Legal Notification

This report was prepared by EXP Services Inc. for the account of Hazeldean Crossing Inc.

Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties unless a reliance letter has been addressed to, or otherwise provides reliance to, such third party. EXP Services Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this project.

Executive Summary

EXP Services Inc. (EXP) was retained by Hazeldean Crossing Inc. to complete a Phase Two Environmental Site Assessment (ESA) of the property referred to as 5938 Hazeldean Road, located in Ottawa, Ontario hereinafter referred to as the "Phase Two property". The objective of the Phase Two ESA is to assess the soil and groundwater quality since the site is a former gasoline retail outlet and automotive service garage. EXP understands that Hazeldean Crossing Inc. plans to re-develop the land as medium density residential and that this report is required as part of the permitting process with the City of Ottawa. Since the site was previously used for commercial purposes, a Record of Site Condition (RSC) is required.

Previously, a Phase One ESA was completed by EXP in order to identify potential environmental impacts. An underground storage tank removal report for the 2015 was also provided for review by EXP. Based on this assessment, the following Areas of Potential Environmental Concern (APEC) were identified:

Media Potentially Area of Potential Location of **Potentially** Location of Impacted **Contaminants** Contaminating PCA (On-Site (Groundwater. **Environmental APEC on Phase** of Concern Concern (APEC) One Property **Activity (PCA)** or Off-Site) Soil and/or Sediment) Petroleum hydrocarbons #28: Gasoline and (PHCs), Associated benzene, 1,Potential **Products** contamination from toluene. Storage in Soil and former on-site retail North / Central On-Site ethylbenzene **Fixed Tanks** groundwater gasoline sales outlet and xylenes #10: Commercial (BTEX), and service garage Autobody volatile organic Shops compounds (VOCs), lead

Table EX.1: Areas of Potential Environmental Concern

Based on these findings, it was recommended that a Phase Two ESA be completed to assess the soil and groundwater quality at the Phase Two property. The Phase Two ESA consisted of advancing eleven boreholes and completing them as groundwater monitoring wells. Soil and groundwater samples were collected and submitted for laboratory analysis of one or more of the following parameters: BTEX, PHC, VOCs, and lead.

For assessment purposes, EXP selected the Site Condition Standards (SCS), provided in Table 7 of *Soil, Groundwater and Sediment Standards for use Under Part XV.1 of the Environmental Protection Act*, Ministry of the Environment, Conservation and Parks (MECP), 2011 for residential/institutional land use at a site with coarse textured soil in accordance with Ontario Regulation 153/04 (as amended).

Based on the Phase Two ESA results, the following summary is provided:

- On February 15, 19 and 20, 2019, a total of 5 boreholes (MW19-1 to MW19-5) were advanced at the Phase Two property and were completed with a monitoring well. On March 13, 2019, six (6) boreholes (BH6 to MW19-11) were advanced at the Phase Two property and a monitoring well was installed in MW19-9 to MW19-11 to facilitate groundwater sampling. The monitoring well at BH11 was installed from 4.3 m to 5.8 m to vertically delineate petroleum impact to groundwater. MW19-9 and MW19-10 were installed to delineate groundwater impact to the west and south of MW19-1.
- Based on the Phase Two ESA, there was approximately 1.5 m of sand fill with some silt and gravel at MW19-3. At MW19-1 and MW19-2, there was sand fill from 1.5 m to 3.6 m which corresponds to the former UST excavations. Slight to moderate petroleum odours were identified in the lower fill material at MW19-1 and MW19-2. At MW19-4 and MW19-5 there was sand and gravel till with a trace silt and clay. The thickness of till ranged from 1.1 m to 1.5 m and was underlain by bedrock. No petroleum odours were identified in the native soil.
- Grey, limestone bedrock was encountered at a depth of 0.8 m to 1.5 m. Groundwater was
 encountered at a depth of 2.49 m bsg in MW19-9 to 3.42 m in MW19-4. No petroleum sheens
 were observed in the monitoring wells during the sampling event. Based on the groundwater
 elevations, the groundwater flow at the Phase Two property is to the north.t
- Based on the results of the investigation, the concentrations of one or more exceedances of PHC F3, cadmium, lead, benzo(a)pyrene and fluoranthene of the MECP Table 7 SCS in soil.
- The concentrations of benzene, PHCs F2 and naphthalene exceeded the MECP Table 7 SCS in groundwater at the Phase Two property in March 2019. The concentrations of BTEX and PHC in the groundwater samples were less than the MECP Table 7 SCS in samples collected in June 2019.
- Approximately 600 m³ of impacted soil was identified east of the existing site building. This soil should be removed and disposed of at a licensed landfill so that the soil concentrations satisfy the MECP Table 7 SCS.
- In March 2019, approximately 900 m² of petroleum impacted groundwater was identified within the limestone bedrock in the former locations of the UST nest and pump island in the north central part of the Phase Two property. Based on the groundwater results from June 2019, no groundwater impact was identified. The initial results could have been due to fine sediment in the groundwater causing false elevated concentrations. Groundwater samples should be collected from the monitoring wells in September 2019 to confirm the June 2019 results.
- If the wells are no longer needed, they should be decommissioned in accordance with Ontario Regulation 903.

1 Introduction

EXP Services Inc. (EXP) was retained by Hazeldean Crossing Inc. to complete a Phase Two Environmental Site Assessment (ESA) of the property referred to as 5938 Hazeldean Road in Ottawa, Ontario, hereinafter referred to as the 'Phase Two property'. The objective of the Phase Two ESA is to assess the soil and groundwater quality since the site is a former gasoline retail outlet and automotive service garage. EXP understands that Hazeldean Crossing Inc. plans to re-develop the land as medium density residential and that this report is required as part of the permitting process with the City of Ottawa. Since the site was previously used for commercial purposes, a Record of Site Condition (RSC) is required.

This report has been prepared in accordance with the Phase Two ESA standard as defined by Ontario Regulation 153/04 (as amended), and in accordance with generally accepted professional practices. Subject to this standard of care, EXP makes no express or implied warranties regarding its services and no third-party beneficiaries are intended. Limitation of liability, scope of report and third-party reliance are outlined in Section 7 of this report.

1.1 Site Description

The Phase Two property is currently occupied by a service garage and retail store and has an area of 0.4 hectares. EXP completed a Phase One and Two ESA at the neighbouring site to the east in February 2019.

The Phase Two property is legally described as *Concession 11 Part of Lot 25 Registered Plan 4R-10078; Parts 1 & 2* and is shown on Figure 1 in Appendix B. The property identification number is 044620475 At the time of the investigation, the Phase Two property was an abandoned retail gasoline sales outlet, improved with one permanent structure, that was partially asphalt covered with gravel and grass covering the remainder. The Phase Two property was developed between 1955 and 1965 (Figure 2 in Appendix B). The Phase Two property and the adjacent properties are expected to be serviced by City of Ottawa water and sewage. At the time of the investigation, the Phase Two property was owned by Hazeldean Crossing Inc.

Owner Contact: Mr. Carmine Zayoun

Hazeldean Crossing Inc. 521 Kilspindie Road Ottawa, Ontario K2J 6A2

Topographically, the Phase Two property is relatively flat. The surrounding area has a noticeable downwards slope towards the east. Regional groundwater flow direction is inferred to be in the easterly direction towards Poole Creek, found 580 m to the east.

The approximate Universal Transverse Mercator (UTM) coordinates for the Phase Two property centroid is NAD83, Zone 18T, 427654.4 m E, 5014040.6 m N. The UTM coordinates were based on an estimate derived using Google Earth™. The accuracy of the centroid is estimated to range from 5 to 50 m.

1.2 Current and Proposed Future Uses

At the time of the Phase Two ESA investigation, the Phase Two property was a former gasoline retail outlet and automotive service garage that is currently vacant. The future land use will be residential. A site plan is included in Appendix B.

1.3 Applicable Site Condition Standards

Analytical results obtained for Site soil and groundwater samples were assessed against Site Condition Standards (SCS) as established under subsection 169.4(1) of the Environmental Protection Act, and presented in the document Ontario Ministry of Environment, Conservation and Parks (MECP) "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act", ("SGWS" Standards), (MECP, 2011a). Tabulated background SCS (Table 1) applicable to environmentally sensitive Sites and effects based generic SCS (Tables 2 to 9) applicable to non-environmentally sensitive Sites are provided in MECP (2011a). The effects based SCS (Tables 2 to 9) are protective of human health and the environment for different groundwater conditions (potable and non-potable), land use scenarios (residential, parkland, institutional, commercial, industrial, community and agricultural/other), soil texture (coarse or medium/fine) and restoration depth (full or stratified).

Application of the generic or background SCS to a specific site is based on a consideration of site conditions related to soil pH (i.e. surface and subsurface soil), thickness and extent of overburden material, (i.e. shallow soil conditions), and proximity to an area of environmental sensitivity or of natural significance. For some chemical constituents, consideration is also given to soil textural classification with SCS having been derived for both coarse and medium-fine textured soil conditions.

For assessment purposes, EXP selected the MECP (2011) Table 7: Full Depth Generic Site Condition Standards (SCS) in a non-potable groundwater condition for a residential/parkland/institutional property use and coarse textured soil. The selection of this category was based on the following factors:

- The predominant soil type on the Phase Two property was considered to be coarse textured (refer
 to the results of the Grain Size Analysis as provided in the Certificates of Analysis presented in
 Appendix E);
- There was no intention to carry out a stratified restoration at the Phase Two property;
- Less than two-thirds of the Phase Two property has an overburden thickness greater than 2 m;
- The Phase Two property is not located within 30 m of a surface water body or an area of natural significance;
- The soil at the Phase Two property has a pH value between 5 and 9 for surficial soils; and, between 5 and 11 for subsurface soils;
- The property is not within an area of natural significance; does not include, nor is it adjacent to an area of natural significance, nor is it part of such an area; and, it does not include land that is within 30 m of an area of natural significance, nor is it part of such an area;
- The Phase Two property will be serviced by the City of Ottawa's water distribution system and the surrounding properties either are already municipally serviced or will be in the near future; and,
- The Phase Two property is planned for residential use.

