Attention: Wally Dubyk
Project Manager, Infrastructure Approvals

Dear Sir:

Reference: East LeBreton Flats Development
Transportation Impact Study
Our File No. : 116042

We are pleased to submit the following Transportation Impact Study (TIS) in support of Zoning By-law Amendment and Official Plan Amendment applications for the east LeBreton Flats lands located at 201, 301 and 324 Lett Street, 450 Lloyd Avenue and 133 Booth Street.

The structure and format of this report is in accordance with the 2006 City of Ottawa Transportation Impact Assessment (TIA) Guidelines. A checklist of the documentation requirements as outlined in Appendix B of the TIA Guidelines is attached overleaf with reference to corresponding report sections.

A PDF version of this report and copies of the electronic software files are provided on the enclosed disk. Please call if you have any questions as you complete your review.

Yours truly,

NOVATECH

Brad Byvelds, P. Eng.
Project Coordinator | Transportation/Traffic

Documentation and Reporting Checklist

Report Context (Section 1.0)

Description of the development (include all of the following that are known at the time of the application):

- ☐ Municipal address;
- ☐ Location relative to major elements of the existing transportation system (e.g., the site is located in the southwest quadrant of the intersection of Main Street/ First Street, 600 meters from the Maple Street Rapid Transit Station);
- ☐ Existing land uses or permitted use provisions in the Official Plan, Zoning By-law, etc.;
- ☐ Proposed land uses and relevant planning regulations to be used in the analysis;
- ☐ Proposed development size (building size, number of residential units, etc.) and location on site;
- ☐ Estimated date of occupancy;
- ☐ Planned phasing of development;
- ☐ Proposed number of parking spaces (not relevant for Draft Plans of Subdivision); and
- ☐ Proposed access points and type of access (full turns, right-in/ right-out, turning restrictions, etc.
- ☐ Study area;
- ☐ Time periods and phasing; and
- ☐ Horizon years (include reference to phased development).

The TIS must include a key plan that shows the general location of the development in relation to the surrounding area. The TIS must also provide a draft site plan of a suitable scale that shows the general location of the development and the proposed access. If the proposed development/ redevelopment is to be constructed in phases, a description must be provided for each phase, identifying the proposed timing of implementation.

Existing Conditions (Section 2.0)

- ☐ Existing roads and ramps in the study area, including jurisdiction, classification, number of lanes, and posted speed limit;
- ☐ Existing intersections, indicating type of control, lane configurations, turning restrictions, and any other relevant data (e.g., extraordinary lane widths, grades, etc.);
- ☐ Existing access points to adjacent developments (both sides of all roads bordering the site);
- ☐ Existing transit system, including stations and stops;
- ☐ Existing on- and off-road bicycle facilities and pedestrian sidewalks and pathway networks;
- ☐ Existing system operations (V/C, LOS); and
- ☐ Major trip generators/ attractors within the Study Area should be indicated.

The TIS report must include: a context plan of a suitable scale that shows the general location of the development, the proposed access locations and the existing conditions in the surrounding area; figures documenting the existing travel demands by mode; and a summary of collisions for the effected study area roads. A photographic inventory of the transportation network elements in

the vicinity of the proposed access points would be beneficial to staff in their review of the Consultant's report.

Demand Forecasting (Section 3.0)

- ☐ General background growth;
- ☐ Other study area developments;
- ☐ Changes to the study area road network;
- ☐ Future background system operations (V/C, LOS, queue lengths):
 - include figures documenting future background travel demands by mode for each horizon year
- ☐ Trip generation rates;
- ☐ Trip distribution and assignment:
 - include figures documenting forecasted site trip generation and assignment by mode; and
 - include figures documenting total future travel demands by mode for each horizon year.

Impact Analysis (Section 4.0-8.0)

- ☐ Total future system operations (V/C, LOS, queue lengths);
- ☐ Signal and auxiliary lane (device) warrants;
- ☐ Operational/ safety assessment (e.g., sight line assessment where grades are an issue);
- ☐ Storage analysis for closely spaced intersections;
- ☐ Pedestrian and bicycle network connections and continuity;
- ☐ On-site circulation and design;
- ☐ Potential for neighbourhood impacts; and
- ☐ TDM.

Mitigation Measures and Site Design Characteristics (Section 7.0, 8.0)

The TIS must identify all mitigation measures required to offset network impacts from the development. The TIS must also identify key site design features required to implement the Official Plan and Transportation Master Plan policies regarding site development.

The TIS must include all of the following, where they are required by the subject development:

- ☐ Location and timing of proposed changes to existing traffic controls at intersections (e.g., new traffic signals, Stop signs, etc.);
- ☐ Location and timing of new intersections, including proposed traffic control measures (e.g., traffic signals, etc.);
- ☐ Requirements for new auxiliary lanes;
- ☐ Mitigation measures required to offset impacts on the surface and Rapid Transit networks;
- ☐ New or modified elements of the bicycle and pedestrian networks;
- ☐ Community impact mitigation measures; and
- ☐ Proposed TDM features or programs to support the site development.

EXECUTIVE SUMMARY

This Transportation Impact Study (TIS) has been prepared in support of Zoning By-law Amendment and Official Plan Amendment applications for the lands east of Booth Street between the historic aqueduct and Confederation Line LRT to the south and Fleet Street to the north. The subject lands will henceforth be referred to as the “East LeBreton Flats lands”. The subject lands are designated as Block P, Q and I in the National Capital Commission’s (NCC) Block Subdivision Plan.

The East LeBreton Flats lands will consist of five buildings, and will accommodate approximately 1950 residential units, a 35,000ft² (GFA) food store, 60,000ft² (GFA) of commercial development and 63,000 square feet (GFA) of institutional development. The proposed developments will include underground parking garages with accesses on Lett Street and Lloyd Street. The estimated completion date of the proposed development is 2031.

The study area for this report was confirmed with City staff, and includes the following intersections:

- Wellington Street/Sir John A MacDonald Parkway/Booth Street;
- Wellington Street/Lett Street;
- Wellington Street/Portage Bridge;
- Booth Street/Fleet Street;
- Booth Street/Albert Street.

The selected time periods for the analysis are the weekday AM and PM peak hours, as they represent the ‘worst case’ combination of site generated traffic and adjacent street traffic. Existing traffic conditions within the study area have been examined, along with background and total traffic conditions for the 2031 build-out year.

Intersection capacity analysis has been completed using the software package Synchro 10.0. This software uses methodology from the *Highway Capacity Manual 2010* (HCM), published by the Transportation Research Board, to evaluate signalized and unsignalized intersections. During the pre-consultation meeting on May 10th, 2017, City staff requested the TIS include a Multi-Modal Level of Service (MMLOS) analysis. The MMLOS analysis has been completed using the MMLOS Guidelines Supplement to the TIA Guidelines prepared by IBI Group in October 2015.

Based on the results of the analysis, the main conclusions and recommendations of this report are as follows:

Segment MMLOS Analysis

- All segments within the study area, excluding Booth Street south of Albert Street and Lett Street, do not meet the target PLOS. Sir John A MacDonald Parkway/Wellington Street, Booth Street north of Wellington Street and south of Albert Street do not meet the target BLOS. None of the segments within the study area are identified as a Transit Priority Corridor in the City’s *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All of the segments within the study area meet the target TkLOS. All segments within the study area, excluding Booth Street south of Albert Street and Albert Street east/west of Booth Street, meet the target Auto LOS.

- The target PLOS A cannot be achieved along a roadway with an AADT greater than 3000 vpd and an operating speed greater than 30km/hr. As Sir John A MacDonald Parkway, Wellington Street, Portage Bridge, Booth Street (north of Albert Street) and Albert Street are arterial roadways with an AADT greater than 3000vpd and an operating speed greater than 30km/hr, a PLOS A cannot be achieved.
- The implementation of a separated cycling facility along Sir John A MacDonald Parkway/ Wellington Street from west of Booth Street to Portage Bridge would result in a BLOS A, meeting the target for the Central Area.
- If possible, physically separating the eastbound bike lane along Wellington Street east of Portage Bridge, similar to the westbound facility, would result in a BLOS A for this segment, meeting the target for the Central Area.
- As the Portage Bridge has a six-lane divided cross section with a median width of 1.5m, the existing width of the bridge limits the ability to provide a boulevard to improve the PLOS on the west side of this segment.
- The City's *Ottawa Cycling Plan* identifies the implementation of either bike lanes or a multi-use pathway along Booth Street north of Wellington Street. A reduction in other cross sectional elements will be required in order to accommodate either facility. The implementation of bike lanes would result in a BLOS B, while a multi-use pathway would result in a BLOS A.
- Traffic calming measures (on-street parking, curb extensions and speed humps) have been implemented along Booth Street south of Albert Street, which reduces the level of stress for cyclists along this segment. Consideration could be given to implementing bike lanes along this segment.
- Although the south side of the Albert Street does not meet the target PLOS, pedestrians requiring additional comfort or safety can use the multi-use pathway on the north side.

Intersection MMLOS Analysis

- All intersections within the study area do not meet the target PLOS and BLOS. All of the study area intersections are not located along a Transit Priority Corridor in the City's *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All intersections within the study area meet the target TkLOS. The Wellington Street/Portage Bridge and Albert Street/Booth Street intersections do not meet the target Auto LOS.
- Consideration could be given to providing either textured or zebra striped crosswalks at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection to improve the pedestrian level of comfort crossing each approach. Consideration could also be given to implementing a two stage, left-turn bike box to facilitate the southbound left turn movement for cyclists at this intersection. Critical movements at this intersection are currently operating with a vehicle LOS F during the PM peak hour.
- Consideration could be given to implementing leading pedestrian intervals and a two stage, left-turn box to facilitate the westbound left turn movement for cyclists at the Wellington Street/Lett Street intersection.

- The Wellington Street/Portage Bridge intersection is not a standard configuration and the results of the PLOS and BLOS analysis should be treated with caution. The pedestrian and cycling facilities at the Wellington Street/Portage Bridge intersection are anticipated to have a higher PLOS and BLOS than represented by the analysis. Critical movements at this intersection are currently operating with a vehicle LOS F during both the AM and PM peak hours.
- The PLOS at the Albert Street/Booth Street intersection is highly influenced by the number of lanes crossed (5-6 lanes) along Albert Street. A reduction in east-west travel lanes is anticipated to have a significant impact on the vehicle operations at this intersection and is not recommended. It is noteworthy that leading pedestrian intervals and zebra striped crosswalks are currently implemented at this intersection to provide a higher level of comfort and safety for pedestrians crossing Albert Street. Critical movements at this intersection are currently operating with a vehicle LOS F during the PM peak hour.

Future Intersection Operations

- Under the 2031 background traffic conditions, critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street, Wellington/Portage Bridge and Albert Street/Booth Street intersections are anticipated to operate with a LOS F during the AM and PM peak hours.
- Continued support of transportation solutions that maximize the transit, bike and walk modes of travel will be critical in this area. Options to displace traffic along the study area roads include increased use of non-auto modes of transportation to/from the downtown core, alternate time of travel for drivers using the corridor to make use of off-peak capacity and alternate routes for travel to/from the downtown core.
- Under the 2031 total traffic conditions, critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street, Wellington/Portage Bridge and Albert Street/Booth Street intersections are anticipated to continue to operate with a LOS F during the AM and PM peak hours.
- A two-lane northbound approach is recommended at the Wellington Street/Lett Street intersection, to be implemented through line painting. Since the right turn movement is significantly heavier than the left turn movement, it is recommended that the right turn lane be painted as the continuous lane and the left turn lane is to be developed as the auxiliary lane. A storage length of approximately 20m is recommended for the proposed left turn lane.

Non-Auto Transportation, On-site Design, Community Impacts and Transportation Demand Management

- The proposed development will maintain a pedestrian/cyclist connection to Pooley's Bridge/Wellington Street via Fleet Street east of Lett Street. This connection provides access to a multi-use pathway network connecting to Wellington Street and the Trans Canada Trail.
- The proposed concept plan identifies City parkland south of Lett Street. Multi-use pathways will be provided within the park, providing an alternative pedestrian/cyclist connection to Pooley's Bridge, Wellington Street and the Trans Canada Trail. These multi-use pathways

will also cross under Booth Street adjacent to the aqueduct, travelling west to the future West LeBreton Flats lands.

- The proposed development will be within a walking distance of approximately 400m of the future Pimisi LRT station. This LRT station will provide comprehensive transit coverage across the City of Ottawa.
- Parking for the proposed development will be provided underground with accesses on Lett Street and Lloyd Street. The specific location of the parking garage accesses will be determined and reviewed through subsequent Site Plan Control applications for each phase as planning and design progresses.
- The number of parking spaces to be provided is unknown at this point and will be reviewed in subsequent Site Plan Control applications for each phase as planning and design progresses. The proposed development will be a transit oriented development located within a 400m walking distance of the future Pimisi LRT station, and is in close proximity to the downtown core. Parking to be provided for the proposed development will not exceed the maximum parking requirement in the City's ZBL. The proposed parking will reflect a transit oriented development, and encourage non-auto modes of transportation.
- As the only accesses to the subject lands are provided on Booth Street and Wellington Street, which are classified as arterial roadways in the City's 2013 TMP, the proposed development is not anticipated to have any measurable impact on the existing or future residential communities in the site's vicinity.
- The proposed development is anticipated to generate approximately 40 trips during the AM peak hour and 65 trips during the PM peak hour along Booth Street south of Albert Street. This equates to approximately one vehicle every one to two minutes during peak hours.
- Traffic calming measures have been implemented along Booth Street south of Albert Street, including on-street parking, curb extensions at intersections and mid-block speed humps. The increase in traffic attributable to the proposed development is not anticipated to have a significant impact on the local roadway intersection operations along Booth Street south of Albert Street.
- The proposed development conforms to the City's TDM initiatives by providing easy access to the local pedestrian, bicycle and transit systems. Further investigation into TDM initiatives will be conducted through subsequent Site Plan Control applications for each phase as planning and design proceeds.

