DEPTH AND VOLUME AT ANY PRECISE LOCATION WILL VARY (UP OR DOWN) BASED ON THE LOCATION OF HIGH POINTS AND LOW POINTS IN THE ROAD AND ON THE LOTS.

THE SITE GRADING PLAN HAS BEEN PREPARED IN GENERAL CONFORMANCE WITH CITY OF OTTAWA DESIGN CRITERIA AND HISTORIC PRACTICES. THE GRADING PLAN HAS NOT BEEN REVIEWED BY CITY OF OTTAWA AND IS SUBJECT TO CHANGE FOLLOWING CITY REVIEW. ANY CHANGE IN THE GRADING PLAN WILL HAVE A CORRESPONDING CHANGE IN EARTHWORKS.

Mississippi Valley Conservation Authority | Rideau Valley Conservation Authority | South Nation Conservation / Conservation de la Nation Sud

May 31, 2020

City of Ottawa
110 Laurier Avenue,
Ottawa, ON K1P 1J1

Attention: Doug James

Subject: **Barrhaven Conservancy Development Corporation**
Status of As-Built Grading
Related: RVCA Permit # RV5-4419 and RV5-1718)
Vacant land on the north side of the Jock River generally bounded by Highway 416 and the Fraser Clarke Creek, City of Ottawa

Dear Mr. James:

The RVCA has reviewed information recently submitted by David Schaeffer Engineering Ltd. including as-built grades in support of works approved by the Rideau Valley Conservation Authority under Section 28 of the Conservation Authorities Act (Permit File Number: RV5-4419 and RV5-1718). The RVCA offers the following comments related to future development proposed for the area within the scope of approved the permits.

The subject lands as identified as part of Lots 11, 12, 13, 14, 15 former geographic Township of Nepean, Concessions 3 & 4, now in the City of Ottawa have been addressed through the general placement of fill and the formal construction of a berm around the perimeter of four blocks within the subject lands. The site specific elevations of the berm have been reviewed by the RVCA and are generally accepted as being appropriate as removing these lands from the floodplain in accordance with the aforementioned approved permits.

The detailed grading plans submitted by David Schaeffer Engineering Ltd. titled As Constructed plan of Berms and Cut Areas – Barrhaven Conservancy", dated May 27, 2020, prepared by Adam Fobert, P.Eng. of DSEL, DSEL File Number 16891 using the following resources:

- Orthoimagery Survey, dated April 20, 2020, acquired and processed by First Base Solutions a division of JD Barnes Ltd and certified by Chris Fox, O.L.S., A.L.S., P. Eng. of JD Barnes Ltd, file reference number 2037OTTA0001; ·
- Topographic Detail of Part of Lot 13, 14,&15 Concession 3&4, dated May 6, 2020, certified by Chris Fox, O.L.S., A.L.S., P. Eng. of JD Barnes Ltd, file reference number 16-10-127-00; ·

- Contractor as-built collected by the Tomlinson Group of Companies of Phase 1 dated May 15, 2020, reviewed by Jeremy Chouindard, EIT and certified by Stephen Pichette, P.Eng. of DSEL

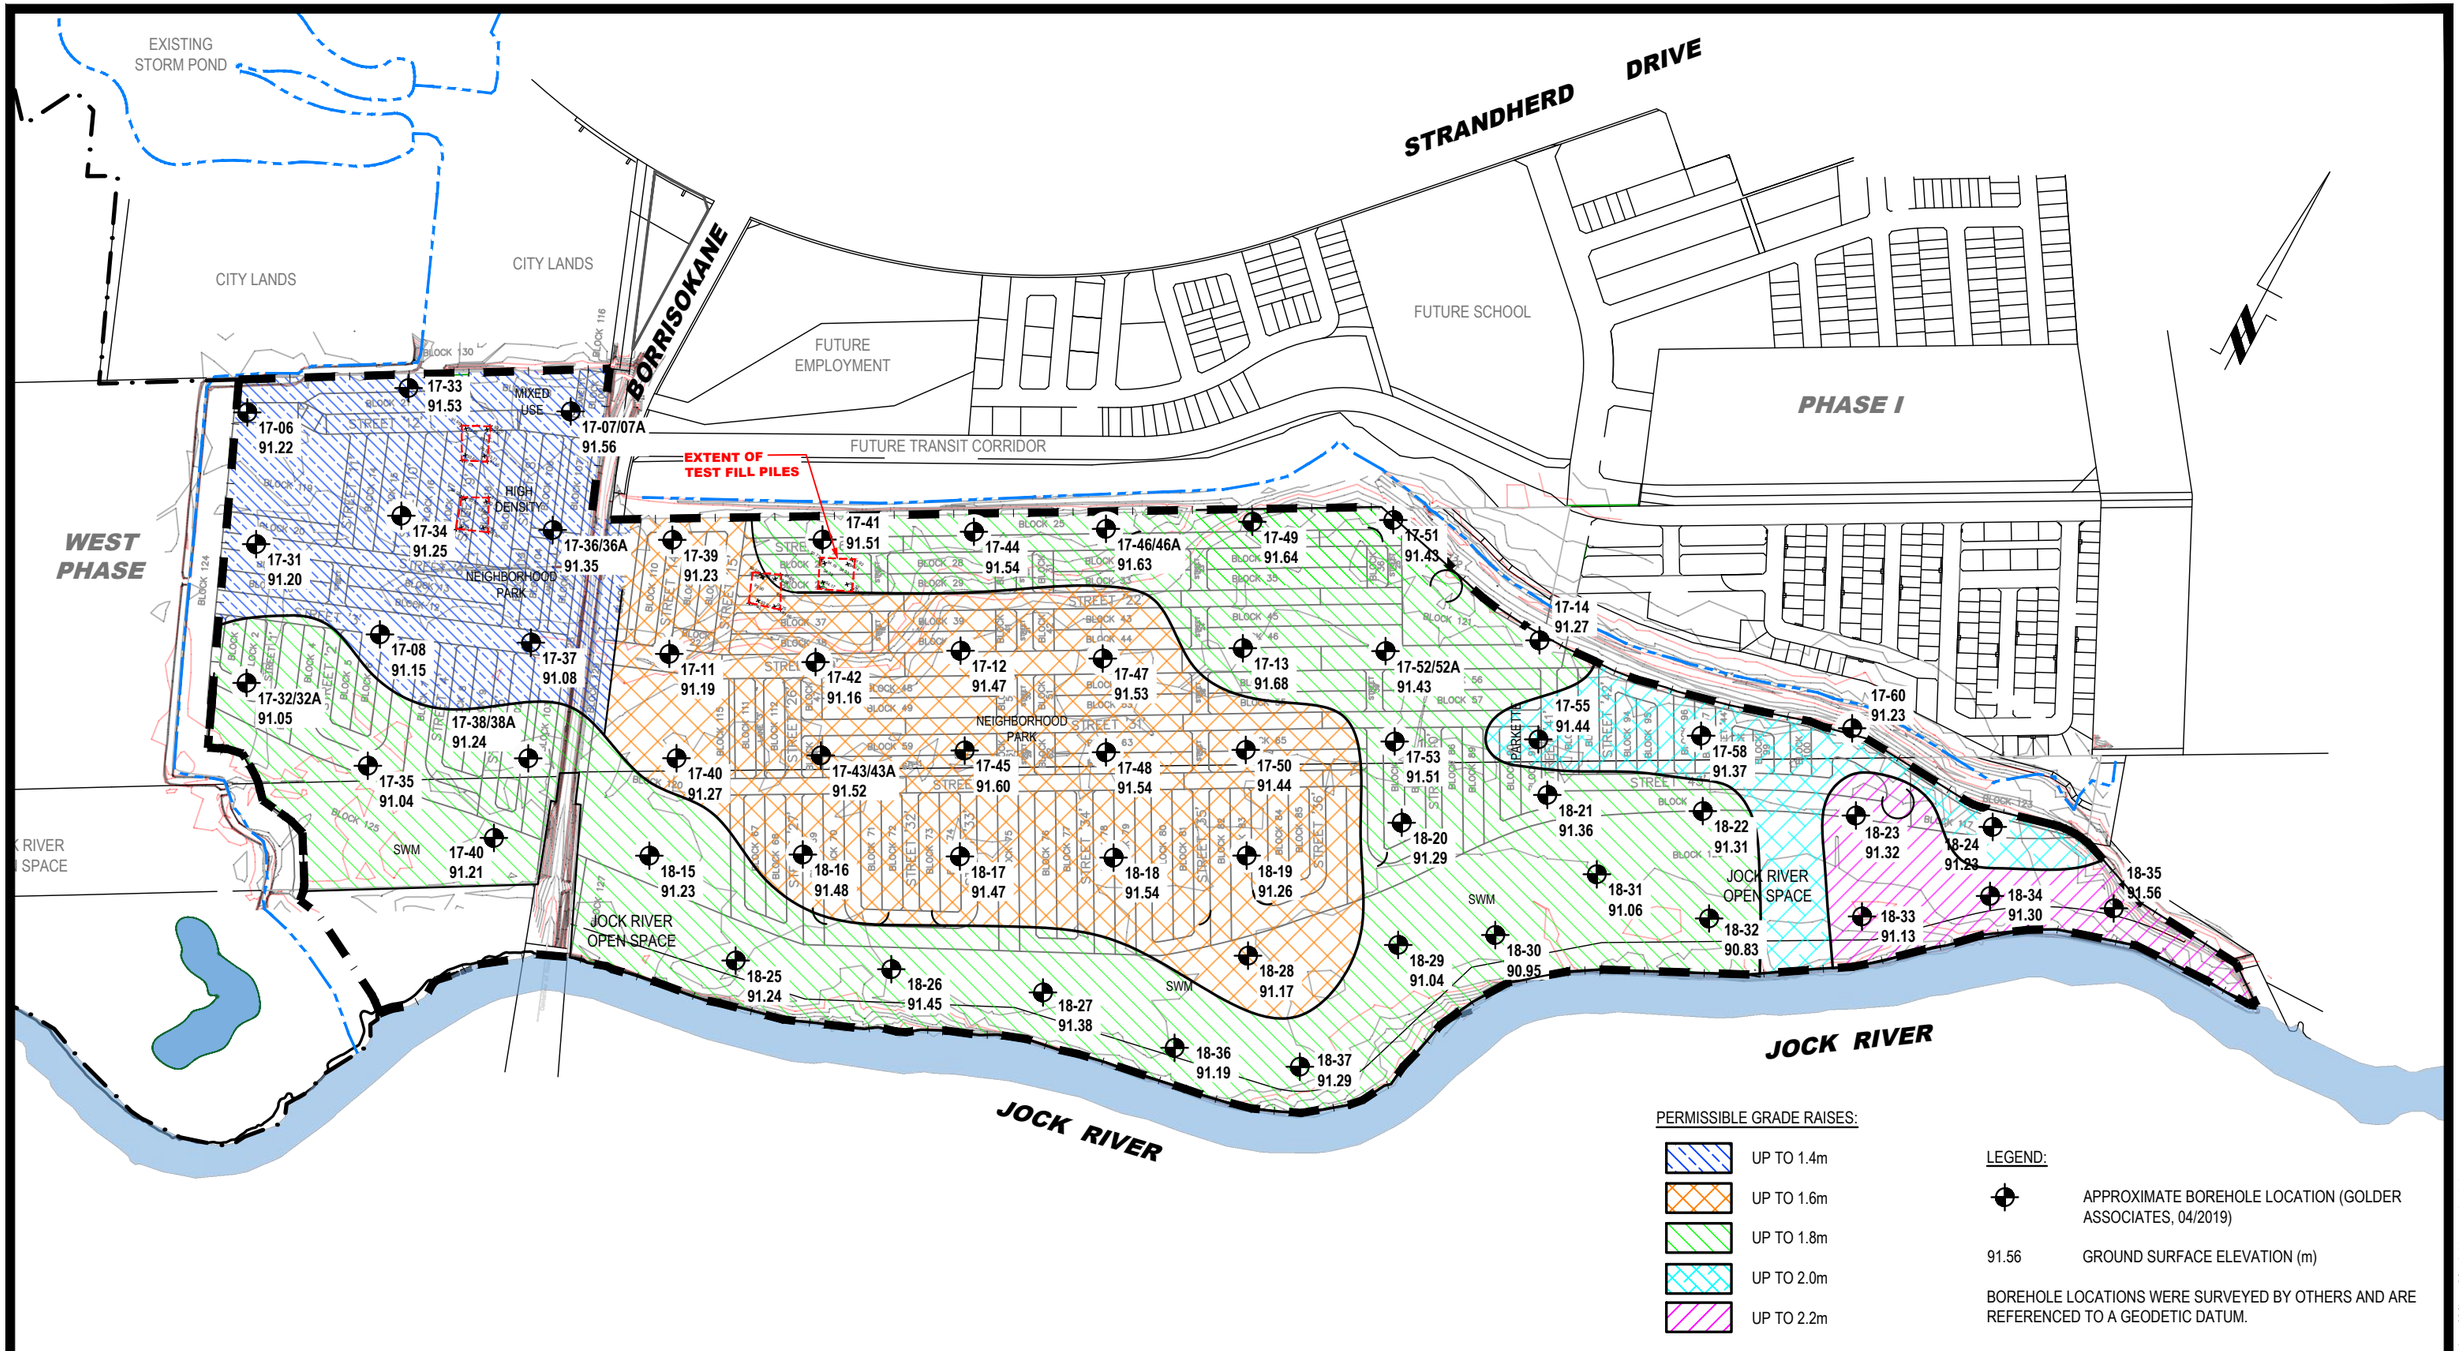
The above information indicates that land within the berm have generally been raised to exceed the flood elevation cross sections throughout the project area. However, it is noted that as this is considered an active construction site the presence of lower areas to manage construction, on-site erosion and sediment control show lower elevations. These areas will be addressed through the construction process, as sufficient material is presently stockpiled for this purpose to ensure. For the purposes of the floodplain, these areas are considered removed by virtue of the berm.

Conclusion:

The grade modifications, including construction of the berm and filling behind the berm, as documented in the above noted "as constructed" plans, have been completed in accordance with the plans approved by the RVCA under permits RV5-4419 and RV5-1718.

Please feel free to contact our office with any questions or comments you may have.

Respectfully,



Terry K. Davidson

re:	**Road Grade Exceedance Review** Proposed Residential Development - Conservancy Lands Borrisokane Road - Ottawa
to:	Caivan Communities - **Mr. Hugo Lalonde** - hugo.lalonde@caivan.com David Schaeffer Engineering Ltd. - **Mr. Kevin Murphy** - KMurphy@dsel.ca
date:	March 8, 2021
file:	PG5036-MEMO.10

Paterson Group (Paterson) prepared the following memo to provide a geotechnical review of permissible grade raise exceedances of the proposed roadway grading at various locations throughout the aforementioned development. This memorandum should be read in conjunction with Paterson Group Report PG5036-1 Revision 1 dated February 3, 2021.

The following drawings prepared by David Schaeffer Engineering Ltd. were reviewed from a geotechnical perspective:

- ❏ Barrhaven Conservancy - Maximum Grade Raise Exceedance - Project No. 16-891 - Drawing No. 6 and 7 - dated March 2021
- ❏ Latest road grading AutoCAD file - 891_Grad_PS_Lowered_Mar5-21

Based on the available drawings, it is understood that minor permissible grade raise exceedances occur within the proposed roadway grades at various locations throughout the subject development.

Geotechnical Review

Based on our detailed review, the grading exceedances are considered acceptable from a geotechnical perspective and lightweight fill will not be required within the City of Ottawa right-of-way(s).

We trust that this information satisfies your immediate requirements.

WATER SERVICING

Stantec

Memo

To:	Kevin Murphy David Schaeffer Engineering Ltd.	From:	Jasmin Sidhu / Kevin Alemany Stantec Consulting Ltd.
File:	163401437 / 163401660	Date:	March 5, 2021

Reference: Hydraulic Potable Water Assessment for Barrhaven Conservancy Development Corporation

OVERVIEW

Stantec Consulting Ltd. (Stantec) was retained by Barrhaven Conservancy Development Corporation to perform a hydraulic assessment for a land parcel located adjacent to Pressure Zone (PZ) 3SW (previously known as PZ BARR). This technical memo reviews and assesses the limitations/opportunities associated with servicing the parcel in question as it is located near the Jock River. The parcel in question, which is divided into east (Conservancy East) and west (Conservancy West) portions, is herein referred to as the Barrhaven Conservancy Lands.

BACKGROUND REVIEW

As part of the assessment, the following reports were reviewed:

- City of Ottawa 2013 Water Master Plan, Stantec Consulting Ltd., September 2013;
- Kennedy-Burnett Potable Water Master Servicing Study, Stantec Consulting Ltd., April 2014;
- SUC Water Infrastructures Upgrades – Hydraulic Assessment, Stantec Consulting Ltd., July 2015; and,
- Barrhaven Master Servicing Study Addendum – Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area, Stantec Consulting Ltd., March 2017.

ZONE 3SW AND ZONE SUC

ZONAL WATER DEMANDS & POPULATION PROJECTIONS

Zone 3SW services the lands adjacent to the proposed Barrhaven Conservancy Lands development. In 2015, the City embarked on a large initiative to reconfigure the pressure zones servicing Barrhaven and the southern reaches of Ottawa, and area called the South Urban Community (SUC). The purpose of the zone reconfiguration was to improve reliability, to improve efficiencies and to provide increased pumping capacity for future growth.

Table 1 shows the projected water demands and **Table 2** shows the projected populations of Zone 3SW and Zone SUC before and after the pressure zone reconfiguration. These values were adapted from the City of Ottawa 2013 Water Master Plan (Stantec, 2013) and the SUC Water Infrastructure Upgrades – Hydraulic Assessment (Stantec, 2015) reports.

Reference: **Hydraulic Potable Water Assessment for Barrhaven Conservancy Development Corporation**

Table 1: Water Demand Projections

Zone	Existing Pre-Zone Reconfiguration (MLD)			2018 Post-Zone Reconfiguration (MLD)			2031 Post-Zone Reconfiguration (MLD)			2060 Post-Zone Reconfiguration (MLD)		
	BSDY	MXDY	PKHR	BSDY	MXDY	PKHR	BSDY	MXDY	PKHR	BSDY	MXDY	PKHR
3SW	12.0	26.2	52.3	5.7	11.7	27.0	6.3	12.8	29.5	6.4	12.9	29.8
SUC	3.4	7.3	14.6	24.7	47.6	90.8	44.4	78.7	148.9	63.3	107.6	207.1

Table 2: Population Projections

Zone	Existing Pre-Zone Reconfiguration	2018 Post-Zone Reconfiguration	2031 Post-Zone Reconfiguration	2060 Post-Zone Reconfiguration
3SW	48,917	29,995	30,363	31,183
SUC	5,737	137,909	175,073	234,538

PUMPING CAPACITY

The newly installed pumps for Zone 3SW are sized based on population/demand projections for lands within current approved growth areas. They do not include demands attributed to the Barrhaven Conservancy Lands. As such, the current pumping capacity into Zone 3SW is not sufficient to supply these additional lands along with the growth already planned for in Zone 3SW up to 2060 projections.

The Fallowfield Road Pumping Station (FRPS) (previously known as Barrhaven Reservoir Pumping Station) and Barrhaven Pumping Station (BPS) will continue to service Zone 3SW post pressure zone reconfiguration; however, both pump stations are being equipped with new pumps that were sized for the post pressure zone reconfiguration water demands in Zone 3SW.

The new FRPS is already commissioned and in operation while the BPS is currently undergoing pumping tests on the newly installed pumps as part of its commissioning process.

The BPS is changing from a single zone station to a dual zone pump station and will operate in conjunction with Ottawa South Pumping Station (OSPS) to service the newly expanded Zone SUC. It will also continue to service the smaller/reduced Zone 3SW with one of its pumps.

The Ottawa South Pumping Station is the second pumping station that will feed Zone SUC. It is currently undergoing a detailed design for its upgrade. It may be possible to make some provisions to account for the additional demands in SUC however it is recommended that this be considered as soon as possible through discussions with the City.

Table 3 provides the pumping capacities into each pressure zone post zone reconfiguration upgrades.

Table 3: Pumping Capacity Post-Zone Reconfiguration

Zone	Firm Pumping Capacity (MLD)	Total Pumping Capacity (MLD)
3SW	14	21
SUC	113	173

Due to the elevated balancing storage provided by Moodie Tank, the firm capacity of the 3SW pumps must be able to supply the future 2060 maximum day demand of 12.9 MLD as shown in **Table 1**. The 3SW pumps were sized based on 2060 demands as they do not increase significantly compared to 2018 post zone reconfiguration demands.

In Zone SUC, without elevated storage, the firm capacity of the pumps must be able to supply the greater demand of peak hour (90.8 MLD) or maximum day plus fire flow (66.3 MLD; FF = 18.7 MLD) for post zone reconfiguration demands. It should be noted that pumping capacity at the SUC pump stations will be further increased in the future to meet 2031 and 2060 projected demands.

The above shows that both the 3SW and SUC pumps have been sized to meet the existing and future demands within the previously established growth areas. For the purpose of this assessment, it is assumed that the demand for the Barrhaven Conservancy Lands is not accounted for in the current capacity of the Zone 3SW pumps but can be accommodated by the SUC pumps. The impact on district-level distribution pumping and needs will be further reviewed as part of the City's 2021 Water Master Plan.

HYDRAULIC ASSESSMENT

WATER DEMANDS

Following the 2013 Water Master Plan "Design Criteria and Levels of Service", when projected population exceeds 3,000 persons, basic unit demands for Zone/System Levels are to be used. For residential land-uses, single family and semi-detached homes were considered to have similar demands, with both types of residential home categorized under "single family home" or SFH. All townhomes were categorized under "multi-level townhomes" or MLT and all apartments or high-density units were categorized under APT. Consumption rates for SFH, MLT and APT are presented in **Table 4**.

To determine the MXDY demand, an outdoor water demand (OWD) of 1,049 L/SFH/d is allocated to all SFH units. This is a fixed value and does not change with zone demand. This outdoor water demand is added to the basic day (BSDY) demand to obtain the MXDY demand.

The unit counts were provided by David Schaeffer Engineering Ltd. (DSEL) via email on March 1, 2021. The estimated water demands are presented in **Table 4**. This additional demand is not within the current capacity of the new pumps within Zone 3SW.

Table 4: Estimated Water Demands of the Barrhaven Conservancy Lands

Unit Types	Unit Count			PPU	Pop.	L/c/d	BSDY (MLD)	MXDY (MLD)
	Conservancy East	Conservancy West	Total					
Single Family	730	775	1,505	3.4	5,117	180	0.92	2.50
Townhouse	445	525	970	2.7	2,619	198	0.52	0.52

High Density	100	-	100	2.1	210	219	0.05	0.05
Total	***1,440***	***1,300***	***2,740***		***8,392***		***1.57***	***3.15***

POTABLE WATER SERVICING ALTERNATIVES

Figures 1 to **6** and **Table 5** present alternatives to service the Barrhaven Conservancy Lands with potable water and discusses limitations of each alternative. For system reliability purposes, primary and secondary feeds have been identified for each alternative. It should be noted that the alignments shown in **Figures 1** to **6** are approximate with the intent to show general locations for possible connections.

Based on hydraulic modelling of trunk main looping through the Conservancy Lands and review of previously completed servicing studies for adjacent lands, all alternatives are anticipated to satisfy the City's objective minimum pressure of 40 psi during peak hour demand and achieve a typical planning level fire flow value 13,000 L/min or greater. These results are discussed further in the following sections. Detailed modelling results are provided in the **Hydraulic Modelling Results** attachment.

Alternative 1 – Servicing from 3SW

Figure 1 shows the connection points to the Kennedy-Burnett watermains that are fed by the future Strandherd Drive watermain.

Based on the Kennedy-Burnett Potable Water Master Servicing Study (Stantec, 2014), which is a subdivision adjacent to the Barrhaven Conservancy Lands, it is likely the Barrhaven Conservancy Lands will experience pressures greater than the City of Ottawa's objective pressure of 80 psi during basic day demands if operating at Zone 3SW pressure. This is corroborated by hydraulic modelling results which show the maximum pressure along the trunk main looping through the Conservancy Lands under basic day demands to be approximately 88 psi. Therefore, pressure mitigation measures would need to be considered (i.e., pressure reducing valves (PRVs) at individual service connections) for this servicing alternative.

Pumping capacity upgrades at FRPS and/or BPS would be required to service the Barrhaven Conservancy Lands from Zone 3SW on a permanent basis. As an example of costs, recent upgrades to the FRPS totaled approximately $1.5 million. Additional works at FRPS and BPS to service the Conservancy Lands could include retrofitting the pump(s), piping, valving and supporting infrastructures as well as instrumentation, electrical and mechanical aspects. A more in-depth assessment would be required to determine the potential costs.

Another alternative to service the Barrhaven Conservancy Lands from Zone 3SW would be on a temporary basis. As shown in **Figure 1**, the initial phase of development (estimated boundary shown) could be serviced at 3SW pressure and switched over to SUC pressure at a later time as development takes place. While this

alternative is likely to be technically feasible, the extent of development within the Barrhaven Conservancy Lands that can operate at 3SW pressure in the interim will depend on the City's planning and approvals currently in place. This alternative essentially borrows capacity from existing approved areas within Zone 3SW until such time that the borrowed capacity is replaced through system upgrades. Through discussions with City staff, the City has indicated that this is not a desirable option.

Alternative 2 – Servicing from SUC

Figures 2 to **5** show the Barrhaven Conservancy Lands being serviced by new SUC watermains and include various options for a secondary feed.

Both Alternatives 2a and 2b propose a new SUC watermain running parallel to the future 3SW Strandherd watermain as the primary feed. This feed would then run south, parallel to the existing watermains that currently service the existing subdivisions north of the Conservancy Lands (including Phase 1 lands) that operate at 3SW pressures. Alternative 2a proposes a secondary feed from Nepean Town Centre (NTC) whereas Alternative 2b proposes a secondary feed from Barrhaven South. Based on findings from the Barrhaven South Urban Expansion Area Master Servicing Study (Stantec, 2017), the Barrhaven Conservancy Lands can anticipate maximum pressures greater than 75 psi and potentially greater than 80 psi during basic day demands if operating at Zone SUC pressure. Hydraulic modelling results indicate that the maximum pressure along the trunk main looping through the Conservancy Lands under basic day demands is estimated to be approximately 76 psi and available fire flow to be in excess of 13,000 L/min for both Alternatives 2a and 2b. Therefore, PRVs would not be required. As these two options would require the installation of a second separate watermain along Strandherd Drive (which will be undergoing widening as part of a separate recently awarded project) and through the existing north subdivision, the City has indicated that these alternatives are not preferred.

Alternative 2c proposes both primary and secondary feeds from the NTC (one along future Chapman Mills Drive and one through the future Claridge development from southeast of the KB pond) to service the first stages of development in the Conservancy Lands. As per currently proposed, site servicing through the Claridge lands, Alternative 2c would connect to a 300 mm diameter watermain along Chapman Mills Drive and a 200 mm watermain southeast of the KB pond. Similar to Alternatives 2a and 2b, hydraulic modelling results show that the maximum pressure along the trunk main looping through the Conservancy Lands under basic day demands is estimated to be approximately 76 psi and available fire flow to be in excess of 13,000 L/min.