2 Background Information

2.1 Physical Setting

At the time of the investigation, the Phase Two property was observed to be vacant former gasoline retail outlet and automotive service garage with an area of 0.4 hectares, approximately 50 m west of the southwest corner of the intersection of Hazeldean Road and Victor Street. The surrounding area to the west and south was developed with residential houses. To the north, across Hazeldean Road the land is commercial and to the east is undeveloped (Figure 2 in Appendix B). The Phase Two property is in a mixed commercial and residential zoned area. The Phase Two property and the neighbouring properties are serviced for water and sewer by the City of Ottawa.

Local Ontario Ministry of Environment, Conservation and Parks (MECP) water wells records show that bedrock was found at 1.5 - 5 m from surface. The overburden consists of sand and sandy clay. Bedrock in the area was found to be limestone.

Topographically, the Phase Two property is relatively flat. The surrounding area has a noticeable downwards slope towards the east. Regional groundwater flow direction is inferred to be in the easterly direction towards Poole Creek, found 500 m to the east.

2.2 Past Investigations

The following previous reports were provided to EXP for review.

• Commercial Property Former Retail Petroleum Outlet 5938 Hazeldean Road, Stittsville, Ontario, Underground Storage Tank Removal Environmental Site Assessment, dated October 8, 2015, prepared by Rubicon Environmental (2008) Inc.

The report details the removal of all existing retail petroleum equipment on the site. Four (4) single wall steel underground storage tanks (UST) were removed in September 2015. Ten (10) confirmatory soil samples were collected from the walls and floor of the two excavations. No exceedances of the Ontario Ministry of Environment, Conservation and Parks (MECP) site condition standards were identified. Only limited groundwater was observed entering the excavation bottoms. No sheens or odours were observed on the groundwater surface. No groundwater samples were collected for laboratory analysis.

Based on this review, the following Areas of Potential Environmental Concern (APEC) are identified:

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)	Location of PCA (On-Site or Off-Site)	Contaminants of Concern	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
1.Potential contamination from former on- site retail gasoline sales outlet and service garage	North Central	#28: Gasoline and Associated Products Storage in Fixed Tanks #10: Commercial Autobody	On-Site	Petroleum hydrocarbons (PHCs), benzene, toluene, ethylbenzene and xylenes	Soil and groundwater

Table 2.1: Areas of Potential Environmental Concern

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)	Location of PCA (On-Site or Off-Site)	Contaminants of Concern	Media Potentially Impacted (Groundwater, Soil and/or Sediment)
				volatile organic compounds (VOCs), lead	

Based on these results, it was recommended that a Phase Two ESA be completed to assess the soil and groundwater quality at the Phase Two property.

3 Scope of the Investigation

3.1 Overview of Site Investigation

The purpose of the Phase Two ESA was to investigate the soil and groundwater quality at the Phase Two property and to obtain soil and groundwater data to further characterize conditions in the surficial fill/shallow overburden soils.

It is understood that the Phase Two property is to be re-developed with medium density residential. As part of the permitting process, the City of Ottawa requires that a Phase Two ESA be completed in accordance with Ontario Regulation 153/04 (as amended).

3.2 Scope of Work

The scope of work for this Phase Two ESA was as follows:

- Request local utility locating companies (e.g., cable, telephone, gas, hydro) to mark any
 underground utilities present at the Phase Two property;
- Retain a private utility locating company to mark any underground utilities present in the vicinity of the borehole locations and to clear the individual borehole locations;
- Advance a total of five (5) boreholes and complete them as groundwater monitoring wells;
- Attempt to collect representative soil samples for chemical analysis of polycyclic aromatic hydrocarbons (PAH), metals, VOC, PHC and BTEX (PAHs were added to assess fill quality);
- Attempt to collect representative groundwater samples for chemical analysis of PAH, metals, VOC, PHC and BTEX;
- Measure groundwater levels in the monitoring wells and piezometer;
- Completion of a survey of the borehole locations relative to a geodetic or other permanent benchmark and in reference with the Universal Transverse Mercator (UTM) coordinate system for vertical and horizontal control; and
- Review the analytical data and prepare a report of the findings.

Maxime Leroux conducted assessment work for this project and was supervised by Mark McCalla, P.Geo., QP_{ESA}. Mark McCalla is a qualified person as defined by O. Reg. 153/04.

3.3 Media Investigated

The Phase Two ESA included the investigation of on-site soil and groundwater. As there are no water bodies on the Phase Two property, no surface water or sediment sampling was required.

The potential contaminants of concern (PCOCs) identified in EXP's (2019) Phase One ESA were identified as target parameters for this Phase Two ESA. The areas of potential environmental concern (APEC) and PCOCs identified in the Phase One ESA are outlined in Table 2.1.

The rationale for the selection of borehole and monitoring well locations during this investigation are to place them on the property to assess the soil and groundwater conditions in the APECs. A copy of the Sampling and Analysis Plan prepared for the Phase Two property is provided in Appendix A.

3.4 Phase One ESA Conceptual Site Model

In order to develop a conceptual model for the Phase Two property and surrounding study area, the following physical characteristics and pathways were considered.

3.4.1 Current and Past Uses

Based on a review chain of title information, air photos, and other records, the Phase Two property was developed into a gasoline retail outlet and automotive service garage since at least 1965.

3.4.2 Summary of Potentially Contaminating Activities

As per Ontario Regulation (O.Reg.) 153/04, a Potential Contaminating Activity (PCA) is defined as one of fifty-nine (59) industrial operations set out in Table 2 of Schedule D that occurs or has occurred in a Phase One study area. The following PCAs were identified:

- PCA 1 5938 Hazeldean Road Former retail gasoline sales outlet and service garage, located adjacent to west of the Phase Two property. (PCA#10 – Commercial Autobody Shops, PCA#28 – Gasoline and Associated Products Stored in Fixed Tanks).
- PCA 2 5943 Hazeldean Road Retail gasoline sales outlet built in 2015, located adjacent to 40 m west of the Phase Two property. (PCA#28 Gasoline and Associated Products Stored in Fixed Tanks). Based on short time frame of existence, this is not considered an APEC.
- PCA 3 5899 Hazeldean Road Retail gasoline sales outlet, located adjacent to 160 m to the east
 of the Phase Two property. (PCA#28 Gasoline and Associated Products Stored in Fixed Tanks).
 Based on intervening distance and being downslope in terms of the assumed direction of
 groundwater flow, this is not considered an APEC.

3.4.3 Areas of Potential Environmental Concern

As a result of the PCAs, the report identified the following APECs at the Phase One Property:

• APEC 1 – (central / north part of the site) Contaminated soil and groundwater. This APEC is associated with PCA 1. The potential contaminants of concern include PHC, BTEX, VOCs, and lead.

It is noted that any significant uncertainty or absence of information has the ability to affect the Phase One Conceptual Site Model. However, based on the information and findings presented within the Phase One ESA, it is EXP's opinion that any uncertainty would be minimal, and it would not alter the validity of the model presented above.

3.4.4 Topography and Geology

Topographically, the Phase Two property is relatively flat. The surrounding area has a downwards slope towards the east. The closest body of water is Poole Creek, located approximately 550 m east of the Site. Regional groundwater flow direction is inferred to be in the eastern direction.

The bedrock in the general area is limestone at a depth of approximately less than 2 m. With respect to surficial geology, beneath any fill, the site is underlain by sand and sandy clay.

3.4.5 Estimated Groundwater Flow Direction

Topographically, the Phase Two property relatively flat with a slight downwards slope towards the east. Regional groundwater flow direction is inferred to be in the eastern direction towards Poole Creek.

3.4.6 Underground Utilities

Currently, there are buried water, sewer, natural gas utilities at the Phase Two property.

3.5 Deviations from Sampling and Analysis Plan

The field investigative and sampling program was carried out following the requirements of the Site Sampling and Analysis Plan (SAAP in Appendix A). No significant deviations from the Sampling and Analysis Plan were reported that affected the sampling and data quality objectives for the Phase Two property.

3.6 Impediments

No physical impediments were encountered during the field investigation. The entire property was accessible at the time of the investigation.

4 Investigation Method

4.1 General

The Phase Two property investigative activities consisted of drilling boreholes to facilitate the collection of soil samples for chemical analysis and the installation of monitoring wells for hydrogeological property characterization and the collection of groundwater samples for chemical analysis.

4.2 Borehole Drilling

Prior to the commencement of drilling, the locations of underground public utilities including telephone, natural gas and electrical lines were marked at the Phase Two property by locating companies. A private utility locating contractor was also retained to clear the individual borehole locations.

On February 15, 19, and 20, 2019, a total of 5 boreholes (MW19-1 to MW19-5) were advanced at the Phase Two property by OGS Drilling, a licensed well contractor, under the full-time supervision of EXP staff concurrently with a geotechnical investigation. A track mounted CME drill rig with split spoon samplers was used to collect the soil samples. A monitoring well was installed in each borehole to facilitate groundwater sampling. The locations of the boreholes and monitoring wells are presented on Figure 3 in Appendix B.

On March 13, 2019, six (6) boreholes (BH6 to MW19-11) were advanced at the Phase Two property by Marathon Drilling, a licensed well contractor, under the full-time supervision of EXP staff. Monitoring wells were installed in MW19-9 to MW19-11 to facilitate groundwater sampling. The monitoring well at BH11 was installed from 4.3 m to 5.8 m to vertically delineate petroleum impact to groundwater. MW19-9 and MW19-10 were installed to delineate groundwater impact to the west and south of MW19-1. The locations of the boreholes and monitoring wells are presented on Figure 3 in Appendix B.