1.0 INTRODUCTION

This Transportation Impact Study (TIS) has been prepared in support of Zoning By-law Amendment and Official Plan Amendment applications for the lands east of Booth Street between the historic aqueduct and Confederation Line LRT to the south and Fleet Street to the north. The subject lands will henceforth be referred to as the “East LeBreton Flats lands”. The subject lands are designated as Block P, Q and I in the National Capital Commission’s (NCC) Block Subdivision Plan, which can be found in **Appendix A**.

An aerial photo of the East LeBreton Flats lands is shown in **Figure 1**.

Figure 1: Aerial Photo of the East LeBreton Flats Lands

The East LeBreton Flats lands are currently zoned GM17[120] H(40) S94 or R5O H (20) and are currently vacant. The subject lands are bounded by the following:

- To the north, Fleet Street and parkland;
- To the south, the historic aqueduct and Confederation Line LRT;
- To the east, existing residential development;
- To the west, Booth Street and vacant land planned for future mixed-use development.

1.1 Proposed Development

The East LeBreton Flats lands will consist of five buildings, and will accommodate approximately 1950 residential units, a 35,000ft² (GFA) food store, 60,000ft² (GFA) of commercial development and 63,000 square feet (GFA) of institutional development. The concept plan for the proposed development is shown in **Figure 2**. The proposed developments will include underground parking

garages with accesses on Lett Street and Lloyd Street. The estimated completion date of the proposed development is 2031.

Figure 2: Proposed Concept Plan

1.2 Analysis Methods

The types of analysis undertaken to assess the transportation impacts of the proposed development are consistent with the requirements of the City of Ottawa *Transportation Impact Assessment (TIA) Guidelines*, published in October 2006.

Intersection capacity analysis has been completed using the software package Synchro 10.0. This software uses methodology from the *Highway Capacity Manual 2010* (HCM), published by the Transportation Research Board, to evaluate signalized and unsignalized intersections.

Intersection operating conditions are commonly described in terms of a Level of Service (LOS). LOS is a qualitative measurement of speed, freedom to manoeuvre, interruptions, comfort and convenience. Letters are assigned to six levels, with LOS 'A' representing optimal operating conditions and LOS 'F' representing failing operating conditions.

The City of Ottawa has adopted criteria that directly relate the LOS of a signalized intersection to a volume to capacity (v/c) ratio. Vehicle capacity is defined as the maximum number of vehicles that can pass a given point during a specified period under prevailing traffic conditions. The City's criteria are as follows:

LOS	v/c ratio
A	0 to 0.60
B	0.61 to 0.70
C	0.71 to 0.80
D	0.81 to 0.90
E	0.91 to 1.00
F	>1.00

The LOS for an unsignalized intersection is based on average control delay and is defined for individual movements. Control delay includes initial deceleration, queue move-up time, stopped time and final acceleration. The HCM presents the following criteria relating the LOS for individual movements to average control delay:

LOS	Delay (sec/veh)
A	<10
B	10 to 15
C	15 to 25
D	25 to 35
E	35 to 50
F	>50

In this study, movements at signalized and unsignalized intersections have been evaluated in terms of the LOS as defined in the foregoing tables. Since all study area intersections are located within the urban core, mitigation measures in the form of additional lane capacity and/or signal adjustments have been identified for movements with LOS F.

During the pre-consultation meeting on May 10th, 2017, City staff requested the TIS include a Multi-Modal Level of Service (MMLOS) analysis. The MMLOS analysis has been completed using the MMLOS Guidelines Supplement to the TIA Guidelines prepared by IBI Group in October 2015.

The MMLOS guidelines outline LOS measures for each travel mode (Pedestrian, Bicycles, Trucks, Transit and Vehicles), to be completed for roadways and intersections.

This TIS has been prepared to provide an assessment of the development proposal. The methodologies used to analyze the transportation impacts of the proposed development are described as follows:

- An operational evaluation of the study area intersections under the background and total traffic conditions for the weekday AM and PM peak hours;
- An evaluation of the study area intersections and roadway segments for Pedestrians, Bicycles, Trucks and Transit LOS.
- An assessment of provisions for non-auto travel modes, including integration with local transit service, and connections with the local pedestrian and bicycle networks;
- A review of the proposed on-site design;
- Evaluation of potential community concerns, including neighbourhood infiltration and parking impacts; and
- An evaluation of conformance with Transportation Demand Management (TDM) principles.

1.3 Analysis Parameters

The study area for this report was confirmed with City staff, and includes the following intersections:

- Wellington Street/Sir John A MacDonald Parkway/Booth Street;
- Wellington Street/Lett Street;
- Wellington Street/Portage Bridge;
- Booth Street/Fleet Street;
- Booth Street/Albert Street.

The selected time periods for the analysis are the weekday AM and PM peak hours, as they represent the 'worst case' combination of site generated traffic and adjacent street traffic. Existing traffic conditions within the study area have been examined, along with background and total traffic conditions for the 2031 build-out of the subject lands. Due to the extended development period, a five-year period beyond build-out has not been analyzed.

2.0 EXISTING CONDITIONS

2.1 Roadway Facilities

Wellington Street

Wellington Street is an arterial roadway that runs on an east-west alignment between Booth Street and Elgin Street. Map 7 in the City of Ottawa's 2013 TMP identifies Wellington Street in the vicinity of the Portage Bridge a "Federally Owned Roadway". It has a four-lane divided urban cross section, transitioning to a six-lane divided urban cross section near the Portage Bridge, and a regulatory speed limit of 50km/hr within the study area.

Sir John A MacDonald Parkway

The Sir John A MacDonald Parkway is a federally owned roadway that runs on an east-west alignment between Carling Avenue and Booth Street. It is classified as an arterial roadway between Vimy Place and Booth Street. It has a four-lane divided urban cross section and a regulatory speed limit of 50km/hr within the study area.

Albert Street

Albert Street is an arterial roadway that runs on an east-west alignment between Bayview Road and the Mackenzie King Bridge. It has recently been reconstructed within the study area to provide transit lanes. The recently reconstructed Albert Street has a five-lane undivided urban cross-section and a regulatory speed limit of 50km/hr within the study area. It contains one transit lane in each direction, two westbound lanes for general traffic and one eastbound lane for general traffic. Albert Street is a full-load urban truck route.

Booth Street

Booth Street runs on a north-south alignment and is classified as an arterial between the Chaudière crossing and Albert Street. Booth Street south of Albert Street is classified as a major collector and has a two-lane undivided urban cross section with a regulatory speed limit of 50km/hr. Traffic calming measures (on-street parking, curb extensions and speed humps) have been implemented along Booth Street south of Albert Street. Booth Street between Albert Street and Wellington Street was recently reconstructed as part of the Confederation Line. Design drawings for Booth Street have been obtained from the City and are provided in **Appendix B**. Booth Street north of Albert Street is an urban truck route with load restrictions.

Portage Bridge

The Portage Bridge is a federally owned bridge connecting the provinces of Ontario and Quebec. The Portage Bridge runs on a north south alignment between Wellington Street (Ontario) and Rue Laurier (Quebec). It has a six-lane divided urban cross section and a regulatory speed limit of 50km/hr.

Lett Street and Fleet Street

Lett Street and Fleet Street are local roadways providing access to the overall East LeBreton Flats lands. Lett Street and Fleet Street have two lane undivided urban cross sections and a regulatory speed limit of 50km/hr.

2.2 Study Area Intersections

The existing lane arrangements at the study area intersections are described below.

Wellington Street/Sir John A MacDonald Parkway/Booth Street

- Northbound – two through lanes
- Southbound – two through lanes, a left turn lane and a right turn lane
- Eastbound – two through lanes
- Westbound – one through lane and one shared through/right turn lane
- The eastbound left/right turn movements as well as the northbound and westbound left turn movements are restricted
- The northbound left turn movement is temporarily permitted for buses only.

Wellington Street/Lett Street

- Eastbound – one through lane and one shared through/right turn lane
- Westbound – two through lanes and a left turn lane
- Northbound – one shared left/right turn lane

Wellington Street/Portage Bridge

- Eastbound – three through lanes and dual left turn lanes
- Westbound – two through/left turn lanes and three right turn lanes
- Southbound – three left turn lanes and a right turn lane with smart channel

Booth Street/Fleet Street

- Northbound – one through lane and one shared through/right turn lane
- Southbound – two through lanes
- Westbound – One approach lane

Albert Street/Booth Street

- Northbound – one shared through/left turn lane and one shared through/right turn lane
- Southbound – one through lane, one left turn lane and one right turn lane
- Eastbound – one through lane, one transit lane and one left turn lane. The transit lane functions as a right turn lane on this approach
- Westbound – two through lanes, one transit lane, one left turn lane and one right turn lane
- It is noteworthy that the curb radii in the northwest corner of this intersection was reduced when constructed, and is not reflected in the design drawings in

Appendix B

- Right turn on red restrictions are in place on the westbound and southbound approaches from 7:00AM to 9:00AM on weekdays
- The westbound left turn movement is restricted between 7:00AM to 9:00AM and 3:30PM to 5:30PM on weekdays
- The southbound through movement is restricted between 11:00PM to 6:00AM

2.3 Existing Pedestrian and Bicycle Facilities

Sidewalks are currently provided on both sides of Wellington Street, Sir John A MacDonald Parkway, Booth Street and the east side of Lett Street. Fleet Street, east of Lett Street, connects to Pooley's Bridge/Wellington Street.

A multi-use pathway network is currently provided just east of the existing residential development east of Lett Street. This multi-use pathway network provides connections from Fleet Street/Pooley's Bridge to Wellington Street and the Trans Canada Trail.

Booth Street, Sir John A MacDonald Parkway, Wellington Street and Albert Street are classified as Spine Cycling Routes in the City's Ultimate Cycling Network. A physically separated bike lane (westbound) and a standard bicycle lane (eastbound) are currently provided along Wellington Street east of the Portage Bridge. A segregated two-way cycle track is provided along the east side of Portage Bridge. A multi-use pathway was implemented on the north side of the recently reconstructed Albert Street. Bike lanes were implemented along the recently reconstructed Booth Street between Wellington Street and Albert Street. The bike lanes were implemented in place of the shared lanes shown on the design drawings in **Appendix B**. It is our understanding that the City is exploring the opportunity to further improve the cycling facilities along Booth Street.

2.4 Existing Transit Facilities

A copy of the 2017 OC Transpo system map for the study area is included in **Appendix C**. This report describes all existing transit facilities within a five-minute walk of the subject site, which equates to a walking distance of approximately 400m.

OC Transpo bus stops #0433 and #5722 are located along Booth Street, north of Wellington Street. These bus stops provide service to the OC Transpo routes 8, 95, 96 and 105. These transit routes provide interprovincial transit service, as shown in **Appendix C**.

The East LeBreton Flats lands are located within a 400m walking distance of the LeBreton Transit Station along the OC Transpo east-west transitway. The LeBreton Transit Station provides service to numerous OC Transpo routes that provide comprehensive transit coverage across the City of Ottawa. The location of the LeBreton Transit Station compared to the subject lands is shown in **Figure 3**. It is noteworthy that the LeBreton Transit station has been temporarily relocated to Booth Street as part of the Confederation Line construction.

Figure 3: LeBreton Transit Station Location

2.5 Existing Traffic Volumes

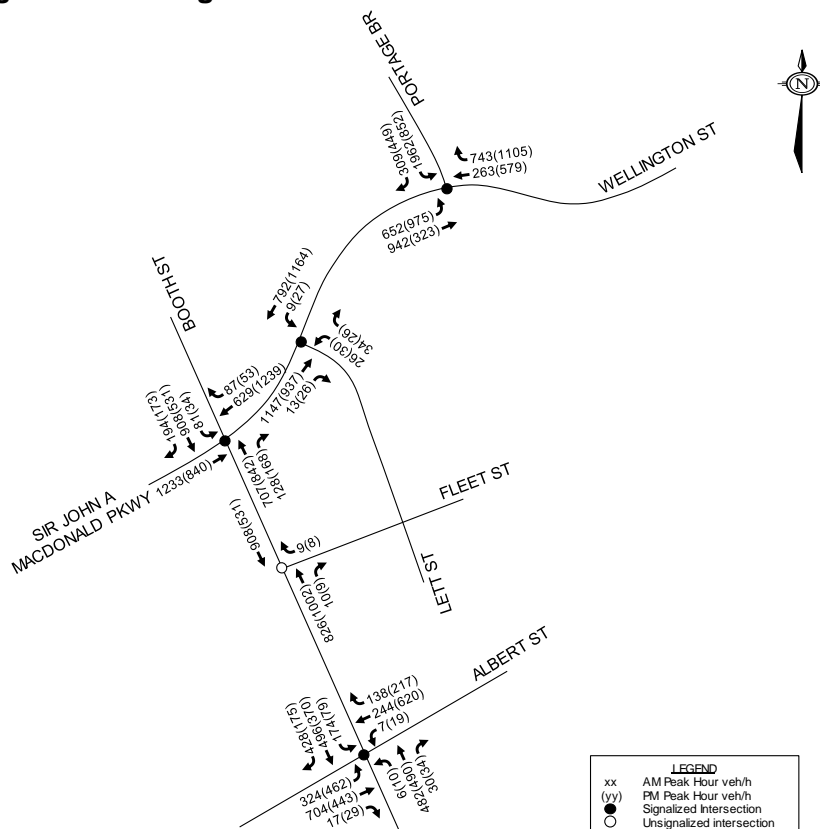

Weekday traffic counts completed by the City of Ottawa were used to determine the existing pedestrian and vehicular traffic volumes at the following study area intersections:

- Wellington Street /Sir John A MacDonald Parkway/Booth Street – May 10th, 2013
- Wellington Street/Lett Street – August 17th, 2015
- Wellington Street/Portage Bridge – June 11th, 2014
- Booth Street/Albert Street – April 2nd, 2014

It is noteworthy that the Wellington Street /Sir John A MacDonald Parkway/Booth Street and Booth Street/Albert Street intersections were counted prior to Booth Street reconstruction. The traffic volumes using the Booth Street/Fleet Street intersection have been estimated using the traffic volumes presented in the 300 Lett Street Transportation Brief (dated April 2011).