Alternative 2d proposes a primary feed through the future Claridge development from southeast of the KB pond and a secondary feed from Barrhaven South. Pressures and available fire flows along the trunk main looping through the Conservancy Lands are similar to those for Alternatives 2a, 2b and 2c.

All four alternatives (2a to 2d) present challenges due to limited land access, crossings of a body of water, and/or requiring a new watermain to be installed along recently or soon to be (re)constructed right-of-ways.

Alternative 3 – Servicing from SUC with an Automated Valve from 3SW

Figure 6 shows the Barrhaven Conservancy Lands being serviced by a new SUC watermain running parallel to the Strandherd Drive watermain and a secondary feed from 3SW for emergency conditions.

This alternative proposes a secondary feed from 3SW via an automated valve off the future Strandherd Drive watermain. Water would flow from the high pressure Zone 3SW into the low pressure Zone SUC if there is a pressure drop on the SUC side of the valve. This alternative requires an interzonal valve connection that is not typically used/accepted in the City of Ottawa and would present both operational challenges and costs to operate and maintain. Similar to Alternatives 2a and 2b, this option would require the installation of a second separate watermain along Strandherd Drive (which will be undergoing widening as part of a separate recently

awarded project) and through the existing north subdivision; therefore, the City has indicated that this alternative is not preferred.

Table 5: Potable Water Servicing Alternatives & Limitations

Alternative		Zone	Max Pressures	Min Pressures	Available Fire Flow at 20 psi	Limitations
1	Connect to the future 3SW 406 mm dia. WM along Strandherd Drive at two locations	3SW	88 psi	52 psi	> 13,000 L/min	Requires additional pumping capacity in Zone 3SW. Will require individual PRVs at each service connection. ***Therefore, the City has indicated that this is not a preferred option.***
2a	Connect to a future SUC WM that will run parallel to the future Strandherd WM and connect to a 2nd future SUC WM from the NTC (north of the Jock River)	SUC	76 psi	64 psi	≥ 13,000 L/min	Requires crossing water way east of the Barrhaven Conservancy Lands. Land around ponds may not be accessible. Requires installation of a second separate WM along Strandherd Drive and through the existing north subdivision. ***Therefore, the City has indicated that this is not a preferred option.***
2b	Connect to a future SUC WM that will run parallel to the future Strandherd WM and connect to a 2nd future SUC WM from Barrhaven South (south of the Jock River – crossing river)	SUC	76 psi	61 psi	> 13,000 L/min	Requires crossing the Jock River. Requires installation of a second separate WM along Strandherd Drive and through the existing north subdivision. ***Therefore, the City has indicated that this is not a preferred option.***
2c	Connect to future SUC WMs in the NTC (north of the Jock River) at two locations	SUC	76 psi	64 psi	> 13,000 L/min	Requires crossing water way east of the Barrhaven Conservancy Lands. Land around ponds may not be accessible. Requires installation of a second separate WM through the existing north subdivision that is currently operated at 3SW pressures.

Alternative		Zone	Max Pressures	Min Pressures	Available Fire Flow at 20 psi	Limitations
2d	Connect to a future SUC WM through the Claridge lands (north of the Jock River) and connect to a 2nd future SUC WM from Barrhaven South (south of the Jock River – crossing river)	SUC	76 psi	61 psi	> 13,000 L/min	Requires crossing the Jock River. Requires crossing water way east of the Barrhaven Conservancy Lands. Land around ponds may not be accessible.
3	Connect to a future SUC WM that will run parallel to the future Strandherd WM and connect to the Strandherd 3SW WM using an automated valve to feed from 3SW under emergency conditions	SUC	76 psi (could potentially be > 80 psi depending on valve operation)	67 psi	> 13,000 L/min	Requires crossing water way east of the Barrhaven Conservancy Lands. Land around ponds may not be accessible. May possibly require PRVs at each service connection. An automated 3SW/SUC valve presents operational challenges and costs. Requires installation of a second separate WM along Strandherd Drive and through the existing north subdivision. ***Therefore, the City has indicated that this is not a preferred option.***

SUMMARY & RECOMMENDATIONS

The recent pump station upgrades at the Zone 3SW pump stations are nearing completion. For the purpose of this assessment, it is assumed that the demand for the Barrhaven Conservancy Lands is not accounted for in the current capacity of the Zone 3SW pumps but can be accommodated by the SUC pumps.

Alternative 1 for servicing the Conservancy Lands would eventually require changing the recently commissioned pumps at the Fallowfield Road Pumping and Station and one of the new pumps at the Barrhaven Pump Station and potentially some of the associated piping, valving, instrumentation, electrical and mechanical appurtenances for higher capacity pumps and appurtenances. Due to the anticipated maximum pressures exceeding 80 psi during basic day demands, individual PRVs will be required at each service connection if the lands operate at Zone 3SW pressure. It is understood from discussions with the City staff that this is not a preferred option.

Servicing the Conservancy Lands from Zone SUC requires the installation of a second separate watermain along Strandherd Drive and through the existing north subdivision and/or a crossing of a stormwater pond and/or the Jock River to complete a looping network. All four alternatives present their own challenges with either limited land access, crossings of a body of water, and/or requiring a new watermain to be installed along recently or soon to be (re)constructed right-of-ways. City staff have indicated that options requiring a separate

Reference: **Hydraulic Potable Water Assessment for Barrhaven Conservancy Development Corporation**

watermain along Strandherd (2a, 2b and 3) are not preferred since this portion of Strandherd Drive is undergoing widening as part of a separate recently awarded project and the timing for modifications does not work. As such, the City has identified Alternative 2c as the preferred servicing alternative, with 2d also being a viable option. Based on hydraulic modelling results along the trunk main looping through the Conservancy Lands, servicing of these lands with two 300 mm diameter watermains from the future 300 mm and 200 mm Claridge lands watermains (i.e., Alternative 2c) is possible, however ultimate optimization of sizing would have to be completed at a later phase.

An automated 3SW/SUC valve could potentially be considered for interim conditions, as discussed in Alternative 3, however inter-zonal automated valve connections are not typically used/accepted in the City of Ottawa and would present both operational challenges and costs to operate and maintain.

In addition to the secondary feeds proposed for each alternative, other system reliability measures may be considered as development continues to progress in adjacent lands. Measures may include providing additional looping between subdivisions and/or potential use of automated valves between the 3SW and SUC networks in this area for use under emergency conditions.

Sincerely,

Stantec Consulting Ltd.

RE: STRANDHERD DRIVE WIDENING PROJECT
SOUTH NEPEAN COLLECTOR PHASE 3: SANITARY FLOW CALCULATIONS

CC: EDSON DONNELLY – NOVATECH

1.0 PURPOSE

This memorandum provides the sanitary sewer flow calculations and design sheet for Phase 3 of the proposed South Nepean Collector (SNC), as part of the Strandherd Drive Widening Project. Sanitary design flows have been estimated for both current-day operational flows and future development peak design flows. They are based on the latest available planning information for the vacant lands within the SNC sewershed.

2.0 BACKGROUND

In January 1998, the Master Servicing Study for the South Nepean Urban Area provided a conceptual plan for water, wastewater and stormwater infrastructure. The preferred alternative for wastewater servicing was an east/west trunk sewer alignment that was to be completed in several phases. The proposed sanitary trunk sewer was initially called the Jock River Collector, but was renamed the South Nepean Collector during the original functional design study completed in 2003.

Phase 1 of the South Nepean Collector was completed in 2005 and currently terminates at a 2400mm maintenance hole located east of Longfields Drive, north of Bren-Maur Road. Phase 2 was completed in 2016 and currently terminates at a 2400mm maintenance hole located at the intersection of Strandherd Drive and Fraser Fields Way.

Phase 3 will extend the trunk sewer along Strandherd Drive to the intersection of Kennevale Drive. Here it will connect with the existing sanitary trunk sewer that was constructed as part of the 2014 works to improve Strandherd Drive and develop the CitiGate Lands.

The sanitary sewer flows were previously documented in the *South Nepean Collector – Functional Design Report and Update* (Dillon, 2012). Novatech (2016) completed a Hydraulics Review / Assessment of the sanitary flows presented in the Dillion Report (attached). This was based on the latest planning information for the vacant lands within the SNC sewershed. The results of the Hydraulics Review / Assessment (Novatech, 2016) were similar to the results from the Dillion (2012) analysis.

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

3.0 DESIGN PARAMETERS AND POPULATION ESTIMATES

3.1 Design Parameters

The sanitary design flow were calculated using the parameters from the City of Ottawa Sewer Design Guidelines (October 2012), revised per Technical Bulletin ISTB-2018-01 (March 2018). These parameters are summarized in **Table 1** and **Table 2**.

Table 1: Peak Design Flow Parameters

Land Use	Average Daily Flow	Peaking Factor	Peak Extraneous Flows
Residential	280 L/cap/day	Harmon Equation, K=0.8 (1.6 min – 3.2 max)	0.33 L/s/ha
Commercial	28,000 L/ha/day	1.0 – 1.5*	
Institutional	28,000 L/ha/day	1.0 – 1.5*	
Other†	0 L/ha/day	N/A	

**Peak Factor = 1.5 if contributing area is >20%; Peak Factor = 1.0 if contributing area is <20%*
†Open Space, Arterial ROW, SWM Blocks, etc. with no sanitary flow contribution (extraneous flow only)

Table 2: Operational Design Flow Parameters

Land Use	Average Daily Flow	Peaking Factor	Peak Extraneous Flows
Residential	200 L/cap/day	Harmon Equation, K=0.6 (1.2 min – 2.4 max)	0.30 L/s/ha
Commercial	17,000 L/ha/day	1.0 (non-coincident peak)	
Institutional	17,000 L/ha/day	1.0 (non-coincident peak)	

**There are no industrial areas identified within the tributary area.*

$$\text{Harmon Equation} = 1 + \frac{14}{4+\left(\frac{P}{1000}\right)^{\frac{1}{2}}} \times K$$

Where:

P = Population
K = Correction Factor:
- Peak Flow = 0.8
- Operational = 0.6

3.2 Land Use Designations & Population Estimates

Population densities and unit counts for future residential development are based on the Novatech (2016) Hydraulics Review / Assessment; refer to **Table 3**. They are based on the concept plans provided by the developers of the future residential areas.

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

Table 3: Residential Land Use Population Densities

Residential Land Use	Units per ha	Persons per Unit	Persons per ha
Low Density (singles and semis)	26 – 28 (28 used)	2.7 – 3.4 (3.4 used)	95.2
Medium Density (row/townhouse)	50 – 60 (60 used)	2.7	162.0
High Density (apartments)	60 – 75 (75 used)	1.8	135.0

The land use designations shown in **Table 4** have been applied for the areas within Phases 2 & 3 of the SNC (Node 70 to 130). The Hydraulics Analysis / Review delineated the sewershed areas and land use designations using aerial photos (existing development) and conceptual site plans (future development).

Table 4: Land Use Designations

Land Use Designation	
Secondary Plan	**SNC Design**
Residential	Residential (Low / Medium / High Density)
Institutional / Office	Institutional
Commercial	Commercial
Recreational	
Business Park	
Prestige Business Park	
Park/Open Space Area	Other*
Ex. Snow Disposal Facility (future commercial)	
Stormwater Management Facility	
Conservation Lands	
Arterial Right-of-Ways	

** No sanitary flow contribution - extraneous flows (inflow/infiltration) only.*

The overall residential population estimate and sewershed area for Phases 2 and 3 of the SNC is provided in **Table 5** below. It is assumed that the snow dump facility at the Stranderd Drive and McKenna Casey Drive will ultimately be re-zoned for commercial development.

Table 5: Population Estimates and Areas

Existing / Future	Estimated Population / Area	Novatech (2015)
Existing	Estimated Population	6,944 persons
	Gross Residential Area	60.09 ha
	Gross Commercial / Institutional Area	64.37 ha
	Total Sewershed Area	124.5 ha
Future (full service)	Estimated Population	27,312 persons
	Gross Residential Area	248.48 ha
	Gross Commercial / Institutional Area	228.82 ha
	Total Sewershed Area	477.3 ha

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

4.0 SANITARY DESIGN FLOWS

The sanitary flow allocations for Phases 2 and 3 of the SNC are provided in **Table 6**. The corresponding sanitary drainage area plan is provided as **Figure 1**. Sanitary sewer flow calculations for Phases 2 and 3 and detailed sanitary sewer design sheets for Phase 3 are attached to this memorandum.

The estimated sanitary design flows from Phase 3 of the SNC (entering Node 90) are as follows:

- Present-Day Operational Design Flows (Theoretical) = 55.1 L/s
- Future Peak Design Flows = 282.5 L/s

The outlet for Phase 3 of the SNC is the existing 900mm outlet pipe at the 2400mm maintenance hole (Node 90) located at the intersection of Strandherd Drive and Fraser Fields Way. Given a minimum design slope of 0.10%, this 900mm sanitary trunk sewer would have a full flow capacity of 597.2 L/s. Therefore, the downstream sanitary trunk sewer would be at 64% capacity, based on the future peak design flow being 282.5 L/s.

DATE: MAY 26, 2016

TO: JONATHAN KNOYLE – CITY OF OTTAWA

FROM: CONRAD STANG – NOVATECH

RE: SOUTH NEPEAN COLLECTOR PHASE 2: SANITARY FLOW CALCULATIONS

CC: EDSON DONNELLY – NOVATECH

1.0 PURPOSE

This memorandum provides the sanitary sewer flow calculations and design sheet for Phase 2 of the proposed South Nepean Collector (SNC). Sanitary design flows have been estimated for both current-day operational flows and future development peak design flows, based on the latest available planning information for the vacant lands within the SNC sewershed.

2.0 BACKGROUND

In January 1998, the Master Servicing Study for the South Nepean Urban Area provided a conceptual plan for water, wastewater and stormwater infrastructure. The preferred alternative for wastewater servicing was an east/west trunk sewer alignment that was to be completed in several phases. The proposed sanitary trunk sewer was initially called the Jock River Collector, but was renamed the South Nepean Collector during the original functional design study completed in 2003.

Phase 1 of the South Nepean Collector was completed in 2005 and currently terminates at a 2400mm maintenance hole located east of Longfields Drive, north of Bren-Maur Road. Phase 2 will extend the trunk sewer to Strandherd Drive at the intersection of the proposed transitway along the proposed extension to Chapman Mills Drive. Phase 3 will extend the trunk sewer along Strandherd Drive to the intersection of Maravista Drive.

The sanitary sewer flows were previously documented in the *South Nepean Collector – Functional Design Report and Update* (Dillon, 2012). A review of the sanitary flows provided in the Dillion Report based on the latest planning information for the vacant lands within the SNC sewershed was documented in the technical memorandum titled South Nepean Collector Phase 2: Hydraulics Review / Assessment (Novatech, 2015), which is attached to this memorandum. The results of the Hydraulics Review / Assessment (Novatech, 2015) were very similar to the results from the Dillion (2012) analysis.

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

3.0 DESIGN PARAMETERS AND POPULATION ESTIMATES

3.1 Design Parameters

The sanitary design flow were calculated using the parameters from the City of Ottawa Sewer Design Guidelines (October 2012), and are summarized in **Table 1** and **Table 2**.

Table 1: Peak Design Flow Parameters

Land Use	Average Daily Flow	Peaking Factor	Peak Extraneous Flows
Residential	350 L/cap/day	Harmon Equation, K=1 (2.0 min – 4.0 max)	0.28 L/s/ha
Commercial	50,000 L/ha/day	1.5	
Institutional	50,000 L/ha/day	1.5	
Other*	0 L/ha/day	N/A	

**Open Space, Arterial ROW, SWM Blocks, etc. with no sanitary flow contribution (extraneous flow only)*

Table 2: Operational Design Flow Parameters

Land Use	Average Daily Flow	Peaking Factor	Peak Extraneous Flows
Residential	300 L/cap/day	Harmon Equation, K=0.6 (1.2 min – 2.4 max)	Dry weather 0.05-0.08 L/s/ha Wet Weather 0.15 - 0.20 L/s/ha (typical events) 0.28 L/s/ha (large/annual events) 0.30 - 0.50 L/s/ha (extreme events)
Commercial	17,000 L/ha/day	1.0 (non-coincident peak)	
Institutional	10,000 L/ha/day	1.0 (non-coincident peak)	

**There are no industrial areas identified within the tributary area.*

$$\text{Harmon Equation} = 1 + \frac{14}{4+\left(\frac{P}{1000}\right)^{\frac{1}{2}}} \times K$$

Where:

P = Population

K = Correction Factor:

- Peak Flow = 1
- Operational = between 0.4 to 0.6 (0.6 used)

3.2 Land Use Designations & Population Estimates

Population densities and unit counts for future residential development are based on the current concept plans for these areas, and are presented in **Table 3**.

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

Table 3: Residential Land Use Population Densities

Residential Land Use	Units per ha	Persons per Unit	Persons per ha
Low Density (singles and semis)	26 – 28 (28 used)	2.7 – 3.4 (3.4 used)	95.2
Medium Density (row/townhouse)	50 – 60 (60 used)	2.7	162.0
High Density (apartments)	60 – 75 (75 used)	1.8	135.0

The land use designations shown in **Table 4** have been applied for the areas within Phases 2 and 3 of the SNC (Node 70 to 130). The sewershed areas and land use designations were delineated using aerial photos (existing development) and conceptual site plans (future development).

Table 4: Land Use Designations

Land Use Designation	
Secondary Plan	**SNC Design**
Residential	Residential (Low / Medium / High Density)
Institutional / Office	Institutional
Commercial	Commercial
Recreational	
Business Park	
Prestige Business Park	
Park/Open Space Area	Other*
Ex. Snow Disposal Facility (future commercial)	
Stormwater Management Facility	
Conservation Lands	
Arterial Right-of-Ways	

** No sanitary flow contribution - extraneous flows (inflow/infiltration) only.*

The overall residential population estimate and sewershed area for Phases 2 and 3 of the SNC is provided in **Table 5** below. It is assumed that the snow dump facility at the Stranderd Drive and McKenna Casey Drive will ultimately be re-zoned for commercial development.

Table 5: Population Estimates and Areas

Existing / Future	Estimated Population / Area	Novatech (2015)
Existing	Estimated Population	6,944 persons
	Gross Residential Area	60.09 ha
	Gross Commercial / Institutional Area	64.37 ha
	Total Sewershed Area	124.5 ha
Future (full service)	Estimated Population	27,312 persons
	Gross Residential Area	248.48 ha
	Gross Commercial / Institutional Area	228.82 ha
	Total Sewershed Area	477.3 ha

Suite 200, 240 Michael Cowpland Drive, Ottawa ON K2M 1P6 Tel: 613.254.9643 Fax: 613.254.5867 www.novatech-eng.com

4.0 SANITARY DESIGN FLOWS

The sanitary flow allocations for Phases 2 and 3 of the SNC are provided in **Table 6**. The corresponding sanitary drainage area plan is provided as **Figure 1**. Sanitary sewer flow calculations for Phases 2 and 3 and detailed sanitary sewer design sheets for Phase 2 are attached to this memorandum.

The estimated sanitary design flows from Phases 2 and 3 of the SNC (entering Node 70) are as follows:

- Present-Day Operational Design Flows (Theoretical) = 72.5 L/s
- Future Peak Design Flows = 634.2 L/s

The outlet for Phase 2 of the SNC is the existing 1050mm outlet pipe at the 2400mm maintenance hole (Node 70) located east of Longfields Drive, north of Bren-Maur Road. Given a minimum design slope of 0.10%, this sanitary trunk sewer would have a full flow capacity of 900.5 L/s. Therefore, the downstream sanitary trunk sewer would be at 70% capacity, based on the future peak design flow being 634.2 L/s.

A2-B	130	Proposed	Commercial	32.46	-	-		
A2-C	120	Proposed	Commercial (ex. Snow dump)	15.25	-	-	Existing snow dump facility assumed to be future commercial.	Functional Design Report and Update – SNC Phase 2 and 3 (Dillon, 2012)
A3-A	130	Proposed	Low Density Residential	16.48	461	95.2	Havencrest – Existing single family units.	Havencrest Design Report (IBI, 2013)
A3-B	130	Existing	Institutional	10.30	-	-	Cedarview Middle School and Cedarview Alliance Church.	Aerial Photos / Site Visits
A3-C	130	Existing	Medium Density Residential	5.19	311	162	Existing townhouse units.	
A3-D	130	Existing	Commercial	0.58	-	-	Existing commercial buildings.	
A3-E	130	Existing	Low Density Residential	35.68	999	95.2	Existing single family units.	
A3-F	130	Existing	Medium Density Residential	8.26	496	162.0	Existing townhouse units.	
A3-G	130	Existing	Institutional	0.90	-	-	Ottawa Torah Centre Chibad.	
A3-H	120	Existing	Low Density Residential	6.09	171	95.2	Existing single family units.	
A4	130	Existing	Low Density Residential	34.44	964	95.2	Existing single family units currently serviced by Jockvale pump station; to be redirected to SNC.	Functional Design Report and Update – SNC Phase 2 and 3 (Dillon, 2012); based on 2011 Census.
A5	110	Proposed	Commercial	17.72	-	-	Proposed commercial south of McKenna Casey Drive.	Site Visits
A6-A	100	Proposed	Institutional	20.70	-	-	Proposed school site on Minto property.	Conceptual Plan for Lands Adjacent the Kennedy-Burnett SWMF provided by Minto (2015)
A6-B	90	Existing	Medium Density Residential	4.87	292	162.0	Existing townhouse units.	Aerial Photos / Site Visits
A6-C	90	Proposed	Low Density Residential	10.11	283	95.2	Proposed single family units on lands owned by Minto.	Conceptual Plans for Lands Adjacent the Kennedy-Burnett SWMF provided by land owners.
A6-D	90	Proposed	Low Density Residential	5.59	157	95.2	Proposed single family units on lands owned by Mion.	
A6-E	90	Proposed	Low Density Residential	7.24	203	95.2	Proposed single family units on lands owned by Pavic / Braovac.	
A7-A	80	Existing	Commercial	13.62	-	-	Existing large retail stores (commercial).	Aerial Photos
A7-B	80	Proposed	High Density Residential	11.01	826	135.0	Proposed high density units on lands owned by Richcraft / Trinity.	Conceptual Plans for Lands Adjacent the Kennedy-Burnett SWMF provided by land owners.
A7-C	80	Proposed	Medium Density Residential	6.97	418	162.0	Proposed Medium density units on lands owned by Mion.	
A7-D	80	Proposed	Medium Density Residential	11.74	704	162.0	Proposed Medium density units on lands owned by Caivan.	
A7-E1/E2	80	Proposed	Medium Density Residential	9.24	554	162.0	Proposed Medium density units on lands owned by Claridge.	
A8-A	80	Existing	Commercial	28.45	-	-	Existing Barrhaven Market Place (commercial).	Aerial Photos / Site Visits
A8-B	80	Proposed	High Density Residential	39.34	2951	135.0	Future development similar to Ampersands development.	Site Visits
A8-C	80	Existing	Institutional	10.52	-	-	Existing St. Joseph High School.	Aerial Photos / Site Visits
A8-D	80	Proposed	Low Density Residential	16.87	1012	162.0	Proposed 600 low density residential units.	Functional Design Report and Update – SNC Phase 2 and 3 (Dillon, 2012)