No petroleum-based greases or solvents were used during drilling activities. EXP staff continuously monitored the drilling activities and recorded the depth of soil sample collection and total depth of boring. Field observations are summarized on the borehole logs provided in Appendix C.

The split spoon samplers were decontaminated between sampling intervals by the drilling contractor using a potable water/phosphate-free detergent solution followed by rinses with potable water.

4.3 Soil Sampling

The soil sampling during the completion of this Phase Two ESA was undertaken in general accordance with the SAAP presented in Appendix A.

Soil samples for geologic characterization were collected on a continuous basis in the overburden materials using 5 cm diameter, 61 cm long, split spoon samplers advanced into the subsurface using the drilling rig. The soil cores were removed from the samplers upon retrieval by drilling personnel. Geologic details of the recovered cores were logged by EXP field staff. EXP staff continuously monitored the drilling activities to log the stratigraphy observed from the recovered soil cores, to record the depth of soil sample collection, to record total depths of borings, and to record visual or olfactory observations of potential impacts. Field observations are summarized on the borehole logs provided in Appendix C.

Soil samples identified for possible laboratory analysis were collected from the split spoon sampler and placed directly into pre-cleaned, laboratory-supplied glass sample jars/vials. Samples to be analysed for VOC, PHC fraction F1 and BTEX were collected using a soil core sampler and placed in to vials containing methanol as a preservative. The jars and vials were sealed with Teflon-lined lids to minimize head-space and reduce the potential for induced volatilization during storage/transport prior to analysis. All soil samples were placed in clean coolers containing ice prior to and during transportation to the subcontract laboratory,

Maxxam Analytics Inc. (Maxxam) of Ottawa, Ontario. The samples were transported/submitted within 24 hours of collection to the laboratory following chain of custody protocols for chemical analysis.

No soil samples were collected from MW19-11 since the purpose of this monitoring well was to vertically delineate the groundwater impact found at MW19-1 and soil samples were previously collected from that location. MW19-11 was installed close to MW19-1.

4.4 Field Screening Measurements

The remaining portion of each soil sample was placed in a sealed Ziploc plastic bag and allowed to reach ambient temperature prior to field screening with a combustible vapour meter (RKI Eagle model) calibrated to hexane gas prior to use. The field screening measurements were made by inserting the instrument's probe into the plastic bag while manipulating the sample to ensure volatilization of the soil gases. These 'headspace' readings provide a real-time indication of the relative concentration of combustible vapours encountered in the subsurface during drilling and are used to aid in the assessment of the vertical and horizontal extent of potential impacts and the selection of soil samples for analysis. The field screening measurements, in parts per million (ppm) hexane equivalents, are presented with the borehole logs provided in Appendix C.

4.5 Soil Sample Submission

Soil samples were selected for laboratory analysis based on combustible vapour measurements and visual and olfactory evidence of impacts, where observed. One (1) worst case soil sample from each borehole was submitted for laboratory analysis of PAH, metals, VOC, PHC, and BTEX.

4.6 Groundwater: Monitoring Well Installation

Groundwater monitoring wells were installed in general accordance with the Ontario Water Resources Act - R.R.O. 1990, Regulation 903 (as-amended).

The monitoring wells consisted of a 1.5 m to 3.0 m length of 37 mm diameter Schedule 40 PVC screen and an appropriate length of PVC riser pipe. The annular space around the well was backfilled with sand to an average height of 0.3 m above the top of the screen. A bentonite seal was added from the top of the sand pack to approximately 0.3 m below ground surface. Details of the monitoring well installations are shown on the Borehole Logs provided in Appendix C.

The installation details of the installed monitoring wells are summarized in Table 4.1.

Note: Elevations were collected using a high precision GPS unit and a geodetic datum was established at the Phase Two Property.

m bsg - metres below surface grade

TOC - top of plastic well casing

When these monitoring wells are no longer required, they will be decommissioned in accordance with the procedure outlined in the Ontario Water Resources Act - R.R.O. 1990, Regulation 903 - Amended to O. Reg. 128/03.

Measures taken to minimize the potential for cross contamination or the introduction of contaminants during well construction included:

- The use of well pipe components (e.g. riser pipe and well screens) with factory machined threaded flush coupling joints;
- Construction of wells without the use of glues or adhesives;
- Removing the protective plastic wraps from well components at the time of borehole insertion to prevent contact with the ground and other surfaces;
- Cleaning of augers between sampling locations; and,
- The use of hollow stem augers to prevent loose and potentially contaminated material in overlying layers from sloughing into the boreholes and coming into contact with groundwater.

4.7 Groundwater: Field Measurement of Water Quality Parameters

The static water level was measured, the depth of each well was recorded and the well sampled. EXP used an interface probe to measure the possible presence of light non-aqueous phase liquid (LNAPL) in the monitoring well.

4.8 Groundwater: Sampling

Groundwater samples were collected from the monitoring wells on January 26 and March 18, 2019. The monitoring activities consisted of measuring the depth to groundwater in each monitoring well so that groundwater flow and direction below the Phase Two property could be assessed. The water level measurements were recorded on water level log sheets. The water level meter probe was decontaminated between monitoring well locations with a spray bottle of water and alconox solution, paper towel, then potable water.

Wells were then sampled using a "low flow" technique whereby the well was continuously purged using an electric pump (equipped with dedicated tubing) and parameters within the purged water were monitored

using a groundwater chemistry multi-meter probe (YSI 550) at 3 minute intervals. These parameters include: pH, conductivity, temperature, and salinity. Once these parameters were found to deviate less than 10% over three testing events, equilibrium was deemed to have occurred and a sample of the groundwater was collected.

Additional groundwater samples were collected from BH1 and BH3 on June 3, 2019. The groundwater samples were submitted for laboratory analysis of BTEX and PHC. The sample from BH3 was also submitted for analysis of PAH.

The purge water was also continuously monitored for visual and olfactory evidence of petroleum and solvent impact (sheen and odour).

The groundwater samples were collected in laboratory provided sample bottles and submitted to Maxxam for analysis of PAH, metals, VOC, PHC, and BTEX. There was insufficient groundwater in MW19-2 during both sampling events so a groundwater sample was not collected from this location. The groundwater samples were placed in clean coolers containing ice prior to and during transportation to the subcontractor laboratory.

4.9 Sediment: Sampling

As no water body was present at the Phase Two property, sediment sampling was not part of the Phase Two ESA.

4.10 Analytical Testing

The contracted laboratory selected to perform chemical analysis on all soil and water samples was Maxxam Analytics Incorporated (Maxxam). Maxxam is an accredited laboratory under the Standards Council of Canada/Canadian Association for Laboratory Accreditation in accordance with ISO/IEC 17025:1999-General Requirements for the Competence of Testing and Calibration Laboratories.

4.11 Elevation Survey

An elevation survey was conducted to obtain vertical control of the newly installed monitoring well locations. The top of casing and surface grade elevation of each monitoring well location was surveyed using a high precision GPS unit.

4.12 Residue Management

The minor amount of drill cuttings were spread around the ground surface near the borehole locations.

Due to the low flow sampling method, purged water from groundwater sampling was stored in a pail. Since there were no visual or olfactory evidence of impact, the minimal amount of purge water was disposed of on the grass at the Phase Two property.

4.13 Quality Assurance and Quality Control Measures

A QA/QC program was also implemented to ensure that the analytical results received are accurate and dependable. A QA/QC program is a system of documented checks that validate the reliability of the data collected regarding any given Site. Quality Assurance is a system that ensures that quality control procedures are correctly performed and documented. Quality Control refers to the established procedures observed both in the field and in the laboratory, designed to ensure that the resulting end data meet intended quality objectives. The QA/QC program implemented by EXP incorporated the following components:

- Collection and analysis of blind duplicate soil and groundwater samples to ensure analytical precision;
- Using dedicated and/or disposal sampling equipment;
- Use of a trip blank, for VOC analysis, during each sampling event;
- Following proper decontamination protocols to minimize cross-contamination;
- Maintaining field notes and completing field forms to document on-Site activities; and,
- Using only laboratory supplied sample containers and following prescribed sample protocols, including proper preservation, meeting sample hold times, proper chain of custody documentation, to ensure integrity of the samples.

Maxxam's QA/QC program involved the systematic analysis of control standards for the purpose of optimizing the measuring system as well as establishing system precision and accuracy and included calibration standards, method blanks, reference standards, spiked samples, surrogates and duplicates.

5 Review and Evaluation

5.1 Geology

The detailed soil profiles encountered in the boreholes are provided on the attached borehole logs (Appendix C). Boundaries of soils indicated on the logs are intended to reflect transition zones for the purpose of environmental assessment and should not be interpreted as exact planes of geological change. A brief description of the soil stratigraphy at the Phase Two property, in order of depth, is summarized in the following sections. The interpreted Phase Two property geology is shown on the enclosed cross section (Figure 5, Appendix B).

5.1.1 Fill Material

There was approximately 1.5 m of sand fill with some silt and gravel at MW19-3. At MW19-1 and MW19-2, there was sand fill from 1.5 m to 3.6 m which corresponds to the former UST excavations. Slight to moderate petroleum odours were identified in the lower fill material at MW19-1 and MW19-2.

5.1.2 Native Material

At MW19-4 and MW19-5 there was sand and gravel till with a trace silt and clay. The thickness of till ranged from 1.1 m to 1.5 m and was underlain by bedrock. No petroleum odours were identified in the native soil in any of the boreholes.

The grain size analyses for BH7 and BH10 showed that less than 50% of the soil had a grain size of silt or finer. This indicates that the native soil is coarse grained. The results of the grain size analyses are found in Appendix A.

5.1.3 Bedrock

Limestone bedrock was encountered from 0.8 m to 1.5 m across the Phase Two property. Bedrock was also found at a depth of 3.6 m in MW19-1 and MW19-2, but these boreholes were located within the former UST nest.

