TIA Plan Reports

On 14 June 2017, the Council of the City of Ottawa adopted new Transportation Impact Assessment (TIA) Guidelines. In adopting the guidelines, Council established a requirement for those preparing and delivering transportation impact assessments and reports to sign a letter of certification.

Individuals submitting TIA reports will be responsible for all aspects of development-related transportation assessment and reporting, and undertaking such work, in accordance and compliance with the City of Ottawa's Official Plan, the Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines.

By submitting the attached TIA report (and any associated documents) and signing this document, the individual acknowledges that s/he meets the four criteria listed below.

CERTIFICATION

1. I have reviewed and have a sound understanding of the objectives, needs and requirements of the City of Ottawa's Official Plan, Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines;
2. I have a sound knowledge of industry standard practice with respect to the preparation of transportation impact assessment reports, including multi modal level of service review;
3. I have substantial experience (more than 5 years) in undertaking and delivering transportation impact studies (analysis, reporting and geometric design) with strong background knowledge in transportation planning, engineering or traffic operations; and
4. I am either a licensed¹ or registered² professional in good standing, whose field of expertise [check ☒ appropriate field(s)] is either transportation engineering ☒ or transportation planning ☐.

1,2 License of registration body that oversees the profession is required to have a code of conduct and ethics guidelines that will ensure appropriate conduct and representation for transportation planning and/or transportation engineering works.

Strategy Report

1. SCREENING FORM

The screening form was submitted in conjunction with the Scoping Report for review and confirmation of the need for a Transportation Impact Assessment (TIA). The Trip Generation, Location, and Safety triggers were met based on the unit count, proposed new driveway on a “Spine” cycling route and proximity to the Robert Grant/Bobolink and Robert Grant/Abbott roundabouts. The Screening Form and Correspondence are provided in **Appendix A**.

2. SCOPING REPORT

2.1. EXISTING AND PLANNED CONDITIONS

2.1.1. PROPOSED DEVELOPMENT

Lépine Corporation has retained Parsons to complete the following TIA Report in support of a Zoning By-Law amendment application for a proposed residential development in Ward 6: Stittsville West. The proposed development is located at 1000 Robert Grant Ave and is expected to consist of three residential towers ranging from five to fifteen storeys with 566 units in total. Buildout has been assumed in a single phase, with full occupancy achieved by 2020 based on current estimates. The subject site is currently vacant and zoned as AM – Arterial Mainstreet. The local context is provided in **Figure 1** and the current site plan is shown in **Figure 2**.

Figure 1: Local Context

Figure 2: Site Plan

The main access is proposed via Robert Grant Avenue, which leads to an internal roundabout, a ramp to the underground parking garage and six surface parking spaces for visitors. The main access intersection with Robert Grant Ave is expected to permit right-in/right-out only vehicular movements only.

A second access is proposed as a full movement driveway connection to Livery Street, which leads directly to the underground parking garage.

2.1.2. EXISTING CONDITIONS

Area Road Network

Fernbank Road is an east-west arterial road that runs between Dwyer Hill Road and Eagleson Road. Fernbank Road has a two-lane undivided rural cross section with paved shoulders. Within the study area, the posted speed limit is 80km/h.

Robert Grant Avenue is a north-south arterial roadway that extends from Fernbank Road in the south to Abbott St E in the north. The roadway has a two-lane cross-section and the posted speed limit is 60 km/h.

Abbott Street E is an east-west major collector roadway east of Stittsville Main Street and a collector roadway west of Stittsville Main Street. Within the study area, it has a two-lane cross-section with auxiliary turn lanes provided at major intersections. The posted speed limit is 50 km/h.

Bobolink Ridge is an east-west local roadway that extends from Robert Grant Avenue in the west and terminates at Asturcon Street in the east. It has a two-lane cross-section and an unposted speed understood to be 50 km/h.

Livery Street is a north-south local roadway that extends north from Bobolink Ridge, turns east and terminates at Tapadero Avenue. It has a two-lane cross-section and an unposted speed understood to be 50 km/h.

Existing Study Area Intersections

Abbott Street E/Robert Grant

The Abbott Street E/Robert Grant intersection is a three-legged, single lane roundabout intersection. All approaches consist of a single approach lane. All movements are permitted at this location.

Bobolink/Robert Grant

The Bobolink/Robert Grant intersection is a four-legged roundabout intersection. All approaches consist of a single approach lane. All movements are permitted at this location.

Fernbank/Robert Grant

The Fernbank/Robert Grant intersection is a signalized 'T' intersection. The southbound approach consists of a left-turn lane and a right-turn lane. The eastbound approach consists of a left-turn lane and a through lane. The westbound approach consists of a through lane and a right-turn lane. All movements are permitted at this location.

Bobolink/Livery

The Bobolink/Livery intersection is an unsignalized 'T' intersection with STOP control in Livery Street. All approaches consist of a single all-movement lane. All movements are permitted at this location.

Existing Driveways to Adjacent Developments

There are no existing driveways on either side of Robert Grant Avenue within 200m of the proposed site access. On the east side of Livery Street there are approximately 17 private residential driveways within 200m of the proposed site access.