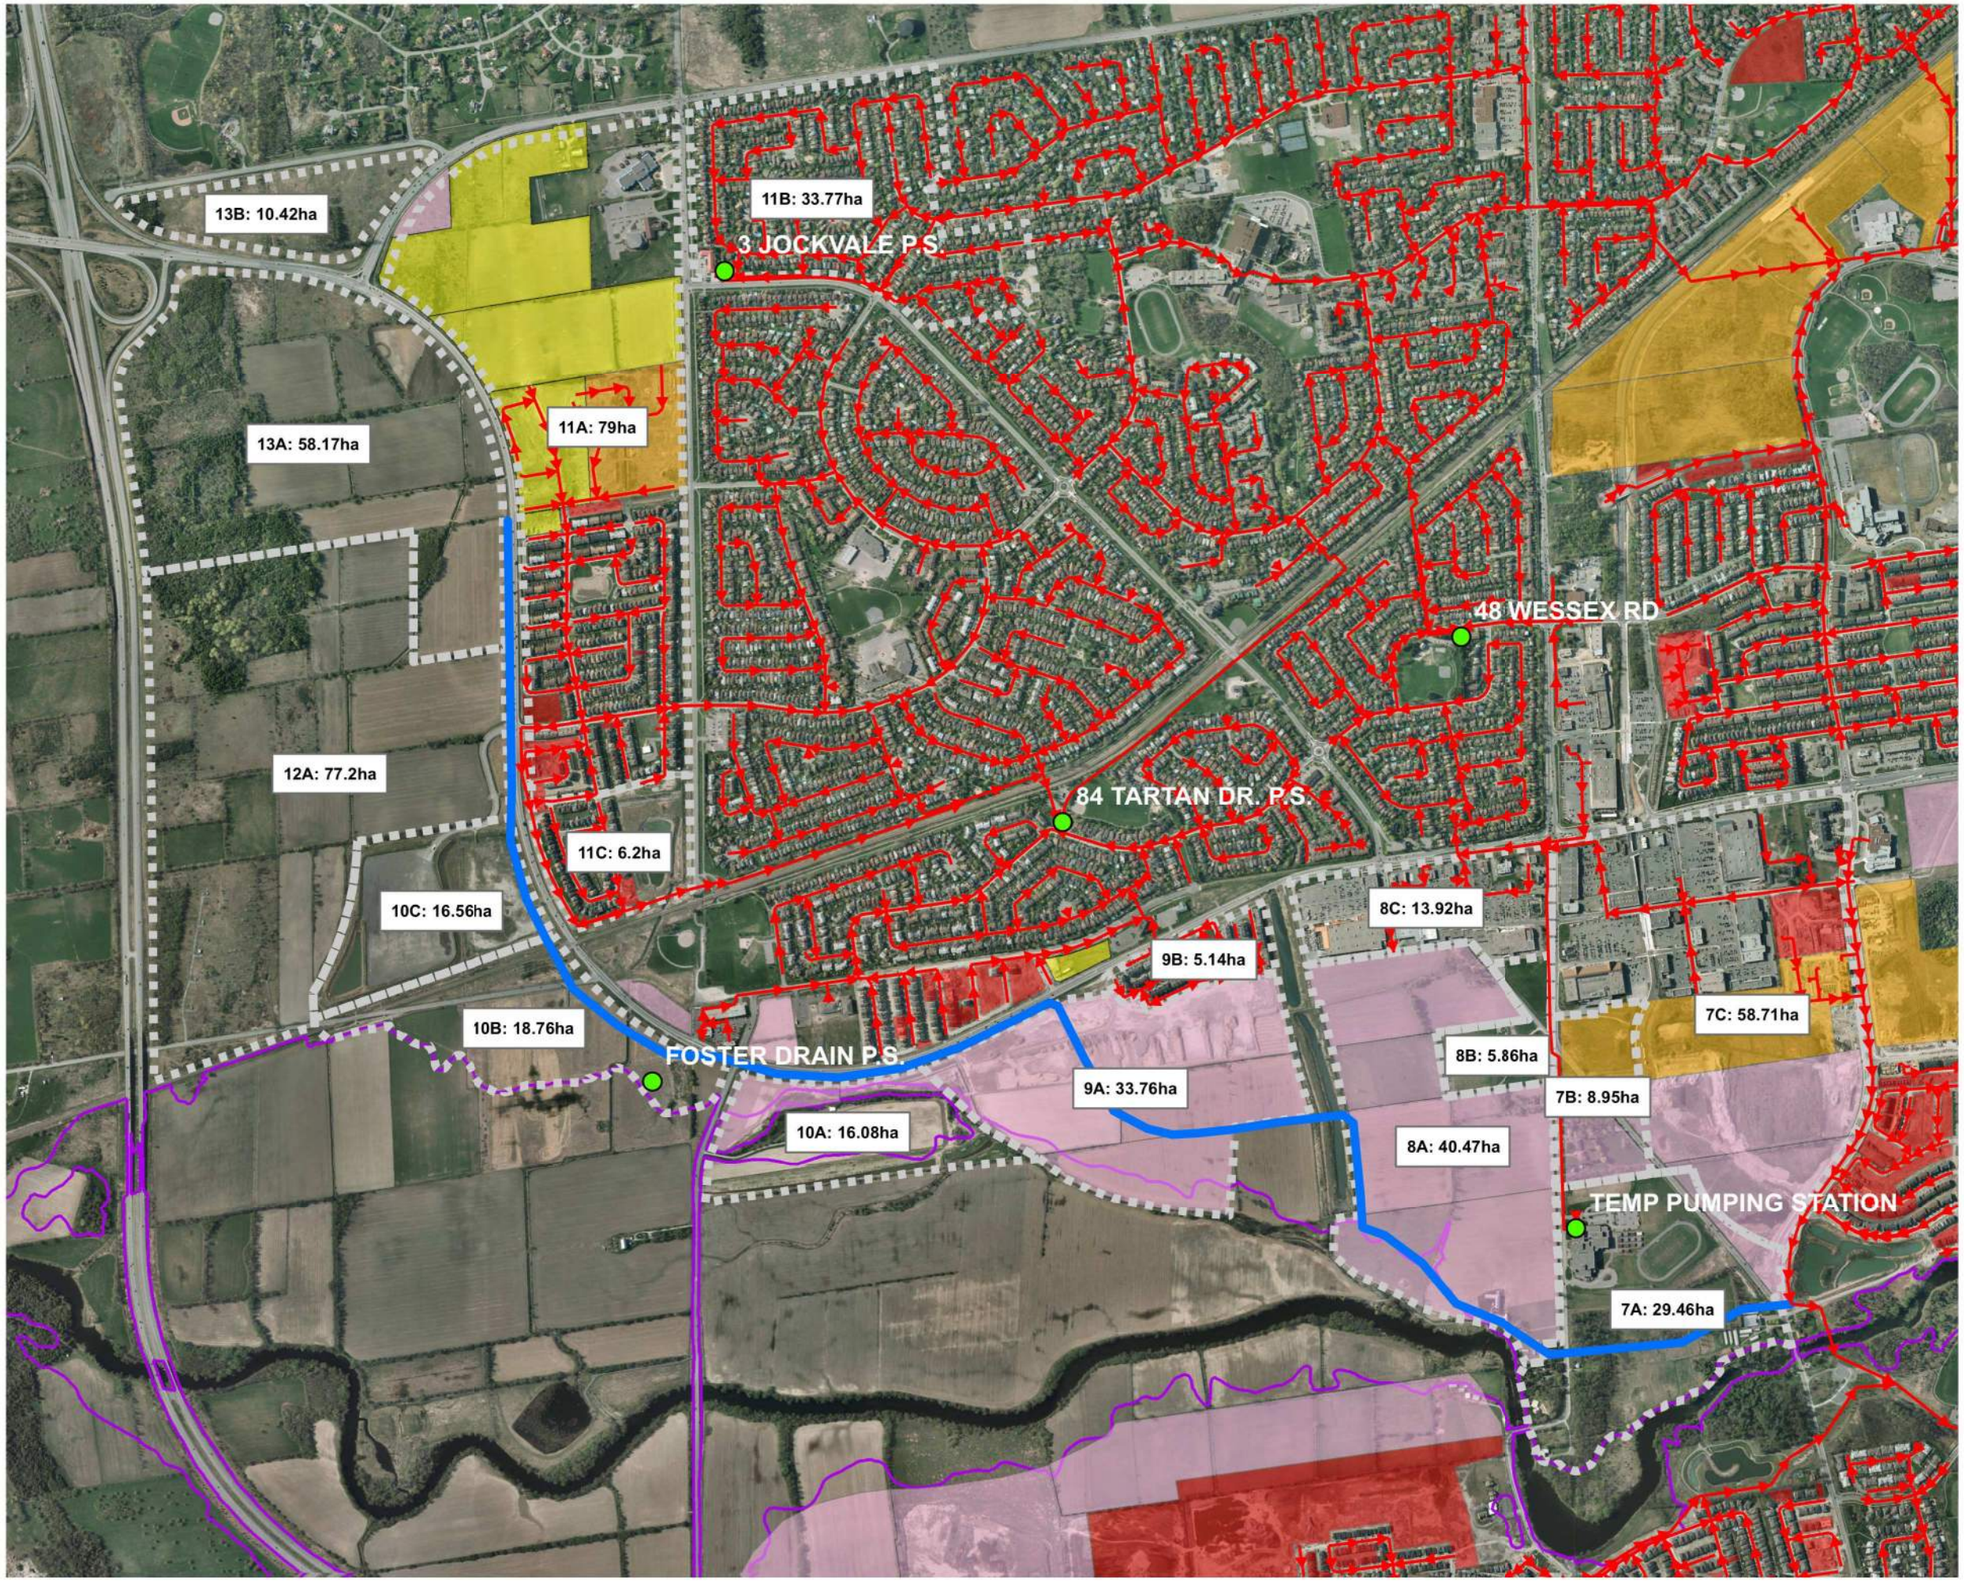
Design Parameters:

Residential Land Use	Population Density (Units / ha)	Persons per Unit	Persons per ha
Low Density (singles / semis)	26 – 28 (28 used)	2.7 – 3.4 (3.4 used)	95.2
Medium Density (row / townhouse)	50 – 60 (60 used)	2.7	162.0
High Density (apartments)	60 – 75 (75 used)	1.8	135.0

Notes:

1. Harmon Equation = $1 + [14 / (4+(P/1000)^{1/2})] \times K$



Where: P = population; K = correction factor = 1.0

2. Instituional / Commercial Peaking Factor = 1.5

Reported Design Flows / Assumptions:

1. Area A4: Existing single family units currently serviced by Jockvale pump station to be redirected to SNC

2. Area A8-D: proposed 600 medium density residential units

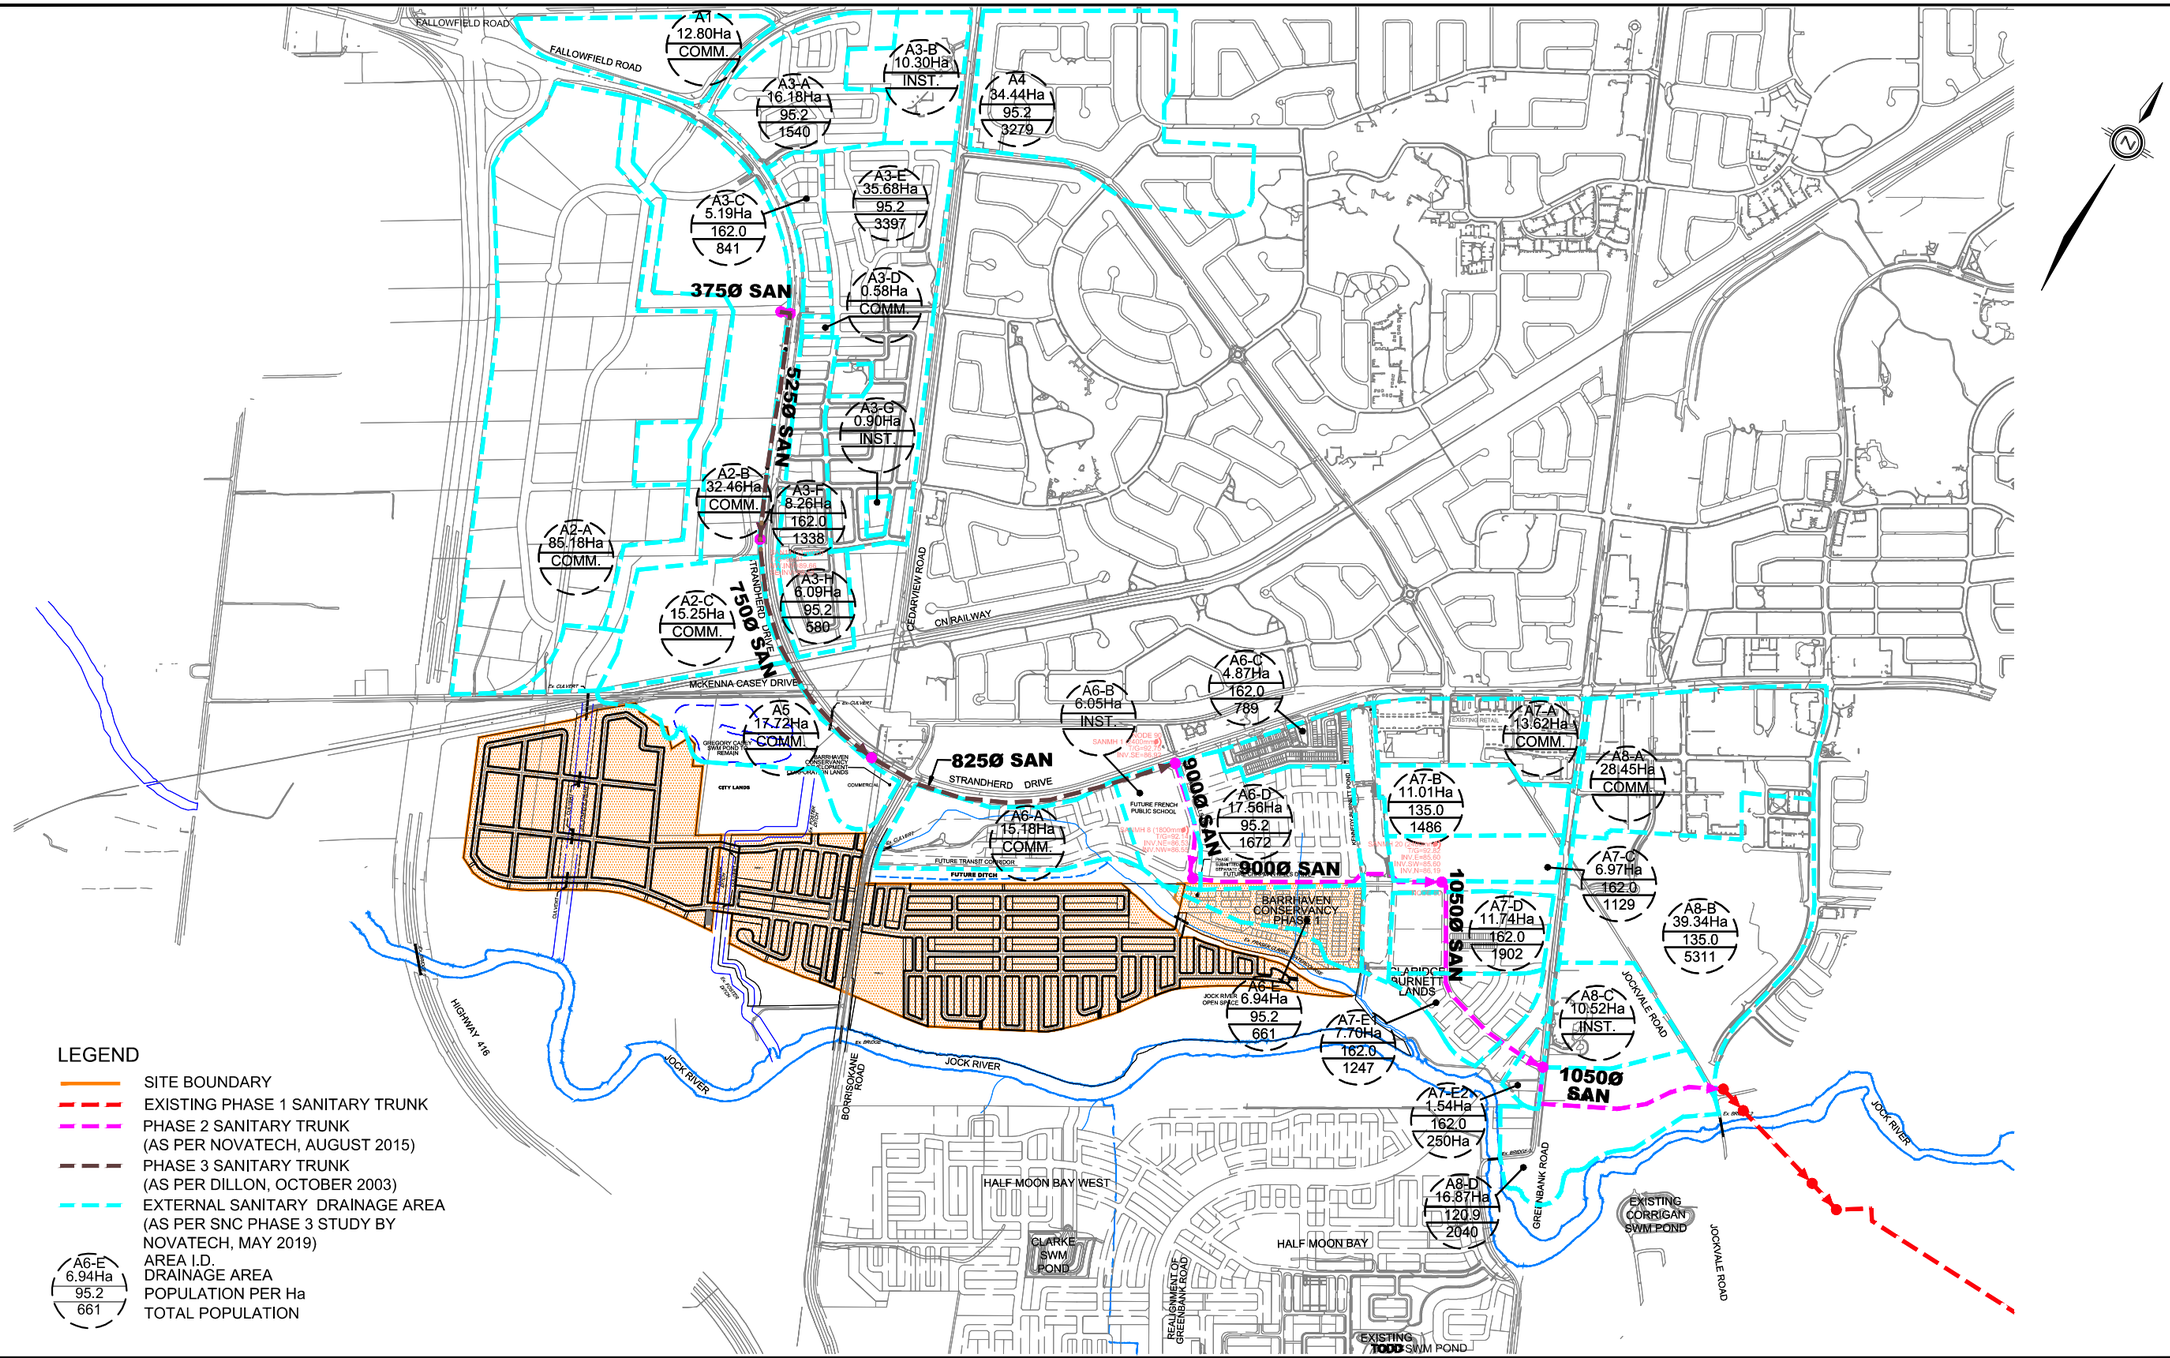
NOTES:

(1) Refer to Novatech Drawing No. 19 - South Nepean Collector (SNC) Sewer Phase 2 - Strandherd Rive to Jockvale Road (ISD14-2033) in Appendix C

(2) Derived from Tributary areas "A6-C" and "A6-D" from Novatech's "Sanitary Drainage Areas and Land Use - Fig. 1" plan dated August 2015 (See Appendix C of DSEL report) = 4.87ha and 17.56ha and derived from Barrhaven Conservancy Phase 1 design sheet (see Appendix C of DSEL report) = 1.13ha + 7.96ha

(3) Based on population densities of 104 people/ha for WEST and 83 people/ha for EAST. See Conservancy East sanitary design sheet



DESIGN PARAMETERS

Park Flow =	9300	L/ha/da	Industrial Peak Factor = as per MOE Graph		
Average Daily Flow =	280	l/p/day	Extraneous Flow =	0.330	L/s/ha
Comm/Inst Flow =	28000	L/ha/da	Minimum Velocity =	0.600	m/s
Industrial Flow =	35000	L/ha/da	Manning's n =	0.000	
Max Res. Peak Factor =	4.00		Townhouse coeff=	2.7	
Commercial/Inst./Park Peak Factor =	1.50		Single house coeff=	3.4	
Institutional	0.32	l/s/Ha			

Designed: KLM	PROJECT: **Barrhaven Conservancy - Evaluation of SNC Flows**		
Checked: KLM	LOCATION: **City of Ottawa**		
Dwg. Reference:	File Ref: 16-891	Date: February 2021	Sheet No. 1 of 1

TOTAL FLOW INCLUDING CONSERVANCY LANDS IS 399.65 L/S WHICH IS LESS THAN THE PRIOR 423.6 L/S DETERMINED IN THE 2015 NOVATECH ASSESSMENT OF FLOWS AT THE SAME LOCATION IN THE SOUTH NEPEAN COLLECTOR DESIGN.

Based on Novatech's SNC as-builts, the minimum asbuilt slope is 0.05% downstream of SANMH8. Slopes range from 0.07 to 0.15.

1 Introduction

This report provides support in addressing meander belt width requirements for the Jock River and its tributaries and erosion threshold analyses for the Fraser Clark, Foster Ditch, and O'Keefe municipal drains. The property of the assessed reaches is located between Highway 416 to the west, Greenbank Road to the east, Strandherd Drive to the north, and Jock River to the South.

To delineate the hazard land associated with Jock River and the three (3) municipal drains and to determine the erosion thresholds analysis in support of the proposed stormwater management, the following activities were completed:

- Background review of existing documents related to the study area, including topography, physiography, and geology mapping;
- Review of the meander belt widths associated with the subwatershed study and subsequent analysis on the adjacent tributaries;
- Updated and confirm reach delineation for all three drains;
- Review of historical and recent aerial photographs;
- Completion of rapid geomorphic assessments of the three drains to document channel condition;
- Delineation of the hazard area adjacent to the Jock River and 3 drains based on the results of the updated belt width assessment where warranted;
- Complete a detailed geomorphic assessment of each municipal drain to determine a critical discharge or confirm existing erosion thresholds; and
- Modelling of erosion indices based on post- to pre-development synthetic storage or continuous modelling.

2 Background Review

A review of the meander belt widths and erosion threshold analyses from previous studies were completed for the Jock River and the three adjacent municipal drains. The following studies were reviewed:

- CH2M Hill Canada Limited. 2013. O'Keefe Drain Environmental and Stormwater Management Plan. Prepared for the City of Ottawa;
- CH2M Hill Canada Limited. 2013. Foster Stormwater Management Facility Environmental Study Report. Prepared for the City of Ottawa;
- Parish Aquatic Services, A Division of Matrix Solutions. 2016. Clarke Drain Erosion Threshold Assessment. Prepared for Minto Communities Inc.; and
- Stantec Consulting Ltd. 2007. Jock River Reach One Subwatershed Study Final Report: Volume 1 of 2. Prepared for the City of Ottawa.

3 Historical Assessment

Historical aerial photographs were reviewed to determine changes to the channel and surrounding land use/cover. This information, in part, provides an understanding of the historical factors that have contributed to current channel morphodynamics. The 1976 and 1991 aerials were provided by the City of Ottawa and the 2016 was provided by Google Earth Pro. A summary of the historical changes to the three drains are provided in **Table 1**. Historical aerial photographs are provided in **Appendix A**.

Table 1. Historical assessment

Watercourse	1976	1991	2014
Fraser Clark Drain	Agricultural fields surround associated reaches with little to no riparian buffer. Land use within the study site remains consistent to 2014. Reaches FCD2 and FCD3 consist of wetland features. Reach FCD3-3 was not present on the aerial photograph. Reaches FCD3-1, FCD3-2, and FCD5 consist of swale features.	Residential development extends to McKenna Drive and Borrisokane Road. A localized residential property present adjacent to Reach FCD4. Tree growth within the narrow riparian areas. Reach FCD5 was ditched and straightened. No changes to the form of the remainder of the reaches since 1976. Two elongated storm water ponds are constructed, extending east from McKenna Drive parallel to Reach FD1-1.	Residential development extends to Strandherd Drive. Residential and commercial properties present along Strandherd Drive. Riparian buffers increase in width and an increase in tree cover. No changes to the form of the reaches since 1991. A storm water pond was constructed between Strandherd Drive and Reach FCD4. Reach FCD4-1 was built to convey flows from the pond to FCD4.
Foster Ditch	Agricultural fields surround associated reaches with no riparian buffer. Land use within the study site remains consistent to 2014. Reaches FD1, FD2, FD3 are narrow features. Reach FD3 was ditched, Reaches FD1 and FD2 were unmodified.	Residential properties extend to the east side of Borrisokane Road. Riparian buffers are narrow and fragmented. Reaches FD1, FD2, FD3, and upstream of Reach FD3 have been noticeably widened. A stormwater pond and Reach FCD1-1 was constructed adjacent to Reach FD1. A flow structure was present at the pond inlet and an access road crosses Reach FD1.	Riparian buffers widen slightly and some tree establishment was noted. Residential areas extend west to Strandherd Drive and north towards Fallowfield Road. Stormwater pond along reach FD1 was reshaped, given a new outlet flowing into Jock River. The flow structure and access road are removed Upstream of the study site stormwater ponds were constructed. Reaches FD4 and FD5 were created as inlet and outlet reaches to the ponds. Further upstream, reaches FD6 to FD14 were re-aligned for development purposes.

Watercourse	1976	1991	2014
O'Keefe Drain	Agricultural fields surround associated reaches. Land use within the study site remains consistent to 2014. A narrow, established riparian buffer zone was only present along Reach OKD1. All other reaches possess little to no riparian area. All reaches were previously straightened and ditched	No notable changes to land use, riparian coverage, and channel formation since 1976.	Riparian tree growth noted upstream of the study site. No changes to riparian coverage and channel formation to reaches OKD1 and OKD2. Commercial development extends east of Strandherd Drive. Reaches OKD3 to OKD8 were re-aligned. Stormwater ponds were constructed along reaches OKD3, and OKD5.
Jock River	Agricultural fields surround associated reaches. Narrow riparian zones along both banks of all reaches. Reach JR-4 more sinuous than reach JR-3. No other morphology apparent in aerial.	No notable changes to land use, riparian coverage, and channel formation since 1976.	No notable changes to riparian coverage and channel formation since 1991. Residential development just south of reach JR-3. Highway 416 was built intersection reach JR-4.

4 Existing Conditions

4.1 Watershed Characteristics

Channel morphology and planform are largely governed by the flow regime and the availability and type of sediments (i.e., surficial geology) within the stream corridor. Physiography, riparian vegetation and land use also physically influence the channel. These factors provide insight into existing conditions and perception to the future potential changes as they relate to a proposed activity.

Physiographically, the project site is located within an area dominated by glaciofluvial deposits comprised of alluvial deposits and topset facies. Within the project site, surficial deposits also include modern alluvium ranging from clay to gravel with organic deposits as well as glaciolacustrine sediments composed of massive to laminated silt and clay with minor sand and gravel (OGS, 2010).

4.2 Confirmation of Reach Delineation

Reaches are homogeneous segments of channel used in geomorphological investigations. They are studied semi-independently as each is expected to function in a manner that is at least slightly different from adjoining reaches. This allows for a meaningful characterization of a watercourse as the aggregate of reaches, or an understanding of a particular reach, for example, as it relates to a proposed activity.

Reaches are delineated based on changes in the following:

- Channel planform;
- Channel gradient;
- Physiography;
- Land cover (land use or vegetation);
- Flow, due to tributary inputs;
- Soil type and surficial geology; and
- Certain types of anthropogenic channel modifications.

This follows scientifically defensible methodology proposed by Montgomery and Buffington (1997), Richards et al. (1997), Brierley and Fryirs (2005), and the Toronto and Region Conservation Authority (2004).

Thirteen reaches were delineated within the study area in a desktop exercise using available data and background reports. These reaches were then field verified. Seven reaches of Fraser Clark Drain (FCD), two reaches of O'Keefe Drain (OKD), and four reaches of Foster Ditch (FD) were defined in the subject lands. The reaches for the Jock River remain the same from the Subwatershed Study (Stantec, 2007). A reach map is provided in **Appendix B**. Reach mapping extends north of the study site.

4.3 Channel Characteristics

Reach observations and channel measurements were collected in June 2017. These field investigations were used to gain insight into the conditions and general characteristics of each reach in the subject property. A photographic record is included in **Appendix C** and documents the conditions from all observed reaches. Field notes and observations are provided in **Appendix D**.

Rapid geomorphological assessments were completed and included the following reach-by-reach observations:

- Characterization of stream form, process, and evolution using the Rapid Geomorphological Assessment (RGA) (MOE, 2003, VANR, 2007);
- Assessment of the ecological function of the watercourse using the Rapid Stream Assessment Technique (RSAT) (Galli, 1996);
- Stream classification following a modified Downs (1995) and a modified Brierley and Fryirs (2005) River Styles Classification approach;
- Reach-scale habitat sketch maps based on Newson and Newson (2000) outlining channel substrate, flow behaviour, geomorphological units, and riparian vegetation on the day;
- Instream estimates of bankfull channel dimensions; and
- Bed and bank material composition and structure.

4.4 Rapid Geomorphological Assessments

Channel stability and susceptibility to erosion were objectively assessed through the application of the Ontario Ministry of the Environment's (2003) Rapid Geomorphic Assessment (RGA). The RGA evaluates degradation, aggradation, widening, and planimetric form adjustment at the reach scale. The end result of the RGA is to produce a score, or stability index, which evaluates the degree to which a stream has departed from its equilibrium condition. A stream with a score of less than 0.20 is in regime, indicating minimal changes to its shape or processes over time. A score of 0.21 to 0.40 indicates that a stream is in transition or stress and is experiencing major change to process and form outside the natural range of variability. A score of greater than 0.41

indicates that a stream is in extreme adjustment, exhibiting a new stream type, or in the process of adjusting to a new equilibrium (MOE, 2003; VANR, 2007).