Peak hour summary sheets for the above traffic counts and an excerpt from the 300 Lett Street Transportation Brief are included in **Appendix D**. Existing weekday AM and PM peak hour traffic volumes at the study area intersections are shown in **Figure 4**.

Figure 4: Existing Traffic Volumes

2.6 Collision Records

Historical collision data from the last three years was obtained from the City's Public Works and Service Department for all study area intersections and roadways. Copies of the collision summary reports are included in **Appendix E**.

The collision data has been evaluated to determine if there are any identifiable collision patterns. The Ottawa TIA Guidelines define a collision pattern as more than one collision involving similar directions or impact types. Further analysis may be warranted for intersections with a pattern of six or more collisions for any one movement or a total of 33 or more collisions, over a three-year period.

The following table summarizes the number of collisions reported at each intersection and roadway segment from January 1st, 2013 to December 31st, 2015.

Table 1: Reported Collisions

Intersection / Street Segment	Number of Reported Collisions (Jan 1, 2013 to Dec 31, 2015)
Wellington Street / Sir John A MacDonald Parkway / Booth Street	31
Wellington Street / Lett Street	5
Wellington Street / Portage Bridge	10
Booth Street / Fleet Street	0
Booth Street / Albert Street	29
Booth Street / OC Transpo Transitway	12
Booth Street – OC Transpo Transitway to Wellington Street	1
Wellington Street – Booth Street to Portage Bridge	2

Wellington Street/Sir John A MacDonald Parkway/Booth Street

A total of 31 collisions occurred at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection over the last three years. Fourteen of the collisions were rear-end impacts, seven were turning impacts, seven were sideswipe impacts, two were other impacts, and one was an angle impact. Nine of the collisions caused personal injuries, but no fatalities. Two of the collisions involved cyclists, and one involved a pedestrian.

Half of the rear-end impacts occurred in a clear environment with dry surface conditions, while the remaining occurred under unfavorable environmental or surface conditions. Seven of the rear-end collisions involved eastbound travelling vehicles, four involved northbound travelling vehicles, two involved westbound travelling vehicles and one involved southbound travelling vehicles.

Six of the turning impacts occurred in a clear environment with dry surface conditions. Three of the turning impacts involved northbound left or right turning vehicles, three involved westbound left or right turning vehicles and one involved an eastbound left turning vehicle.

All of the sideswipe impacts occurred in a clear environment with dry surface conditions. Three of the sideswipe collisions involved southbound travelling vehicles, two involved eastbound travelling vehicles and two involved westbound travelling vehicles.

It is noteworthy that a detour was in place from 2014 to 2016 to accommodate the closure of Booth Street for Confederation Line Light Rail Transit (LRT) construction. This detour required the construction of significant infrastructure at this intersection, including eastbound dual left turn lanes and converting the southbound lanes into dual right turn lanes. This detour significantly changed the traffic flow at this intersection, and may have had an impact on the collision history.

Booth Street/Albert Street

A total of 29 collisions occurred at the Booth Street/Albert Street intersection over the last three years. Nine of the collisions were rear-end impacts, eight were turning movement impacts, seven were angle impacts, four were sideswipe impacts and one was an other impacts. Three of the collisions caused personal injuries, but no fatalities. One of the collisions involved a pedestrian.

Eight of the rear-end impacts occurred in a clear environment with dry surface conditions. Three of the rear-end impacts involved southbound travelling vehicles, three involved eastbound travelling vehicles, two involved westbound travelling vehicles and one involved northbound travelling vehicles. The rear-end collision history at this intersection warrants further analysis based on the criteria identified in the City of Ottawa TIA guidelines.

Four of the eight turning movement impacts occurred under unfavorable environmental or surface conditions. This suggests environmental factors played a significant role in the collision history at this intersection. Five of the turning impacts involved eastbound left or right turning vehicles, two involved northbound left or right turning vehicles and one involved a southbound left turning vehicle.

Five of the seven angle impacts occurred in a clear environment with dry surface conditions. Two of the angle impacts involved a southbound vehicle and an eastbound vehicle, two involved a southbound vehicle and a westbound vehicle, two involved a northbound vehicle and an eastbound vehicle and one involved a northbound vehicle and a westbound vehicle.

It is noteworthy that the northern leg of this intersection was closed from 2014 to 2016 for the construction of the Confederation Line and all other approaches were recently reconstructed as part of the Albert Street Reconstruction project.

The changes implemented as part of the Albert Street/Confederation Line construction are expected to have a positive effect on the safety of this intersection, and by extension, the number and types of collisions that will be observed in years to come. As such, Novatech have not identified any potential mitigation measures at this intersection, since the conditions that may have warranted mitigation measures will be addressed by the reconstruction.

Booth Street/Transitway

A total of 12 collisions occurred at the Booth Street/Transitway intersection over the last three years. Seven of the collisions were angle impacts, four were rear-end impacts and one was an other impact. Four of the collisions caused personal injuries but no fatalities.

Four of the angle impacts occurred in a clear environment with dry surface conditions, while the remaining occurred under unfavorable environmental or surface conditions. Three of the angle collisions involved a northbound vehicle and an eastbound vehicle, two involved a southbound vehicle and westbound vehicle, two involved a southbound vehicle and an eastbound vehicle and one involved a northbound vehicle and a westbound vehicle.

It is noteworthy that this intersection has been removed as part of the Confederation Line construction.

2.7 Existing MMLOS Analysis

The MMLOS guidelines produced by IBI Group in October 2015 were used to evaluate the LOS of all roadway segments and signalized intersections for each mode of transportation. Schedule B of the City of Ottawa's Official Plan indicates all study area intersections and roadway segments are located in the Central Policy Area, except the Booth Street south of Albert Street roadway segment, which is located in the General Urban Policy Area.

2.7.1 Pedestrian Level of Service (PLOS)

The intent of the PLOS tool, as described in the MMLOS Guidelines, is to evaluate the level of pedestrian comfort, safety and convenience along roadway segments and intersections. Exhibits 4, 5, 6 and 7 of the MMLOS Guidelines have been used to evaluate the existing segment and intersection PLOS within the project limits. Exhibit 22 of the MMLOS Guidelines suggests that the minimum desirable PLOS target for the Central Area is LOS A for arterial, collector and local roads. Exhibit 22 of the MMLOS Guidelines suggests that the minimum desirable PLOS target for the General Urban Area is LOS C for arterial, collector and local roads.

2.7.1.1 Segment PLOS

The results of the segment PLOS analysis are summarized as follows:

Table 2: PLOS Segment Analysis

Sidewalk Width	Boulevard Width	Motor Vehicle Volume (AADT)	Presence of On-Street Parking	Operating Speed ¹	Segment PLOS
<i>Sir John A MacDonald Parkway/Wellington Street, West of Booth Street to Portage Bridge</i>					
2m +	None	> 3000 vpd	Yes	30-50km/hr	B
  					

Sidewalk Width	Boulevard Width	Motor Vehicle Volume (AADT)	Presence of On-Street Parking	Operating Speed ¹	Segment PLOS
<i>Wellington Street, east of Portage Bridge</i>

2.7.2 Bicycle Level of Service (BLOS)

The intent of the BLOS tool, as described in the MMLOS Guidelines, is to evaluate both roadway segments and signalized intersections for the level of traffic stress experienced by cyclists using the corridor. Exhibits 11 and 12 of the MMLOS Guidelines have been used to evaluate the existing segment and intersection BLOS within the project limits.

Exhibit 22 of the MMLOS Guidelines suggests that the minimum desirable BLOS target for the subject study area is LOS C, except for Lett Street which has a BLOS D.

2.7.2.1 Segment BLOS

The results of the segment BLOS analysis are shown in the following table.

Table 7: BLOS Segment Analysis

Road Class/ Route Type	Type of Bikeway	Travel Lanes and/or Speed ¹	BLOS
<i>Sir John A MacDonald Parkway/Wellington Street, West of Booth Street to Portage Bridge</i>			
Arterial; Spine Route	Mixed Traffic	4 travel lanes; 50km/h	E
<i>Wellington Street, East of Portage Bridge (Eastbound)</i>			
Arterial; Spine Route	Bike Lanes – Not Adjacent to Parking Lane	6 travel lanes; 1.8m Bike Lane; 50km/h	D
<i>Wellington Street, East of Portage Bridge (Westbound)</i>			
Arterial; Spine Route	Physically Separated Facility	6 travel lanes; 50km/hr	A
<i>Portage Bridge, North of Wellington Street</i>			
Arterial	Physically Separated Bikeway	6 travel lanes; separated two-way cycle track	A
<i>Booth Street, North of Wellington Street</i>			
Arterial; Spine Route	Mixed Traffic	4-5 travel lanes; 50km/h	E
<i>Booth Street, Wellington Street to Albert Street</i>			
Arterial, Spine Route	Bike Lanes – Not Adjacent to Parking Lane	4 travel lanes; 50km/h; ≥1.2m to <1.5m	C
<i>Booth Street, South of Albert Street</i>			
Major Collector; Spine Route	Mixed Traffic	2 travel lanes; 50km/h	D
<i>Albert Street, East and West of Booth Street</i>			
Arterial; Spine Route	Physically Separated Bikeway	6 travel lanes; separated MUP	A
<i>Lett Street, South of Wellington Street</i>			
Local Route	Mixed Traffic	2 travel lanes; 50km/hr; no marked centerline	B

1. As speed surveys were unavailable from the City of Ottawa, speed is based on posted/regulatory speed limit

2.7.2.2 Intersection BLOS

The results of the intersection BLOS analysis are summarized in the following table.

Table 8: BLOS Intersection Analysis

Approach	Bikeway Facility Type	Criteria	Travel Lanes and/or Speed ¹	BLOS
<i>Sir John A MacDonald Parkway/Wellington Street/Booth Street</i>				
Northbound	Mixed Traffic Approach	Right turn lane characteristics	No right-turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	Left turns prohibited	-

Approach	Bikeway Facility Type	Criteria	Travel Lanes and/or Speed ¹	BLOS
Southbound	Mixed Traffic Approach	Right turn lane characteristics	Right-turn lane 25 to 50m long; Turning speed ≤ 25km/hr	D
		Left turn accommodation	2 or more lanes crossed; ≥ 50km/hr	F
Eastbound	Mixed Traffic Approach	Right turn lane characteristics	No right-turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	Left turns prohibited	-
Westbound	Mixed Traffic Approach	Right turn lane characteristics	No right-turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	Left turns prohibited	-
Wellington Street/Lett Street				
Northbound	Mixed Traffic Approach	Right turn lane characteristics	No-right turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	No lanes crossed; 50km/hr	B
Eastbound	Mixed Traffic Approach	Right turn lane characteristics	No right-turn lane; Motorists yield to cyclists; 50km/hr	A
Westbound	Mixed Traffic Approach	Left turn accommodation	2 or more lanes crossed; ≥ 50km/hr	F
Wellington Street/Portage Bridge				
Southbound	Bike Lanes	Right turn lane characteristics	Right-turn lane introduced to the right of the bike lane and ≤ 50m long; Turning speed ≤ 25km/hr	B
		Left turn accommodation	No left turn	-
Eastbound	Bike Lanes	Right turn lane characteristics	No right turn lane	-
		Left turn accommodation	3 lanes crossed; ≥ 50km/hr	F
Westbound	Bike Lanes	Right turn lane characteristics	No right turn lane	-
		Left turn accommodation	3 lanes crossed; ≥ 50km/hr	F
Booth Street/Albert Street				
Northbound	Mixed Traffic Approach	Right turn lane characteristics	No right-turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	No lanes crossed; ≤ 50km/hr	B
Southbound	Bike Lanes	Right turn lane characteristics	Right-turn lane introduced to the right of the bike lane and > 50m long; Turning speed ≤ 30km/hr	D
		Left turn accommodation	1 lane crossed; 50km/hr	C

Approach	Bikeway Facility Type	Criteria	Travel Lanes and/or Speed ¹	BLOS
Eastbound/ Westbound	Separated Multi-Use Pathway and/or Mixed Traffic	Right turn lane characteristics	No right turn lane; Motorists yield to cyclists; 50km/hr	A
		Left turn accommodation	N/A	-

1. As speed surveys were unavailable from the City of Ottawa, speed is based on posted/regulatory speed limit

2.7.3 Transit Level of Service (TLOS)

The intent of TLOS, as described in the MMLOS Guidelines, is to evaluate the relative attractiveness of transit to support the City's aim to ultimately increase transit modal share. Exhibits 15 and 16 of the MMLOS Guidelines have been used to evaluate the existing segment and intersection TLOS within the project limits.

TLOS targets are identified in the MMLOS Guidelines for rapid transit and transit priority corridors. As the former/new transitway is segregated in this area (LOS A), the TLOS targets don't necessarily apply to other study area roads. Booth Street, Portage Bridge and Albert Street carry regular bus routes without transit priority measures, and do not have a target TLOS in the MMLOS Guidelines. The study area roadways and intersections have still been evaluated using the MMLOS methodology.

2.7.3.1 Segment TLOS

The results of the segment TLOS analysis is shown in the following table.

Table 9: TLOS Segment Analysis

Facility Type	Level/Exposure to Congestion Delay, Friction and Incidents			Quantitative Measurement ¹	LOS
	Congestion	Friction	Incident Potential		
Wellington Street, East of Portage Bridge					
Westbound Bus Lane – No/limited parking/driveway friction	NO	LOW	LOW	$C_f \leq 60$	B
Eastbound Mixed Traffic – Limited parking/driveway friction	YES	LOW	MEDIUM	$V_t / V_p \geq 0.8$	C
Portage Bridge, North of Wellington Street					
Bus Lane – No/limited parking/driveway friction	NO	LOW	LOW	$C_f \leq 60$	B
Booth Street, North of Albert Street					
Mixed Traffic – Limited parking/driveway friction	YES	LOW	MEDIUM	$V_t / V_p \geq 0.8$	C
Albert Street, East and West of Booth Street					
Bus Lane – No/limited parking/driveway friction	NO	LOW	LOW	$C_f \leq 60$	B

1. C_f , Conflict Factor = (Number of Driveways x Crossing Volume) / 1km; V_t/V_p is the ratio of average transit travel speed to posted speed limit

2.7.3.2 Intersection TLOS

The results of the intersection TLOS analysis is shown in the following table.