5.2 Aquifers

In the Ottawa area, the regional aquifers consist of both bedrock and overburden sources, with the two key aquifers consisting of the highly weathered and fractured portion of the upper bedrock surface and overlying sand and gravel deposits (contact zone aquifer) and deeper bedrock aquifers.

In southeastern Ontario, there are four main bedrock aquifers (Singer et al., 2003):

- Nepean-March-Oxford Aquifer
- Rockcliffe Aquifer
- Ottawa Group Aquifer
- Billing-Carlsbad-Queenston Aquifer

In the vicinity of the Phase One Property, the primary bedrock aquifer is the Ottawa Group. This aquifer is considered to have good water yielding capacity with generally fair to good water quality (RRCA and SNCA, 2008).

The contact zone aquifer, which generally includes the sand and gravel deposits and underlying fractured bedrock, is present across the Ottawa region, with more than 90% of the water extracted in eastern Ontario

is extracted from the Contact Zone Aquifer (RRCA and SNCA, 2008). The contact zone aquifer varies in thickness across the region due to the large variation in the zone of upper bedrock fracturing.

Regional groundwater flow in both the contact zone and bedrock have been interpreted to be to the northeast towards the Ottawa River, generally following bedrock topography.

Recharge of aquifers regionally is limited due to the confining silty clay layer resulting from the former Champlain Sea. It has been estimated that only 10% of precipitation that falls in the Ottawa region infiltrates into the ground to recharge the aquifers, with the remainder of the precipitation being lost to evapotranspiration or runoff to rivers and lakes (City of Ottawa, 2011).

5.3 Groundwater: Elevations and Flow Direction

The monitoring well network advanced as part of this Phase Two ESA consists of two monitoring wells (MW19-1 and MW19-2) that were installed within the backfill material of a former UST nest within the limestone bedrock. Five additional monitoring wells (MW19-3, MW19-4, MW19-5, MW19-9, and MW19-10) and a deeper monitoring well (MW19-11) were screened within the limestone bedrock at the Phase Two property.

Groundwater elevations and water levels were measured at the Phase Two property on January 26, March 18, and April 25, 2019. Groundwater was encountered within the limestone at a depth of 2.49 m bsg in MW19-9 to 3.42 m in MW19-4. No petroleum sheens were observed in the monitoring wells during either sampling event.

A summary of the elevation survey and groundwater levels for each well are shown on Table 5.1.

February 26, 2019 March 18, 2019 April 25, 2019 Monitoring Ground Well Elevation Water Water Water Water Water Water ID (MASL) Level Level Level Level Level Level (MASL) (m bsg) (m bsg) (MASL) (m bsg) (MASL) 111.96 2.54 112.38 MW19-1* 114.92 3.03 111.89 2.96 111.88 2.70 112.18 MW19-2* 114.88 3.10 111.78 3.00 111.43 3.42 111.40 114.82 111.49 MW19-3 3.33 3.39 110.99 111.86 3.11 MW19-4 114.97 3.98 3.60 111.37 111.05 3.30 111.26 MW19-5 114.56 3.93 110.63 3.51 113.10 2.49 112.73 MW19-9 115.22 2.12 NA NA 112.15 111.97 3.11 MW19-10 115.08 NA NA 2.93 111.97 2.69 112.23 MW19-11 114.92 NA NA 2.95

Table 5.1: Groundwater Elevations

Note: Elevations were referenced using a high precision GPS unit and a geodetic datum was established at the Phase Two Property.

mbtoc - metres below top of plastic well casing

mASL - metres above sea level

NA - not applicable

^{* -} well screened in backfill material in former UST nest within the limestone bedrock

Based on the groundwater levels measured on February 26 and March 18, 2019, the groundwater flow direction within the limestone bedrock at the site was to the north as shown on Figure 6 in Appendix B. EXP notes that groundwater flow direction and level can be influenced by utility trenches and other subsurface structures and may migrate in the bedding stone of nearby subsurface utility trenches.

5.4 Groundwater: Hydraulic Gradients

Horizontal hydraulic gradients estimated for the groundwater flow components identified in the shallow bedrock aquifer, based on the April 2019 groundwater elevations, was 0.029 m/m.

5.5 Single Well Response Tests (SWRTs) Analysis

The thin overburden at the site did not have sufficient groundwater to construct a monitoring well. Single well response tests were conducted on BH3 and BH5 which were completed within the shallow bedrock as a part of this Phase Two ESA. The calculated hydraulic conductivity in the limestone bedrock unit at these two monitoring wells was 9.1 x 10-8 m/s.

5.6 Soil Texture

Based on the grain size analysis of two (2) soil samples, the soil texture at the water table at the Phase One Property was assessed to be coarse textured (refer to the two grain-size analyses in Appendix E) consisting of silty sand and gravel. Therefore, the soil texture is coarse grained.

5.7 Soil: Field Screening

Inspection of the soil cores retrieved from the boreholes did not indicate the presence of sheen, the presence of a separate organic phase, or other evidence of a non-aqueous phase liquid (NAPL) either in the surficial fill or overburden soil materials. No petroleum staining or odours were observed in any of the soil samples.

5.8 Soil Quality

In accordance with the scope of work, chemical analyses were performed on selected soil samples recovered from the boreholes. The selection of representative "worst case" soil samples from each borehole was based on field visual or olfactory evidence of impacts and/or presence of potential water bearing zones. Summaries of the soil analytical results are found in Appendix D. Copies of the laboratory Certificates of Analysis for the tested soil samples are provided in Appendix E.

The MECP Table 7 SCS are applicable if soil pH is in the range of 5 to 11 for subsurface soil (less than 1.5 m below soil surface). The Certificates of Analysis include pH measurements taken from the subsurface soils. Two (2) soil samples were submitted for pH analysis with results of 7.70 and 7.90. The pH values were within the acceptable range for the application of MECP Table 7 SCS.

5.8.1 Petroleum Hydrocarbons

Ten (10) soil samples and two (2) blind duplicates were submitted for PHC and BTEX analyses. As shown in Table 1 in Appendix D, the concentrations of PHC and BTEX measured in the analysed soil samples were less than the MECP 2011 Table 7 SCS, with the exception of PHC F3 in the samples taken from BH4, BH6 and BH7. The area of PHC impact to soil is shown on Figure 7 and on cross-sections shown on Figures 10A and 11A.

5.8.2 Metals

Ten (10) soil samples and two (2) blind duplicates were submitted for metals analyses. As shown in Table 2 in Appendix D, the concentrations of metals measured in the analysed soil samples were less than the MECP 2011 Table 7 SCS, with the exception of cadmium in the samples from BH4 and BH6 and lead in BH4, BH6 and BH7. The area of metals impact to soil is shown on Figure 9 and on cross-sections shown on Figures 10C and 11C.

5.8.3 Volatile Organic Compounds

Five (5) soil samples and two blind duplicates were submitted for VOC analyses. The concentrations of VOC measured in the analysed soil samples were generally less than the laboratory detection limits and were less than the MECP 2011 Table 7 SCS, as shown in Table 3 in Appendix D.

5.8.4 Polycyclic Aromatic Hydrocarbons

Ten (10) soil samples and two (2) blind duplicates were submitted for PAH analyses. As shown in Table 4 in Appendix D, the concentrations of PAH measured in the analysed soil samples were less than the MECP 2011 Table 7 SCS, with the exception of benzo(a)pyrene and fluoranthene in the sample from BH4. The area of PAH impact to soil is shown on Figure 8 and on cross-sections shown on Figures 10B and 11B.

5.8.5 Chemical Transformation and Soil Contaminant Sources

There are three soil samples located east of the service garage building that had one or more exceedances of PHC F3, cadmium, lead, benzo(a)pyrene and fluoranthene of the MECP Table 7 SCS. Chemical transformations are a potential concern at the Site. However, based on the obtained results soils are not expected to be acting as a contaminant mass that could impact the Site's groundwater.

5.8.6 Evidence of Non-Aqueous Phase Liquid

Inspection of the soil cores retrieved from the boreholes did not indicate the presence of non-aqueous phase liquid (NAPL), via staining or sheen. Slight to moderate petroleum odours were identified in the lower fill material at MW19-1 and MW19-2. NAPLs are not expected to be present at the Phase Two property.

5.9 Groundwater Quality

Representative groundwater samples were collected from the newly installed monitoring wells to assess groundwater quality at the Phase Two property. Evidence of free phase product (i.e. visible film or sheen), and odour was not noted during well development or purging.

The groundwater analytical results are summarized on Tables 5 to 8 in Appendix D and the Certificates of Analysis are enclosed in Appendix E.

5.9.1 Petroleum Hydrocarbons

Nine (9) groundwater samples and a blind duplicate were submitted for the chemical analysis of PHC and BTEX. As shown in Table 5 in Appendix D, the concentrations of benzene and PHC F2 exceeded the MECP Table 7 SCS in the groundwater sample collected from BH3. The groundwater sample from BH1 also had a benzene concentration that exceeded the MECP Table 7 SCS. The groundwater samples from BH4, BH5, BH9, BH10, and BH11 had non-detectable concentrations of BTEX and PHC. The locations of the PHC groundwater exceedences are presented on the cross-section shown on Figures 12 and 13A. Additional groundwater samples were collected from BH1 and BH3 on June 3, 2019. The results showed

no exceedences of MECP Table 7 SCS and indicates that the groundwater is not impacted. The previous elevated results may have been caused by fine sediment in the groundwater.

5.9.2 Metals

Four (4) groundwater samples were submitted for the chemical analysis of metals. As shown in Table 6 in Appendix D, the concentrations of metals parameters in the groundwater samples were less than the MECP Table 7 SCS.