The Rapid Stream Assessment Technique (RSAT) was also employed to provide a broader view of the system and consider the ecological functioning of the watercourses (Galli, 1996). Observations were made of channel stability, channel scouring or sediment deposition, instream and riparian habitats, and water quality. The RSAT score ranks the channel as maintaining a poor (<13), fair (13-24), good (25-34), or excellent (35-42) degree of stream health.

Reaches were also classified according to a modified Downs (1995) Channel Evolution Model and the River Styles Framework (Brierley and Fryirs, 2005). The Down's Model describes successional stages of a channel as a result of a perturbation, namely hydromodification. Understanding the current stage of the system is beneficial as this allows one to predict how the channel will continue to evolve, or respond to an alteration to the system. The River Styles Framework (Brierley and Fryirs, 2005) provides a geomorphological approach to examining river character, behaviour, condition, and recovery potential.

Field observations are provided in **Table 2** and **Table 3** below.

4.4.1 Fraser Clark Drain

Reach FCD2 exists as an unconfined wetland between agricultural fields. The reach flows south east with low gradient and entrenchment to the Jock River. Riparian vegetation was comprised of trees and grasses. In the upstream portion of the reach, riparian cover was continuous and tree dominated. The downstream was grass dominated and entirely encroached with reeds. Average feature width and depth were 9.3, and 0.4 m, respectively. Bed and bank material were soft and comprised of clay, silt, and sand. There was no development of geomorphic units. Approximately 0.30 to 0.40 m deep of loose bed material and organics were present on the bed at the time of assessment.

Reach FCD3 exists as an unconfined wetland. Riparian vegetation was fragmented containing scattered trees and dominated by grasses. Approximately 75% of upstream is heavily encroached with reeds, containing no notable flow. Bed and bank materials consisted of clay, silt, and sand. Average feature width and depth were 12.3 m, and 0.2 m, respectively. There was no riffle-pool development throughout the reach.

Reach FCD3-1 is an unconfined swale feature surrounded by active agricultural fields. The riparian zone was fragmented and consisted of grasses with scattered trees and shrubs. The swale was heavily encroached with grasses and reeds. The reach had no defined channel banks and no riffle-pool features. Bed material consisted of clay, silt, and sand.

Reach FCD3-2 starts approximately 25 m east of Borrisokane Road and flows intermittently over a low gradient. There was no surface water present at the time of assessment. The riparian area was grass dominated, with reeds fully encroaching the bed. The reach had no defined channel banks and no riffle-pool features. Bed material consisted of clay, silt, and sand.

Reach FCD3-3 was not present at the time of assessment.

Reach FCD5 exists as an unconfined swale feature with a low gradient. The reach begins on the western side of Borrisokane Road, and concludes at a culvert at Borrisokane Road. No surface water was present at the time of assessment. The bank angles were low with no evidence of erosion. Riparian vegetation consisted of mainly grasses with scattered trees. Bed and bank material consisted of clay, silt, sand. The reach was absent of geomorphic development.

4.4.2 Foster Ditch

Reach FD1 consists as a sinuous, unconfined channel that perennially flows into Jock River. The reach flows over a low gradient surrounded by agricultural fields. Riparian coverage was dominated by grass, with trees present at the upstream and downstream breaks. The banks were highly entrenched and undercutting was present in the downstream portion of the reach. Bank angles were high and extent of bank erosion included 30-60% of the reach. Bankfull width and depth were 4.7 m and 0.7 m, respectively. No riffle-pool features were present. Grasses encroached minimally into the channel and a low density of woody debris was present. The bed and banks of the channel were both comprised of clay and silt, with sand and scattered rip rap present in the heavily modified areas. Bed materials were soft and were 0.05 to 0.20 m deep.

Reach FD2 consisted of a low gradient, perennial channel surrounded by agricultural fields. The reach exhibits a sinuous planform and was slightly entrenched. The riparian area was narrow and consisted of trees, shrubs, and grasses. Reeds were extensively encroaching the channel at the downstream reach break. A moderate density of woody debris was present. High bank angles at 60-90 degrees and undercutting up to 0.10 m was present. Average bankfull width and depth were 7.6 m and 0.6 m, respectively. No riffle-pool features were present. The bed and banks were composed of clay and silt.

Reach FD3 is straight, ditched, and unconfined channel with a low gradient. The reach was surrounded by a narrow riparian buffer dominated by grasses with scattered trees. Reeds were moderately encroaching the channel. The banks had high angles of 60-90 degrees and were highly entrenched. A large woody debris jam at the downstream portion of the reach was causing substantial backwatering. Undercutting was present upstream and downstream of a large woody debris jam. Average bankfull width and depth were 6.9 m and 0.5 m, respectively. The reach was absent of riffle-pool features. Bed and bank material consisted of clay, silt, and sand. Approximately 0.3 to 0.4 m deep of fines were present on the bed upstream of the woody debris jam.

4.4.3 O'Keefe Drain

Reach OKD1 is a previously straightened and ditched channel flowing between agricultural fields. The reach had a low gradient and was unconfined. Riparian vegetation was continuous and dominated by trees and grasses. The channel was highly entrenched, with high bank angles between 60-90 degrees. Fluvial entrainment and exposed tree roots were commonly observed, with an extent of 60-100% of the reach exhibiting erosion. Encroachment was minimal. Woody debris was high in density with two woody debris jams per 50 m. Average bankfull width and depth were 4.6 and 0.7 m, respectively. The reach had no riffle-pool features. Substrate of the bed and bank ranged between clay, silt, sand, and organics. At the time of assessment, approximately 0.2 – 0.3 m of loose bed material was present on the bed.

Reach OKD2 was previously straightened and ditched. Riparian vegetation was narrow and consisted of grasses. Reed encroachment was moderate. The banks were highly entrenched with high angles of 60-90 degrees. Erosion was present in 30-60% of the reach. Two erosion scars were observed along the right bank. Average bankfull width and depth were 4.4 m and 0.7 m, respectively. Riffle-pool features were not observed. Bed and bank material included clay and silt. A low density of woody debris was present in the channel.

General reach characteristics are summarized below in **Table 2**, and results from the rapid assessments are summarized in **Table 3**.

Table 2. General reach characteristics

Reach	Average Bankfull Width (m)	Average Bankfull Depth (m)	Substrate		Valley Type	Riparian Vegetation	Notes
			Riffle	Pool			
FCD2	N/A: wetland feature		No riffle-pool development: clay, silt, organics		Unconfined	Trees and grasses, fragmented	Wetland feature. Heavy reed encroachment. Soft bed materials.
FCD3	N/A: wetland feature		No riffle-pool development: clay, silt, organics		Unconfined	Trees and grasses, fragmented	Wetland feature. Heavy reed encroachment. No flow.
FCD3-1	N/A: swale feature		No riffle-pool development: clay, silt, organics		Unconfined	Trees and grasses, fragmented	Swale feature. Channel dry at time of assessment. Heavy reed encroachment.
FCD3-2	N/A: swale feature		No riffle-pool development: clay, silt, organics		Unconfined	Trees and grasses, fragmented	Swale feature. Channel dry at time of assessment. Heavy reed encroachment.
FCD3-3	N/A: no feature at the time of assessment						
FCD5	N/A: swale feature		No riffle pool development: clay, silt, sand		Unconfined	Trees and grasses, fragmented	Swale feature. Channel dry at time of assessment. Heavy reed encroachment.
FD1	4.3	0.4	No riffle pool development: clay, silt		Unconfined	Trees and grasses, fragmented	Sinuous and entrenched. Undercutting. Soft bed materials.
FD2	7.6*	0.4	No riffle pool development: clay, silt		Unconfined	Trees shrubs and grasses, continuous	Sinuous and slightly entrenched. Undercutting. Heavy reed encroachment.
FD3	6.9*	0.4	No riffle pool development: clay, silt, sand		Unconfined	Trees and grasses, fragmented	Straightened and ditch feature. Backwatering due to a large woody debris jam.
OKD1	4.6	1.0	No riffle pool development: clay, silt, sand, organics		Unconfined	Trees shrubs and grasses, fragmented	Straightened and ditch feature. Highly entrenched. Soft bed materials.
OKD2	4.4	0.7	No riffle pool development: clay, silt		Unconfined	Trees and grasses, fragmented	Straightened and ditch feature. Highly entrenched. Erosion scars observed.

4.4.4 Jock River

Reach JR-2 is just downstream and east of the study site. Site reconnaissance was completed at the Borrisokane Road crossing at the reach break between JR-3 and JR-4. Photographs are provided in **Appendix C**. Both reaches are unconfined with narrow riparian buffer zones. Bank erosion was not observed in the vicinity of the crossing. This was consistent with Stantec's observations.

4.5 Detailed Geomorphological Assessments

A detailed geomorphological assessment was completed for each drain: OKD1, FD1, and FCD2 in June 2017. As these reaches are downstream of the proposed SWM facility, Wet Ponds, and Oil and Grit Separator. The extent of the detailed assessments areas are provided in **Appendix F**. As such, defining an erosion threshold is necessary to mitigate negative post-development impacts.

The detailed assessment includes the following:

- Longitudinal profile of the channel;
- Eight detailed cross-sectional surveys of the watercourse;
- Detailed instream measurements at each cross-section location including bankfull channel geometry, riparian conditions, bank material, bank height/angle, and bank root density;
- Bed material sampling at each cross-section following a modified Wolman's (1954) Pebble Count Technique or substrate sample; and
- Velocity, discharge and observations of active/inactive sediment transport at select representative cross-sections.

Bankfull characteristics, based on the results of the detailed assessments for each drain are presented in **Table 5** in **Section 6.1**. A summary of the detailed assessment results for Reach OKD1, FCD1, and FCD2 are provided in **Appendix G**.

5 Meander Belt Width Assessment

Most watercourses in southern Ontario have a natural tendency to develop and maintain a meandering planform, provided there are no spatial constraints. A meander belt width assessment estimates the lateral extent that a meandering channel has historically occupied and will likely occupy in the future. This assessment is therefore useful for determining the potential limit of development for proposed activities in the vicinity of a stream.

When defining the meander belt width for a creek system, the Ministry of Natural Resources and Forestry (MNRF) treats unconfined and confined systems differently. Unconfined systems are those with poorly defined valleys or slopes well-outside where the channel could realistically migrate. Confined systems are those where the watercourse in contained within a defined valley, where valley wall contact is possible.

In unconfined systems, the meander belt width can be graphically defined using orthorectified aerial imagery by determining the channel centreline and the channel's central tendency (i.e. meander belt axis). In cases where the channel has been previously modified or the location cannot be determined in the imagery – due to tree cover or poor photograph resolution, for example – a modelling approach is employed. More specifically, empirical models by Williams (1986). These models are scientifically-defensible and have been verified in past projects as suitable for use in southern Ontario. This modelling approach also serves as a preliminary, or planning level, meander belt width assessment.

All watercourses within the study site are within unconfined valley systems. Since the drainage features have been heavily modified, the meander belt width cannot be determined using orthorectified aerial imagery. Therefore, the modelling approach was used for all the drainage feature within the study site.

Meander belt widths were calculated using empirical models, as these reaches showed signs of previous modification. The results are outlined in **Table 4** and a map is provided in **Appendix H**.

Meander belt widths were proposed using a modified Williams (1986) model, based on field measurements of channel geometries. The modified model also accounts for the average bankfull width of a given reach and an additional 20% factor of safety. These empirical relations are outlined below:

$$B_w = 4.3{W_b}^{1.12} + W_b \quad \text{[Eq. 1]}$$

where B_w is meander belt width (m) and W_b is bankfull channel width (m).

Table 4. Meander belt width estimates

Reach	#CH2MHILL (2013)	##Stantec (2007)	GEO Morphix Ltd.	
			*Williams – Width (1986) (m)	Proposed Meander Belt Width (m)
FCD2	No previous meander belt widths given for the Fraser Clark Drain		N/A: wetland feature; no erosion hazard	
FCD3			N/A: wetland feature; no erosion hazard

OKD2	45.6		32	32

*includes a 20% factor of safety

#O'Keefe and Foster Drain Report

##No reach specified, average given

^Using the bankfull width from reach FD1

The Fraser Clark Drain, reaches FCD2 and FCD3, consisted of a wetland feature with no channel centreline. Therefore, there is no erosion hazard associated with these features. The same applies to the swale features for reaches FCD3-1, FCD3-2, and FCD5.

Since the Foster Ditch was previously ditched, the bankfull dimensions are comprised. The detailed assessment completed at reach FD1 has more accurate bankfull dimension measurements. Therefore, the meander belt with calculation for reach FD1 are used for reaches FD2 and FD3.

The Jock River meander belt widths within the Subwatershed Study (Stantec, 2007) were reviewed to assess suitability. The meander belt widths provided by the Subwatershed Study for reaches JR-3 and JR-4 are 218 and 231 m, respectively (Stantec, 2007). These meander belt widths include a 10% buffer. We are generally in agreement with the scale of the meander belt widths. The central tendency of the watercourse generally follows the overall trend of the channel passing through riffles or runs. Although there may be an opportunity for minor adjustments to the central

tendencies for reaches JR-3 and JR-4. This does not fundamentally adjust the meander belt width from the location illustrated in the subwatershed study.

We have a minor refinement for the downstream reach, JR-2. The geologic feature at Half Moon bay is not technically a meander. Half Moon bay was formed by reworking the underlying glaciomarine deposits (OGS, 2010). Therefore, the meander belt width for reach JR-2 is 130 m plus a 10% buffer plus a 7 m setback. The proposed meander belt width for reach JR-2 is 150 m. This is smaller than that proposed in the subwatershed study.

6 Erosion Analysis

6.1 Erosion threshold Analysis

Erosion threshold analyses were completed for reaches OKD1, FD1, and FCD2 to determine the flow conditions under which channel bed and bank materials can potentially be entrained and transported. Erosion thresholds are established to provide targets for the proposed SWM facility, Wet Ponds, and Oil and Grit Separator discharges to ensure that post-development erosion rates into the receiving watercourses do not exceed natural pre-development rates.

The erosion threshold analysis provides a depth, velocity, or discharge at which sediments of a particular size may potentially be entrained. The results of the detailed geomorphic assessments were used to inform the erosion threshold analysis. Detailed geomorphic assessment locations were completed downstream of the proposed SWM facility, Wet Ponds, and Oil and Grit Separators. We note that even under the most typical conditions, due to natural variability of channel morphology and sediment characteristics within the reach, the computed flow characteristics would only provide first approximations of erosion thresholds.

Erosion thresholds are determined using different methods that are dependent on channel and sediment characteristics. For example, erosion thresholds for non-cohesive sediments may be estimated using either a shear stress or a velocity approach. An erosion threshold, in the form of a critical discharge, is then calculated based on the bed and bank materials and local channel geometry. Theoretically, above this discharge, entrainment and transport of sediment can occur.

Threshold targets are determined using different methods that are dependent on channel and sediment characteristics. An erosion threshold was quantified based on the bed and bank materials and local channel geometry in the form of a critical discharge. Theoretically, above this discharge, entrainment and transport of sediment can occur. The velocity, U (m/s) is iteratively calculated at various depths, until the average velocity in the cross section slightly exceeds the critical velocity of the bed material. The velocity is determined using a Manning's approach, where the Manning's n value is visually estimated, a method proposed by Cowan (1956). This is mathematically represented as

$$U = \frac{1}{n} d^{2/3} S^{1/2} \qquad \text{[Eq. 2]}$$

where, d is depth of water (m), S is channel slope, and n is the Manning's roughness. The discharge is then calculated using the area of a typical cross section at that depth. Results of the erosion threshold analysis are provided below in **Table 5**.

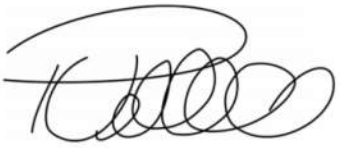
Table 5. Erosion thresholds for each drain

Channel parameter	O'Keefe Drain Reach OKD1	Foster Ditch Reach FD1	Fraser Clark Drain Reach FCD2
Measured			
Average bankfull channel width (m)	4.59	4.69	9.33
Average bankfull channel depth (m)	0.98	0.70	0.39
Bankfull channel gradient (%)	0.05	0.17	0.0001
D_{50} (m)	0.000002	0.000002	0.000002
Average bankfull velocity (m/s)	0.51	0.52	0.05
Bankfull discharge (m^3/s)	1.69	1.21	0.10
Bankfull shear stress (N/m^2)	3.53	8.33	1.46
Calculated for Bed Materials			
Critical velocity (m/s)	0.53*	0.53*	0.15
Critical discharge (m^3/s)	0.80	0.68	0.33
Apparent shear stress (N/m^2)	3.80	11.60	2.5
Conditions at Time of Assessment			
Water depth (m)	0.14	0.21	0.23
Average velocity (m/s)	0.26	0.20	0.05
Average discharge (m^3/s)	0.08	0.13	0.04
Sediment Transport Observations	No transport	No transport	No transport
Critical Discharges from Previous Reports			
Critical discharge (m^3/s)	1.86# (Stantec, 2007) 0.08## (CH2MHILL, 2013)	0.79# (Stantec, 2007) 0.82 (CH2MHILL, 2013)	1.70 (PARISH, 2013)

* Based on Fischenich (2001) for sandy loam
# Not given for a specific reach
calculated for reach OKD2

Since both bed and bank material are similar in all three reaches and bank erosion thresholds are a proportion of thresholds for bed material, erosion thresholds for bank materials would be higher. Therefore, using the thresholds for bed materials would keep the bank erosion thresholds values conservative.

The critical discharge of the bed and bank materials for the O'Keefe Drain at reach OKD1 is 0.80 m^3/s. The critical discharge of the bed and bank materials for the Foster Ditch at reach FD1 is 0.68 m^3/s. The critical discharge of the bed and bank materials for the Fraser Clark Drain at reach FCD2 is 0.33 m^3/s.



7 Summary and Conclusions

The purpose of this report was to provide support in addressing meander belt width requirements and erosion threshold analyses for the Frazer Clark drain, the Foster Ditch, and the O'Keefe Drain. To delineate the limit of development, the meander belt width was calculated for the 2 reaches of the O'Keefe Drain and the 3 reaches of the Foster Ditch. The Frazer Clark Drain does not have a centre line of channel as the drain consisted of a wetland feature and therefore does not require and meander belt width. The meander belt widths for the O'Keefe Drain are 34 m for reach OKD1 and 32 m for reach OKD2. The meander belt widths for the reaches within the Foster Ditch are 32 m. The meander belt widths for the Jock River reaches JR-2, JR-3, and JR-4 are 150 m, 218 m, and 231 m, respectively.

The erosion threshold analyses provide targets for the proposed SWM facility, Wet Ponds, and Oil and Grit Separator discharge to ensure that post-development erosion rates into the receiving drains do not exceed the natural pre-development rates. The critical discharge of the bed and bank materials for reach OKD1, FD1, and FCD2 are 0.80 m^3/s, 0.68 m^3/s, and 0.33 m^3/s respectively.

We trust this report meets your requirements. Should you have any questions please contact the undersigned.

Respectfully submitted,

Appendix C Photographic Record

Photo 1 Reach FCD2	
	Photograph taken facing west. Bed material was 30 to 40cm deep consisted of fines and organics.
Photo 2 Reach FCD2	
	Photograph taken facing east. Wetland feature fully encroached with reeds.

Photo 3 Reach FCD3	
	Photograph taken facing east. Heavily encroaching reeds in the wetland feature was observed.
Photo 4 Reach FCD3	
	Photograph taken facing east. Fragmented riparian buffer was dominated by grass.

Photo 5 Reach FCD3-1	
	Photograph taken facing east. Riparian buffer composed of trees, grasses and shrubs.
Photo 6 Reach FCD3-1	
	Photograph taken in the middle of the feature, facing east. Swale was primarily composed of reeds and was dry at the time of assessment.

Photo 7 Reach FCD3-2	
	Photograph taken facing south east. Center of swale was encroached with reeds, with a primarily grass buffer.
Photo 8 Reach FCD3-2	
	Photograph taken facing south east. No water was present in the feature at the time of assessment.

Photo 9 Reach FD3-3	
	Photograph taken facing south east. Feature not present at time of assessment.

Photo 10 Reach FCD5	
	Photograph taken facing downstream towards left bank. Channel dry at time of assessment.
Photo 11 Reach FCD5	
	Photograph taken facing upstream. Heavy encroachment of tall reeds was observed.

Photo 12 Reach FD1	
	Photograph taken facing downstream towards left bank. Channel was entrenched. Rip rap was observed along the banks in some areas.
Photo 13 Reach FD1	
	Photograph taken facing downstream towards right bank. Minor undercutting observed on right bank.

Photo 14 Storm -water Pond at FD1	
	Photograph taken facing south from Reach FD1.
Photo 15 Reach FD1-1	
	Photograph taken facing west from overflow channel FD1-1.

Photo 16 Reach FD2	
	Photograph taken facing upstream. The channel was slightly entrenched and large woody debris was observed.
Photo 17 Reach FD2	
	Photograph taken facing upstream from Reach FD1 break. Reeds heavily encroached the channel near the downstream reach break.

Photo 18 Reach FD3	
	Photograph taken facing upstream towards left bank. Channel was a straightened and ditched feature.
Photo 19 Reach FD3	
	Photograph taken facing downstream. Extensive backwatering observed upstream of large woody debris jam.

Photo 20 Reach OKD1	
	Photograph taken facing downstream. Channel was a straightened and ditched feature.
Photo 21 Reach OKD1	
	Photograph taken facing left bank. Channel was highly entrenched, woody debris was commonly observed.

Photo 22 Reach OKD2	
	Photograph taken facing upstream. Channel exists as a highly entrenched, straightened and ditched feature.
Photo 23 Reach OKD2	
	Photograph taken facing right bank. Erosion scarring was observed.

Photo 24 Reach JR-4	
	Photograph taken facing upstream, west, from Borrisokane Road.
Photo 25 Reach JR-4	
	Photograph taken facing right bank, south, from Borrisokane Road. The reach was unconfined.

Photo 26 Reach JR-3	
	Photograph taken facing downstream, east, from Borrisokane Road.
Photo 27 Reach JR-3	
	Photograph taken facing the left bank, north, from Borrisokane Road. The reach was unconfined with a narrow riparian buffer zones.

Reach Characteristics

Date:	2017-06-23	Reach:	FCD2
Field Staff:	LG BM2	Watercourse:	Foster Drain
Weather:	Rain 18C	Watershed:	Jock River

Location

lat=45.260226245331054, long=-75.75114652679375, alt=94.27012027340467, accuracy=48.0

General Characteristics

Land Use:	Agricultural
Valley Type:	Unconfined
Channel Type:	11 - Straight suspended load
Flow Type:	Perennial
Groundwater:	No
Notes:	

Riparian Vegetation

Dominant Vegetation Type:	Trees, Grasses
Dominant Species:	Grass dominant in downstream portion, trees dominant upstream portion
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 - 4 Channel Widths
Riparian Age Class:	Established (5-30 years)
Extent of Encroachment into channel:	Moderate
Notes:	Fully encroached in downstream portion of reach.

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Rooted Emergent
Coverage of Reach (%):	70
Presence of Woody Debris:	Present in Channel
Density of Woody Debris:	Low
Number of WDJs per 50 m:	0
Notes:	

Channel Characteristics

Type of Sinuosity:	Sinuous
Degree of Sinuosity:	Straight (1 - 1.05)
Gradient:	Low
Number of Channels:	Single
Entrenchment:	Low (>2.2)
Bank Failures (Brierley and Fryirs, 2005):	None
Downs Model of Channel Evolution (1995):	S - stable
Riffle Substrate:	N/A
Pool Substrate:	Clay, Silt, Organics
Bank Material:	Clay, Silt, Sand
Bank Angle:	0 - 30
Extent of Bank Erosion:	< 5%

Notes:

Channel Measurements

Additional Measurements

Is riffle-pool development absent?	yes
Riffle-pool Spacing (m):	N/A
% Riffles:	N/A
% Pools:	N/A
Meander Amplitude (m):	N/A
Pool Depth (m):	N/A
Riffle Length (m):	N/A
Undercuts (m):	N/A

Rapid Stream Assessment Technique

Project Code: 17071

Date:	June 23/17	**Stream/Reach:**	FCD3
Weather:	rainy 20°	**Location:**	Ottawa-Barrhaven
Field Staff:	LG / BM2	**Watershed/Subwatershed:**	

Evaluation Category	Poor	Fair	Good	Excellent
Channel Stability (~~no~~ roots exposed)	• < 50% of bank network stable • Recent bank sloughing, slumping or failure frequently observed	• 50-70% of bank network stable • Recent signs of bank sloughing, slumping or failure fairly common	• 71-80% of bank network stable • Infrequent signs of bank sloughing, slumping or failure	• > 80% of bank network stable • No evidence of bank sloughing, slumping or failure
	• Stream bend areas highly unstable • Outer bank height 1.2 m above stream bank (2.1 m above stream bank for large mainstem areas) • Bank overhang > 0.8-1.0 m	• Stream bend areas unstable • Outer bank height 0.9-1.2 m above stream bank (1.5-2.1 m above stream bank for large mainstem areas) • Bank overhang 0.8-0.9m	• Stream bend areas stable • Outer bank height 0.6-0.9 m above stream bank (1.2-1.5 m above stream bank for large mainstem areas) • Bank overhang 0.6-0.8 m	• Stream bend areas very stable • Height < 0.6 m above stream (< 1.2 m above stream bank for large mainstem areas) • Bank overhang < 0.6 m
	• Young exposed tree roots abundant • > 6 recent large tree falls per stream mile	• Young exposed tree roots common • 4-5 recent large tree falls per stream mile	• Exposed tree roots predominantly old and large, smaller young roots scarce • 2-3 recent large tree falls per stream mile	• Exposed tree roots old, large and woody • Generally 0-1 recent large tree falls per stream mile
	• Bottom 1/3 of bank is highly erodible material • Plant/soil matrix severely compromised	• Bottom 1/3 of bank is generally highly erodible material • Plant/soil matrix compromised	• Bottom 1/3 of bank is generally highly resistant plant/soil matrix or material	• Bottom 1/3 of bank is generally highly resistant plant/soil matrix or material
	• Channel cross-section is generally trapezoidally-shaped	• Channel cross-section is generally trapezoidally-shaped	• Channel cross-section is generally V- or U-shaped	• Channel cross-section is generally V- or U-shaped
Point range	☐ 0 ☐ 1 ☐ 2	☐ 3 ☐ 4 ☐ 5	☐ 6 ☐ 7 ☐ 8	☐ 9 ☐ 10 ☐ 11
Channel Scouring/ Sediment Deposition (N/A)	• > 75% embedded (> 85% embedded for large mainstem areas)	• 50-75% embedded (60-85% embedded for large mainstem areas)	• 25-49% embedded (35-59% embedded for large mainstem areas)	• Riffle embeddedness < 25% sand-silt (< 35% embedded for large mainstem areas)
	• Few, if any, deep pools • Pool substrate composition >81% sand-silt	• Low to moderate number of deep pools • Pool substrate composition 60-80% sand-silt	• Moderate number of deep pools • Pool substrate composition 30-59% sand-silt	• High number of deep pools (> 61 cm deep) (> 122 cm deep for large mainstem areas) • Pool substrate composition <30% sand-silt
	• Streambed streak marks and/or "banana"-shaped sediment deposits common	• Streambed streak marks and/or "banana"-shaped sediment deposits common	• Streambed streak marks and/or "banana"-shaped sediment deposits uncommon	• Streambed streak marks and/or "banana"-shaped sediment deposits absent
	• Fresh, large sand deposits very common in channel • Moderate to heavy sand deposition along major portion of overbank area	• Fresh, large sand deposits common in channel • Small localized areas of fresh sand deposits along top of low banks	• Fresh, large sand deposits uncommon in channel • Small localized areas of fresh sand deposits along top of low banks	• Fresh, large sand deposits rare or absent from channel • No evidence of fresh sediment deposition on overbank
(N/A)	• Point bars present at most stream bends, moderate to large and unstable with high amount of fresh sand	• Point bars common, moderate to large and unstable with high amount of fresh sand	• Point bars small and stable, well-vegetated and/or armoured with little or no fresh sand	• Point bars few, small and stable, well-vegetated and/or armoured with little or no fresh sand

Reach Characteristics

Date:	2017-06-23	Reach:	FCD3-1
Field Staff:	LG BM2	Watercourse:	Frazer Clark Drain
Weather:	Rain 18C	Watershed:	Jock River

Location

lat=45.25719582508419, long=-75.76280598993611, alt=49.93364386812506, accuracy=12.0

General Characteristics

Land Use:	Agricultural,Residential
Valley Type:	Unconfined
Channel Type:	12 - Sinuous suspended load
Flow Type:	Intermittent
Groundwater:	No
Notes:	No flow . Channel fully encroached by reeds and grasses. Only small puddles of water found .