Table 10: TLOS Intersection Analysis

Approach	Delay ¹	LOS
<i>Sir John A MacDonald Parkway/Wellington Street/Booth Street</i>		
North	25s	D
South	35s	E
<i>Wellington Street/Portage Bridge</i>		
South	190s	F
East	20s	C
<i>Booth Street/Albert Street</i>		
North	40s	F
East	50s	F
West	45s	F

1. Delay based on vehicle delay outputs from Synchro analysis

2.7.4 Truck Level of Service (TkLOS)

The intent of the TkLOS, as described in the MMLOS Guidelines, is to compliment motor vehicle LOS by considering the physical space available for trucks to negotiate corners quickly and easily, and to operate safely within travel lanes. Exhibits 20 and 21 of the MMLOS Guidelines have been used to evaluate the existing segment and intersection TkLOS within the project limits. Booth Street and Albert Street are arterial truck routes with a target TLOS D in the Central Area, as defined in Exhibit 22 of the MMLOS Guidelines.

2.7.4.1 Segment TkLOS

The results of the segment TkLOS analysis is shown in the following table.

Table 11: TkLOS Segment Analysis

Curb Lane Width (m)	Number of Travel Lanes	LOS
<i>Sir John A MacDonald Parkway/Wellington Street, West of Booth Street to Portage Bridge</i>		
> 3.7	4	A
<i>Wellington Street, East of Portage Bridge</i>		
≤ 3.3	6	C
<i>Portage Bridge, North of Wellington Street</i>		
≤ 3.5	6	A
<i>Booth Street, North of Wellington Street</i>		
> 3.7	4	A
<i>Booth Street, Wellington Street to Albert Street</i>		
≤ 3.2	4	D
<i>Albert Street, East and West of Booth Street</i>		
≤ 3.3	4	C

2.7.4.2 Intersection TkLOS

The results of the intersection TkLOS analysis is shown in the following table.

Table 12: TkLOS Intersection Analysis

Approach	Effective Corner Radius (m)	Number of Receiving Lanes on Departure from Intersection	LOS
<i>Sir John A MacDonald Parkway/Wellington Street/Booth Street</i>			
Northbound	< 10	2	D
Southbound	< 10	2	D
Westbound	< 10	2	D
<i>Wellington Street/Portage Bridge</i>			
Southbound	10 to 15	2	B
<i>Booth Street/Albert Street</i>			
Southbound	> 15	2	A
Westbound	10 to 15	2	B

2.7.5 Auto LOS

The intent of the Auto LOS tool is to evaluate both roadway segments and intersections for the level of service provided for vehicles. Exhibit 22 of the MMLOS Guidelines suggests the minimum desirable Auto LOS in the Central Area is LOS E and LOS D in the General Urban Area.

2.7.5.1 Segment Auto LOS

The typical lane capacity along the study area roadways are based on the City's guidelines for the TRANS long-range Transportation Model. The lane capacity along the study area roadways has been estimated based on roadway classification and general characteristics (i.e. Suburban with limited access, urban with on-street parking, etc.). The segment Auto analysis is shown in the following table.

Table 13: Auto LOS Segment Analysis

Table for Rate 200 Segment Analysis							
Direction	Directional Capacity	Traffic Volumes		V/C Ratio and LOS			
		AM Peak	PM Peak	AM Peak		PM Peak	
				V/C	LOS	V/C	LOS
Sir John A MacDonald Parkway/Wellington Street, West of Booth Street to Portage Bridge

1. Signalized Intersection
2. Unsignalized Intersection

2.8 Trade-off Evaluation

2.8.1 Segment Evaluation

A summary of the results of the segment MMLOS analysis is provided in the below table.

2.8.1.1 BLOS

Sir John A MacDonald Parkway/Wellington Street, Booth Street north of Wellington Street and south of Albert Street do not meet the target BLOS.

The implementation of a separated cycling facility along Sir John A MacDonald Parkway/Wellington Street from west of Booth Street to Portage Bridge would result in a BLOS A, meeting the target for the Central Area. In order to accommodate a separated cycling facility a reduction in the width of other cross section elements is required. No Projects are currently identified in the City's *Ottawa Cycling Plan* for Sir John A MacDonald Parkway and Wellington Street.

Table 15: Segment MMLOS Summary

The existing westbound bike lane provided along Wellington Street east of Portage Bridge is separated from general traffic by a barrier curb and delineation flex posts. If possible, physically separating the eastbound bike lane, similar to the westbound facility, would result in a BLOS A for this segment, meeting the target for the Central Area.

The City's *Ottawa Cycling Plan* identifies the implementation of either bike lanes or a multi-use pathway along Booth Street north of Wellington Street. A reduction in other cross sectional elements will be required in order to accommodate either facility. The implementation of bike lanes would result in a BLOS B, while a multi-use pathway would result in a BLOS A.

Traffic calming measures (on-street parking, curb extensions and speed humps) have been implemented along Booth Street south of Albert Street, which reduces the level of stress for cyclists along this segment. Consideration could be given to implementing bike lanes along this segment. In order to accommodate bike lanes, removal/reduction of other cross sectional elements may be required. The implementation of bike lanes would result in a BLOS A.

2.8.1.2 PLOS

All segments within the study area, excluding Booth Street south of Albert Street and Lett Street, do not meet the target PLOS. It is noteworthy that based on the MMLOS Guidelines, the target PLOS A cannot be achieved along a roadway with an AADT greater than 3000 vpd and an operating speed greater than 30km/hr. As Sir John A MacDonald Parkway, Wellington Street, Portage Bridge, Booth Street (north of Albert Street) and Albert Street are arterial roadways with an AADT greater than 3000vpd and an operating speed greater than 30km/hr, a PLOS A cannot be achieved.

The sidewalk on the north side of Wellington Street east of Portage Bridge is greater than 2m in width, with street lights/trees and separated bike lane between the roadway and the sidewalk. This configuration provides a higher level of pedestrian comfort and reflects a PLOS B. The sidewalk on the south side of this segment is greater than 2m in width, with street lights located near the curb edge. If the physically separated eastbound bike lane identified above is implemented, the cycling facility will act as a boulevard between the roadway and the sidewalk. This would improve pedestrian comfort along the south side of this segment, increasing this segment to a PLOS B.

The sidewalk on the east side of Portage Bridge is greater than 2m in width and is located adjacent to a bi-directional cycle track. The bi-directional cycle track separates the roadway and the sidewalk, providing a higher level of pedestrian comfort and reflects a PLOS B. The western sidewalk is approximately 3.5m in width, and located adjacent to the curb. As the Portage Bridge has a six-lane divided cross section with a median width of 1.5m, the existing width of the bridge limits the ability to provide a boulevard to improve the PLOS on the west side of this segment.

The sidewalks along Booth Street north of Wellington Street are greater than 2m in width and located adjacent to the curb. The implementation of a 2m boulevard between the roadway and the sidewalk would improve this segment to a PLOS B. The existing right-of-way (ROW) width is insufficient to accommodate both a 2m boulevard and the bike lanes (or multi-use pathway) identified above. It is noteworthy that bike lanes would meet the target BLOS for the area while providing a separation between the general travel lane and the sidewalk. This configuration would provide a higher level of comfort for pedestrians and reflect a PLOS B.

It is noteworthy that if the above-mentioned bike lanes are implemented along this segment, the bike lanes will provide a separation between the general travel lane and the sidewalk. This configuration would provide a higher level of comfort for pedestrians and reflect a PLOS B.

Booth Street between Wellington Street and Albert Street was recently reconstructed as part of the Confederation Line. This segment contains wide sidewalks. There is limited opportunity to provide additional measures to increase the PLOS along this segment due to ROW constraints and the grade separation of the LRT.

The sidewalk on the south side of Albert Street governs the PLOS analysis, and the multi-use pathway on the north side of the road provides a PLOS A. Although the south side of the road does not meet the target PLOS, pedestrians requiring additional comfort or safety can use the multi-use pathway on the north side.

2.8.1.3 TLOS, TkLOS and Auto LOS

None of the segments within the study area are identified as a Transit Priority Corridor in the City's *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All of the segments within the study area meet the target TkLOS. All segments within the study area, excluding Booth Street south of Albert Street and Albert Street east/west of Booth Street, meet the target Auto LOS.

2.8.2 Intersection Evaluation

A summary of the results of the intersection MMLOS analysis is provided in the below table.

All intersections within the study area do not meet the target PLOS and BLOS. All of the study area intersections are not located along a Transit Priority Corridor in the City's *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All intersections within the study area meet the target TkLOS. The Wellington Street/Portage Bridge and Albert Street/Booth Street intersections do not meet the target Auto LOS.

2.8.2.1 Sir John A MacDonald Parkway/Wellington Street/Booth Street

As all approaches to the Sir John A MacDonald Parkway/Wellington Street/Booth Street intersection have a minimum four-lane divided cross-section, there is limited opportunity to improve the overall PLOS. Left turn movements are restricted on the northbound, eastbound and westbound approaches of this intersection, and the right turn movement is restricted on the eastbound approach. The aforementioned turning restrictions reduce the potential for pedestrian/vehicle conflicts. Consideration could be given to providing zebra striped crosswalks to further improve the pedestrian level of comfort crossing each approach. It is noteworthy that zebra striped crosswalks are warranted on the north, east and west legs of this intersection based on the vehicle/pedestrian conflict warrants (>400,000 vehicle/pedestrian conflicts over an eight-hour period).

Consideration could be given to implementing a two stage, left-turn bike box to facilitate the southbound left turn movement for cyclists at the Sir John A MacDonald Parkway/Wellington Street/Booth Street intersection. The implementation of a two stage, left-turn bike box would improve the left turn accommodation to a PLOS A. As identified above, the City's *Ottawa Cycling Plan* identifies the implementation of either bike lanes or a multi-use pathway along Booth Street north of Wellington Street. The implementation of bike lanes would result in a BLOS B, while a multi-use pathway would result in a BLOS A based on the right turn criteria. Based on the foregoing, the implementation of a southbound two stage, left turn box in conjunction with the future cycling improvements along Booth Street north of Wellington Street would meet the Central Area BLOS target at this intersection.

Table 16: Intersection MMLOS Summary

INTERSECTIONS		Wellington St/Sir JAM Pkwy/Booth St				Wellington St/Lett St				Wellington St/Portage Bridge				Albert St/Booth St

		D				-				B				B			
Auto	Level of Service	F				A				F				F			

Critical auto movements at the Sir John A MacDonald Parkway/Wellington Street/Booth Street intersection are currently operating at with a vehicle LOS F during the PM peak hour. Traffic signal optimization is anticipated to decrease the critical v/c ratios at this intersection to 0.96 (LOS E) during the PM peak hour.

2.8.2.2 *Wellington Street/Lett Street*

Consideration could be given to providing zebra striped crosswalks, to improve the pedestrian level of comfort crossing each approach to the Wellington Street/Lett Street intersection. Zebra striped crosswalks are not currently warranted based on the vehicle/pedestrian conflict warrants (>400,000 vehicle/pedestrian conflicts over an eight-hour period). Consideration could also be given to implementing leading pedestrian intervals at this intersection. The implementation of leading pedestrian intervals would provide pedestrians with a head start when entering the intersection, but may have an impact on the intersection operations during peak hours. As the intersection is currently operating with a vehicle LOS A, leading pedestrian intervals are not anticipated to have a significant effect on the vehicular operations.

Consideration could be given to implementing a two stage, left-turn box to facilitate the westbound left turn movement for cyclists at the Wellington Street/Lett Street intersection. The implementation of a two stage, left-turn box to facilitate the westbound left turn movement would meet the Central Area BLOS target at this intersection.

2.8.2.3 *Wellington Street/Portage Bridge*

The Wellington Street/Portage Bridge intersection is not a standard configuration and the results of the PLOS and BLOS analysis should be treated with caution. The east and west approaches to the intersection have two stage pedestrian crossings, with a channelized island refuge area. All vehicular movements are fully protected, excluding southbound right turn smart channel, limiting the potential for vehicle/pedestrian conflict. Based on the foregoing, the pedestrian level of comfort crossing this intersection is anticipated to be higher than represented by the PLOS analysis. There is limited opportunity to improve the delay score for each pedestrian crossing, as the intersection is a major link to/from the downtown core and is currently operating with a vehicle LOS F.

The cyclist eastbound and westbound left turn accommodation at the Wellington Street/Portage Bridge intersection governs the BLOS analysis. The on-road cycling facilities require cyclists to cross three lanes of traffic into a pocket bike lane to perform an eastbound or westbound left turn. As this intersection has a two-stage pedestrian crossing on the east and west approaches, cyclists may alternatively choose to dismount adjacent to the curb to cross to the channelized island refuge area using the pedestrian crossing. Cyclists can then mount their bike and enter the pocket bike lane to perform the left turn movement. This approach reduces the level of traffic stress experienced by the cyclist. As this approach is not reflected in the MMLOS guidelines, it is reasonable to assume that the level of service at this intersection is higher than BLOS F.

Critical auto movements at the Wellington Street/Portage Bridge intersection are currently operating at with a vehicle LOS F during both the AM and PM peak hours. Traffic signal optimization is anticipated to decrease the critical v/c ratios at this intersection to 1.05 (LOS F) during the AM peak hour and 0.93 (LOS E) during the PM peak hour.

2.8.2.4 *Albert Street/Booth Street*

The east and west approaches to the Albert Street/Booth Street intersection currently have a PLOS F. The PLOS on these approaches is highly influenced by the number of lanes crossed (5-6

lanes) along Albert Street. A reduction in east-west travel lanes is anticipated to have a significant impact on the vehicle operations at this intersection and is not recommended. It is noteworthy that leading pedestrian intervals and zebra striped crosswalks are currently implemented at this intersection to provide a higher level of comfort and safety for pedestrians crossing Albert Street.