5.9.3 Volatile Organic Compounds

Four (4) groundwater samples were submitted for the chemical analysis of volatile organic compounds (VOC). As shown in Table 7 in Appendix D, the concentrations of VOC parameters in the groundwater sample were non-detect and below the MECP Table 7 SCS, with the exception of benzene in BH1 and BH3 which exceeded the MECP Table 7 SCS. The locations of the benzene groundwater exceedences are shown on Figure 10 and on cross-sections shown on Figures 12A and 12B

5.9.4 Polycyclic Aromatic Hydrocarbons

Nine (9) groundwater samples and a blind duplicate were submitted for the chemical analysis of PAH. As shown in Table 8 in Appendix D, the concentrations of PAH parameters in the groundwater sample were less than the MECP Table 7 SCS, with the exception of naphthalene in the two groundwater samples collected from BH3. The locations of the PAH groundwater exceedences are shown on the cross-section shown on Figure 13B. Additional groundwater samples were collected from BH3 on June 3, 2019. The results showed no exceedences of MECP Table 7 SCS and indicates that the groundwater is not impacted. The previous elevated results may have been caused by fine sediment in the groundwater.

5.9.5 Chemical Transformation and Contaminant Sources

There are no contaminants of concern in the groundwater at the Phase Two property.

5.9.6 Evidence of Non-Aqueous Phase Liquid

Inspection of the groundwater monitoring wells did not indicate the presence of non-aqueous phase liquid (NAPL), staining or sheen. Odours were not observed during groundwater sampling activities. NAPLs are not expected to be present at the Phase Two property.

5.10 Sediment Quality

As there were no water bodies on the Phase Two property, surface water and sediment sampling were not required.

5.11 Quality Assurance and Quality Control Results

Quality assurance and quality control measures were taken during the field activities to meet the objectives of the sampling and quality assurance plan to collect unbiased and representative samples to characterize existing conditions in the fill/upper overburden materials and groundwater at the Phase Two property. QA/QC measures, as described in Section 4.13, included:

- Using dedicated and/or disposal sampling equipment;
- Following proper decontamination protocols to minimize cross-contamination;
- Maintaining field notes and completing field forms to document on-site activities; and,

 Using only laboratory supplied sample containers and following prescribed sample protocols, including proper preservation, meeting sample hold times, proper chain of custody documentation, to ensure integrity of the samples.

Review of field activity documentation indicated that recommended sample volumes were collected from groundwater for each analytical test group into appropriate containers and preserved with proper chemical reagents in accordance with the protocols set out in the *Protocol for Analytical Methods used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (MOE, 2004). Samples were preserved at the required temperatures in insulated coolers and met applicable holding time requirements, when relinquished to the receiving laboratory.

Duplicate soil sample pairs BH1 SS4 and its duplicate DUPE, and BH10 AS1 and its duplicate Dup 1 were submitted for chemical analysis of PHC, PAH, and metals. Only duplicate pair BH1 SS4 and its duplicate DUPE were also submitted for VOC analyses. For QA/QC purposes, the analytical sample results are quantitatively evaluated by calculating the relative percent difference (RPD) between the samples and their duplicates. The concentrations of VOC, PAH, and PHC were less than the laboratory reported detection limits for both the primary and duplicate samples. The RPD for metals was 21.2% which is well within the 30% RPD threshold and therefore the soil data is acceptable from an RPD perspective.

Duplicate groundwater sample pair BH11 SS4 and its duplicate BH20 were submitted for chemical analysis of PHC and PAH. The concentrations of PHC were less than the laboratory reported detection limits for both the primary and duplicate samples. The RPD for PAH was 8.0% which is well within the 30% RPD threshold and therefore the soil data is acceptable from an RPD perspective.

Certificates of Analysis were received from Maxxam reporting the results of all the chemical analyses performed on the submitted soil and groundwater samples. Copies of the laboratory Certificates of Analysis are provided in Appendix E. A review of the Certificates of Analysis prepared by the laboratory indicates that they were in compliance with the requirements set out under subsection 47(3) of O.Reg. 511/09.

The analytical program conducted by laboratory included analytical test group specific QA/QC measures to evaluate the accuracy and precision of the analytical results and the efficiency of analyte recovery during solute extraction procedures. The laboratory QA/QC program consisted of the preparation and analysis of laboratory duplicate samples to assess precision and sample homogeneity, method blanks to assess analytical bias, spiked blanks and QC standards to evaluate analyte recovery, matrix spikes to evaluate matrix interferences and surrogate compound recoveries (VOCs only) to evaluate extraction efficiency. The laboratory QA/QC results are presented in the Quality Assurance Report provided in the Certificate of Analysis prepared by the laboratory. The QA/QC results are reported as percent recoveries for matrix spikes, spike blanks and QC standards, relative percent difference for laboratory duplicates and analyte concentrations for method blanks.

The laboratory QA/QC results were assessed against test group control limits in the case of spiked blanks, matrix spikes and surrogate recoveries and alert criteria in the case of method blanks and laboratory duplicates. Review of the laboratory QA/QC results reported by the laboratory indicated that they were within acceptable control limits or below applicable alert criteria for the sampled media and analytical test groups. Based on the assessment of the QA/QC, the analytical results reported by the laboratory are of acceptable quality and data qualifications are not required.

5.12 Phase Two Conceptual Site Model

This section presents a Conceptual Site Model (CSM) providing a narrative, graphical and tabulated description integrating information related to the Phase Two property's geologic and hydrogeological conditions, areas of potential environmental concern/potential contaminating activities, the presence and distribution of contaminants of concern, contaminant fate and transport, and potential exposure pathways.

For the purposes of this Phase Two CSM, the information relied upon was taken from all current and previous environmental reports conducted for the Phase One Property. However, the data relied upon was limited to the most recent information to convey the current Phase Two property conditions.

5.12.1 Site Identification Information

At the time of the investigation, the Phase Two property was observed to be vacant former gasoline retail outlet and automotive service garage with an area of 0.4 hectares, approximately 50 m west of the southwest corner of the intersection of Hazeldean Road and Victor Street (Figure 1 in Appendix A). The surrounding area to the west and south was developed with residential houses. To the north, across Hazeldean Road the land is commercial and to the east is undeveloped as shown on Figure 2 in Appendix B. At the time of the investigation, the Phase Two property was snow-covered, but is assumed to have been grass and asphalt covered. The Phase Two property was a gasoline retail outlet and automotive service garage since at least 1965. At the time of the investigation, the Phase Two property was owned by Hazeldean Crossing Incorporated.

The Phase Two property is in a mixed commercial and residentially zoned area. The Phase Two property is legally described as *Concession 11 Part of Lot 25 Registered Plan 4R-10078; Parts 1 & 2.* The property identification number is 044620475. The property and neighbouring properties are serviced for water and sewer by the City of Ottawa.

Local Ontario Ministry of Environment, Conservation and Parks (MECP) water wells records show that bedrock was found at 0.3 - 3 m from surface. The overburden consists of sand and gravel from the ground surface to 0.6 – 1.54 m. Bedrock in the area was found to be limestone.

Topographically, the Phase Two property is relatively flat. The surrounding area has a noticeable downwards slope towards the east. Regional groundwater flow direction is inferred to be in the easterly direction towards Poole Creek, found 580 m to the east.

Refer to the following table for the Phase Two property identification information.

Civic Address	5938 Hazeldean Road, Ottawa, ON			
Current Land Use	Former Gasoline Outlet and Service Garage			
Proposed Land Use	Residential			
Legal Description	Concession 11 Part of Lot 25 Registered Plan 4R-10078; Parts 1 & 2. City of Ottawa			
Property Identification Number	044620475			
UTM Coordinates	427654.4 m E, 5014040.6 m N			
Phase One Property Area	0.4 ha			
Property Owner	Hazeldean Crossing Inc			
Owner Contact	Mr. Carmine Zayoun			
Owner Address	521 Kilspindie Road, Ottawa, ON			

5.12.2 Physical Site Description

The Phase Two CSM provides a narrative and graphical interpretation of the Phase Two property surface features, near surface geologic and hydrogeologic conditions, PCOCs, contaminant fate and transport

mechanisms, and relevant receptors and exposure pathways. These components are discussed in the following sections and summarized in Table 1 in the Tables appendix.

The Phase Two property is located in a residential area of Ottawa where potable water is supplied by the City of Ottawa, however the depth to bedrock is less than 2 m over most of the Phase Two property and therefore the MECP Table 7 Site Condition Standards (SCS) are applied to the Phase Two property. The City of Ottawa obtains its water from the Ottawa River, located approximately 15 km northeast of the Phase Two property.

In accordance with Section 41 of the Ontario Regulation 153/04 (as amended), the Phase Two property is not an environmentally sensitive area. The Phase Two property is not located within an area of natural significance and it does not include land that is within 30 metres of an area of natural significance.

Based on the Phase Two ESA investigation, the Phase Two property is a shallow soil property as defined in Section 43.1 of the regulation. It does not include all or part of a water body, is not adjacent to a water body, and does not include land that is within 30 metres of a water body.

5.12.3 Geological and Hydrogeological Setting

Based on the findings of the Phase Two ESA, there was approximately 1.5 m of sand fill with some silt and gravel at MW19-3. At MW19-1 and MW19-2, there was sand fill from 1.5 m to 3.6 m which corresponds to the former UST excavations. Slight to moderate petroleum odours were identified in the lower fill material at MW19-1 and MW19-2.

At MW19-4 and MW19-5 there was sand and gravel till with a trace silt and clay. The thickness of till ranged from 1.1 m to 1.5 m and was underlain by bedrock. No petroleum odours were identified in the native soil.

Grey, limestone bedrock was encountered at a depth of 0.8 m to 1.5 m. Groundwater was encountered at a depth of 2.49 m bsg in MW19-9 to 3.42 m in MW19-4. No petroleum sheens were observed in the monitoring wells during the sampling event.

The geologic cross-sections prepared from the Phase Two property boreholes is presented on Figures 10 to 13 Appendix B.

Based on the Phase Two ESA, the groundwater flow within the bedrock is to the north.

5.12.4 Underground Utilities

The Phase Two property is municipally serviced by underground utilities such as bell, gas, water and sewer. The groundwater flow pattern in the limestone bedrock could be influenced by buried services.