Riparian Vegetation

Dominant Vegetation Type:	Trees,Grasses
Dominant Species:	Reeds and grasses
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 - 4 Channel Widths
Riparian Age Class:	Established (5-30 years)
Extent of Encroachment into channel:	Heavy
Notes:	Grasses and reeds fully encroach channel . Scattered trees present , trees denser at the upstream confluence with FCD3-1 AND FCD4-1

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Rooted Emergent
Coverage of Reach (%):	100
Presence of Woody Debris:	Not Present
Density of Woody Debris:	None
Number of WDJs per 50 m:	0
Notes:	There may have been debris present , grasses to thick to see anything on the ground

Channel Characteristics

Type of Sinuosity:	Sinuous
Degree of Sinuosity:	Straight (1 - 1.05)
Gradient:	Low
Number of Channels:	Single
Entrenchment:	Low (>2.2)
Bank Failures (Brierley and Fryirs, 2005):	None
Downs Model of Channel Evolution (1995):	S - stable
Riffle Substrate:	N/A
Pool Substrate:	Clay, silt
Bank Material:	Clay,Silt,Sand
Bank Angle:	0 - 30
Extent of Bank Erosion:	< 5%

Notes:

Channel Measurements

Cross Section #1:

Bankfull Width (m):	12	**Wetted Width (m):**	N/A
Bankfull Depth (m):	N/A	**Wetted Depth (m):**	N/A
Velocity (m/s):	N/A	**Measurement Type:**	N/A

Cross Section #2:

Bankfull Width (m):	8	**Wetted Width (m):**	N/A
Bankfull Depth (m):	N/A	**Wetted Depth (m):**	N/A
Velocity (m/s):	N/A	**Measurement Type:**	N/A

Additional Measurements

Is riffle-pool development absent?	yes
Riffle-pool Spacing (m):	N/A
% Riffles:	N/A
% Pools:	N/A
Meander Amplitude (m):	N/A
Pool Depth (m):	N/A
Riffle Length (m):	N/A
Undercuts (m):	N/A

Notes:

Water Quality

Odour:	N/A
Turbidity:	N/A
Notes:	No flow

General Site Characteristics

Project Code: 17071

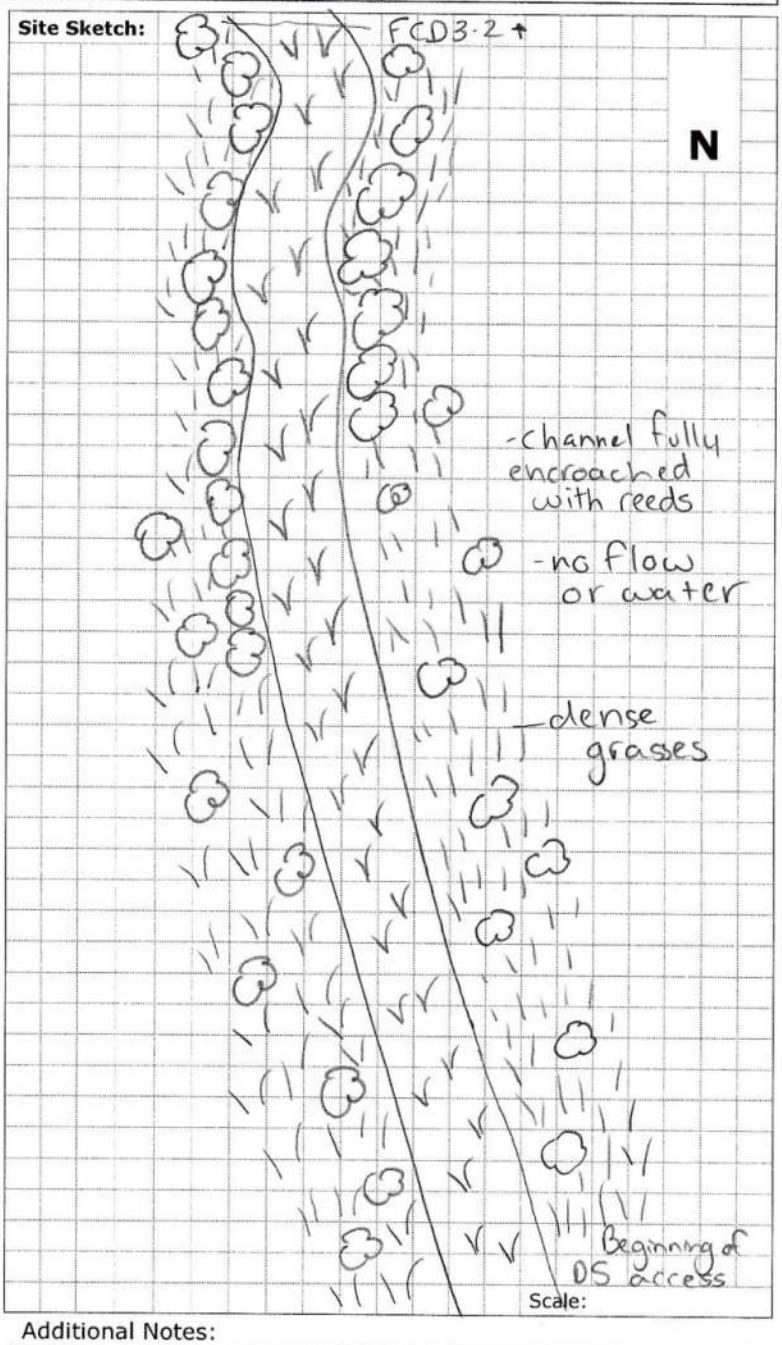
Date:	June 23/17	**Stream/Reach:**	FCD3-1
Weather:	rainy 20°	**Location:**	Ottawa-Barrhaven
Field Staff:	LG, BM2	**Watershed/Subwatershed:**	

Features

- Reach break
- Cross-section
- Flow direction
- Riffle
- Pool
- Medial bar
- Eroded bank
- Undercut bank
- Rip rap/stabilization/gabion
- Leaning tree
- Fence
- Culvert/outfall
- Swamp/wetland
- Grasses
- Tree
- Instream log/tree
- Woody debris
- Station location
- Vegetated island

Flow Type

H1	Standing water
H2	Scarcely perceptible flow
H3	Smooth surface flow
H4	Upwelling
H5	Rippled
H6	Unbroken standing wave
H7	Broken standing wave
H8	Chute
H9	Free fall



Substrate

S1	Silt	**S6**	Small boulder
S2	Sand	**S7**	Large boulder
S3	Gravel	**S8**	Bimodal
S4	Small cobble	**S9**	Bedrock/till
S5	Large cobble		

Other

BM	Benchmark	**EP**	Erosion pin
BS	Backsight	**RB**	Rebar
DS	Downstream	**US**	Upstream
WDJ	Woody debris jam	**TR**	Terrace
VWC	Valley wall contact	**FC**	Flood chute
BOS	Bottom of slope	**FP**	Flood plain
TOS	Top of slope	**KP**	Knick point

General Site Characteristics

Project Code: 17071

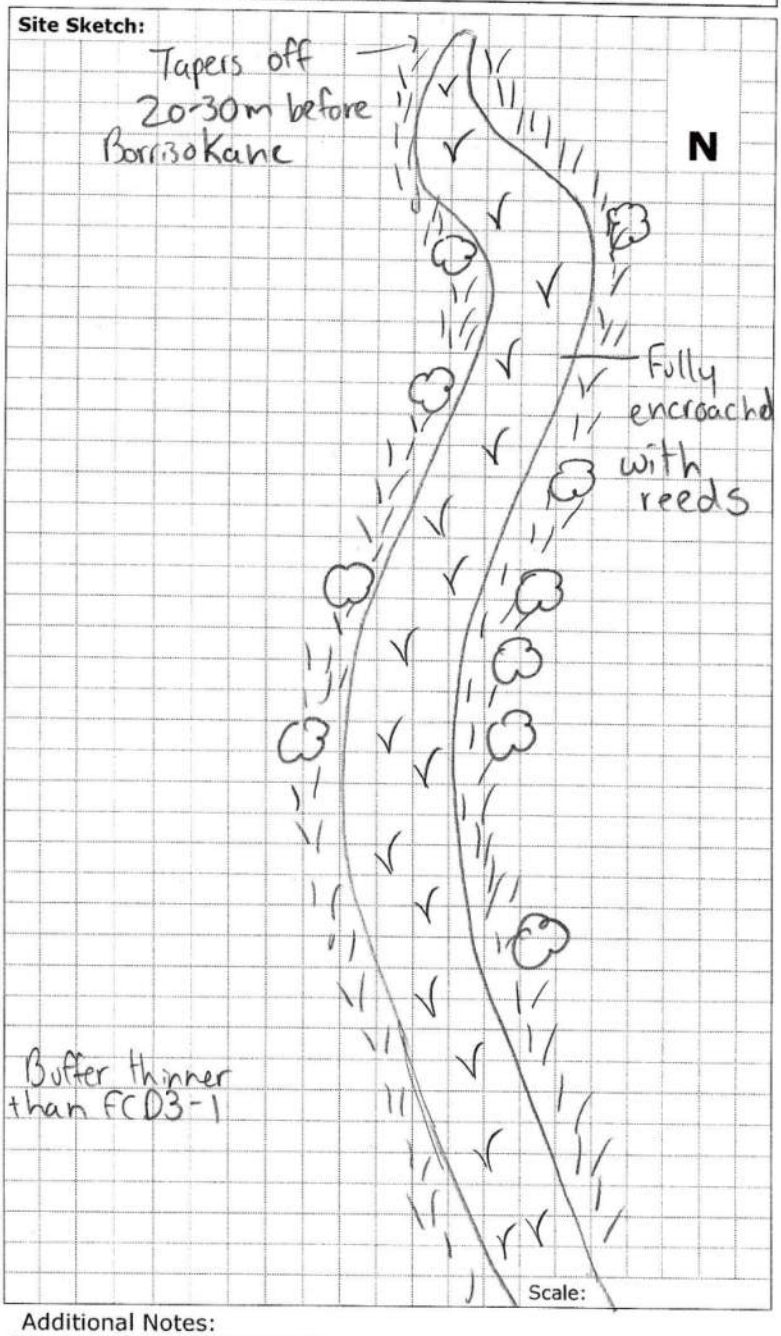
Date:	June 23/17	**Stream/Reach:**	FC302
Weather:	rainy 20°	**Location:**	Ottawa - Barrhaven
Field Staff:	LG, BM²	**Watershed/Subwatershed:**	

Features

- Reach break
- Cross-section
- Flow direction
- Riffle
- Pool
- Medial bar
- Eroded bank
- Undercut bank
- Rip rap/stabilization/gabion
- Leaning tree
- Fence
- Culvert/outfall
- Swamp/wetland
- Grasses
- Tree
- Instream log/tree
- Woody debris
- Station location
- Vegetated island

Flow Type

H1	Standing water
H2	Scarcely perceptible flow
H3	Smooth surface flow
H4	Upwelling
H5	Rippled
H6	Unbroken standing wave
H7	Broken standing wave
H8	Chute
H9	Free fall



Substrate

S1	Silt	**S6**	Small boulder
S2	Sand	**S7**	Large boulder
S3	Gravel	**S8**	Bimodal
S4	Small cobble	**S9**	Bedrock/till
S5	Large cobble		

Other

BM	Benchmark	**EP**	Erosion pin
BS	Backsight	**RB**	Rebar
DS	Downstream	**US**	Upstream
WDJ	Woody debris jam	**TR**	Terrace
VWC	Valley wall contact	**FC**	Flood chute

Reach Characteristics

Date:	2017-06-23	Reach:	FCD5
Field Staff:	LG BM2	Watercourse:	Frazer Clark Drain
Weather:	Cloudy 20 degrees	Watershed:	Jock River

Location

General Characteristics

Land Use:	Agricultural
Valley Type:	Unconfined
Channel Type:	11 – Straight suspended load
Flow Type:	Intermittent
Groundwater:	No
Notes:	No water present.

Riparian Vegetation

Dominant Vegetation Type:	Grasses, Trees
Dominant Species:	Grass
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 – 4Widths
Riparian Age Class:	Established
Extent of Encroachment into channel:	Heavy

Notes:

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Reeds
Coverage of Reach (%):	100%
Presence of Woody Debris:	Not present
Density of Woody Debris:	None
Number of WDJs per 50 m:	0

Notes:

Channel Characteristics

Type of Sinuosity:	N/A
Degree of Sinuosity:	Straight (1 - 1.05)
Gradient:	Low
Number of Channels:	Single
Entrenchment:	Slightly Entrenched
Bank Failures (Brierley and Fryirs, 2005):	N/A
Downs Model of Channel Evolution (1995):	S – stable
Riffle Substrate:	N/A
Pool Substrate:	N/A
Bank Material:	Clay, Silt, Sand
Bank Angle:	0 – 30
Extent of Bank Erosion:	<5%

Notes:

Reach Characteristics

Date:	2017-06-22	Reach:	FD1
Field Staff:	LG BM2	Watercourse:	Foster Drain
Weather:	Sunny 25 degrees	Watershed:	Jock River

Location

lat=45.25182925690391, long=-75.768392678713, alt=61.008241515689946, accuracy=12.0

General Characteristics

Land Use:	Agricultural
Valley Type:	Unconfined
Channel Type:	12 - Sinuous suspended load
Flow Type:	Perennial
Groundwater:	No
Notes:	

Riparian Vegetation

Dominant Vegetation Type:	Trees,Grasses
Dominant Species:	Grasses
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 - 4 Channel Widths
Riparian Age Class:	Established (5-30 years)
Extent of Encroachment into channel:	Minimal
Notes:	

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Rooted Submergent
Coverage of Reach (%):	80
Presence of Woody Debris:	Present in Channel
Density of Woody Debris:	Low
Number of WDJs per 50 m:	0
Notes:	Rooted emergent and submergent veg.

Channel Characteristics

Type of Sinuosity:	Sinuous
Degree of Sinuosity:	Straight
Gradient:	Low
Number of Channels:	Single
Entrenchment:	High (<1.4)
Bank Failures (Brierley and Fryirs, 2005):	Undercutting (Hydraulic Action)
Downs Model of Channel Evolution (1995):	S – Stable – no observable morphological change
Riffle Substrate:	N/A
Pool Substrate:	Clay, Silt
Bank Material:	Clay, Silt
Bank Angle:	60 - 90
Extent of Bank Erosion:	30 - 60%

Notes: Riffle pool sequence absent .

Channel Measurements

Additional Measurements

Is riffle-pool development absent?	Yes
Riffle-pool Spacing (m):	N/A
% Riffles:	N/A
% Pools:	N/A
Meander Amplitude (m):	N/A
Pool Depth (m):	N/A
Riffle Length (m):	N/A
Undercuts (m):	0.20,

Notes: 50-75% erosion extent along reach .

Water Quality

Odour:	None
Turbidity:	Clear
Notes:	Slightly turbid to opaque, appears clear because of bed sediment being close to surface

Evaluation Category	Poor	Fair	Good	Excellent
Channel Stability	• < 50% of bank network stable • Recent bank sloughing, slumping or failure frequently observed	• 50-70% of bank network stable • Recent signs of bank sloughing, slumping or failure fairly common	• 71-80% of bank network stable • Infrequent signs of bank sloughing, slumping or failure	• > 80% of bank network stable • No evidence of bank sloughing, slumping or failure
	• Stream bend areas highly unstable • Outer bank height 1.2 m above stream bank (2.1 m above stream bank for large mainstem areas) • Bank overhang > 0.8-1.0 m	• Stream bend areas unstable • Outer bank height 0.9-1.2 m above stream bank (1.5-2.1 m above stream bank for large mainstem areas) • Bank overhang 0.8-0.9m	• Stream bend areas stable • Outer bank height 0.6-0.9 m above stream bank (1.2-1.5 m above stream bank for large mainstem areas) • Bank overhang 0.6-0.8 m	• Stream bend areas very stable • Height < 0.6 m above stream (< 1.2 m above stream bank for large mainstem areas) • Bank overhang < 0.6 m
	• Young exposed tree roots abundant • > 6 recent large tree falls per stream mile	• Young exposed tree roots common • 4-5 recent large tree falls per stream mile	• Exposed tree roots predominantly old and large, smaller young roots scarce • 2-3 recent large tree falls per stream mile	• Exposed tree roots old, large and woody • Generally 0-1 recent large tree falls per stream mile
	• Bottom 1/3 of bank is highly erodible material • Plant/soil matrix severely compromised	• Bottom 1/3 of bank is generally highly erodible material • Plant/soil matrix compromised	• Bottom 1/3 of bank is generally highly resistant plant/soil matrix or material	• Bottom 1/3 of bank is generally highly resistant plant/soil matrix or material
	• Channel cross-section is generally trapezoidally-shaped	• Channel cross-section is generally trapezoidally-shaped	• Channel cross-section is generally V- or U-shaped	• Channel cross-section is generally V- or U-shaped
Point range	☐ 0 ☐ 1 ☐ 2	☐ 3 ☐ 4 ☐ 5	☐ 6 ☐ 7 ☒ 8	☐ 9 ☐ 10 ☐ 11

Channel Scouring/ Sediment Deposition	• > 75% embedded (> 85% embedded for large mainstem areas)	• 50-75% embedded (60-85% embedded for large mainstem areas)	• 25-49% embedded (35-59% embedded for large mainstem areas)	• Riffle embeddedness < 25% sand-silt (< 35% embedded for large mainstem areas)
	• Few, if any, deep pools • Pool substrate composition >81% sand-silt	• Low to moderate number of deep pools • Pool substrate composition 60-80% sand-silt	• Moderate number of deep pools • Pool substrate composition 30-59% sand-silt	• High number of deep pools (> 61 cm deep) (> 122 cm deep for large mainstem areas) • Pool substrate composition <30% sand-silt
	• Streambed streak marks and/or "banana"-shaped sediment deposits common	• Streambed streak marks and/or "banana"-shaped sediment deposits common	• Streambed streak marks and/or "banana"-shaped sediment deposits uncommon	• Streambed streak marks and/or "banana"-shaped sediment deposits absent
	• Fresh, large sand deposits very common in channel • Moderate to heavy sand deposition along major portion of overbank area	• Fresh, large sand deposits common in channel • Small localized areas of fresh sand deposits along top of low banks	• Fresh, large sand deposits uncommon in channel • Small localized areas of fresh sand deposits along top of low banks	• Fresh, large sand deposits rare or absent from channel • No evidence of fresh sediment deposition on overbank
	• Point bars present at most stream bends, moderate to large and unstable with high amount of fresh sand	• Point bars common, moderate to large and unstable with high amount of fresh sand	• Point bars small and stable, well-vegetated and/or armoured with little or no fresh sand	• Point bars few, small and stable, well-vegetated and/or armoured with little or no fresh sand

Field Staff:	LG BM2	Watercourse:	Foster Drain
Weather:	Cloudy 20 degrees	Watershed:	Jock River

Location

lat=45.25255737724697, long=-75.76969411847692, alt=60.14974220112034, accuracy=6.0

General Characteristics

Land Use:	Agricultural
Valley Type:	Unconfined
Channel Type:	11 - Straight suspended load
Flow Type:	Perennial
Groundwater:	no
Notes:	

Riparian Vegetation

Dominant Vegetation Type:	Trees,Grasses
Dominant Species:	Grass
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 - 4 Channel Widths
Riparian Age Class:	Established (5-30 years)
Extent of Encroachment into channel:	Minimal
Notes:	

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Rooted Submergent
Coverage of Reach (%):	75
Presence of Woody Debris:	Present in Channel
Density of Woody Debris:	Low
Number of WDJs per 50 m:	0.25
Notes:	1 large WDJ causing extensive back watering Rooted submergent dominant, emergent also moderately present

Channel Characteristics

Type of Sinuosity:	N/A
Degree of Sinuosity:	Straight (1 - 1.05)
Gradient:	Low
Number of Channels:	Single
Entrenchment:	High (<1.4)
Bank Failures (Brierley and Fryirs, 2005):	Undercutting (Hydraulic Action)
Downs Model of Channel Evolution (1995):	S – Stable – no observable morphological change
Riffle Substrate:	N/A
Pool Substrate:	N/A
Bank Material:	Clay, Silt, Sand
Bank Angle:	60 - 90, Undercut
Extent of Bank Erosion:	30 - 60%

Notes:

Channel Measurements

Cross Section #1: Run

Bankfull Width (m):	8.2	**Wetted Width (m):**	5.4
Bankfull Depth (m):	N/A	**Wetted Depth (m):**	0.31
Velocity (m/s):	0.22	**Measurement Type:**	Wiffle Ball

Cross Section #2:

Bankfull Width (m):	5.5	**Wetted Width (m):**	4.3
Bankfull Depth (m):	N/A	**Wetted Depth (m):**	0.48
Velocity (m/s):	0.15	**Measurement Type:**	Wiffle Ball

Additional Measurements

Is riffle-pool development absent?	Yes
Riffle-pool Spacing (m):	N/A
% Riffles:	N/A
% Pools:	N/A
Meander Amplitude (m):	N/A
Pool Depth (m):	N/A
Riffle Length (m):	N/A
Undercuts (m):	0.08 , most likely higher in some areas

Notes: Upstream of culvert bank height ~1.4

Water Quality

Odour:	None
Turbidity:	Opaque
Notes:	Turbid/ opaque

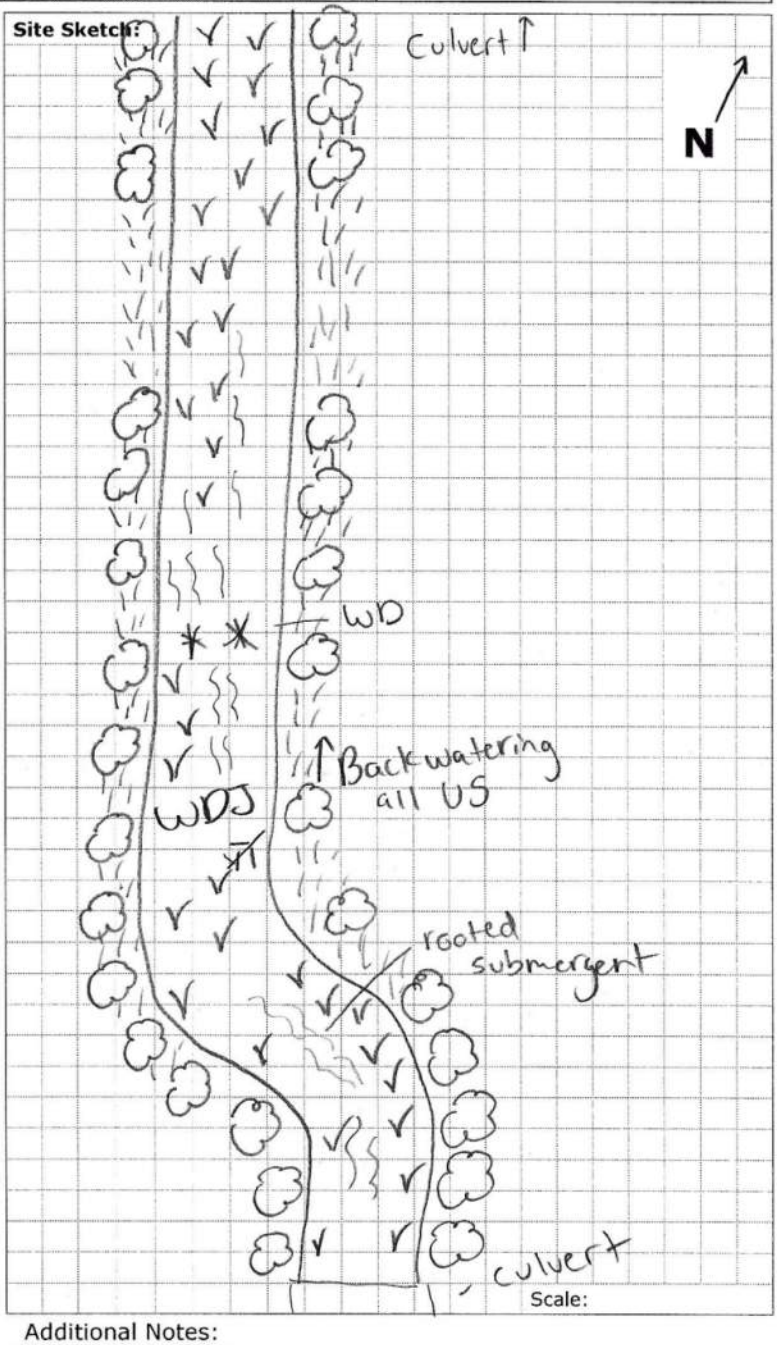
Features

- Reach break
- Cross-section
- Flow direction
- Riffle
- Pool
- Medial bar
- Eroded bank
- Undercut bank
- Rip rap/stabilization/gabion
- Leaning tree
- Fence
- Culvert/outfall
- Swamp/wetland
- Grasses
- Tree
- Instream log/tree
- Woody debris
- Station location
- Vegetated island