As a bi-directional multi-use pathway is provided on the north side of Albert Street, left turn movements for cyclists at the Albert Street/Booth Street intersection are not reflected in the MMLOS Guidelines. As the left turn maneuvers at this intersection are not reflected in the MMLOS Guidelines and a separated cycling facility is provided on the north side of Albert Street, it is reasonable to assume that the BLOS for the left turn accommodation criteria meets the Central Area target.

The BLOS at the Albert Street/Booth Street intersection is governed by the southbound right turn lane characteristics. The southbound right turn lane is approximately 55m in length, and located to the right of the southbound bike lane. The MMLOS Guidelines suggest a right turn lane of less than 50m in length and a small curb radii corresponds to a BLOS B. As the southbound right turn lane only exceeds the length threshold in the MMLOS guidelines by 5m and a reduced curb radii is provided in the northwest corner of the intersection, no modifications are recommended to improve the BLOS at the intersection.

Critical auto movements at the Albert Street/Booth Street intersection are currently operating at with a vehicle LOS F during the PM peak hour. Traffic signal optimization is anticipated to decrease the critical v/c ratios at this intersection to 1.01 (LOS F) during the PM peak hour.

3.0 TRAVEL DEMAND FORECASTING

3.1 Planned Roadway and Transit Improvements

OC Transpo is currently converting the east-west transitway between Tunney's Pasture and Blair stations to LRT, known as the Confederation Line. This construction is currently on-going and is anticipated to be complete by 2018. As part of the construction of the Confederation Line, Booth Street was temporarily closed between Albert Street and Wellington Street from 2014 to 2016 to grade separate the transit system.

As part of the closure of Booth Street, the City of Ottawa constructed major infrastructure to provide a detour leading to the Chaudière crossing to Quebec. This detour included an extension to Preston Street north to Sir John A MacDonald Parkway, and construction of eastbound dual left turn lanes at the Wellington Street/Booth Street intersection. This detour also included the conversion of the two southbound through lanes into dual right turn lanes at this intersection.

The construction of the Confederation Line within the study area is now complete, and the infrastructure developed for the Booth Street detour has been removed (extension of Preston Street and turn lanes at the Wellington Street/Booth Street intersection), reverting the Wellington Street/Booth Street intersection back to the previous lane configuration. A median has been constructed along Booth Street, restricting Fleet Street to right-in right-out operation. Pavement markings and signage drawings for Booth Street were received from the City of Ottawa and can be found in **Appendix B**.

As part of the Confederation Line construction, the LeBreton Transit Station will be renamed to be the Pimisi LRT station and will be relocated to the west side of Booth Street. Sidewalks have been constructed along both sides of Booth Street, providing direct access to the Pimisi LRT station entrances to be located along Booth Street north of Albert Street.

The Confederation Line will travel from the Tunney's Pasture station in the west and Blair station in the east, with new stations at Bayview, Pimisi, Lyon, Parliament, Rideau, uOttawa, Lees, Hurdman, Tremblay, St-Laurant and Cyrville. The Confederation Line will be served by 17 trains with a capacity of approximately 600 passengers per train (240 seated and 360 standing). Trains will run approximately every five minutes during peak hours, while train frequency will be reduced to approximately every 15 minutes during off peak hours. Based on the foregoing, the Confederation Line is anticipated to provide efficient and reliable travel to/from the downtown core and increase transit ridership in the City of Ottawa.

3.2 Planned Pedestrian and Cycling Improvements

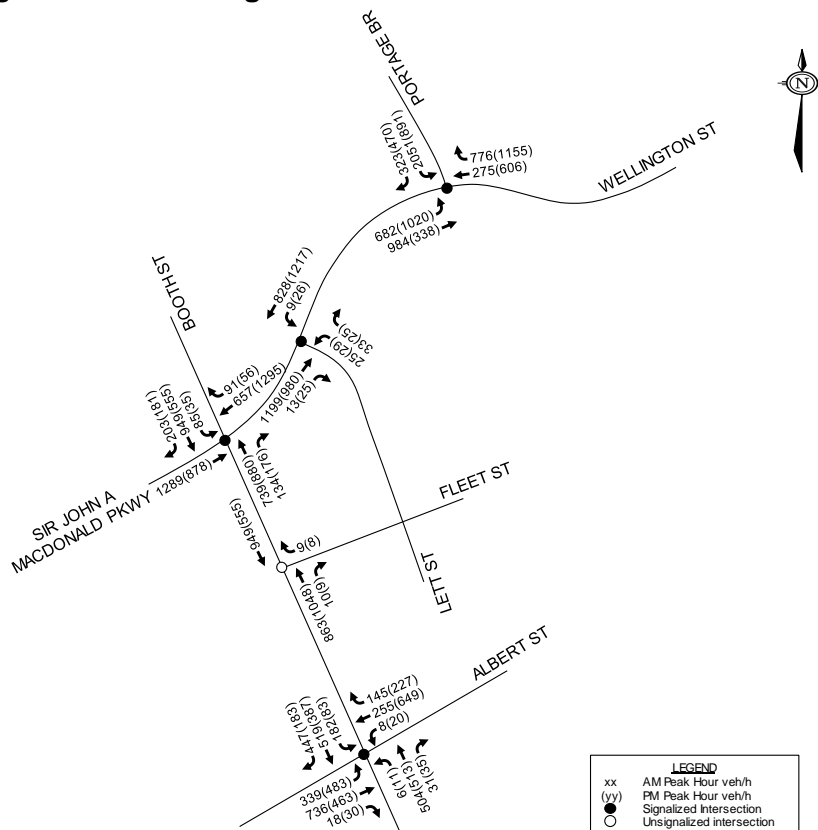

The City of Ottawa's *Ottawa Cycling Plan* (OCP) Ultimate Cycling Network identifies the construction of bicycle lanes along Albert Street (Phase One – 2014 to 2019 implementation) and either bicycle lanes or a multi-use pathway along Booth Street between Sir John A MacDonald Parkway and the Ottawa River Pathway (Phase 2 – 2020 to 2025 implementation).

It is noteworthy that the Albert Street reconstruction project re-implemented a multi-use pathway on the north side of Albert Street, and the Confederation Line construction implemented bike lanes on Booth Street between Albert Street and Wellington Street. It is our understanding that the City is also exploring the opportunity to further improve the cycling facilities along Booth Street.

3.3 Background Traffic Growth

The City of Ottawa's TMP identifies the overall transit modal share (TMS) in the Ottawa Inner Area is anticipated to increase by 2% prior to the 2031 horizon year. The implementation of the Confederation Line in 2018 is anticipated to achieve the increased TMS prior to the 2031 build-out year. The projected traffic volumes at the study area intersections have been reduced to reflect the future TMS in the area.

Background traffic projections are based on 2011 and 2031 snapshots from the City of Ottawa's Strategic Long Range Model and traffic generated by other planned developments in the area. The City's long range model suggests a growth rate of approximately 0.5% per year along Wellington Street and Booth Street (north of Wellington Street). The long-range model suggests a -0.5% growth rate along Booth Street (south of Wellington Street). In order to provide a conservative and robust analysis, the traffic volumes along Wellington Street, Booth Street and Albert Street have been inflated using a growth rate of 0.5% per year. Background traffic growth projections for the 2031 build-out are shown in **Figure 5**.

Figure 5: 2031 Background Growth

3.4 Other Study Area Developments

The City of Ottawa's Strategic Long Range Model allows for the other developments in the LeBreton Flats area. The overall growth assumptions for the City's Long Range Model were confirmed with City staff, and found to underestimate the overall development anticipated from the LeBreton Flats area. For example, based on the proposed concept plan and the Rendezvous LeBreton concept described in the following section, it appears that the model accounts for approximately 60% of the residential development and 40% of the employment development.

Although the growth rates identified in Section 3.3 above account for some of the development in the area, traffic generated by other planned developments in the vicinity of the subject site have been added to the background traffic. This will provide a highly conservative and robust analysis of the study area intersections.

For the purposes of this analysis, the future development of the NCC lands west of Booth Street has been considered. The NCC lands west of Booth Street will henceforth be referred to as the "West LeBreton Flats lands".

In January 2016, the NCC received two proposals for the West LeBreton Flats lands. The Devcore Candarell DLS Group proposal included a high emphasis on public space/uses north of the Confederation Line and residential mixed uses south of the Confederation Line. The Rendezvous

LeBreton proposal included a higher emphasis on residential mixed uses along the exterior of the site and public space/uses on the interior.

On April 28, 2016, the NCC announced the Rendezvous LeBreton proposal as the preferred bid for the West LeBreton Flats lands. Novatech has broken down the NCC's preferred proposal (Rendezvous LeBreton) into residential units, office space and retail space. Based on the bids submitted in January 2016, the Rendezvous LeBreton proposal is anticipated to contain a total of 4,400 residential units and 2.8M square feet of retail/office space. For the purposes of this analysis, it has been assumed that the retail and office space will be split 50/50. A concept plan for the Rendezvous LeBreton proposal is shown in **Figure 6**.

Figure 6: Rendezvous LeBreton Concept Plan

It is understood that the overall development of the West LeBreton Flats lands is expected to take approximately 30 years, but residential and commercial development is expected to be well underway by 2031. For the purposes of this analysis, it is assumed that approximately 50% of the residential and commercial development within West LeBreton Flats lands will be constructed by the 2031 build-out year of the subject site. It is acknowledged that the aforementioned traffic projections do not account for a future arena within the West LeBreton Flats Lands. The traffic generated by the future arena is anticipated to have a high transit modal share, and generally occur during off-peak hours along the adjacent roadways. As such the background traffic projections in this report do not reflect the future arena within the West LeBreton Flats Lands.

The Ottawa Central Library is proposed to be relocated to the property south of the subject lands. The library is anticipated to be located along Albert Street east of Booth Street. For the purposes of this analysis, the new Ottawa Central Library has been assumed to be approximately 130,000 square feet (GFA).

Trips generated by the West LeBreton Flats lands (based on the Rendezvous LeBreton proposal) and the proposed Ottawa Central Library have been generated and distributed to the study area intersections using a similar methodology as presented in **Section 3.5** and **3.6** below.

It has been assumed that the West LeBreton Flats lands will have right-in right-out access on Booth Street and all movement on access on Albert Street. It has been assumed that the Ottawa Central Library will have all movement access on Albert Street.

Windmill Development is proposing to redevelop the Domtar lands shown in **Figure 7**. The Domtar lands will contain approximately 1M square feet of mixed-use development on the on the Ontario side of the provincial border and 2M square feet of mixed-use development on the Quebec side. A

Multi-Modal Transportation Impact Study was prepared in support of the Domtar lands redevelopment in April 2014 by Delcan. This report projects traffic volumes from the development in the area of the subject site. This report suggests full build-out of the Domtar lands will take approximately 15-20 years. Relevant excerpts from the report are included in **Appendix G**.

Figure 7: Domtar Lands Redevelopment Area

For the purposes of this analysis, a 20-year build-out has been assumed for the Domtar lands. Based on the foregoing build-out timeframe, the Domtar lands are anticipated to be 80% built-out by 2031.

Trinity Group are proposing a development at 900 Albert Street, consisting 1,632 residential units, 10,905m² of retail space, and 16,818m² of office space. The proposed Trinity development is anticipated to be fully built-out by 2025. Parsons Engineering have prepared a TIS in support of the aforementioned development, dated November 2016. Relevant excerpts from the report are included in **Appendix G**.

Traffic volumes from the West LeBreton Flats lands, the Ottawa Central Library, the Domtar Lands and 900 Albert Street have been added to the background growth projections presented above. The overall background traffic projections for the 2031 build-out year are shown in **Figure 8**.

The map shows the intersection area in Portage, BC. The streets shown are Wellington St, Fleet St, Albert St, and Sir John A Macdonald Pkwy. The map includes traffic volume data for various approaches and a legend for signalized and unsignalized intersections.

LEGEND

- xx AM Peak Hour veh/h
- (yy) PM Peak Hour veh/h
- Signalized Intersection
- Unsignalized Intersection

Trips generated by the subject lands have been estimated using the relevant peak hour rates identified in the Institute of Transportation Engineers (*ITE Trip Generation Manual, 9th Edition*). It is noteworthy that the specific institutional land use has not been confirmed at this point in time and could be a combination of school, day-care or cultural spaces. For the purposes of this analysis, trips generated by the institutional land use have been estimated using the Elementary School land use. The trips generated by the subject lands during the weekday AM and PM peak hours are outlined in the following table.

Land Use	ITE Code	Units / GFA (s.f.)	AM Peak			PM Peak		
			In	Out	Total	In	Out	Total
Condominium	230	1,950	94	462	556	460	227	687
Supermarket	850	35,000	73	46	119	169	163	332
Specialty Retail	826	60,000	25	16	41	71	92	163
Institutional	520	63,000	183	145	328	34	42	76
Total			375	669	1,044	734	524	1,258

Page 34

developments where multiple modes of transportation are readily available, it is considered good practice to express projected trip generation volumes in terms of person trips instead of vehicle trips.

Based on our review of available literature, a factor of 1.3 applied to ITE vehicle trip generation rates is considered to be a reasonable estimate of “person” trips, given typical auto occupancy in North America is approximately 1.15 and the typical modal share of non-auto person trips is approximately 10% (e.g. 70% Auto Driver, 10% Auto Passenger, 10% Transit, and 10% Non-motorized). This factor was not applied to the trips generated by the congregate care facility due to the nature of the land uses.

For the purposes of this analysis, all trips generated by the institutional land use have been assumed to be vehicle trips.

Table 18: Person Trips

Land Use	In	Out	Total	Person Trip Factor	In	Out	Total
AM Peak							
Condominium	94	462	556	x 1.30 →	122	601	723

Supermarket	169	163	332		219	212	431
Specialty Retail	71	92	163		92	119	211

The number of car trips that the site will generate has been estimated by categorizing the person trips by modal share. The modal shares are based on observed percentages in the *2011 TRANS O-D Survey Report* that are specific to the region referred to as the Ottawa Inner Area.

The modal shares for the proposed residential development have been estimated based on trips made within the Ottawa Inner Area, trips exiting the region in the AM and trips entering the region in the PM.