5.12.5 Potentially Contaminating Activities

As per Ontario Regulation (O.Reg.) 153/04, a Potential Contaminating Activity (PCA) is defined as one of fifty-nine (59) industrial operations set out in Table 2 of Schedule D that occurs or has occurred in a Phase One study area. The following PCAs were previously identified:

- PCA 1 5938 Hazeldean Road Former retail gasoline sales outlet and service garage, located adjacent to west of the Phase Two property. (PCA#10 – Commercial Autobody Shops, PCA#28 – Gasoline and Associated Products Stored in Fixed Tanks).
- PCA 2 5943 Hazeldean Road Retail gasoline sales outlet built in 2015, located adjacent to 40 m west of the Phase Two property. (PCA#28 Gasoline and Associated Products Stored in Fixed Tanks). Based on short time frame of existence, this is not considered an APEC.

PCA 3 – 5899 Hazeldean Road – Retail gasoline sales outlet, located adjacent to 160 m to the east
of the Phase Two property. (PCA#28 – Gasoline and Associated Products Stored in Fixed Tanks).
Based on intervening distance and being downslope in terms of the assumed direction of
groundwater flow, this is not considered an APEC.

No other PCAs that took place within the vicinity of the Phase Two property (approximately 250 m radius) were identified.

5.12.6 Areas of Potential Environmental Concern / Potential Contaminants of Concern

As per Ontario Regulation 153/04 (as amended), Potential Contaminating Activity (PCA) is defined as one of the 59 industrial operations set out in Table 2 of Schedule D that occurs or has occurred on the Phase Two property or within the Phase Two property study area. Based on Phase One ESA, the identified areas of potential environmental concern (APEC) and potential contaminants of concern (PCOC) are summarized in the table below and are shown on Figure 2 in Appendix B.

Media Potentially Area of Potential Location of Potentially Location of Impacted **Contaminants** Environmental **APEC on Phase** Contaminating PCA (On-Site (Groundwater, of Concern Concern (APEC) One Property **Activity (PCA)** or Off-Site) Soil and/or Sediment) Petroleum 1.Potential hydrocarbons #28: Gasoline and contamination (PHCs), Associated benzene, from a former **Products** retail gasoline toluene. Storage in Phase One Soil and sales outlet and On-Site ethylbenzene **Fixed Tanks** property groundwater service garage and xylenes #10: Commercial located at the (BTEX), Autobody Phase One volatile organic Shops compounds property (VOCs), lead

Table 5.2: Areas of Potential Environmental Concern

5.12.7 Investigation and Remediation

The Phase Two ESA was conducted to assess the soil and groundwater quality at the Phase Two property. As indicated in the APEC and PCOC Table (above), the analytical program of the Phase Two ESA included testing of soil for metals, VOC, PHC, and PAH, and groundwater for metals, VOC, PHC, and PAH from the boreholes and monitoring well installed on the Phase Two property. The addition of PAH analyses was made to assess the fill quality at the site. The borehole and monitoring well locations are shown on Figure 5 in Appendix B.

5.12.8 Contaminants of Concern (COC)

Based on the results of the investigation, the concentrations of one or more exceedances of PHC F3, cadmium, lead, benzo(a)pyrene and fluoranthene of the MECP Table 7 SCS in soil. There are no contaminants of concern in the groundwater at the Phase Two property

5.12.9 Contaminant Fate and Transport

Soil COCs

A variety of physical, chemical and biochemical mechanisms affect the fate and transport of the potential COCs in soil, the contribution of which is dependent on the soil conditions and the chemical/physical properties of the COCs. Relevant fate and transport mechanisms are natural attenuation mechanisms, including advection mixing, mechanical dispersion/molecular diffusion, phase partitions (i.e. sorption and volatilization), and possibly abiotic or biotic chemical reactions, which effectively reduce COC concentrations.

Concentrations of the COCs in soil will be reduced by the effects of molecular diffusion and the creation of concentration gradients. As non-volatile chemical constituents PHC F3, cadmium, lead, benzo(a)pyrene and fluoranthene may undergo abiotic or biotic chemical reactions associated with the soil mineral particles and the micro-organisms present in the overburden material.

As a result of the various natural attenuation mechanisms in the soil environment, the concentrations of any COCs in soil will be reduced at the Site. The soil impacts are shown on the geologic cross sections (Figures 12A to 12C and 13A to 13C).

Approximately 600 m³ of impacted soil was identified east of the existing site building.

Groundwater COCs

There are no contaminants of concern in the groundwater at the Phase Two property.

5.12.10 Receptors and Exposure Pathways

Human Health Receptors and Exposure Pathways

The Phase Two property is currently vacant but was used for commercial purposes and is occupied by a vacant service garage and all petroleum related equipment has been removed. The Phase Two property will be redeveloped to residential townhomes in the future. The potential on-Site human receptors currently comprise long-term workers, short-term workers, property visitors (adult, teen, child, toddler and infant), and construction workers. The future potential residential land use on-Site human receptors comprise residents (adult, teen, child, toddler and infant) and short-term visitors (adult, teen, child, toddler and infant).

The potential on-site exposure pathways for the construction workers are inadvertent soil ingestion, soil particulate inhalation, soil dermal contact, incidental groundwater ingestion, groundwater dermal contact and ambient vapour inhalation (sourced from soil due to potential work conducted in a trench scenario).

The potential on-site exposure pathways for the short-term (outdoor) workers are soil particulate inhalation, soil dermal contact, and inadvertent soil ingestion.

The potential on-site exposure pathways for the long-term (indoor) workers, residents and property visitors indoor air inhalation (sourced from soil).

Ecological Receptors and Exposure Pathways

The Phase Two property is comprised of developed commercial lands capable of supporting some terrestrial ecological receptors. Relevant terrestrial receptors are terrestrial vegetation, such as trees, grasses and weeds; soil invertebrates, such as earthworms, millipedes and beetles; terrestrial birds, such as pigeons, sparrows and robins; and small terrestrial mammals, such as moles, voles, and mice.

The potential on-site exposure pathways for terrestrial vegetation are root uptake (soil), and stem and foliar uptake of vapours (sourced from soil).

EXP Services Inc.

Hazeldean Crossing Inc.
Phase Two Environmental Site Assessment
5938 Hazeldean Road, Ottawa, Ontario
OTT-00250806-A0
June 27, 2019

The potential on-site exposure pathways for soil invertebrates are soil particulate inhalation, soil dermal contact, soil ingestion, vapour inhalation (sourced from soil), and dermal contact and ingestion of groundwater.

The potential on-site exposure pathways for mammals and birds are soil particulate inhalation, soil dermal contact, soil ingestion, vapour inhalation (sourced from soil), animal tissue ingestion (as a result of biotransformation of soil), and dermal contact and ingestion of groundwater.

6 Conclusions and Recommendations

Based on the Phase Two ESA results, the following summary is provided:

- On February 15, 19 and 20, 2019, a total of 5 boreholes (MW19-1 to MW19-5) were advanced at the Phase Two property and were completed with a monitoring well. On March 13, 2019, six (6) boreholes (BH6 to MW19-11) were advanced at the Phase Two property and a monitoring well was installed in MW19-9 to MW19-11 to facilitate groundwater sampling. The monitoring well at BH11 was installed from 4.3 m to 5.8 m to vertically delineate petroleum impact to groundwater. MW19-9 and MW19-10 were installed to delineate groundwater impact to the west and south of MW19-1.
- Based on the Phase Two ESA, there was approximately 1.5 m of sand fill with some silt and gravel at MW19-3. At MW19-1 and MW19-2, there was sand fill from 1.5 m to 3.6 m which corresponds to the former UST excavations. Slight to moderate petroleum odours were identified in the lower fill material at MW19-1 and MW19-2. At MW19-4 and MW19-5 there was sand and gravel till with a trace silt and clay. The thickness of till ranged from 1.1 m to 1.5 m and was underlain by bedrock. No petroleum odours were identified in the native soil.
- Grey, limestone bedrock was encountered at a depth of 0.8 m to 1.5 m. Groundwater was encountered at a depth of 2.49 m bsg in MW19-9 to 3.42 m in MW19-4. No petroleum sheens were observed in the monitoring wells during the sampling event. Based on the groundwater elevations, the groundwater flow at the Phase Two property is to the north.t
- The concentrations of benzene, PHCs F2 and naphthalene exceeded the MECP Table 7 SCS in groundwater at the Phase Two property in March 2019. The concentrations of BTEX and PHC in the groundwater samples were less than the MECP Table 7 SCS in samples collected in June 2019.
- Approximately 600 m³ of impacted soil was identified east of the existing site building. This soil should be removed and disposed of at a licensed landfill so that the soil concentrations satisfy the MECP Table 7 SCS.
- In March 2019, approximately 900 m² of petroleum impacted groundwater was identified within the limestone bedrock in the former locations of the UST nest and pump island in the north central part of the Phase Two property. Based on the groundwater results from June 2019, no groundwater impact was identified. The initial results could have been due to fine sediment in the groundwater causing false elevated concentrations. Groundwater samples should be collected from the monitoring wells in September 2019 to confirm the June 2019 results.
- If the wells are no longer needed, they should be decommissioned in accordance with Ontario Regulation 903.

7 General Limitations

The information presented in this report is based on a limited investigation designed to provide information to support an assessment of the current environmental conditions within the Phase Two property. The conclusions and recommendations presented in this report reflect Phase Two property conditions existing at the time of the investigation.

More specific information with respect to the conditions between samples, or the lateral and vertical extent of materials may become apparent during excavation operations. The interpretation of the borehole information must, therefore, be validated during any such excavation operations. Consequently, during the future development of the Phase Two property, conditions not observed during this investigation may become apparent. Should this occur, EXP Services Inc. should be contacted to assess the situation, and the need for additional testing and reporting. EXP has qualified personnel to provide assistance in regards to any future geotechnical and environmental issues related to this property.