Flow Type

H1	Standing water
H2	Scarcely perceptible flow
H3	Smooth surface flow
H4	Upwelling
H5	Rippled
H6	Unbroken standing wave
H7	Broken standing wave
H8	Chute
H9	Free fall



Substrate

S1	Silt	**S6**	Small boulder
S2	Sand	**S7**	Large boulder
S3	Gravel	**S8**	Bimodal
S4	Small cobble	**S9**	Bedrock/till
S5	Large cobble		

Other

BM	Benchmark	**EP**	Erosion pin
BS	Backsight	**RB**	Rebar
DS	Downstream	**US**	Upstream
WDJ	Woody debris jam	**TR**	Terrace
VWC	Valley wall contact	**FC**	Flood chute
BOS	Bottom of slope	**FP**	Flood plain
TOS	Top of slope	**KP**	Knick point

General Site Characteristics

Project Code: 17071

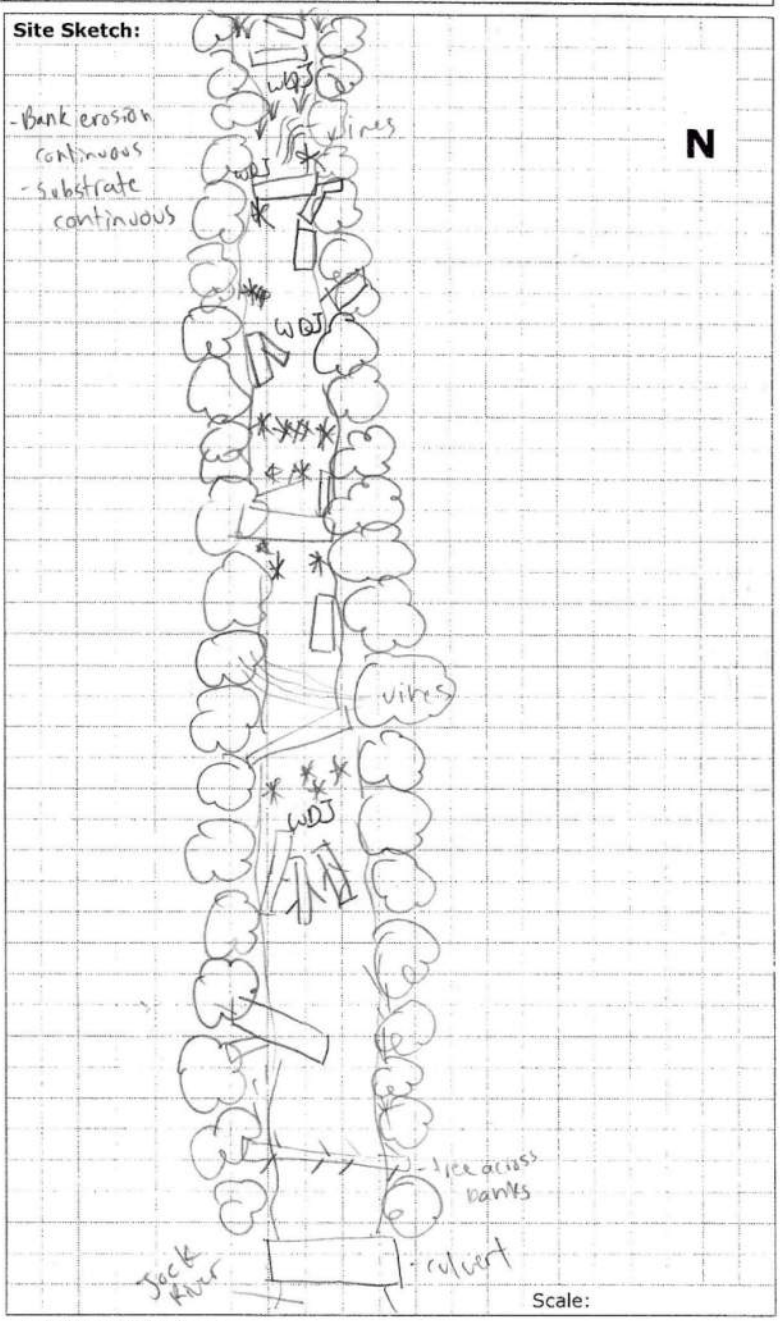
Date:	June 20/17	**Stream/Reach:**	OKD1
Weather:	Sunny 25°	**Location:**	Ottawa - Barrhaven
Field Staff:	LG BMZ	**Watershed/Subwatershed:**	

Features

- Reach break
- Cross-section
- Flow direction
- Riffle
- Pool
- Medial bar
- Eroded bank
- Undercut bank
- Rip rap/stabilization/gabion
- Leaning tree
- Fence
- Culvert/outfall
- Swamp/wetland
- Grasses
- Tree
- Instream log/tree
- Woody debris
- Station location
- Vegetated island

Flow Type

H1	Standing water
H2	Scarcely perceptible flow
H3	Smooth surface flow
H4	Upwelling
H5	Rippled
H6	Unbroken standing wave
H7	Broken standing wave
H8	Chute
H9	Free fall



Substrate

S1	Silt	**S6**	Small boulder
S2	Sand	**S7**	Large boulder
S3	Gravel	**S8**	Bimodal
S4	Small cobble	**S9**	Bedrock/till
S5	Large cobble		

Other

BM	Benchmark	**EP**	Erosion pin
BS	Backsight	**RB**	Rebar
DS	Downstream	**US**	Upstream
WDJ	Woody debris jam	**TR**	Terrace
VWC	Valley wall contact	**FC**	Flood chute
BOS	Bottom of slope	**FP**	Flood plain
TOS	Top of slope	**KP**	Knick point

Reach Characteristics

Date:	2017-06-21	Reach:	OKD2
Field Staff:	LG BM2	Watercourse:	O'Keefe Drain
Weather:	Sun and cloud 18C	Watershed:	Jock River

Location

lat=45.253683882781495, long=-75.77752606140785, alt=57.03539215789929, accuracy=6.0

General Characteristics

Land Use:	Agricultural
Valley Type:	Unconfined
Channel Type:	11 - Straight suspended load
Flow Type:	Perennial
Groundwater:	No
Notes:	

Riparian Vegetation

Dominant Vegetation Type:	Grasses, trees
Dominant Species:	Grass
Riparian Coverage:	Fragmented
Width of Riparian Zone:	1 - 4 Channel Widths
Riparian Age Class:	Established (5-30 years)
Extent of Encroachment into channel:	Moderate
Notes:	A few trees scattered along banks.

Aquatic/Instream Vegetation

Type of Instream Vegetation:	Rooted Emergent
Coverage of Reach (%):	100
Presence of Woody Debris:	Not Present
Density of Woody Debris:	None
Number of WDJs per 50 m:	0
Notes:	Top half of reach heavily encroached with reeds.

Channel Characteristics

Type of Sinuosity:	N/A
Degree of Sinuosity:	Straight (1 - 1.05)
Gradient:	Low
Number of Channels:	Single
Entrenchment:	High (<1.4)
Bank Failures (Brierley and Fryirs, 2005):	Fall/Sloughing (Mass Failure)
Downs Model of Channel Evolution (1995):	C – Compound – aggradation of channel bed with erosion of channel banks
Riffle Substrate:	N/A
Pool Substrate:	Clay, Silt
Bank Material:	Clay, Silt
Bank Angle:	60 - 90,Undercut
Extent of Bank Erosion:	30 - 60%

Notes:	Two erosion scars, potentially from sloughing brought on by undercutting photos 191-192 Significant erosion on the sides of the upstream culvert photos 183-185

Channel Measurements

Additional Measurements

Is riffle-pool development absent?	Yes
Riffle-pool Spacing (m):	N/A
% Riffles:	N/A
% Pools:	N/A
Meander Amplitude (m):	N/A
Pool Depth (m):	N/A
Riffle Length (m):	N/A
Undercuts (m):	N/A

General Field Observations

Channel Description

This channel runs between agricultural fields before flowing into Jock River. The channel is straight, slightly entrenched, and has a low gradient. Riffle-pool sequences are absent within this reach, only run features are present. Bank erosion was not present. Woody debris is present in the channel at a low density. Average bankfull width and depth are 9.23 m and 0.23 m, respectively. Bank material consists of sandy loam, bed material consists of fine sediment and organics. Depth of fine sediment on the bed at the time of assessment was approximately 0.30 - 0.40 m.

General Field Observations

Channel Description

This channel runs between agricultural fields before flowing into Jock River. The channel is sinuous with a low gradient, and highly entrenched. Riffle-pool sequences are absent within this reach, only run features are present. Undercutting is present in the downstream portion of the reach. A low density of woody debris is present in the channel. Average bankfull width and depth are 4.69 m and 0.50 m, respectively. Bank material consists of clay, silt and sand, with rip-rap between cross sections 2 and 5. Bed material consists of clay, and sporatic rip-rap. Depth of fine sediment on the bed at time of assessment was approximately 0.05 - 0.20 m.

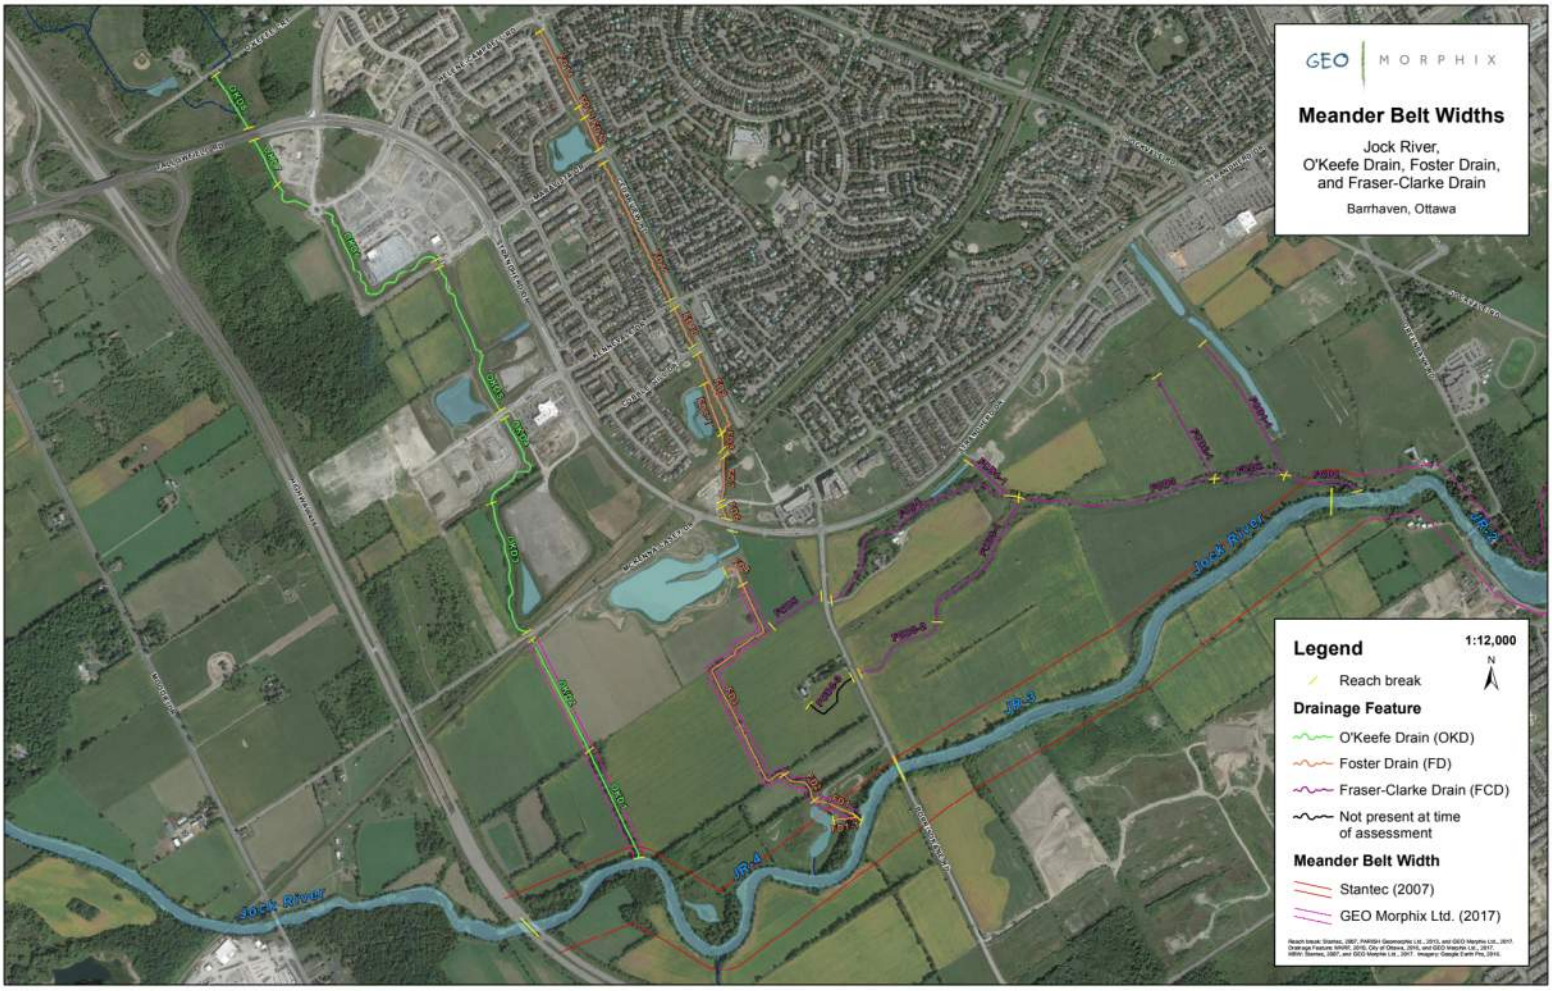
General Field Observations



Channel Description

This channel runs between agricultural fields before flowing into Jock River. The channel is straight and highly entrenched, with a low gradient. This reach did not contain riffle-pool sequences, only run features were present. Average bankfull width and depth are 4.6 m and 0.7 m, respectively. Bank erosion was evident. Woody debris was commonly observed in the channel. Both bed and bank material consisted of a sandy loam. Depth of fines on the bed were approximately 0.2 - 0.3 m at time of assessment.

Definitions:
Q = 2.78 AIR, where
Q = Peak Flow in Litres per second (L/s)
A = Areas in hectares (ha)
I = Rainfall Intensity (mm/h)
R = Runoff Coefficient

Notes:
1) Ottawa Rainfall-Intensity Curve
2) Min. Velocity = 0.80 m/s

Designed: R.B.	PROJECT: BARRHAVEN COSERVANCY WEST	
Checked: D.A.	LOCATION: City of Ottawa	
Dwg. Reference: 3	File Ref: 16-891	Date: March 2021 — Sheet No. SHEET 1 OF 1

STORM SEWER CALCULATION SHEET (RATIONAL METHOD)

Local Roads Return Frequency = 2 years
Collector Roads Return Frequency = 5 years
Manning 0.013 Arterial Roads Return Frequency = 10 years

Chapter 25

City of Etobicoke Exfiltration and Filtration Systems Pilot/Demonstration Project

A.M. Candaras and Luis M.J. Carvalho
A.M. Candaras Associates Inc.
8600 Keele Street, Suite 68
Concord, Ontario, L4K 4H8

The timely development of the Etobicoke Exfiltration System (EES) occurred at a period when engineers, biologists and scientists were actively investigating infiltration as a technique to manage stormwater.

In most areas which can be significantly impacted by urbanization, infiltration is a major component of the hydrologic cycle. Consequently, the reduction in pervious land cover due to urbanization has a direct and detrimental impact on fluvial geomorphology, erosion, water temperature, chemistry, aquatic environment (fisheries) and adjacent terrestrial environments.

Candaras, A.M., L. Carvalho and M-K. Koo. 1995. "City of Etobicoke Exfiltration and Filtration Systems Pilot/ Demonstration Project." *Journal of Water Management Modeling* R183-25. doi: 10.14796/JWMM.R183-25.

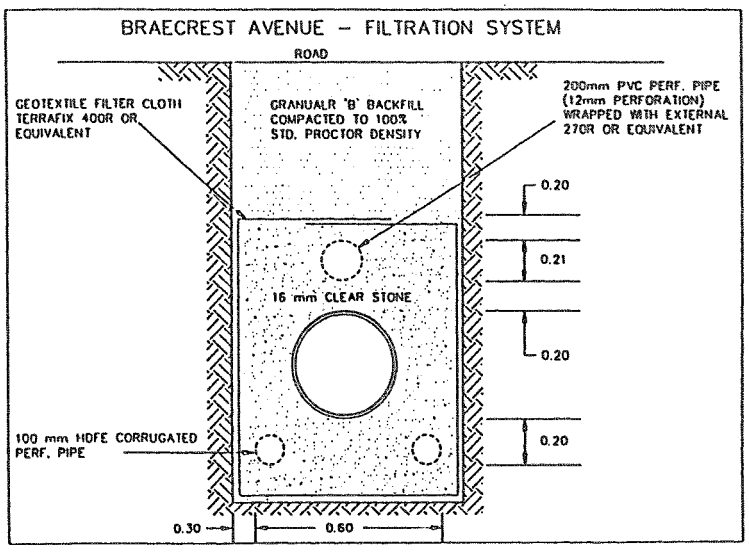

Figure 25.4
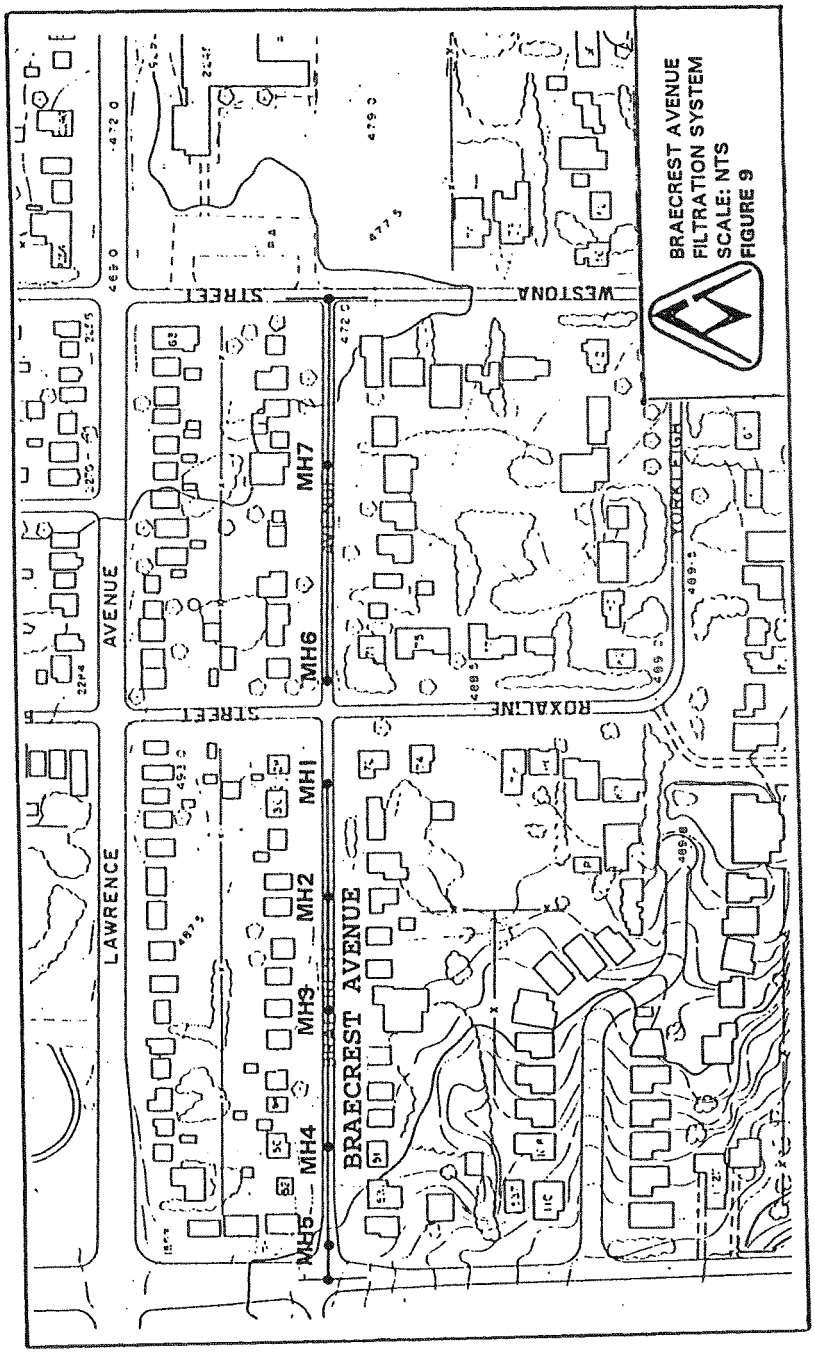
Braecrest Avenue filtration system - cross section.

geotechnical investigation was carried out in which seven boreholes were dug between January 18 to 20 1993. The borehole locations were chosen based on proximity to storm sewer and sanitary sewer crossings. The investigation confirmed that the subsurface soils were dominated by silty clay to clayey silt till underlain by silty sand till.

The underlying soils were observed to be very dense due to the geomorphological processes which created them. Thus the hydraulic conductivity of these soils were lower than would normally be expected for these soil types. Quantification of this characteristic was accomplished by carrying out falling-head tests on all of the boreholes. The hydraulic conductivity for the silty sand to sandy silt till ranged from $6x10^{-6}$ m/s to $1x10^{-7}$ m/s.



All boreholes were dry on completion of drilling. Depth of drilling ranged from approximately 4.5 m to 14.0 m below ground surface.

25.3.3 Braecrest Road - Filtration System

The Braecrest Road (Fig 25.7) study area has a tributary area of 2.38 ha of low-density residential housing. The site drains to the west, at approximately 2% to Royal York Road. The high point of Braecrest Road in this area is approximately at the intersection of Braecrest Avenue and Roxaline Street. East of this high point Braecrest drains to Westona Street. The similarity of the east and west draining areas is further discussed below in the monitoring section. The roadway is presently ditched, but will be "upgraded" to curb and gutter.

A geotechnical investigation was carried out during which two boreholes were drilled on Royal York Road. Study results suggested that the controlling soil types are brown silty clay and dark grey organic sand loam with organic matter. Additional soils records from the City of Etobicoke show that on Braecrest Avenue the dominant soils are clay loam. Local well records indicate that the upper soils in the area (up to 7 m deep) are brown clays. These studies corroborate the dominance of relatively impervious soils in the area of the proposed system.

Records of water table locations are not available for this site. However, this lack of information is not of significance since the filtration system will be used and the site is relatively high in relation to the adjacent lands. Exfiltration to the surrounding soil will not be a feasible method of transporting the stormwater due to the relatively impervious local soils.

25.7 Braecrest Avenue filtration system plan.

connect directly to the storm sewer between MH1 and MH2 at the upstream end of the local drainage system. The four catchbasins connecting to the storm sewer between MH2 and MH4 will be temporarily sealed to prevent runoff entering the monitored section. Only one runoff input source to the monitored section (at MH2) will be allowed, in order to simplify monitoring and increase equipment cost-effectiveness. Road grading will convey this surface runoff downstream of MH3 to the catchbasins between MH3 and MH4. Similar to the Queens Marys Drive site, the exfiltration system upstream of MH2 will be temporarily put offline by plugging the perforated PVC pipes between MH1 and MH2. System monitoring within the section will be essentially identical to that in the Queens Marys Drive site.

The major difference in monitoring between the two exfiltration sites is that piezometers will not be installed on Princess Margaret Boulevard. A geotechnical investigation suggests that groundwater in the area is located at depths exceeding 15 m below the ground surface. The exfiltration rate from this EES will therefore not be affected by local ground water conditions.

As in the Queen Marys Drive site, monitoring will also be carried out to ascertain the effectiveness of this system on a larger scale. Total flows and water quality will be monitored near the end of the EES at MH7 on Princess Anne Crescent.

25.4.3 The Etobicoke Filtration System

The exfiltration system is not appropriate for the Braecrest Avenue site due to the local low permeability soils. This condition will not permit the exfiltration of the first flush in less than 48 hours. Therefore, the Braecrest site will use the filtration system.

Braecrest Avenue

Monitoring of the EFS will be conducted at the upstream end of the drainage basin. A single catchbasin drains directly into the upstream maintenance hatch (MH1) and two others connect directly into the storm sewer between MH1 and MH2. The catchbasin connected to MH1 and the catchbasin north of the storm sewer between MH1 and MH2 will be temporarily plugged. This will ensure that the only input to the EFS at this section is the single catchbasin. The catchbasin south of the sewer was chosen over the one to the north as it drains a much greater area.

Re: BSUEA Infiltration System Maintenance Requirements

Date: June 22, 2017

Job No.: 26610

CC: Hugo Lalonde, MCIP, RPP
Land Development Manager
Minto Communities - Canada

Purpose of Undertaking

The future Barrhaven South Urban Expansion Area (BSUEA) will be developed as a standard suburb subdivision that will include the typical range of land usages; residential, commercial, institutional, parks and a Park and Ride facility. Based on the findings of the Study Area Existing Conditions Reports, the servicing of the Subdivision will need to be developed with measures that will promote infiltration to preserve the pre-infiltration levels. This Memorandum was prepared to address operation and maintenance requirements for a system that would be solely implemented on local roads and that has been described in previous Memoranda as capable to maintain pre-infiltration levels.

Background

On May 24, 2017, a meeting was held at the City of Ottawa (City) to discuss advantages and disadvantages associated with two (2) servicing systems that could be implemented within the BSUEA to promote infiltration of “clean runoff” to maintain pre-infiltration levels. The first part of the meeting consisted of a presentation that described both servicing systems promoting infiltration; the Etobicoke Exfiltration System (EES) and the Clear Water Collector (CWC) system that was implemented in the former City of Vaughan. During the latter part of the meeting, the advantages and disadvantages of both systems were discussed over with operation staff. Both of these systems have been discussed in a previous Modelling Memorandum and were presented to the City on May 24, 2017, a copy of the presentation has been attached.

During the May 24, 2017 meeting, the City has requested further information on the increased maintenance requirements for a stormwater conveyance system that would be designed with infiltration capabilities. From the Operation Staff, it was understood that the current maintenance program for traditional stormwater conveyance systems consist of cleaning of the storm sewers by jet flushing and, subsequently, proceeding with a closed circuit television (CCTV) inspection. This process is generally completed on a 20-year frequency. This Memorandum has, therefore, been prepared using as the baseline condition, the 20-year maintenance frequency.

Reported Maintenance Requirements of Infiltration Systems

The requirements of a maintenance program can be based on experience with previous installations of the EES or CWC systems. The EES was first designed in 1993 in the former City of Etobicoke, now part of the City of Toronto. The system was subsequently constructed later in 1993 and spanning until 1994 as part of the municipality’s road reconstruction projects, which included the installation of 2.1 km of the EES as a means to provide water quality enhancement for existing serviced areas. From the 2.1 km of EES installed, three (3) small sections were subject to monitoring and reporting post-construction; the Princess Margaret and Queen Mary’s Drive sites as well as the Braecrest site (refer to the Table below for details for each of the sites).