The proposed retail development is anticipated to serve the local community and is not anticipated to have a large interregional draw. As such, the modal shares for the proposed retail development have been estimated based on trips made within the Ottawa Inner Area.

A full breakdown of the projected person trips by modal share and arrival/departure is shown in the following table.

Table 19: Site-Generated Person Trips by Modal Share

Travel Mode	Modal Share	AM Peak			PM Peak		
		In	Out	Total	In	Out	Total
Condominium Trips							
Condominium Person Trips		122	601	723	598	295	893
Auto Driver	35%	43	211	254	210	104	314
Auto Passenger	10%	13	60	73	60	29	89
Transit	20%	24	120	144	119	59	178
Non-Motorized	35%	42	210	252	209	103	312
Supermarket Trips

Auto Passenger	10%	4	2	6	10	12	22
Transit	15%	4	3	7	13	18	31
Non-Motorized	55%	17	11	28	50	65	115

The commercial land uses are expected to generate two types of external peak hour trips: primary and pass-by trips. Primary trips are made for the specific purpose of visiting the site and pass-by trips are made as intermediate stops on the way to another destination. Peak hour pass-by trips have been estimated based on a pass-by rate of 34%. The *ITE Trip Generation Handbook, 9th Edition* identifies this percentage as an average rate for the Shopping Centre land use. The pass-by trips generated by the commercial development are part of the observed background traffic and do not constitute 'new' trips on the adjacent road network. The primary and pass-by trip generation for the commercial land use is summarized in the following table.

Table 20: Primary and Pass-by Trips (Commercial)

Trip Type	AM Peak			PM Peak		
	In	Out	Total	In	Out	Total
<i>Supermarket Trips</i>						
<i>Supermarket Vehicle Trips</i>	20	12	32	44	43	87
Pass-by	5	5	10	15	15	30
Primary	15	7	22	29	28	57

Trip Type	AM Peak			PM Peak		
	In	Out	Total	In	Out	Total
<i>Specialty Retail Trips</i>						
<i>Specialty Retail Vehicle Trips</i>	7	5	12	19	24	43
Pass-by	2	2	4	7	7	14
Primary	5	3	8	12	17	29

Since the development is to contain a mix of residential, commercial and institutional land uses, some trips are anticipated to be internally captured within the subject lands. Internal capture rates for the residential and commercial land uses were determined using the methodology identified in Chapter 7 of the *ITE Trip Generation Handbook, 9th Edition*. Internal capture summary sheets are provided in **Appendix H**.

The *ITE Trip Generation Handbook* does not identify internal capture rates associated with institutional land uses. It is anticipated that some of the trips to/from the institutional land use will be residents of the subject development. For the purposes of this analysis, an internal capture rate of 50% has been applied to the trips generated by the institutional land use.

Table 21: Internally Captured Trips

Trip Type	AM Peak			PM Peak		
	In	Out	Total	In	Out	Total
<i>Condominium Trips</i>						
<i>Condominium Primary Trips</i>	43	211	254	210	104	314
Internal	1	1	2	5	4	9
External	42	210	252	205	100	305
<i>Supermarket Trips</i>						
<i>Supermarket Primary Trips</i>	15	7	22	29	28	57
Internal	1	1	2	3	3	6
External	14	6	20	26	25	51
<i>Specialty Retail Trips</i>						
<i>Specialty Retail Primary Trips</i>	5	3	8	12	17	29
Internal	0	0	0	1	2	3
External	5	3	8	11	15	26
<i>Institutional Trips</i>						
<i>Institutional Primary Trips</i>	183	145	328	34	42	76
Internal	92	72	164	17	21	38
External	91	73	164	17	21	38

Based on the above calculations, the multi-modal trip generation characteristics of the proposed development at ultimate build-out can be summarized as follows:

- The proposed development is expected to generate a total of **444** and **420** external vehicle trips in the weekday AM and PM peak hours respectively

- The proposed development is expected to generate a total of **95** and **155** auto passenger trips in the weekday AM and PM peak hours respectively
- The proposed development is expected to generate a total of **177** and **273** transit trips in the weekday AM and PM peak hours respectively
- The proposed development is expected to generate a total of **364** and **663** non-motorized trips during the weekday AM and PM peak hours respectively

3.6 Trip Distribution

The projected distribution of vehicular trips generated by the proposed development has been derived with appropriate consideration given to several key factors, including:

- The size and nature of the proposed development
- Existing traffic patterns
- The location of the site accesses with respect to the adjacent roadway system
- The principles of logical trip routing

Trips generated by the proposed development will be distributed differently based on arrival and departure due to the location of the accesses and the traffic restrictions at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection. Trips generated by the proposed development have been distributed to the adjacent road network as follows:

Arrival

- 60% to/from the east via Wellington Street
- 25% to/from the south via Booth Street
- 10% to/from the west via Wellington Street/Sir John A MacDonald Parkway
- 5% to/from the north via the Portage Bridge

Departure

- 70% to/from the east via Wellington Street
- 20% to/from the west via Wellington Street/Sir John A MacDonald Parkway
- 5% to/from the north via Booth Street/Chaudiere Bridge
- 5% to/from the north via the Portage Bridge

Pass-by trips generated by the proposed development have been distributed to the site accesses based on existing traffic conditions.

Traffic volumes generated by the subject site are shown in **Figure 9**. Total traffic volumes for the 2031 build-out year are shown in **Figures 10**.

The map shows the intersection area in Portage, BC. The streets shown are Wellington St, Fleet St, Albert St, and Sir John A Macdonald Pkwy. The map includes traffic volume data for various approaches and a legend for peak hour volumes and intersection types.

Legend:

- xx AM Peak Hour veh/h
- (yy) PM Peak Hour veh/h
- Signalized Intersection
- Unsignalized Intersection

Intersection Data:

Intersection	Approach	AM Peak Hour (veh/h)	PM Peak Hour (veh/h)
Wellington St / Fleet St	Northbound	91	155
	Southbound	15	8
	Eastbound	204	113
	Westbound	6	13
Fleet St / Albert St	Northbound	223	128
	Southbound	6	4
	Eastbound	36	17
	Westbound	57	88
Sir John A Macdonald Pkwy / Fleet St	Northbound	59	32
	Southbound	15	27
	Eastbound	149	66
	Westbound	19	51

[illegible]

4.0 FUTURE INTERSECTION OPERATIONS

4.1 2031 Background Traffic

Intersection capacity analysis has been completed for the 2031 background traffic conditions. The signal timing plans for each intersection is based on the existing signal timing plans received from the City of Ottawa.

The results of the analysis are summarized in the following table for the weekday AM and PM peak hours. Detailed reports are included in **Appendix I**.

Table 22: Intersection Analysis – 2031 Background Traffic

Intersection	AM Peak			PM Peak		
	max v/c or Delay	LOS	Mvmt	max v/c or Delay	LOS	Mvmt
Wellington Street/Portage Bridge ¹	1.31	F	SBL	1.40	F	EBL
Albert Street/Booth Street ¹	1.30	F	EBT	1.70	F	EBL
Wellington Street/Sir John A MacDonald Parkway/ Booth Street ¹	1.12	F	NBT/R	1.49	F	SBL
Wellington Street/Lett Street ¹	0.50	A	EBT/R	0.50	A	WBT
Booth Street/ Fleet Street ²	10 sec	B	WB	11 sec	B	WB

1. Signalized Intersection
2. Unsignalized Intersection

Critical movements at the Wellington Street/Portage Bridge intersection are anticipated to continue to operate with a LOS F during the AM and PM peak hours. AM and PM peak hour traffic signal optimization is anticipated to yield improved results with critical v/c ratios of 1.17 and 0.98 respectively. To alleviate the projected failing conditions at this intersection during the AM peak hour, a reduction of 200 southbound left turning vehicles and 130 eastbound left turning vehicles is required.

Critical movements at the Albert Street/Booth Street intersection are anticipated to operate with a LOS F during the AM and PM peak hours respectively. AM and PM peak hour traffic signal optimization is anticipated to yield improved results with critical v/c ratios of 1.16 and 1.46 respectively. The anticipated background eastbound left turn volumes at this intersection are approximately 580 vph during the PM peak hour, which warrants consideration of dual left turn lanes. Dual eastbound left turn lanes are anticipated to improve conditions during the PM peak hour, but will increase the critical v/c ratio during the AM peak hour. Based on the foregoing, and in the interest of minimizing the pedestrian crossing distance, dual eastbound left turn lanes are not recommended. To alleviate the projected failing conditions at this intersection during the AM peak hour, a reduction in 110 eastbound through vehicles and 40 northbound through vehicles is required. To alleviate the projected failing conditions at this intersection during the PM peak hour, a reduction in 300 westbound through vehicles, 260 eastbound left turning vehicles and 100 northbound through vehicles through vehicles is required.

Critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection are anticipated to operate with a LOS F during the AM and PM peak hours. AM and PM peak hour traffic signal optimization is anticipated to yield improved results with critical v/c ratios of 1.01 and 1.13 respectively. The aforementioned reduction of 130 eastbound vehicles along the Wellington Street corridor and 40 northbound vehicles along the Booth Street corridor, originating from the Wellington Street/Portage Bridge and Albert Street/Booth Street intersections, during the AM peak hour will also alleviate projected failing conditions at this intersection. The aforementioned reduction of 360 northbound vehicles along the Booth Street corridor, originating from the Albert Street/Booth Street intersection, during the PM peak hour will also alleviate projected failing conditions at this intersection.

Based on the foregoing, continued support of transportation solutions that maximize the transit, bike and walk modes of travel will be critical in this area. Options to displace traffic along the study area roads include:

- Increased use of non-auto modes of transportation to/from the downtown core
- Alternate time of travel for drivers using the corridor to make use of off-peak capacity
- Alternate routes for travel to/from the downtown core

4.3 2031 Total Traffic

Intersection capacity analysis has been completed for the 2031 total traffic conditions. The signal timing plans for each intersection is based on the existing signal timing plans received from the City of Ottawa.

The results of the analysis are summarized in the following table for the weekday AM and PM peak hours. Detailed reports are included in **Appendix I**.

Table 23: Intersection Analysis – 2031 Total Traffic

Intersection	AM Peak			PM Peak		
	max v/c or Delay	LOS	Mvmt	max v/c or Delay	LOS	Mvmt
Wellington Street/Portage Bridge ¹	1.31	F	SBL	1.41	F	EBL
Albert Street/Booth Street ¹	1.33	F	EBT	1.70	F	EBL
Wellington Street/Sir John A MacDonald Parkway/Booth Street ¹	1.18	F	NBT/R	1.49	F	SBL
Wellington Street/Lett Street ¹	0.99	D	NBL	0.93	E	WBL
Booth Street/Fleet Street ²	10 sec	B	WB	11 sec	B	WB

1. Signalized Intersection

2. Unsignalized Intersection

Critical movements at the Wellington Street/Portage Bridge intersection are anticipated to continue to operate with a LOS F during the AM and PM peak hours. To alleviate the projected failing conditions at this intersection during the AM peak hour, an additional reduction of 10vph (beyond the reduction identified for background traffic) is required for the eastbound left turn movement. To

alleviate the projected failing conditions at this intersection during the PM peak hour, a reduction of 60 eastbound left turning vehicles and 50 westbound through vehicles is required.

Critical movements at the Albert Street/Booth Street intersection are anticipated to operate with a LOS F during the AM and PM peak hours respectively. To alleviate the projected failing conditions at this intersection during the AM peak hour, an additional reduction of 40vph (beyond the reduction identified for background traffic) is required for the northbound through movement. To alleviate the projected failing conditions at this intersection during the PM peak hour, an additional reduction of 20vph (beyond the reduction identified for background traffic) is required for the westbound through, eastbound left and northbound through movements.

Critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection are anticipated to operate with a LOS F during the AM and PM peak hours. The aforementioned reduction of 140 eastbound vehicles along the Wellington Street corridor and 80 northbound vehicles along the Booth Street corridor, originating from the Wellington Street/Portage Bridge and Albert Street/Booth Street intersections, during the AM peak hour will also alleviate projected failing conditions at this intersection. The aforementioned reduction of 60 eastbound and 50 westbound vehicles along the Wellington Street corridor and 400 northbound vehicles along the Booth Street corridor, originating from the Wellington Street/Portage Bridge and Albert Street/Booth Street intersections, during the PM peak hour will also alleviate projected failing conditions at this intersection.