The environmental investigation was carried out to address the intent of applicable provincial Regulations, Guidelines, Policies, Standards, Protocols and Objectives administered by the Ministry of Environment. It should also be noted that current environmental Regulations, Guidelines, Policies, Standards, Protocols and Objectives are subject to change, and such changes, when put into effect, could alter the conclusions and recommendations noted throughout this report. Achieving the study objectives stated in this report has required us to arrive at conclusions based upon the best information presently known to us. No investigative method can completely eliminate the possibility of obtaining partially imprecise or incomplete information; it can only reduce the possibility to an acceptable level. Professional judgment was exercised in gathering and analyzing the information obtained and in the formulation of the conclusions. Like all professional persons rendering advice we do not act as absolute insurers of the conclusions we reach, but we commit ourselves to care and competence in reaching those conclusions.

Our undertaking at EXP, therefore, is to perform our work within limits prescribed by our clients, with the usual thoroughness and competence of the engineering profession. It is intended that the outcome of this investigation assist in reducing the client's risk associated with environmental impairment. Our work should not be considered 'risk mitigation'. No other warranty or representation, either expressed or implied, is included or intended in this report.

This report was prepared for the exclusive use of Hazeldean Crossing Inc. and may not be reproduced in whole or in part, without the prior written consent of EXP, or used or relied upon in whole or in part by other parties for any purposes whatsoever. Any use which a third party makes of this report, or any part thereof, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. EXP Services Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

We trust this report satisfies your immediate requirements. If you have any questions regarding the information in this report, please do not hesitate to contact this office.

Appendix A – Sampling and Analysis Plan

1 Introduction

This appendix presents the Sampling and Analysis Plan (SAAP) that was developed in support of the Phase Two Environmental Site Assessment (ESA) for the property located at 5938 Hazeldean Road in Ottawa, Ontario (hereinafter referred to as the 'site'). The SAAP presents the procedures and measures that will be undertaken during field investigative activities to characterize the site conditions and meet the data quality objectives of the Phase Two ESA.

The SAAP presents the sampling program proposed for the site, the recommended procedures and protocols for sampling and related field activities, the data quality objectives, and the quality assurance/ quality control measures that will be undertaken to provide for the collection of accurate, reproducible and representative data. These components are described in further detail below.

2 Field Sampling Program

The field sampling program was developed to provide for the collection of samples of the soil and groundwater for chemical analysis of petroleum hydrocarbons (PHC), benzene, toluene, ethylbenzene and xylenes (collectively known as 'BTEX'), polycyclic aromatic hydrocarbons (PAH), volatile organic compounds (VOC), and/or metals. The soil sampling media is to consist of the overburden materials (depths up to 3.5 m of overburden beneath site). The soil sampling will be location-specific to assess for the potential presence of PHC, BTEX, PAH, VOC, and/or metals based on the identification of potential areas of potential environmental concern identified in a Phase One ESA completed by EXP in 2019. Vapour readings will also be taken in the field to determine samples to be submitted for laboratory analysis.

Each of the groundwater samples will be submitted for analysis of metals, VOC, PAH, PHC and BTEX. The monitoring well network is to comprise of five monitoring wells.

Vertical control of the boreholes and monitoring wells will be obtained through the completion of an elevation survey with reference to a geodetic benchmark. Groundwater flow and direction in the overburden aquifer will also be determined through groundwater level measurements and the elevations established in the site elevation survey.

3 Field Methods

To meet the requirements of the field sampling program, the following field investigative methods will be undertaken:

- Borehole Drilling;
- Soil Sampling;
- Monitoring Well Installation;
- Groundwater Level Measurements;
- · Elevation Survey; and,
- Groundwater Sampling.

The field investigative methods will be performed following the procedures and protocols set out in EXP's standard operating procedures and are outlined below:

3.1 Borehole Drilling

Boreholes will be advanced at the site to facilitate the collection of soil samples for chemical analysis and geologic characterization; and, for the installation of groundwater monitoring wells. A total of five (5) boreholes are proposed to be advanced at the site, up to a maximum overburden depth of approximately 6 m below grade, to provide for the collection of samples of the surficial and overburden materials beneath the site. The borehole locations will be selected to delineate the extent and magnitude of PCOC related impacts to the soils and the groundwater.

Prior to borehole drilling, utility clearances will be obtained from public and private locators, as required. The borehole drilling program will be conducted by a licensed driller under the oversight of EXP field staff. All drilling equipment will be cleaned prior to the commencement of drilling at each borehole location.

3.2 Soil Sampling

Soil samples will be collected for chemical analysis and geologic property characterization. The soil samples will be collected using 5 cm diameter, 60 cm long, stainless steel split-spoon sampling devices advanced ahead of the direct push drilling equipment at continuous intervals. The split spoon sampling devices will be attached to drill rods and advanced into the soil by means of a standard penetrating hammer. Upon retrieval from the boreholes, the split-spoon samplers will be placed on a flat surface and disassembled by drilling personnel to provide access of the recovered cores. Geologic and sampling details of the recovered cores will be logged and the samples will be assessed for the potential presence of non-aqueous phase liquids. Samples for chemical analysis will be selected on the basis of visual and olfactory evidence of impacts and at specific intervals to define the lateral and vertical extent of known impacts.

Recommended volumes of soil samples selected for chemical analysis will be collected into pre-cleaned, laboratory supplied, analytical test group specific containers. The samples will be placed into clean insulated coolers chilled with ice for storage and transport. Samples intended for analysis of VOC, BTEX and PHC F1-F2 will be collected into 40 ml vials. The samples will be assigned unique identification numbers, and the date, time, location, and requested analyses for each sample will be documented in a bound field note book. The samples will be submitted to the contract laboratory within analytical test group holding times under Chain of Custody (COC) protocols. New disposable chemical resistant gloves will be used for each soil core to prevent sample cross-contamination.

3.3 Monitoring Well Installation

It is proposed that five boreholes will be instrumented as a groundwater monitoring well installed with slotted screens intercepting either the native overburden material or the shallow bedrock, where the water table aquifer is expected, extending to depths of approximately 6 m below grade. The monitoring wells will be constructed using 37 mm diameter, Schedule 40, PVC riser pipe and number 10 slot size (0.25 mm) well screens. The base of the well screens will be sealed with threaded flush PVC end caps. All well pipe connections will be factory machined threaded flush couplings. The annular space around the well screens will be backfilled with silica sand, to an average height of 0.3 m above the top of the screen. Granular bentonite will be placed in the borehole annulus from the top of the sand pack to approximately 0.3 m below grade. The monitoring wells will be completed with either a flush-mounted protective steel casing or above ground protective casings cemented into place.

3.4 Monitoring Well Development

The newly installed monitoring wells will be developed to remove fine sediment particles potentially lodged in the sand pack and well screen to enhance hydraulic communication with the surrounding formation waters.

Standing water volumes will be determined by means of an electronic water level meter. Prior to collecting groundwater samples, the monitoring wells will be developed using low flow sampling techniques to reduce the amount of sediment in the samples. Well development details will be documented on a well development log sheet or in a bound hard cover notebook. All development waters will be collected and stored in labeled, sealed containers.

3.5 Groundwater Level Measurements

Groundwater level measurements will be recorded for the monitoring wells to determine groundwater flow and direction in the water table aquifer beneath the site. Water levels will be measured with respect to the top of the casing by means of an electronic water level meter. The water levels will be recorded on water level log sheets. The water level meter probe will be decontaminated between monitoring well locations.

3.6 Elevation Survey

An elevation survey will be conducted to obtain vertical control of all monitoring well locations. The top of casing and ground surface elevation of each monitoring well location will be surveyed against a known geodetic benchmark, or if unavailable, against a suitable arbitrary benchmark. Elevations measured against using a high precision GPS unit and a benchmark with an assigned elevation will be recorded as meters above mean sea level (m AMSL). The elevation survey will be accurate to within ± 0.5 cm.

3.7 Groundwater Sampling

Groundwater samples will be collected from the monitoring wells for chemical analysis. The wells will be sampled using a "low flow" technique whereby the wells are continuously purged using an electric pump (equipped with dedicated tubing) and parameters within the purged water are monitored using a groundwater chemistry multi-meter at 3 minute intervals. These parameters include: pH, conductivity, temperature, and salinity. Once these parameters are found to deviate less than 10% over three testing events, equilibrium is deemed to have occurred and a sample of the groundwater will be collected. The purge water will also be continuously monitored for visual and olfactory evidence of petroleum and solvent impact (sheen and odour).

Recommended groundwater sample volumes will be collected into pre-clean laboratory-supplied vials or bottles provided with analytical test group specific preservatives, as required. The samples will be placed in an insulated cooler chilled with ice for storage and transport. Each VOC vial will be inverted and inspected for gas bubbles prior to being placed in the cooler to ensure that no head-space is present. All groundwater samples will be assigned unique identification numbers, and the date, time, project number, company name, location and requested analyses for each sample will be documented in a bound hard cover notebook. The samples will be submitted to the contractual laboratory within analytical test group holding times under COC protocols. New disposable chemical resistant gloves will be used for each sampling location to prevent sample cross-contamination.

4 Field Quality Assurance/Quality Control Program

The objective of the field quality assurance/quality control (QA/QC) program is to obtain soil and groundwater samples and other field measurements that provide data of acceptable quality that meets the objectives of the Phase Two ESA. The objectives of the QA/QC program will be achieved through the implementation of procedures for the collection of unbiased (i.e. non-contaminated) samples, sample documentation and the collection of appropriate QC samples to provide a measure of sample reproducibility and accuracy. The field QA/QC measures will comprise:

- Decontamination Protocols;
- Equipment Calibration;
- Sample Preservation;
- · Sample Documentation; and,
- Field Quality Control Samples.

Details on the field QA/QC measures are provided below.