The first two (2) sites comprises of an EES with Goss traps similar to what is proposed for the BSUEA while the latter site, Braecrest, is closer to the CWC system with some minor modifications. Each system was designed with capacity to capture the runoff generated from the 15 mm - 1 hour AES rainfall event. For comparison purposes, the system now being proposed for the BSUEA is sized to capture, detain and infiltrate the runoff generated by the 22 mm - 4 hour rainfall event.

Monitoring Sites	Sewer Length (m)	Tributary Area (ha)
Princess Margaret	415	0.4
Queen Mary's Drive	443	13.3[1]
Braecrest	209	2.4

Post construction monitoring of the above-noted systems was initiated on completion of construction. Once completed, the systems were cleaned by jet flushing and subsequently inspected via CCTV. Follow up monitoring was undertaken for a two year period between 1996 and 1998 (SWAMP, 2004) and subsequently by the TRCA in 2013 (presentation slides attached). The 1996-1998 monitoring information was reported; however, the recent monitoring has not been formally reported other than the information attached to the presentation slides.

Prior to the 2013 monitoring, there was no further cleaning undertaken and the infiltration capability of the EES installations were found to be very similar to the original infiltration condition after 18 years of operation. At the Princess Margaret site, the infiltration capability was virtually found to be the same than the original one as the system's drawdown time was found to take approximately only ten (10) minutes longer than found during the 1998 monitoring program. At the Queen Mary site, the 2013 monitoring results were reported after the cleaning phase of the program occurred and it was found that the average water level drawdown rate approximately doubled following the clean out. The information presented by the TRCA (see attached) on the monitoring program suggested that the maintenance frequency would vary depending on design of the EES and catchment characteristics. As a result, inspections should be carried out preferably at least every 5 years to verify that drawdown time does not exceed 48 hours.

The Sustainable Technologies Evaluation Program, led by the TRCA, has prepared a publication entitled "Low Impact Development Stormwater Management Practice Inspection and Maintenance Guide" (PIMG), which includes a section devoted to underground infiltration systems; however, this section of the PIMG does not specifically address the EES or CWC. The PIMG (i.e., Table 7.28, with relative sections extracted below) suggests recommended frequencies for routine maintenance tasks including clean out of sediments (flushing and removal) once an accumulated depth of 100 mm has been reached. Based on inspection photographs of the EES during the 2013 monitoring (see the sewer inspection photographs in the attached TRCA presentation), approximately 100 mm of sediment or less had accumulated over the 20 year period; this accumulation excludes what was accumulated in the catch basins. In addition, the PIMG document recommends maintenance procedures such as removing accumulated trash and debris in the catch basins on a more regular basis, up to twice per year. This inspection work could evidently be combined with an inspection program.

The 2003 Stormwater Management Planning and Design Manual (SWMPDM),from the Ontario Ministry of the Environment and Climate Change (MOECC), provides some guidance on maintenance required for similar infiltration / pervious pipe systems such as the EES that is proposed. Table 6.1 in the Manual identifies the need for general inspection, removal of accumulated sediments, pipe flushing, catchbasin cleaning, trash removal and closing of the system for winter months when in a high salt / sand area. By installing the EES solely along local roads, the maintenance activity of closing the system for the winter months is not required.

According to the Manual, inspections should take place at a greater frequency for the first two years, after every significant storm event, to better understand the system's performance and to ensure that the perforated pipe system is operating as designed. After the first two years, the frequency of inspections could be reduced to annual inspections. In terms of frequency of sediment removal and cleaning, the Manual indicates that the system, including catchbasins, should be cleaned out if there is greater than one third the design depth of water in the catch basin sump 48 hours after a storm or if there is visible accumulation of sediment in the bottom of the catchbasin sump. Cleaning could be carried out by means of standard flushing, radial washing where the pipe is pressurized to force water through the perforations and cleaning out the sediment, or alternatively, jet flushing via a pressurized hose nozzle that directs water under high velocities into the perforations to remove the accumulated sediment.

[1] Of the 13.3 ha tributary area to the monitored section of the Queen Mary's Drive site, only 3.7 ha was immediately tributary to the EES sewers, the remaining area was from conventional sewer systems upstream of the site.

Measures to Reduce Maintenance Requirements

The design of the EES can be carried out by incorporating measures to reduce the maintenance frequency of the system. The measures include; i) using Goss traps in the upstream catchbasins as a pre-treatment measure, and ii) by rotating the angle of perforations to 45^{o} in the perforated pipe

Goss traps are used as standard in some Ontario municipalities including the City of Windsor and the City of Hamilton. They were used in the original sites of the EES in Etobicoke including those subject to the monitoring discussed above. This measure was adopted by the designers to: i) prevent debris collected in the catch basins from entering the perforated pipes, and ii) minimize oil trapped in the catch basins from entering the perforated pipes.

The alignment of the perforated pipe on its longitudinal axis is important in maximizing the efficiency of the system between maintenance visits and reducing the maintenance required. By placing the perforated pipes so that the perforations are not on the bottom of the pipe and are closer to the 4:30 and 7:30 locations on the clock, the perforated pipe will continue to function at full exfiltration capacity while sediment is deposited on the bottom. The need to clean out the sediment can be extended until sufficient sediment has built up to close up the angled perforations.

Recommended Maintenance Procedures and Frequency

Based on historical notes collected during the EES monitoring work, the review of the PIMG document (TRCA), the review of MOECC's SWPDM, best practices in operating conventional storm sewer systems and recent discussions held with stormwater professionals (refer to attached E-Mails), the following maintenance schedule is recommended:

Maintenance Schedule

Task	Frequency	Compared to conventional systems
Inspection of the system to ensure adequate operation including full drawdown of the sumps to below the perforated pipe invert level and ensuring that the plug part of the Goss trap is functioning properly by only allowing water from the deeper column to enter the catch basin lead	Once or twice per year - 48 hours or more after a significant storm event	Not required in conventional systems although could be considered good practice and preventative
Removal of accumulated trash and debris from sumps and grates	Twice per year	Best practice in conventional systems, part completed annually on grates with spring street clearing
Monitoring of the accumulated sediment depth in catch basins	Once a year	Best practice in conventional systems
Jet pressure wash and CCTV inspection of sewer and perforated pipes	At least every 20 years or when sediment levels reach 150 mm depth	As per conventional systems but only one sewer in conventional systems

From the table above, the increase in the maintenance requirements for an EES would consist of the following:

1. Annual or bi-annual inspections of the system at the manholes to confirm that drawdown is occurring within 48 hours following a storm event. If drawdown is not fully achieved after 48 hours, this could be indicative of the need to schedule flushing of the system; and

2. Jet pressure washing of the conventional storm sewer as well as the two (2) perforated pipes, from manhole to manhole, every 20 years. The increase in maintenance would be associated with the time to remove the mechanical plugs at the downstream end of the perforated pipes and to flush the perforated pipes. The mobilization cost will remain the same when compared to the single conventional sewer.

The additional maintenance requirement associated with item 2 above would not incur a significant time or a significant increase in costs. As previously noted, the time for the crew to mobilize would remain the same as what is anticipated for

a conventional system. The additional cost will be associated with jet pressure washing the additional length of sewers (i.e., perforated pipes) and potential for removing additional accumulated sediments, which is likely to occur in the perforated pipes when compared to conventional systems where the sediments can be washed away under self-cleansing flows.

An annual or bi-annual inspection of the EES at manholes would be the more costly of the two increased maintenance requirements as this task (checking drawdown time) is not currently completed and would require additional man-power (i.e, travel time and inspection time).

Estimated Maintenance Costs

A cost analysis of the increased maintenance is summarized below. In the event that the City has more recent costs for these tasks, then these would prevail. It should be noted that the costs listed below are in 2017 dollars.

- Anticipated number of manholes / catch basins for inspection: 250
- Time per manhole / catchbasin: 5 minutes
- Time for site: 21 hours
- Cost per hour: $53
- Total Cost for inspections: $1,120
- Annual cost: $2,240

- Anticipated length of EES sewer: 8.6 km
- Total Combo unit time: 86 hours
- Average cost per hour: $195
- Estimated cleaning cost: $16,770
- Estimated disposal: $500
- Annual equivalent cost: $870

Overall, the annual increase in cost for the City to undertake maintenance of the EES over the conventional storm sewer system is ±$3,500 a year on average for the anticipated sewer length within the CDP, excluding the aggregate extraction areas. It is considered that the increase in maintenance costs of the EES would be considerably less than the maintenance costs incurred with two wet pond structures, which is the alternative to provide similar levels of water quality control.

Subject: **BCDC Phase 2 – Preliminary HGL Analysis**

Introduction

Phase 2 of the Barrhaven Conservancy Development (aka Concervancy East) is located in Barrhaven, Ontario, north of the Jock River, south of the Fraser Clarke Creek and east of the Foster Creek. The proposed development is approximately 59.26 ha that will primarily comprise of single and townhouse residential lots. As a part of the City of Ottawa's review of the proposed development draft plan submitted in December 2020, it was requested that a preliminary hydraulic grade line (HGL) assessment be completed for the site to ensure that the proposed minor system within the development is adequately sized to safely convey flows to the Jock River under various conditions. As such the following memo outlines the approach taken in assessing the development's HGL and summarises the findings of this analysis.

Analysis Approach

Preliminary hydraulic grade line calculations for the proposed BCDC Phase 2 development were completed using PCSWMM modelling software. Pipe data, storm sewer layout and Rational Method flows in the storm sewer are as provided by DSEL. The Rational Method flows were calculated based on the 2-, 5- or 10-year level of service requirements, and the 100-year flows in the hydraulic grade line calculations were estimated as 14% greater than the Rational Method flows, to account for the additional flows captured by catchbasin grates, lead pipes and/or inlet control devices under the higher surface water depths of the 100-year storm. The proposed storm sewer infrastructure data was extracted from DSEL's detailed drawings and incorporated into a PCSWMM model, and flows derived by DSEL's rational method calculations were then applied to each Maintenance Hole (MH) in the model as steady flows (using the baseflow option). Exit losses were applied to all storm sewer pipes in the system based on the angle of the downstream connection.

As with BCDC Phase 1, the preliminary HGL analysis was completed under two conditions:

- 100-year rainfall event on the development and a 5-year spring water level on the Jock River
- 5-year rainfall event on the development and a 100-year spring water level on the Jock River

Note that the water level along the Jock River through the length of this development varies, and as such the nearest corresponding upstream water surface elevation calculated by RVCA's HEC-RAS floodplain mapping model of the Jock River was applied at each of the respective storm sewer outlets. Also, note that assuming a 5-year spring water level on the Jock River for a 100-year rainfall event on the development is an inherently conservative assumption, as the critical storm for the proposed development is a summer (intense rainfall) event while the critical storm for the Jock River is a Spring (snowmelt + rainfall) event. A preliminary Single Station Flood Frequency analysis was completed by JFSA using only summer flows (from May 15 to October 31) based on historical flow data recorded at the Moodie Drive Water Survey Canada gauge. This analysis found that the 100-year summer flow on the Jock River is around 99 m^3/s, while the 5-year spring flow is around 123 m^3/s.

Results

The maximum HGL obtained at each MH has been extracted from the 100-year event/5-year water level scenario and 5-year event/100-year water level scenario, with the results from this analysis provided in Tables 1 & 2, respectively. As all proposed units within this development will have sump pumps, the simulated HGL was compared against the top of MH elevation to ensure that all storm sewers infrastructure is sufficiently sized and is not surcharging to the major system during the assessed events.

From this analysis, it was found that the critical scenario for HGL within the development was the 5-year development event and 100-year water level on the Jock River scenario. Based on this scenario, no MHs will have an HGL elevation above the top of MH (minimum freeboard of 0.4 m at MH-6152), with an average freeboard of 0.76 m from the top of MH throughout the proposed development. For the 100-year event and 5-year water level on the Jock River, no MHs will have HGL elevations above the top of MH (minimum freeboard of 1.06 m at MH-6152), with an average freeboard of 1.39 m from the top of MH throughout the proposed development. As such it can be concluded that the proposed storm sewer infrastructure is sufficiently sized, to safely convey minor system flows from the development under various extreme conditions.

Conclusion

A preliminary HGL analysis for Phase 2 of the Barrhaven Conservancy Development was completed using PCSWMM based on storm sewer and flow details provided by DSEL. From this analysis, it was found that the proposed storm sewer infrastructure is sufficiently sized to convey all minor system flows to the Jock River and will not result in any MHs surcharging to the street under extreme events such as 100-year rainfall event on the development and a 5-year spring water level on the Jock River and, a 5-year rainfall event on the development and a 100-year spring water level on the Jock River. With the former being the more critical scenario for the HGL within the development.

Yours truly,
J.F Sabourin and Associates Inc.

Definitions:
Q = 2.78 AIR, where
Q = Peak Flow in Litres per second (L/s)
A = Areas in hectares (ha)
I = Rainfall Intensity (mm/h)
R = Runoff Coefficient

Notes:
1) Ottawa Rainfall-Intensity Curve
2) Min. Velocity = 0.80 m/s

Designed: H.L.	PROJECT: BARRHAVEN CONSERVANCY	
Checked: D.A.	LOCATION: City of Ottawa	
Dwg. Reference:	File Ref: 16-891	Date: MARCH 2021
		Sheet No. SHEET 5 OF 11

STORM SEWER CALCULATION SHEET (RATIONAL METHOD)

Analysis Options
****
Flow Units ..... LPS
Process Models:
  Rainfall/Runoff ..... NO
  RDII ..... NO
  Snowmelt ..... NO
  Groundwater ..... NO
  Flow Routing ..... YES
  Ponding Allowed ..... NO
  Water Quality ..... NO
Flow Routing Method ..... DYNWAVE
Surcharge Method ..... EXTRAN
Starting Date 02/16/2021 00:00:00
Ending Date 02/16/2021 12:00:00
Antecedent Dry Days 0.0
Report Time Step 00:01:00
Routing Time Step ..... 0.50 sec
Variable Time Step ..... YES
Maximum Trials 41
Number of Threads 6
Head Tolerance ..... 0.000010 m

**********	Volume	Volume
Flow Routing Continuity	hectare-m	10^6 ltr
**********	---	---
Dry Weather Inflow	0.000	0.000
Wet Weather Inflow	0.000	0.000
Groundwater Inflow	0.000	0.000