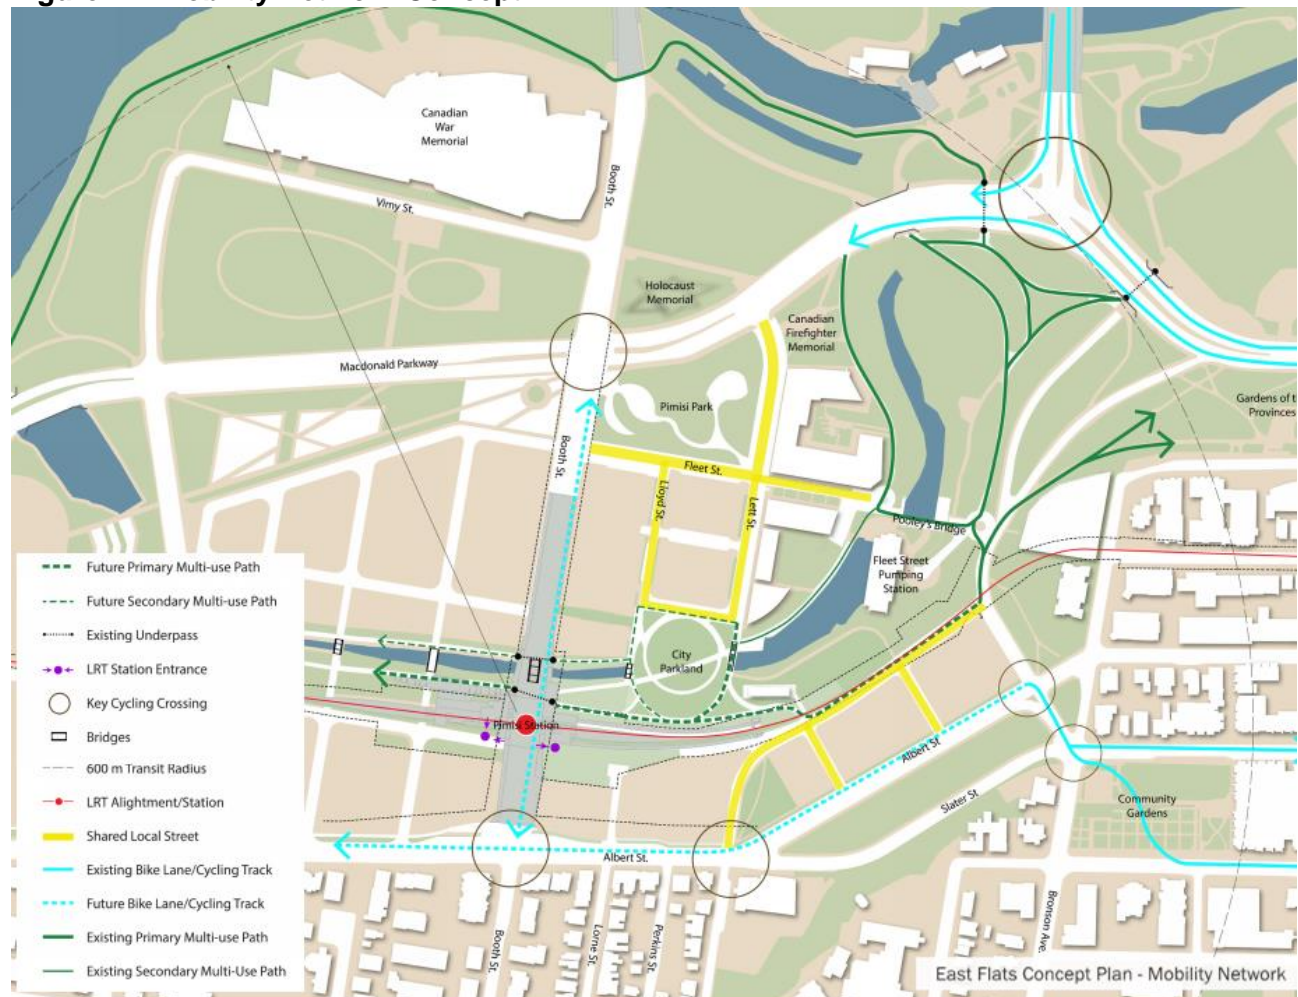

It is noteworthy that significant queues are anticipated on the northbound approach to the Wellington Street/Lett Street intersection during the AM peak hour. The traffic volumes on the northbound approach total to 342 vehicles during the AM peak hour, 256 of which make a right onto Wellington Street. A two-lane northbound approach is recommended to alleviate the queue length on Lett Street during the AM peak hour. A permitted and protected phasing is recommended for the westbound left turn movement during the AM and PM peak hours to improve intersection operations and reduce queueing. The implementation of a two-lane northbound approach, and a permitted and protected phasing for the westbound left turn movement will decrease the critical v/c ratio at this intersection to 0.78 and 0.69 during the AM and PM peak hours respectively.

The existing northbound approach to the Wellington Street/Lett Street intersection has a curb-to-curb width of approximately 11m, tapering to 7m approximately 45m east of Wellington Street. It is recommended the two-lane approach be implemented through line painting. Since the right turn movement is significantly heavier than the left turn movement, it is recommended that the right turn lane be painted as the continuous lane and the left turn lane is to be developed as the auxiliary lane. A storage length of approximately 20m is recommended for the proposed left turn lane based on TAC Equation 2.3.3 ($S = 1.5NL/[3600/CL]$). **Figure 11** shows a conceptual design of the northbound approach to the Wellington Street/Lett Street intersection.

Figure 11: Conceptual Design of Lett Street at Wellington Street

5.0 PROVISIONS FOR NON-AUTO MODES

A mobility network concept map is shown in **Figure 12**. The proposed road lay-out is consistent with the Block Subdivision Plan, which can be found in **Appendix A**. Sidewalks are recommended along both sides of Lett Street, Lloyd Street and Fleet Street.

Figure 12: Mobility Network Concept

The proposed development will maintain a pedestrian/cyclist connection to Pooley's Bridge/Wellington Street via Fleet Street east of Lett Street. This connection provides access to a multi-use pathway network connecting to Wellington Street and the Trans Canada Trail.

The proposed concept plan identifies City parkland south of Lett Street. Multi-use pathways will be provided within the park, providing an alternative pedestrian/cyclist connection to Pooley's Bridge, Wellington Street and the Trans Canada Trail. These multi-use pathways will also cross under Booth Street adjacent to the aqueduct, travelling west to the future West LeBreton Flats lands.

The proposed development will be within a walking distance of approximately 400m of the future Pimisi LRT station. This LRT station will provide comprehensive transit coverage across the City of Ottawa.

6.0 ON-SITE DESIGN

The proposed development will be accessed through the Booth Street/Fleet Street and Wellington Street/Lett Street intersections. This is consistent with the Block Subdivision Plan, which can be found in **Appendix A**.

The recently completed Confederation Line construction has developed a median along the entire length of Booth Street, restricting the Fleet Street intersection to right-in right-out. The Wellington Street/Lett Street intersection will remain signalized. Based on the intersection analysis presented in **Section 5.0**, a two-lane northbound approach is recommended to alleviate projected queuing at this intersection.

Parking for the proposed development will be provided underground with accesses on Lett Street and Lloyd Street. The specific location of the parking garage accesses will be determined and reviewed through subsequent Site Plan Control applications for each phase as planning and design progresses.

The proposed development is located within Area A of Schedule 1 and Area Z of Schedule 1A to the City's Zoning By-law (ZBL). The ZBL identifies no off-site motor vehicle parking is required to be provided for developments with Area Z. As the proposed development is within a 600m walking distance of the future Pimisi LRT station, the ZBL identifies the following maximum parking space rates for the proposed development:

- 1.5 spaces per dwelling unit (combined resident and visitor parking)
- 1.0 per 100m² of GFA for a retail store

The number of parking spaces to be provided is unknown at this point and will be reviewed in subsequent Site Plan Control applications for each phase as planning and design progresses. The proposed development will be a transit oriented development located within a 400m walking distance of the future Pimisi LRT station, and is in close proximity to the downtown core. Parking to be provided for the proposed development will not exceed the maximum parking requirement in the City's ZBL. The proposed parking will reflect a transit oriented development, and encourage non-auto modes of transportation.

7.0 COMMUNITY IMPACTS

The majority of the undeveloped lands surrounding the subject lands are those set aside for the LeBreton Flats Development, and are zoned for residential and general mixed use developments. The proposed concept plan is consistent with the Rendezvous LeBreton proposal for the West LeBreton Flats lands.

The subject lands are to be accessed through the Booth Street/Fleet Street and Wellington Street/Lett Street intersections. This is consistent with the Block Subdivision Plan, which can be found in **Appendix A**. As the only accesses to the subject lands are provided on Booth Street and Wellington Street, which are classified as arterial roadways in the City's 2013 TMP, the proposed development is not anticipated to have any measurable impact on the existing or future residential communities in the site's vicinity.

During the pre-consultation meeting held on May 10, 2017, a representative from the Dalhousie Community Association (DCA) expressed concerns regarding transportation impacts on the local streets south of the proposed development. The proposed development is anticipated to generate approximately 40 trips during the AM peak hour and 65 trips during the PM peak hour along Booth Street south of Albert Street. This equates to approximately one vehicle every one to two minutes during peak hours.

Traffic calming measures have been implemented along Booth Street south of Albert Street, including on-street parking, curb extensions at intersections and mid-block speed humps. The

increase in traffic attributable to the proposed development is not anticipated to have a significant impact on the local roadway intersection operations along Booth Street south of Albert Street.

8.0 TRANSPORTATION DEMAND MANAGEMENT

The City of Ottawa has developed a comprehensive Transportation Demand Management (TDM) strategy as part of its efforts to reduce automobile dependency. TDM measures can reduce transportation infrastructure requirements by encouraging people to change their travel mode, timing or destination.

The proposed development conforms to the City's TDM initiatives by providing easy access to the local pedestrian, bicycle and transit systems as outlined in **Section 6.0**. Further investigation into TDM initiatives will be conducted through subsequent Site Plan Control applications for each phase as planning and design proceeds.

9.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the foregoing analysis, the main conclusions and recommendations of this report are as follows:

Segment MMLOS Analysis

- All segments within the study area, excluding Booth Street south of Albert Street and Lett Street, do not meet the target PLOS. Sir John A MacDonald Parkway/Wellington Street, Booth Street north of Wellington Street and south of Albert Street do not meet the target BLOS. None of the segments within the study area are identified as a Transit Priority Corridor in the City's *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All of the segments within the study area meet the target TkLOS. All segments within the study area, excluding Booth Street south of Albert Street and Albert Street east/west of Booth Street, meet the target Auto LOS.
- The target PLOS A cannot be achieved along a roadway with an AADT greater than 3000 vpd and an operating speed greater than 30km/hr. As Sir John A MacDonald Parkway, Wellington Street, Portage Bridge, Booth Street (north of Albert Street) and Albert Street are arterial roadways with an AADT greater than 3000vpd and an operating speed greater than 30km/hr, a PLOS A cannot be achieved.
- The implementation of a separated cycling facility along Sir John A MacDonald Parkway/Wellington Street from west of Booth Street to Portage Bridge would result in a BLOS A, meeting the target for the Central Area.
- If possible, physically separating the eastbound bike lane along Wellington Street east of Portage Bridge, similar to the westbound facility, would result in a BLOS A for this segment, meeting the target for the Central Area.
- As the Portage Bridge has a six-lane divided cross section with a median width of 1.5m, the existing width of the bridge limits the ability to provide a boulevard to improve the PLOS on the west side of this segment.
- The City's *Ottawa Cycling Plan* identifies the implementation of either bike lanes or a multi-use pathway along Booth Street north of Wellington Street. A reduction in other cross

sectional elements will be required in order to accommodate either facility. The implementation of bike lanes would result in a BLOS B, while a multi-use pathway would result in a BLOS A.

- Traffic calming measures (on-street parking, curb extensions and speed humps) have been implemented along Booth Street south of Albert Street, which reduces the level of stress for cyclists along this segment. Consideration could be given to implementing bike lanes along this segment.
- Although the south side of the Albert Street does not meet the target PLOS, pedestrians requiring additional comfort or safety can use the multi-use pathway on the north side.

Intersection MMLOS Analysis

- All intersections within the study area do not meet the target PLOS and BLOS. All of the study area intersections are not located along a Transit Priority Corridor in the City's *Transportation Master Plan* and do not have a target TLOS in the MMLOS Guidelines. All intersections within the study area meet the target TkLOS. The Wellington Street/Portage Bridge and Albert Street/Booth Street intersections do not meet the target Auto LOS.
- Consideration could be given to providing either textured or zebra striped crosswalks at the Wellington Street/Sir John A MacDonald Parkway/Booth Street intersection to improve the pedestrian level of comfort crossing each approach. Consideration could also be given to implementing a two stage, left-turn bike box to facilitate the southbound left turn movement for cyclists at this intersection. Critical movements at this intersection are currently operating with a vehicle LOS F during the PM peak hour.
- Consideration could be given to implementing leading pedestrian intervals and a two stage, left-turn box to facilitate the westbound left turn movement for cyclists at the Wellington Street/Lett Street intersection.
- The Wellington Street/Portage Bridge intersection is not a standard configuration and the results of the PLOS and BLOS analysis should be treated with caution. The pedestrian and cycling facilities at the Wellington Street/Portage Bridge intersection are anticipated to have a higher PLOS and BLOS than represented by the analysis. Critical movements at this intersection are currently operating with a vehicle LOS F during both the AM and PM peak hours.
- The PLOS at the Albert Street/Booth Street intersection is highly influenced by the number of lanes crossed (5-6 lanes) along Albert Street. A reduction in east-west travel lanes is anticipated to have a significant impact on the vehicle operations at this intersection and is not recommended. It is noteworthy that leading pedestrian intervals and zebra striped crosswalks are currently implemented at this intersection to provide a higher level of comfort and safety for pedestrians crossing Albert Street. Critical movements at this intersection are currently operating with a vehicle LOS F during the PM peak hour.

Future Intersection Operations

- Under the 2031 background traffic conditions, critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street, Wellington/Portage Bridge and Albert Street/Booth Street intersections are anticipated to operate with a LOS F during the AM and PM peak hours.

- Continued support of transportation solutions that maximize the transit, bike and walk modes of travel will be critical in this area. Options to displace traffic along the study area roads include increased use of non-auto modes of transportation to/from the downtown core, alternate time of travel for drivers using the corridor to make use of off-peak capacity and alternate routes for travel to/from the downtown core.
- Under the 2031 total traffic conditions, critical movements at the Wellington Street/Sir John A MacDonald Parkway/Booth Street, Wellington/Portage Bridge and Albert Street/Booth Street intersections are anticipated to continue to operate with a LOS F during the AM and PM peak hours.
- A two-lane northbound approach is recommended at the Wellington Street/Lett Street intersection, to be implemented through line painting. Since the right turn movement is significantly heavier than the left turn movement, it is recommended that the right turn lane be painted as the continuous lane and the left turn lane is to be developed as the auxiliary lane. A storage length of approximately 20m is recommended for the proposed left turn lane.