4.1 Decontamination Protocols

Decontamination protocols will be followed during field sampling where non-dedicated sampling equipment is used to prevent sample cross contamination. The split spoon soil sampling device will be cleaned/decontaminated between sampling intervals in according with SOP requirements. For the monitoring well installation, well components are not to come into contact with the ground surface prior to insertion into boreholes. Electronic water level meters will be decontaminated between monitoring well locations during well development, and purging activities. For hydraulic conductivity tests, the electronic water level meters will be decontaminated between sampling locations. All decontamination fluids will be collected and stored in sealed, labeled containers.

4.2 Equipment Calibration

All equipment requiring calibration will be calibrated in the field according to manufacturer's requirements using analytical grade reagents, or by the supplier prior to conducting field activities, and subsequently checked in the field. The calibration of all pre-calibrated instruments will be checked in the field using analytical grade reagents and re-calibrated as required. For multiple day sampling events, equipment calibration will be checked prior to the beginning of sampling activities. All calibration data will be documented in a bound hard cover notebook.

4.3 Sample Preservation

All samples will be preserved using appropriate analytical test group specific reagents, as required, and upon collection placed in pre-chilled insulated coolers packed with ice for storage and transport.

4.4 Sample Documentation

All samples will be assigned a unique identification number, which is to be recorded along with the date, time, project number, company name, location and requested analysis in a bound field notebook. All samples will be handled and transported following COC protocols.

4.5 Field Quality Control

Field quality controls samples will be collected to evaluate the accuracy and reproducibility of the field sampling procedures. For soil and groundwater sampling, one (1) field duplicate is to be collected for every ten (10) samples submitted for chemical analysis. The field duplicate samples will be assessed by calculating the relative percent difference and comparing to the analytical test group specific acceptance criteria.

Appendix C: Borehole Logs

Explanation of Terms Used on Borehole Records

SOIL DESCRIPTION

Terminology describing common soil genesis:

Topsoil: mixture of soil and humus capable of supporting good vegetative growth.

Peat: fibrous fragments of visible and invisible decayed organic matter.

Fill: where fill is designated on the borehole log it is defined as indicated by the sample recovered during the boring process. The reader is cautioned that fills are heterogeneous in nature and variable in density or degree of compaction. The borehole description may therefore not be applicable as a general description of site fill materials. All fills should be expected to contain obstruction such as wood, large concrete pieces or subsurface basements, floors, tanks, etc.; none of these may have been encountered in the boreholes. Since boreholes cannot accurately define the contents of the fill, test pits are recommended to provide supplementary information. Despite the use of test pits, the heterogeneous nature of fill will leave some ambiguity as to the exact composition of the fill. Most fills contain pockets, seams, or layers of organically contaminated soil. This organic material can result in the generation of methane gas and/or significant ongoing and future settlements. Fill at this site may have been monitored for the presence of methane gas and, if so, the results are given on the borehole logs. The monitoring process does not indicate the volume of gas that can be potentially generated nor does it pinpoint the source of the gas. These readings are to advise of the presence of gas only, and a detailed study is recommended for sites where any explosive gas/methane is detected. Some fill material may be contaminated by toxic/hazardous waste that renders it unacceptable for deposition in any but designated land fill sites; unless specifically stated the fill on this site has not been tested for contaminants that may be considered toxic or hazardous. This testing and a potential hazard study can be undertaken if requested. In most residential/commercial areas undergoing reconstruction, buried oil tanks are common and are generally not detected in a conventional geotechnical site investigation.

Till: the term till on the borehole logs indicates that the material originates from a geological process associated with glaciation. Because of this geological process the till must be considered heterogeneous in composition and as such may contain pockets and/or seams of material such as sand, gravel, silt or clay. Till often contains cobbles (60 to 200 mm) or boulders (over 200 mm). Contractors may therefore encounter cobbles and boulders during excavation, even if they are not indicated by the borings. It should be appreciated that normal sampling equipment cannot differentiate the size or type of any obstruction. Because of the horizontal and vertical variability of till, the sample description may be applicable to a very limited zone; caution is therefore essential when dealing with sensitive excavations or dewatering programs in till materials.

Terminology describing soil structure:

Desiccated: having visible signs of weathering by oxidization of clay minerals, shrinkage cracks, etc.

Stratified: alternating layers of varying material or color with the layers greater than 6 mm thick.

Laminated: alternating layers of varying material or color with the layers less than 6 mm thick.

Fissured: material breaks along plane of fracture.

Varved: composed of regular alternating layers of silt and clay.

Slickensided: fracture planes appear polished or glossy, sometimes striated.

Blocky: cohesive soil that can be broken down into small angular lumps which resist further

breakdown.

Lensed: inclusion of small pockets of different soil, such as small lenses of sand scattered

through a mass of clay; not thickness.

Seam: a thin, confined layer of soil having different particle size, texture, or color from

materials above and below.

Homogeneous: same color and appearance throughout.

Well Graded: having wide range in grain sized and substantial amounts of all predominantly on grain

size.

Uniformly Graded: predominantly on grain size.

All soil sample descriptions included in this report follow the ASTM D2487-11 Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System). The system divides soils into three major categories: (1) coarse grained, (2) fine-grained, and (3) highly organic. The soil is then subdivided based on either gradation or plasticity characteristics. The system provides a group symbol (e.g. SM) and group name (e.g. silty sand) for identification. The classification excludes particles larger than 76 mm. Please note that, with the exception of those samples where a grain size analysis has been made, all samples are classified visually in accordance with ASTM D2488-09a Standard Practice for Description and Identification of Soils (Visual-Manual Procedure). Visual classification is not sufficiently accurate to provide exact grain sizing or precise differentiation between size classification systems. Others may use different classification systems; one such system is the ISSMFE Soil Classification.

ISSMFE SOIL CLASSIFICATION

CLAY		SILT			SAND	<u> </u>		GRAVEL		COBBLES	BOULDERS
	FINE	MEDIUM	COARSE	FINE	MEDIUM	COARSE	FINE	MEDIUM	COARSE		
0.002	0.00	6 0.02	0.06	0.2	0.6	2.0	6.0	20	60	200	

EQUIVALENT GRAIN DIAMETER IN MILLIMETRES

CLAY (PLASTIC) TO	FINE	MEDIUM	CRS.	FINE	COARSE
SILT (NONPLASTIC)		SAND		GF	RAVEL

UNIFIED SOIL CLASSIFICATION

Terminology describing materials outside the USCS, (e.g. particles larger than 76 mm, visible organic matter, construction debris) is based upon the proportion of these materials present and as described below in accordance with Note 16 in ASTM D2488-09a:

Table a: Percent or Proportion of Soil, Pp

	Criteria
Trace	Particles are present but estimated to be less than 5%
Few	5≤Pp≤10%
Little	15≤Pp≤25%
Some	30≤Pp≤45%
Mostly	50≤Pp≤100%

The standard terminology to describe cohesionless soils includes the compactness as determined by the Standard Penetration Test 'N' value:

Table b: Apparent Density of Cohesionless Soil

'N' Value (blows/0.3 m)
N<5
5≤N<10
10≤N<30
30≤N<50
50≤N

The standard terminology to describe cohesive soils includes consistency, which is based on undrained shear strength as measured by insitu vane tests, penetrometer tests, unconfined compression tests or similar field and laboratory analysis, Standard Penetration Test 'N' values can also be used to provide an approximate indication of the consistency and shear strength of fine grained, cohesive soils:

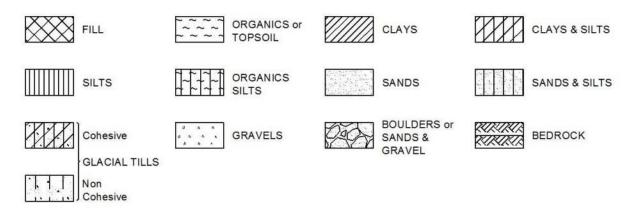

Table c: Consistency of Cohesive Soil

Consistency	Vane Shear Measurement (kPa)	'N' Value
Very Soft	<12.5	<2
Soft	12.5-25	2-4
Firm	25-50	4-8
Stiff	50-100	8-15
Very Stiff	100-200	15-30
Hard	>200	>30

Note: 'N' Value - The Standard Penetration Test records the number of blows of a 140 pound (64kg) hammer falling 30 inches (760mm), required to drive a 2 inch (50.8mm) O.D. split spoon sampler 1 foot (305mm). For split spoon samples where full penetration is not achieved, the number of blows is reported over the sampler penetration in meters (e.g. 50/0.15).

STRATA PLOT

Strata plots symbolize the soil or bedrock description. They are combinations of the following basic symbols:

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) This test was performed by Maxxam Analytics Mississauga
- (2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the

reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Encryption Key

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Sampler Initials: ML

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1 10.0°C

VOCF1 Analysis: Extraction surrogates (D10- Xylene) is above the limit for some samples due to the low level of methanol in the sample.

Sample JBQ773 [BH4 AS1]: PAH analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

VOLATILE ORGANICS BY GC/MS (SOIL)

Volatile Organic Compounds and F1 PHCs: VOCF1 Analysis: Some parameters for matrix spike were not calclulated (NC) due to high concentration of target analyte in the parent sample.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) This test was performed by Maxxam Analytics Mississauga
- (2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.

(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each to	emperature is the	average of up to	three cooler temperatures taken at receipt
	Package 1	1.7°C	
Revised	d Report[2019/04	/15]: pH & Grain	Size analysis has been included on samples BH7 & BH10 as per client request.
Result	s relate only to th	e items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

 $Reference\ Method\ suffix\ "m"\ indicates\ test\ methods\ incorporate\ validated\ modifications\ from\ specific\ reference\ methods\ to\ improve\ performance.$

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) This test was performed by Maxxam Analytics Mississauga
- (2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- st RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) This test was performed by Maxxam Analytics Mississauga
- (2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) This test was performed by Bureau Veritas Laboratories Mississauga
- (2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas Laboratories conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Steve Roberts, Ottawa Lab Manager

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.