1210     Node Surcharge Summary
1211     **********************
1212
1213     Surcharging occurs when water rises above the top of the highest conduit.
1214     -------------------------------------------------------------------
```

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.1 (Build 5.1.015)

5-Year flow in the storm sewers, 100 Year water level on the Jock River

****
Element Count
****
Number of rain gages 0
Number of subcatchments ... 0
Number of nodes 218
Number of links 207
Number of pollutants 0
Number of land uses 0

****

Analysis Options
****
Flow Units ..... LPS
Process Models:
  Rainfall/Runoff ..... NO
  RDII ..... NO
  Snowmelt ..... NO
  Groundwater ..... NO
  Flow Routing ..... YES
  Ponding Allowed ..... NO
  Water Quality ..... NO
Flow Routing Method ..... DYNWAVE
Surcharge Method ..... EXTRAN
Starting Date 02/16/2021 00:00:00
Ending Date 02/16/2021 02:00:00
Antecedent Dry Days 0.0
Report Time Step 00:01:00
Routing Time Step ..... 0.50 sec
Variable Time Step ..... YES
Maximum Trials 41
Number of Threads 6
Head Tolerance ..... 0.000010 m

**********	Volume	Volume
Flow Routing Continuity	hectare-m	10^6 ltr
**********	---------	---------
Dry Weather Inflow	0.000	0.000
Wet Weather Inflow	0.000	0.000

****
Node Surcharge Summary
****

Surcharging occurs when water rises above the top of the highest conduit.

Node	Type	Hours Surcharged	Max. Height Above Crown Meters	Min. Depth Below Rim Meters

Subject: **BCDC Phase 2 – Preliminary Water Balance & Water Quality Controls**

Introduction

Phase 2 of the Barrhaven Conservancy Development (aka Conservancy East) is located in Barrhaven, Ontario, north of the Jock River, south of the Fraser Clarke Creek and east of the Foster Creek. The proposed development is approximately 59.26 ha that will primarily comprise of single and townhouse residential lots. As a part of the City of Ottawa's review of the proposed development draft plan submitted in December 2020, it was requested that a preliminary water balance for the site be completed, and that additional information is provided to show how the development will meet the water quality requirements (80% TSS removal). As such the following memo outlines how the proposed development will match/exceed the existing water budget and meet the water quality requirements for the site; both of which will be achieved through the use of LIDs.

Modified Etobicoke Filtration Systems (MEFS)

It is proposed that Modified Etobicoke Filtration Systems (MEFS) will be implemented on all roads within the development. The MEFS takes the idea of using the right of way (ROW) to implement Low Impact Developments (LID) solutions, a concept originally proposed by James Li and John Tran in the development of the Etobicoke Exfiltration Systems (EES), but with some modifications made to the design to better suit the conditions observed at the proposed BCDC Phase 2 site. Figure 1 provides detailed drawings of the proposed MEFS.

The primary difference between the EES and the MEFS is that the EES provide storage volume solely below the proposed storm sewer, which then exfiltrates to the soils underneath the system, while the MEFS filters runoff through the granular storage volume around (above, below and beside) the storm sewer before it is conveyed to the downstream Maintenance Hole (MH). One other major difference between the EES and MEFS is that while the MEFS does provide some stormwater infiltration it is primarily a stormwater filtration solution. This is due to the BCDC Phase 2 development site consisting primarily of tight clay soils, providing low infiltration potential.

As shown in Figure 1, the MEFS will consist of catch basins with deep sumps (1 m) and will have two lead pipes, located at different elevations, with both equipped with goss traps. The lower lead pipe, a 150 mm non-ridged PVC pipe, will direct the first flush flows to a perforated 200 mm PVC pipe located near the top of the 2.5 m wide by 1.35 m deep, clear stone MEFS trench, which will then disperse and filter the runoff throughout the granular material in the trench. Once this filtered water reaches the bottom of the trench it can exfiltrate back to the surrounding soils or be collected by another 200 mm perforated pipe that drains to a downstream stormwater maintenance hole which then directs the flow into the stormwater sewer system. The second (higher) catch basin lead pipe, is a typical and conventional 200 mm pipe and will connect directly to the storm sewer.

Under this configuration, the first lead pipe will capture the first flush runoff from the development and direct it to the MEFS trench, where it will percolate and filter through the granular, with a portion of this volume retained within the trench to infiltrate. During high flow events (100-year storm) or when the filtration trench volume is already utilized, water will slightly back up in the catchbasin before reaching the second lead pipe, at which point it will pass flows directly to the storm sewer. Refer to Figure 1, for the detailed drawings of the proposed filtration system.

Water Quality Treatment

An analysis of various potential stormwater quality treatment options was investigated for this site. These included options and combinations of options such as street sweeping, curb cuts with grass swales, curb cuts with infiltration trenches, catch basin inserts, deep sump catch basins, below ground infiltration/ filtration trenches such as the Etobicoke systems or variations of it, and end of pipe alternatives such as oil and grit separators, and JellyFish filters. Each of these options has an expected total suspended sediment (TSS) removal capability, varying from 5% to 88%. When used in a treatment train approach the combination of TSS removal methods improves the overall performance. A summary of quality control options is provided in Attachment A.

Table 1 provides a summary of the TSS removal methods that were considered. Various options and combinations of options have been assessed and shown to meet or exceed the required 80% TSS target. However, with the proposed use of the MEFS which will provide a combination of filtration and infiltration (which is a vital component to meet the site's water budget requirements - further discussion below), Option 6 was selected for this project.

As such, stormwater quality treatment will be provided through the combined use of deep sump catch basins, goss traps on the lead pipes and MEFS. As per the available literature, deep sump catch basins can remove/ retain 25% of the total suspended sediments (TSS) and the MEFS can remove at least 80% of TSS. While it may be argued that the objective to remove 80% TSS could be achieved solely by the MEFS, the use of deep sump catch basins will provide pre-treatment to the MEFS, especially from being overloaded during construction periods and will reduce cleanout/maintenance frequency, further increasing its longevity. In addition to this, it is proposed that the catch basin lead pipes, both the upper and lower pipes, be protected with goss traps. This will prevent floatable pollutants, including oils, from being discharged to the stormwater collection system. The characteristics of the MEFS are described in the previous section of this memo and presented in Figure 1.

Table 1: Quality Control Options - Treatment Train to get 80% TSS Removal

Selection and comparison of Options

Method	TSS Removal	Opt. 1	Opt. 2	Opt. 3	Opt. 4	Opt. 5	Opt. 6	Opt. 7	Opt. 8
Street Sweeping (Monthly)	5%								
Street Sweeping (Weekly)	10%								
Street Sweeping (Weekly with Elgin Eagle)*	88%	X							
Curb Cut with Grass Swales	75%			X					
Curb Cut with Infiltration Trenches	80%		X						
Catch basin Inserts (CB Shield)*	27%				X	X		X	X
Deep Sump Catch Basin	25%				X		X		X
Infiltration/ Filtration Trenches**	80%				X	X	X		
OGS*	50%			X					X
JellyFish*	85%							X	
Overall Performance		**88.00%**	**80.00%**	**87.50%**	**89.10%**	**85.40%**	**85.00%**	**89.10%**	**72.60%**

Treatment Train Overall Performance = 1 - (1- TSS Removal Rate Method 1) x (1- TSS Removal Rate Method 2) x (1- TSS Removal Rate Method 3 x …)

*) TSS Removal as documented by ETV Canada

**) includes the use of Etobicoke infiltration or filtration systems or other permutations of the same

Water Balance

A pre-and post-development water balance has been completed for the site based on the Ministry of the Environment, Conservation and Parks (MECP) SWM design guidelines; the following section outlines the approach and results of this analysis for the various site conditions.

Pre-Development

Based on the Soil Survey Complex mapping from the Ontario Ministry of Agriculture, Food, and Rural Affairs (OMAFRA) the site primarily consists of Carsonby - Silty Clay (Type C) Soils. This was confirmed through onsite field investigations and boreholes which also reported Silty Clays through the majority of the site, refer to Paterson Groups report title "Geotechnical Investigation – Proposed Residential development – Conservancy Lands East", 24 September 2019, for full details. The existing site's water budget parameters have been based on Table 3.1 - Hydrologic Cycle Component Values of the MECP's SWM Manual, assuming Pasture and shrub conditions and a Type C hydrologic soil type, with a soil infiltration factor of 0.1 (tight clays) applied. Under pre-development conditions, the site has a total imperviousness of approximately 2%.

To determine the total water budget for the site, the proposed development lands have been broken into pervious and impervious areas. The annual evaporation, runoff and infiltration volumes were calculated for the impervious and pervious lands separately and summated to provide the overall water balance for the site. Based on continuous hydrologic SWMHYMO model simulations using 39 years of historical rainfall data from the Ottawa Airport, City default impervious Initial Abstraction parameters and an impervious drying time of 45 minutes, it was found that for 100% impervious surfaces, on average, 26% of the annual precipitation will be lost due to evaporation with runoff making up the remaining 74%, these values have been adopted in the water balance calculations for impervious surfaces.

Tables B1-1 to B1-3 outline the calculations of each of these components. Based on this analysis it was found that this site on average, 57.5% of the annual precipitation will return to the atmosphere through evaporation and evapotranspiration, 16.4% will infiltrate and 26.1% will runoff. For the total site drainage area of 59.26 ha, the site will infiltrate 91,518 m³/yr. or 154 mm/yr. of the total annual precipitation of 940 mm/yr.

Post-Development-Without LIDs

Under post-development conditions, the site has been broken into 3 subcomponents based on the proposed land use type: Town Homes, Single Homes and Park Lands. Note that the impervious area associated with the proposed roads has been included in the various development types outlined above. Based on the development conceptual plan, the 59.26 ha site will have a total imperviousness of 64%. The site's water budget parameters have been updated based on Table 3.1 - Hydrologic Cycle Component Values of the MECP's SWM Manual, assuming Urban Lawns and Type C hydrologic soil type. This analysis also assumes that the pervious surfaces within the development will be covered with imported topsoil, and as such a soil infiltration factor of 0.2 (reflective of a mix of clay and loam) was applied.

As completed under pre-development conditions, each of the land use types have been broken into pervious and impervious areas, and these resulting values summated. Tables B2-1 to B2-3 outline the calculations of each of these components. Based on this analysis it was found that, under post-development conditions (without any LID measures in place), this site on average will evaporate 37.0% of its annual precipitation while 7.6% will infiltrate and 55.4% will runoff. Based on the total development area of 59.26 ha, the site will infiltrate 42,561 m³/yr. or 71.8 mm/yr. of the total annual rainfall of 940 mm/yr.: 48,957 m³/yr. or 82.6 mm/yr. short of the pre-development conditions.

Post-Development – With LIDs

As indicated above, the increase in the impervious area due to the proposed development will result in a decrease in annual infiltration volume. To offset this deficit, it is proposed that LID measures will be implemented throughout the site to capture a portion of the additional runoff and allow it to infiltrate back into the soil. As indicated above, the Modified Etobicoke Filtration Systems (MEFS) are proposed to be implemented throughout this site in all locations physically and practically possible.

As a part of the "Barrhaven South Urban Expansion Area Master Servicing Study" completed by J.L. Richards and Associates Inc. (JLR), a detailed historical rainfall analysis was completed to correlate the volume of a single rainfall event to an annual event percentile; for example, based on JLR's study a 22 mm rainfall event correlates to the 95th percentile of all annual rainfall events in the Ottawa region. Similarly, the 85th, 75th and 65th percentile events correspond to 11.4 mm, 7.5 mm and 5.1 mm rainfall events. Using JLR's data, further extrapolation/interpolation can be applied to determine the annual percentiles for particular rainfall events. JLR's analysis helps determine how much of the annual rainfall volume will be dealt with but is missing a key piece of information; the runoff volume (in mm) generated by such rainfall events, which then can be used to conceptually size LID measures. To provide this missing information, a series of conceptual SWMHYMO models were prepared for various total imperviousness (TIMP) ranging from 40% to 95% with various degrees of directly connected imperviousness (XIMP), all with City Standard parameters. These models were run for the 5 mm, 10 mm, 15 mm, 20 mm, 22 mm, 25 mm and 30 mm design storms. From the results obtained (provided in Attachment C) it is possible to determine the runoff (in mm) generated from a given TIMP and XIMP, for any of these storms. For events with less than 5 mm of rainfall, the runoff volume can be computed by simply removing the initial abstraction (IA), from the total rainfall, over the impervious surfaces as the pervious surfaces will not generate any runoff.

It is noted that for the proposed development, with 65% total imperviousness (TIMP) and 52% directly connected imperviousness (XIMP), a 5 mm event would generate approximately 1.78 mm of runoff volume. For a typical ROW of 20 m and 30 m deep residential lots, this represents a volume of 0.142 m³/m (1.78 mm * 80 m²/m). Noting that for the current application, 16.5 m ROW widths and 21 m deep lots are being proposed, the runoff generated per linear meter of roads is reduced to 0.104 m³/m (1.78 mm * 58.5 m²/m). With the proposed 2.5 m wide MEFS clear stone trenches (40% porosity) either of these volumes can be retained within the vertical space between the bottom of the trench and the invert of the lower perforated pipe. For the larger of the two-volume to exfiltrate to the soils underneath the trench within a 48-to-72-hour period, the soils' effective infiltration rates would need to be 0.8 mm/hr to 1.2 mm/hr. These required rates are much lower than those reported by Paterson Group of 9 mm/hr - 25 mm/hr, based on the soil types observed on site.

As a part of this preliminary water budget analysis, it is assumed that 100% of the total drainage area within the development will be treated via MEFS. Interpolating the values in the tables derived by JLR (Table B2-5), combined with the SWMHYMO results provided in Appendix C, it is found that if the MEFS is designed to capture and infiltrate the runoff for storms up to the 5 mm event (64th percentile) a runoff volume of 1.78 mm, the MEFS would provide the means to maintain and exceed the existing on-site infiltration. The results of this analysis are summarized in Appendix B Table B2-4 and show that if LIDs were designed to retain and infiltrate the runoff from 5 mm storms or less, some additional 70,703 m³/yr. (119 mm/yr.) of runoff volume would be infiltrated. This volume offsets the deficit of 48,957 m³/yr. (82.6 mm/yr.) that was calculated under post-development conditions without any LIDs implemented, shown above.

Note that this analysis assumes that these LID measures will infiltrate the runoff volume for storms up to a 5 mm event, this does not mean that these LIDs will only be sized to capture and treat the 5 mm event. These measures will be sized to filter events greater than the 5 mm event, but only need to capture and infiltrate up to the 5 mm event to meet the existing water budget. It is important to note that the relatively low capture (retention/infiltration) rate of up to the 5 mm event is driven by the naturally low infiltration rates of the existing underlying soils (Silty Clays). The design capture event could be further increased but this would also greatly increase the drawdown times within the MEFS; these details can be refined at detailed design.

Water Budget Scenario Summary

Tables 2-4 summarize the annual average water balance under existing conditions and post-development conditions with and without LID measures in place, as m³/year, mm/year and % of total annual rainfall.

Table 2:Pre-Development Water Balance

Drainage Area (ha)		59.26	Imperviousness:	2%
Annual Average Volume	Precipitation	Evapotranspira-tion	Infiltration	Runoff

m³	556,997	206,259	113,264	237,474
mm	940	348	191	401
%	100%	37.1%	20.3%	42.6%

Based on this analysis of pre-development conditions this site will evaporate 57.4%, infiltrate 16.4% and runoff 26.1% of all annual rainfall. Under Post-development conditions without LID, this site will evaporate 37.1%, infiltrate 7.6% and runoff 55.3% of all annual rainfall. Under post-development conditions with LIDs, this site will evaporate 37.1%, infiltrate 20.3% and runoff 42.6% of all annual rainfall, exceeding existing pre-development infiltration rates.

Conclusion

Phase 2 of the Barrhaven Conservancy Development will meet and exceed the quality control requirements of 80% TSS removal, through the implementation of a stormwater quality treatment train, which will combine the use of deep sump catch basins, goss traps on the lead pipes and MEFS. This combined treatment train approach is expected to provide 85% TSS removal, exceeding the site's water quality requirements.

A preliminary water balance analysis of the existing site was completed to determine pre-development infiltration rates. A post-development analysis, where no LIDs were implemented, showed that the percentage of annual rainfall infiltrated would decrease by 8.8%. Implementing LIDs in the way of Modified Etobicoke Filtration Systems that are designed to capture and infiltrate up to the 5 mm event would offset this deficit and exceed pre-development conditions. Based on this analysis it has been shown that the proposed development will be able to meet and exceed the existing annual infiltration volumes through the use of MEFS.

Yours truly,
J.F Sabourin and Associates Inc.

Subject: **Review of Quantity Control Requirement for Jock River-Reach One**

Introduction

Phase 2 of the Barrhaven Conservancy Development (aka Conservancy East) is located in Barrhaven, Ontario, north of the Jock River, south of the Fraser Clarke Creek and east of the Foster Creek. The proposed development is approximately 59.26 ha that will primarily comprise of single and townhouse residential lots. As a part of the City of Ottawa's review of the proposed development draft plan of Phase 2 of the Barrhaven Conservancy Development, submitted in December 2020, it is proposed that flood quantity control measures will not need to be implemented as a part of this development. This assumption is based on the work completed by Stantec in June 2007 in the "Jock River Reach One Subwatershed Study" which concluded that for future developments within Reach 1 of the Jock River: "No quantity control storage is required for flood control purposes as the hydrograph from the subwatershed will peak before the upstream peak in the Jock River" and that "No erosion control storage is required to maintain the predevelopment in-stream erosion condition". Although this study did not consider the future development of the Barrhaven Conservancy Lands, and as such the modelling completed by Stantec has been updated by JFSA to reflect these changes. The following memo outlines data sources, assessed scenarios, assumptions, and conclusions of this independent Jock River Reach One study.

It is noted that RVCA is currently engaging in a formal update/review of the Jock River Reach One Subwatershed Study, with the findings of this study having the potential to affect the above-noted design criteria. While that study is underway J.F. Sabourin and Associates Inc. (JFSA) has completed an independent Jock River - Reach One study to re-assess/confirm that the assumptions presented in the original 2007 study by Stantec are still valid, as any changes to this conclusion could greatly impact the current BCDC Phase 2 development plan.

Background Data

The following outlines all the model and data sources used in this analysis:

- *"Jock River Floodplain Mapping Report"*, (2005 - PSR Group Ltd. & JFSA)
- *"Jock River Reach One Subwatershed Study Final Report",* (2007 – Stantec)
- *"Corrigan Stormwater Management Facility Stormwater Management Report and Design Brief"*, (2010 - IBI Group)
- *"Citi Gate, Highway 416 Employment Lands, Servicing Study and Stormwater Management Report (O'Keefe SWM)",* (2012 – Novatech)
- *"Foster Stormwater Management Facility, Environmental Study Report",* (2013 - CH2MHill)
- *"Todd Pond Model Keeper Analysis (Re-Assessment of Existing System Capacity)"*, (2015 – JFSA)

- *"CitiGate 416 Corporate Campus Detailed Servicing and Stormwater Management Report (Phase 1)"*, (2015 – Novatech)
- *"Kennedy-Burnett Stormwater Management Facility Retrofit, Detailed Design Report"*, (2020 – Novatech)
- *"Half Moon Bay South / Addendum to April 2015 Todd Pond Model Keeper Analysis, Re-Assessment of Existing System Capacity Report" (2020 - JFSA).*

Model Development/Scenarios

The following section outlines the various hydrologic model scenarios developed as a part of this work, with a brief description of the data sources used for each scenario and how they have been incorporated into the existing Jock River subwatershed hydrologic model.

Model 1 - Jock River Floodplain Model – JFSA, 2005

This hydrologic model was developed as a part of the floodplain mapping study of the Jock River completed in 2005. The hydrologic model of the Jock River was developed by JFSA using SWMHYMO, with independent models developed to simulate both summer and spring events. Both models were calibrated to field measured flows, recorded at the Water Survey Canada Flow Gauge at Moodie Drive. These models function as the basis for which all future models (both by JFSA and others) have been built on. Refer to Figure 1 (JFSA, 2005) for an overview of the subcatchments for reach one in this model, with full SWMHYMO input and summary files provided in Attachment A.

Model 2 – Jock River Reach One Model – Stantec, 2007

The hydrologic analysis completed by Stantec in 2007 built upon the JFSA 2005 floodplain mapping modelling. As a part of the Stantec work, the lower reach of the Jock River (3,176 ha) which was represented as a single subcatchment in the 2005 study was subdivided into thirteen (13) subcatchments to better delineate the drainage areas to the various tributaries (O'Keefe, Fraser, Foster, Todd, Corrigan and Clarke) and to also provide a better representation of the existing development areas (Kennedy Burnett, Chapman Mills, Jockvale and Hearts Desire). The remaining natural/undeveloped areas within the Jock River corridor were subdivided into three smaller (3) sub-catchments. Refer to Figure 2 (Stantec, 2007) for an overview of the subcatchments for reach one in this model, with full SWMHYMO input and summary files provided in Attachment B.

As mentioned above from this study, it was concluded that developments located in the lower reaches of the Jock River do not require any quantity control storage for flood control purposes as the hydrograph from the subwatershed will peak before the upstream peak in the Jock River and that no erosion control storage is required to maintain the pre-development in-stream erosion conditions.

Model 3 – Jock River Reach One Model Update – JFSA, 2021

As a part of the study outlined in this report, the 2007 Stantec SWMHYMO model of the Jock River was updated to reflect (as best as possible with the available information) proposed, approved and potential future developments, since the 2007 study.

At the time of the 2007 study, it was assumed that the floodplain of reach one of the Jock River (from Highway 416 to Greenbank Road) would not be filled and developed. Furthermore, the assumptions that were made in 2007 for the total imperviousness of future developments are not reflective of the actual constructed conditions observed in 2021; for example, the total impervious area for the Todd drainage area was assumed to be 43% in the 2007 study, while based on latest aerial photography it appears that the imperviousness for this area is closer to 58.5%). Additionally, SWM quantity controls were implemented in some tributaries within Reach One (e.g., O'Keefe, Foster and Kennedy-Burnett) to respect the hydraulic capacity of the local watercourses or other existing hydraulic constraints.

As outlined in the Background Data section of this memo, data from various reports and studies were collected and used to update Stantec's 2007 model, to best reflect existing conditions and known approved and planned development projects. As such, the thirteen (13) subcatchments of the 2007 Stantec model have been further discretized into one hundred ten (110) subcatchments, with numerous additional major system storage, SWM Ponds, and channel routing commands added. This updated existing condition model is reflective of current 2021 conditions, which assumes that the lower Jock River floodplain is undeveloped. It should also be noted that only subcatchments downstream of Highway 416 have been updated as a part of this analysis. Updates to other catchments of the Jock River further upstream, such as the Monahan Drain, Hobbs Creek, King Creek, and development areas in Richmond, where additional new information may be available, have not been included in the model updates at this time. Refer to Figure 3 for an overview of the subcatchments for reach one in this model, with full SWMHYMO input and summary files been provided in Attachment C, detailed schematics of the subcatchments updated as a part of this study have been provided in Attachment F.

Note that Novatech's PCSWMM model of the Kennedy-Burnett area was used to create a detailed SWMHYMO model of the same area. In creating this SWMHYMO model it was found that the 100-year peak outflows from the Kennedy Burnett facility were 1.4 times higher than that reported in the Novatech PCSWMM model. While it is expected that different modelling software will produce slightly different results, this difference is significant and should be investigated further; although it is unlikely that this difference is expected to change the fundamental conclusions of this analysis.

Model 4A & 4B – Jock River Reach One Future Conditions (without and with quantity SWM controls) – JFSA, 2021

Two additional models (4A and 4B) were created (which built on model 3) to evaluate the impacts of developing portions of the lower Jock River floodplain (from Highway 416 to Greenbank Road). These lands make up approximately 156 ha and would include BCDC and other properties on the south side of the Jock River. Model 4A assumes that these lands would be developed without any SWM quantity controls and Model 4B assumes that the lands would be developed with SWM Post to Pre-development quantity controls. Refer to Figure 4 for an overview of the subcatchments for reach one in these models, with full SWMHYMO input and summary files for scenarios 4A and 4B provided in Attachment D & E, respectively.

Results

All hydrologic models were run using a 24 hours SCS storm for the 2-to-100-year events. Note that this analysis focuses on this particular rainfall event as for developed areas the summer rainfall events are more critical than the spring rainfall plus snowmelt conditions. Hence, only the summer peak flows have been summarized and compared for the various scenarios below, as the flow contributions from the developments in the lower Jock River under the spring rainfall + snowmelt event are negligible compared to the flows upstream from the greater Jock River. It is further noted that the same design storms were used in all models.

Peak flows at key locations along Reach One of the Jock River have been extracted from the various hydrologic models and provided in the following section. As a part of this analysis, 5 key locations on the Jock River have been selected to compare the simulated peak flows and are as follows: Highway 416, Borrisokane Road, Greenbank Road, Jockvale Road and the Jock River's confluence with the Rideau River. Note that for the older models (JFSA 2005 & Stantec 2007) results have only been provided at some locations, as these original models were not discretized to this higher level of detail. Additionally, the Stantec 2007 model did not assess flows on the Jock River for the 10- and 50-year events at any locations.

Table 1: Comparison of Summer Peak Flows (m^3/s) at Highway 416 (52483.00 ha)

Scenario	Return Period					
	2-Year	5- Year	10-Year	25-Year	50-Year	100-Year
Model 1: 2005 Floodplain Study	45.676	66.292	82.076	104.643	122.469	141.415
Model 2: Stantec 2007 Reach One Analysis	45.789	66.413	n/a	104.834	n/a	141.853
Model 3: Updated Model 2 to current/ approved conditions	46.294	67.222	83.235	106.109	124.249	143.580
Model 4A: Model 3 with BCDC & others w/o SWM	46.294	67.222	83.235	106.109	124.249	143.580
Model 4B: Model 3 with BCDC & others with SWM	46.294	67.222	83.235	106.109	124.249	143.580

From Table 1 above it is seen that the peak flows on the Jock River at Highway 416 for Models 3, 4A and 4B are higher than in Models 1 and 2. This is because the computational time step in the updated models was reduced from 5 - 10 minutes to 1 minute. This change was necessary to provide stable results in the various models, especially with the additional ROUTE CHANNEL commands that have been added to the updated models. There were no other changes made to the models upstream of Highway 416.

Table 2: Comparison of Summer Peak Flows (m^3/s) at Borrisokane Road (53577.82 ha)

Scenario	Return Period					
	2-Year	5- Year	10-Year	25-Year	50-Year	100-Year
Model 1: 2005 Floodplain Study	n/a	n/a	n/a	n/a	n/a	n/a
Model 2: Stantec 2007 Reach One Analysis	46.817	68.124	n/a	107.402	n/a	144.892
Model 3: Updated Model 2 to current/ approved conditions	47.379	69.117	85.613	108.988	127.740	147.849
Model 4A: Model 3 with BCDC & others w/o SWM	47.426	68.998	85.561	109.064	127.650	147.535
Model 4B: Model 3 with BCDC & others with SWM	47.599	69.319	85.870	109.449	128.055	147.939

From Table 2 it is seen that the peak flows on the Jock River at Borrisokane are generally lower in model 4A (developed without SWM controls) than under existing conditions (Model 3). The inclusion of SWM controls for these future developments results in the peak flows increasing from existing conditions for all return periods at this location. Note that the increase in flows at this location between the Stantec model (model 2) and the JFSA existing conditions model (model 3) again is due to the greater discretization of subcatchments at Borrisokane Road in the JFSA model. For example, in the Stantec model, the subcatchment that represents the currently undeveloped lands along the Jock River is represented as a single subcatchment (S-1). Where the JFSA updated model represents these lands as 14 individual subcatchments, all discharging to their respective locations within the Jock River (e.g. O'Keefe Creek, Foster Creek & Borrisokane Road).

Table 3: Comparison of Summer Peak Flows (m^3/s) at Greenbank Road (54717.80 ha)

Scenario	Return Period					
	2-Year	5- Year	10-Year	25-Year	50-Year	100-Year
Model 1: 2005 Floodplain Study	n/a	n/a	n/a	n/a	n/a	n/a
Model 2: Stantec 2007 Reach One Analysis	49.195	71.220	n/a	111.172	n/a	149.236
Model 3: Updated Model 2 to current/ approved conditions	49.055	70.826	86.895	110.282	128.564	147.488
Model 4A: Model 3 with BCDC & others w/o SWM	48.599	69.773	85.389	103.842	126.050	144.531
Model 4B: Model 3 with BCDC & others with SWM	48.982	70.171	85.928	103.651	126.537	144.894

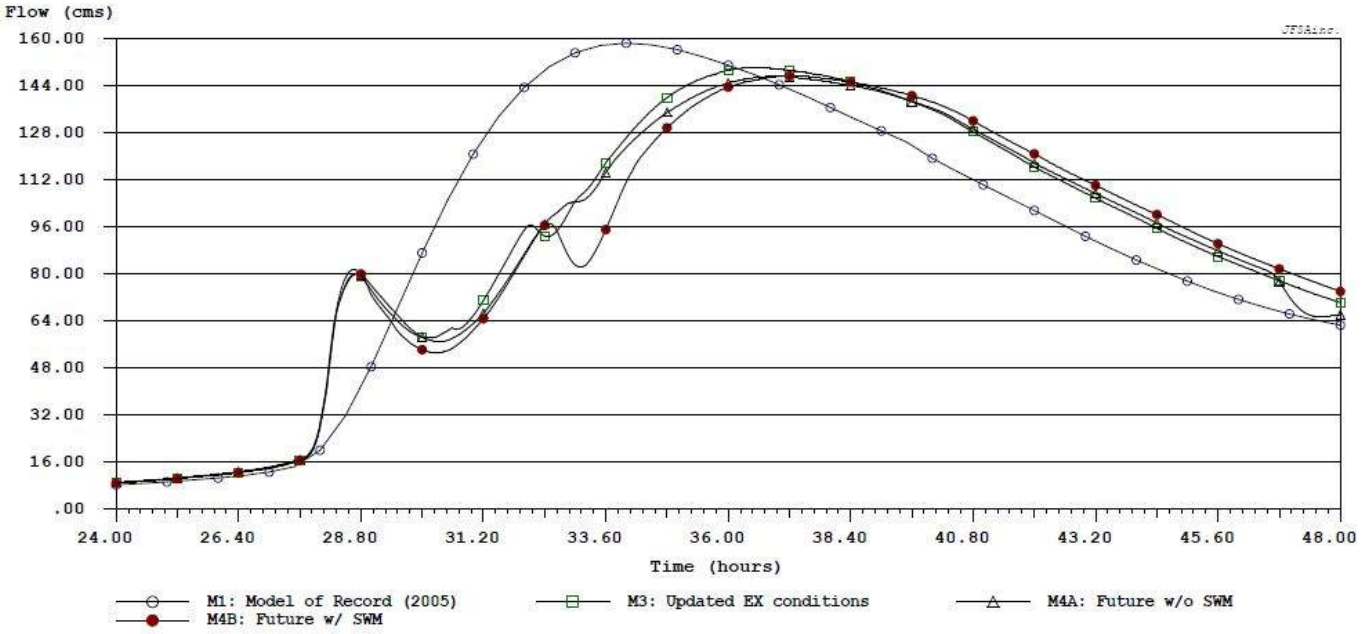
From Table 3 it is seen that peak flows on the Jock River at Greenbank Road are the lowest without SWM controls in place (Model 4A). With SWM controls in place, the peak flows are lower than the existing conditions, but not as low as when SWM controls are not implemented. Note that the JFSA existing conditions model (model 3) is presenting peak flows lower than the Stantec model (model 2) at this location, again this is due to the greater discretization in the JFSA model as discussed above.

Table 4: Comparison of Summer Peak Flows (m^3/s) at Jockvale Road (55476.26 ha)

Scenario	Return Period					
	2-Year	5- Year	10-Year	25-Year	50-Year	100-Year
Model 1: 2005 Floodplain Study	n/a	n/a	n/a	n/a	n/a	n/a
Model 2: Stantec 2007 Reach One Analysis	49.870	72.143	n/a	112.074	n/a	150.033
Model 3: Updated Model 2 to current/ approved conditions	49.619	72.224	88.294	111.989	130.865	149.819
Model 4A: Model 3 with BCDC & others w/o SWM	49.482	71.017	86.165	105.082	128.174	146.840
Model 4B: Model 3 with BCDC & others with SWM	49.606	71.408	86.690	104.765	128.229	147.027

From Table 4 is seen that the peak flows at Jockvale Road are generally at their lowest without SWM controls in place, and that either implementing or not implementing SWM controls for future developments results in peak flows at this location being less than existing conditions.

Table 5: Comparison of Summer Peak Flows (m^3/s) at Outlet of Jock River (55579.20 ha)



Scenario	Return Period					
	2-Year	5- Year	10-Year	25-Year	50-Year	100-Year
Model 1: 2005 Floodplain Study	49.16	72.08	89.96	115.84	136.46	158.42
Model 2: Stantec 2007 Reach One Analysis	50.78	73.65	n/a	113.97	n/a	157.69
Model 3: Updated Model 2 to current/ approved conditions	49.72	72.36	88.45	112.2	131.12	150.12
Model 4A: Model 3 with BCDC & others w/o SWM	49.58	71.17	86.35	105.27	128.42	147.10
Model 4B: Model 3 with BCDC & others with SWM	49.70	71.54	86.85	104.96	128.45	147.28

From Table 5 it is seen that the peak flows on the Jock River at the confluence with the Rideau River are generally at their lowest without SWM controls in place, and that either implementing or not implementing SWM controls for future developments results in peak flows at this location to be less than existing conditions.

Discussion

Although not initially obvious, the reason that future urban developments within Reach One of the Jock River are decreasing peak flows on the Jock River is because developing land not only affects the peak of the hydrograph but also the overall shape. Figure A below provides a comparison of the simulated hydrographs at the Jock River's confluence with the Rideau River from the various model scenarios. During any rainfall event, the runoff from the existing and future developments within Reach One will have already peaked and decayed before the peak flows arrive at this location from the upstream drainage area. For the 100-Year SCS storm, the peak from the development in Reach One can be seen in the figure below at around 28 hours, while the peak flow on the Jock River from the upstream drainage areas occurs at around 36-37 hours, this is approximately a 9-hour difference in timing. As such, implementing SWM measures for developments in the lower portions of the Jock River will decrease peak flows from the development, but would also prolong the period of time during which they discharge into the Jock River, thus coinciding with flows from the greater Jock River, ultimately resulting in potential increases in peak flows on the Jock River. This is seen in the figure below with the future condition with SWM controls (Model 4B - Red Circles) having a higher flow in the tail than future conditions without SWM controls (Model 4A – Black Triangles). Note that the difference between Model 1 and all other scenarios is simply due to further discretization of subcatchments within Reach One.

Figure A: Comparison of simulated 100 yr Jock River hyrographs at the confluence with the Rideau River

Hydrograph Statistics:

—●—	SN_N1.0100 : M4B: Future w/ SWM	1.00	55579.19	147.276	37.250	14.03	7.798E+06	24.000	90.252

Conclusion

The hydrologic model developed as a part of the Jock River Reach One Subwatershed Study (Stantec 2007) has been updated to provide additional refinements in the lower reaches of the Jock River (downstream of Highway 416) and assumes the development of lands that were previously not considered in the 2007 analysis (e.g. Barrhaven Conservancy). Future development condition models were created with and without SWM controls assumed, and the peak flows extracted from these models at key locations along the lower Jock River. From this analysis, it was found that with these additional developments in the lower Jock River peak flows are generally less than existing conditions without SWM controls in place. Implementing SWM controls for these developments has also been found to generally decrease peak flows on the Jock River, but not at all locations and not to the same degree as without SWM controls. Ultimately these findings are consistent with the fundamental conclusions drawn in Stantec's 2007 Jock River Reach One study, which initially determined that for future developments within Reach One of the Jock River "No quantity control storage is required for flood control purposes as the hydrograph from the subwatershed will peak before the upstream peak in the Jock River" and that "No erosion control storage is required to maintain the pre-development in-stream erosion condition". Based on the results of the updated analysis outlined in this memo, it can confirm that the fundamental conclusions drawn in Stantec's 2007 for developments in reach one of the Jock River remain valid.

Yours truly,

*#
*# Version: Draft Final Report, October 2006
*# Revision History
*# -Draft Interim Condition Report, Nov. 2005
*#************************************************************************
*# Assumptions
*# - All catchments are assumed to be developed except S-1, S-2, and SW-1a
*# - SWM facilities are modeled
*# - Rating curves were estimated based on existing reports and modeling for the
*#   proposed SWM facilities
*# - The rating curve for the existing Kennedy Burnett SWM Facility was obtained from
*#   the Urban Runoff Treatment in the Kennedy Burnett Settling Pond (URTKBP)- Regional
*#   Municipality of Ottawa Carleton, March 1983
*# - River routing modeled
*# - River cross sections obtained from RVCA's HEC-RAS hydraulic model
*#-----------------|------------------------------------------------------|
*# Parameters
*# - Design Storms: 2,5,10,25,50 &1 00yr events: 24hr SCS (DT=10min)-model comparison
*# - Impervious area weighted based on: rural subdivision @20%, urban @55%
*# - NRCS(SCS) CN based on landuse (airphoto) and soil type (base mapping)
*# - Time to peak using Uplands Method
*#-----------------|------------------------------------------------------|
*#************************************************************************

Model 3 – Jock River Reach One Update

JFSA, 2021

SWMHYMO Input & Summary files

```
20    Metric units / ID numbers OFF
*#*************************************************************************
*#  SWMHYMO Ver:5.02/Jan 2001 <BETA> / INPUT DATA FILE
*#*************************************************************************
*#  Project Name: [Jock River]    Project Number: [1474-16]
*#  Date        : 04-03-2021
*#  Modeller    : [M.M.]
*#  Company     : JFSAinc.
*#  License #   :  2549237
*#*************************************************************************
*# CALIBRATION OF SUMMER MODEL PARAMETERS
*# USING CONTINUOUS SIMULATIONS
*# Rainfall data from JFSA raingauge installed at site + other gauges by the City
*# Use data collected from May 1st to July 14, 2003
*# 2020-11-30 change TMJSTO in COMPUTE DUALHYD (TMJSTO = 0.1 instead of 0.0001)
*# 2020-12-01 correct pond curve values
*# 2020-12-01 change W_CLAR_BRAZ XIMP to 0.55, SLPI=[0.5](%) (impervious slope), and
LGI up to 700m
*# 2021-02-19 Change the slope for ROUTE CHANNEL Station 2462 (NHYDout=["N_TO"]
,NHYDin=["SN_TO"]) from 0.033 % (as per Stantec Report 2007) to 0.05 % so the model
will be more stable and give reasonable results. It is justifiable as ROUTE CHANNELs
aren't well suited to really flat slopes.
*# 2021-02-19 Change the slope for ROUTE CHANNEL Station 5002 (NHYDout=["N_WC"]
,NHYDin=["SN_CE"]) from 0.01 % (as per Stantec Report 2007) to 0.0255 % so the model
will be more stable and give reasonable results. It is justifiable as ROUTE CHANNELs
aren't well suited to really flat slopes.
*
* Calibrated parameters for Summer 2003 data:  APII=50, APIK=0.85, CN=varies,
*                                              SK=0.01, InterEventTime=12,
*                                              GWResk=0.96, VHydCond=0.055