Non-Auto Transportation, On-site Design, Community Impacts and Transportation Demand Management

- The proposed development will maintain a pedestrian/cyclist connection to Pooley's Bridge/Wellington Street via Fleet Street east of Lett Street. This connection provides access to a multi-use pathway network connecting to Wellington Street and the Trans Canada Trail.
- The proposed concept plan identifies City parkland south of Lett Street. Multi-use pathways will be provided within the park, providing an alternative pedestrian/cyclist connection to Pooley's Bridge, Wellington Street and the Trans Canada Trail. These multi-use pathways will also cross under Booth Street adjacent to the aqueduct, travelling west to the future West LeBreton Flats lands.
- The proposed development will be within a walking distance of approximately 400m of the future Pimisi LRT station. This LRT station will provide comprehensive transit coverage across the City of Ottawa.
- Parking for the proposed development will be provided underground with accesses on Lett Street and Lloyd Street. The specific location of the parking garage accesses will be determined and reviewed through subsequent Site Plan Control applications for each phase as planning and design progresses.
- The number of parking spaces to be provided is unknown at this point and will be reviewed in subsequent Site Plan Control applications for each phase as planning and design progresses. The proposed development will be a transit oriented development located within a 400m walking distance of the future Pimisi LRT station, and is in close proximity to the downtown core. Parking to be provided for the proposed development will not exceed the maximum parking requirement in the City's ZBL. The proposed parking will reflect a transit oriented development, and encourage non-auto modes of transportation.
- As the only accesses to the subject lands are provided on Booth Street and Wellington Street, which are classified as arterial roadways in the City's 2013 TMP, the proposed development is not anticipated to have any measurable impact on the existing or future residential communities in the site's vicinity.

- The proposed development is anticipated to generate approximately 40 trips during the AM peak hour and 65 trips during the PM peak hour along Booth Street south of Albert Street. This equates to approximately one vehicle every one to two minutes during peak hours.
- Traffic calming measures have been implemented along Booth Street south of Albert Street, including on-street parking, curb extensions at intersections and mid-block speed humps. The increase in traffic attributable to the proposed development is not anticipated to have a significant impact on the local roadway intersection operations along Booth Street south of Albert Street.
- The proposed development conforms to the City's TDM initiatives by providing easy access to the local pedestrian, bicycle and transit systems. Further investigation into TDM initiatives will be conducted through subsequent Site Plan Control applications for each phase as planning and design proceeds.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green, Master Intersection

Natural Cycle: 100

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.89

Intersection Signal Delay: 41.3

Intersection LOS: D

Intersection Capacity Utilization 119.6%

ICU Level of Service H

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 0 (0%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 100

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.96

Intersection Signal Delay: 53.3

Intersection LOS: D

Intersection Capacity Utilization 81.5%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

APPENDIX G

RELAVENT EXCERPTS FROM OTHER DEVELOPMENTS

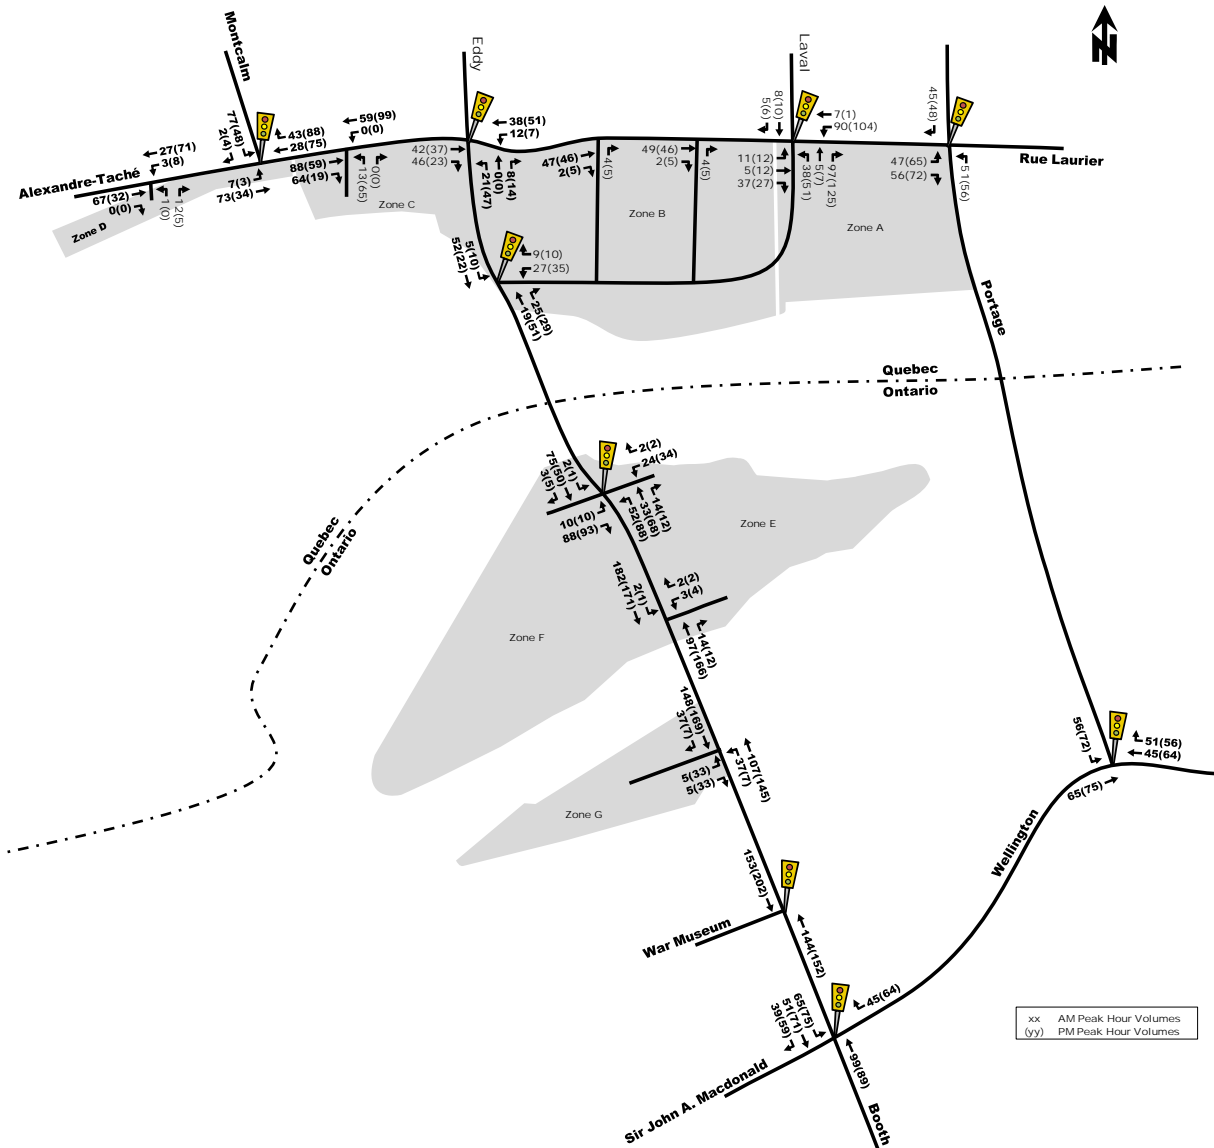

Domtar Lands Redevelopment

Multi-Modal Transportation Impact Study

April 2014

Prepared by:

Figure 12: 'New' Site-Generated Traffic Volumes (Ottawa + Gatineau Sites)

5.4 Other Planned/Potential Development in the Vicinity of the Study Area

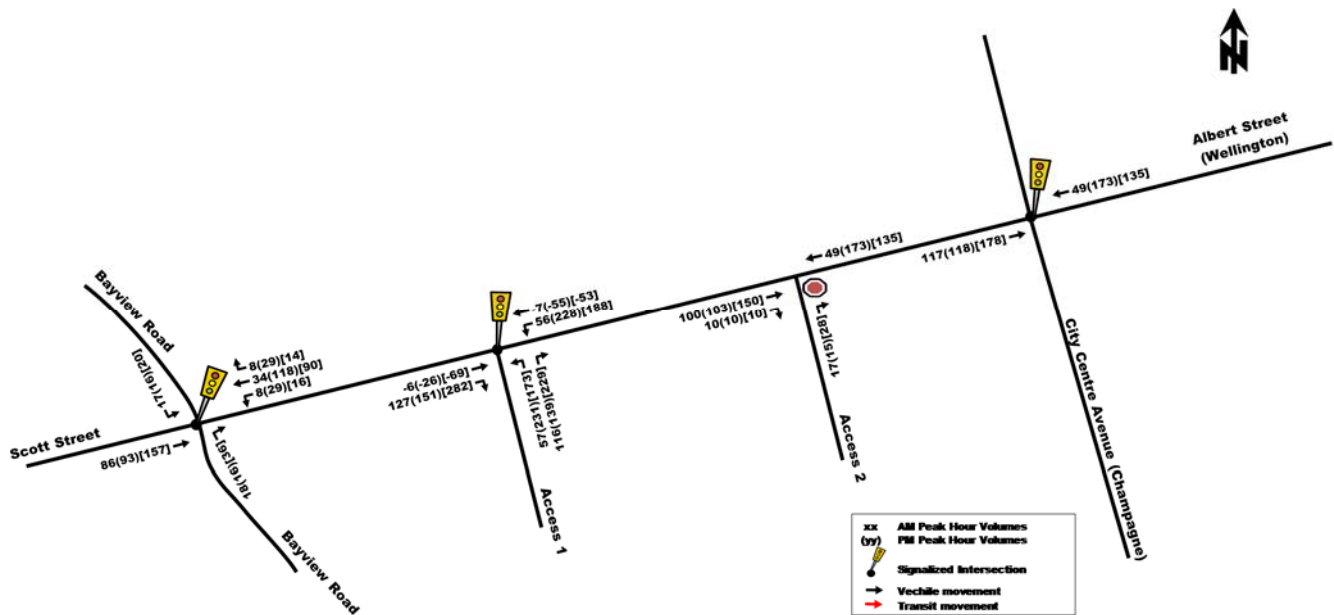

The Domtar lands are not the only site in this area of Gatineau and Ottawa that has development/redevelopment potential. The following Table 8 summarizes development sites identified by the Cities of Gatineau and Ottawa, as well their assumed development yield. Also included in this table are the assumptions used to estimate vehicle trips and the resultant peak hour vehicle trips. These being approximately 1000 vph two-way total during both peak hours for the Gatineau sites, and approximately 1300 vph two-way total during both peak hours for the Ottawa sites. Combining both provinces, the two-way peak hour total is approximately 2200 vph to 2400 vph.

900 Albert Street Transportation Impact Study Including Multi-Modal Level of Service Analysis and Roadway Modification Approval Submission

Figure 11: New and Pass-by Site-Generated Traffic Volumes – 2025

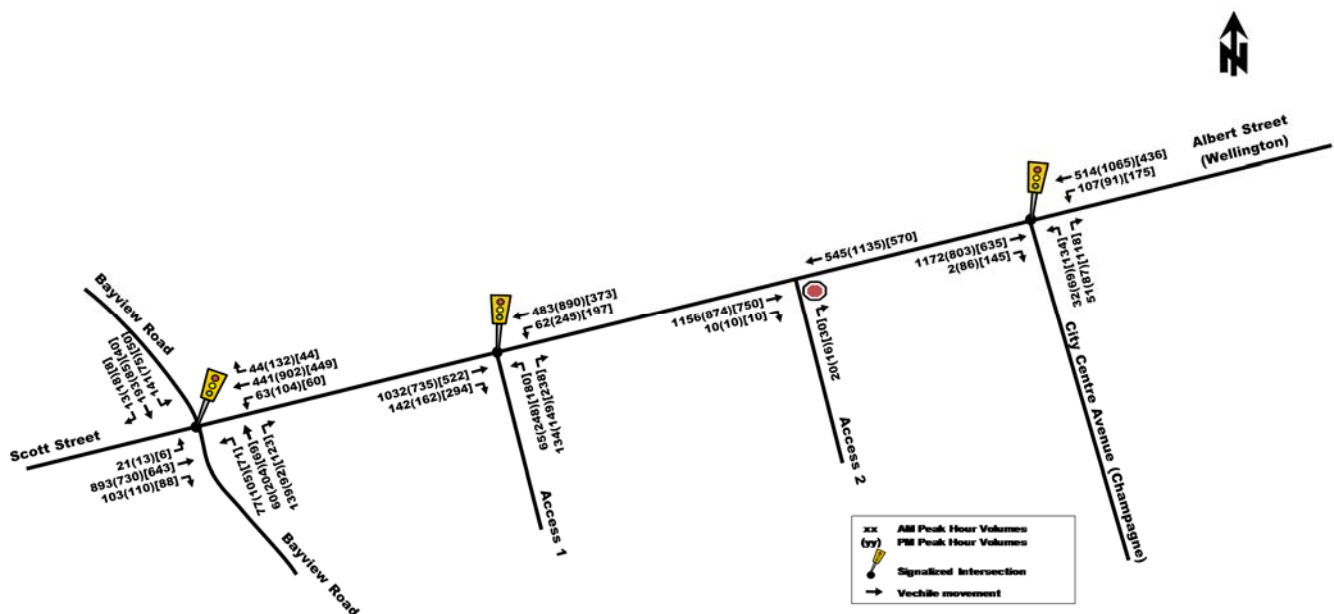

FUTURE TRAFFIC OPERATIONS

PROJECTED CONDITIONS AT FULL SITE DEVELOPMENT

The total projected volumes associated with the proposed development were derived by superimposing new and pass-by site-generated traffic volumes (Figure 10 and 11) onto projected background traffic volumes (Figure 7 and 8). The resulting total projected volumes for the horizon years 2020 and 2025 are illustrated as Figure 12 and 13, respectively.

Figure 12: Total Projected Peak Hour Traffic Volumes - 2020

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 150

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.46

Intersection Signal Delay: 147.5

Intersection LOS: F

Intersection Capacity Utilization 140.6%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 0 (0%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.98

Intersection Signal Delay: 54.5

Intersection LOS: D

Intersection Capacity Utilization 89.5%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 1 (1%), Referenced to phase 2:EBT and 6:WBTL, Start of Green

Natural Cycle: 130

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.93

Intersection Signal Delay: 15.2

Intersection LOS: B

Intersection Capacity Utilization 77.5%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 31 (24%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 125

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.00

Intersection Signal Delay: 49.2

Intersection LOS: D

Intersection Capacity Utilization 92.0%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Booth Street & Sir John A MacDonald Parkway/Wellington Street

Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green, Master Intersection

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.00

Intersection Signal Delay: 56.6

Intersection LOS: E

Intersection Capacity Utilization 128.4%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 5: Booth Street & Albert Street