Existing Area Traffic Management Measures

Below are the existing area traffic management measures on the boundary streets:

Robert Grant Avenue

- Medians;
- Sidewalks;
- Streetscaping

Bobolink Ridge

- Sidewalks

Livery Street

- Sidewalks

Pedestrian/Cycling Network

Sidewalks are provided on both sides of Robert Grant Avenue, on the north side of Abbott Street E, the north side of Bobolink Drive and the west side of Livery Street. There are no existing sidewalks on Fernbank Road. A multi-use pathway is provided on the south side of Abbott Street E. The Ottawa Pedestrian Plan (2013) does not identify any future projects within the study area.

The City of Ottawa's 2013 Cycling Plan identifies Robert Grant Avenue and Fernbank Road as Spine Routes, and Abbott Street E as a major pathway. Cycling facilities include cycle tracks on Robert Grant Avenue and a pathway on the south side of Abbott Street E. There are no existing cycling facilities on Fernbank Road.

Transit Network

There is currently no transit service provided north of Cope Dr along Robert Grant Ave. The OC Transpo routes that currently operate within the study area are as follows:

- **Route #62 (St-Laurent, Hurdman <-> Terry Fox, Stittsville):** identified by OC Transpo as a "Rapid Route", Route #62 operates at an average rate of every 30 minutes during weekday peak hour periods. The nearest bus stops to the site are available along Abbott St, as well as Iber Rd.
- **Route #167 (Terry Fox <-> Blackstone):** identified by OC Transpo as a "Local Route", this route operates at a rate of every 30-or-60 minutes during weekday morning and afternoon peak hour periods. The nearest bus stops to the development site are available along Robert Grant Ave, as well as Cope Dr.
- **Route #252 (Mackenzie King <-> Fernbank):** identified by OC Transpo as a "Connexion Route", this route operates during weekday rush-hours only at an average rate of every 10-to-15 minutes. The nearest bus stops to the site are available along Robert Grant Ave, as well as Cope Dr.

The noted OC Transpo route maps have been provided in **Appendix B**. **Figure 3** below illustrates the area transit network, while **Figure 4** provides the nearest bus stop locations to the development site.

Figure 3: Area Transit Network

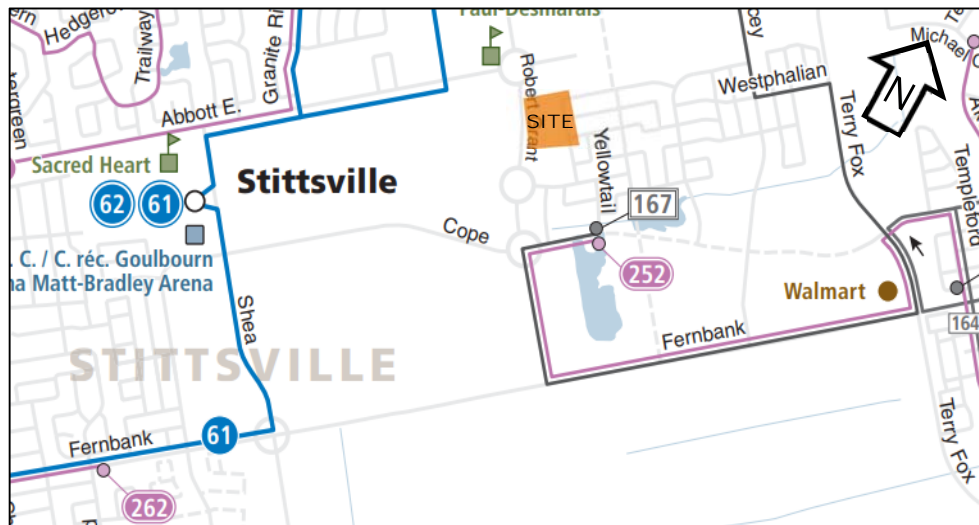

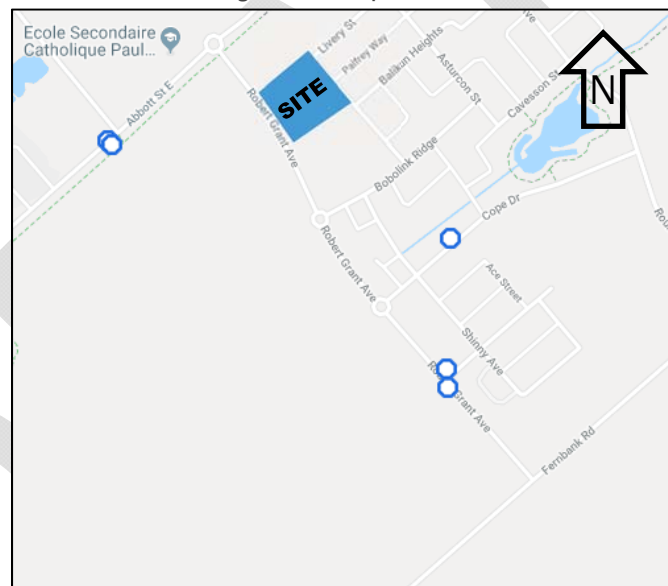

Figure 4: Bus Stop Locations

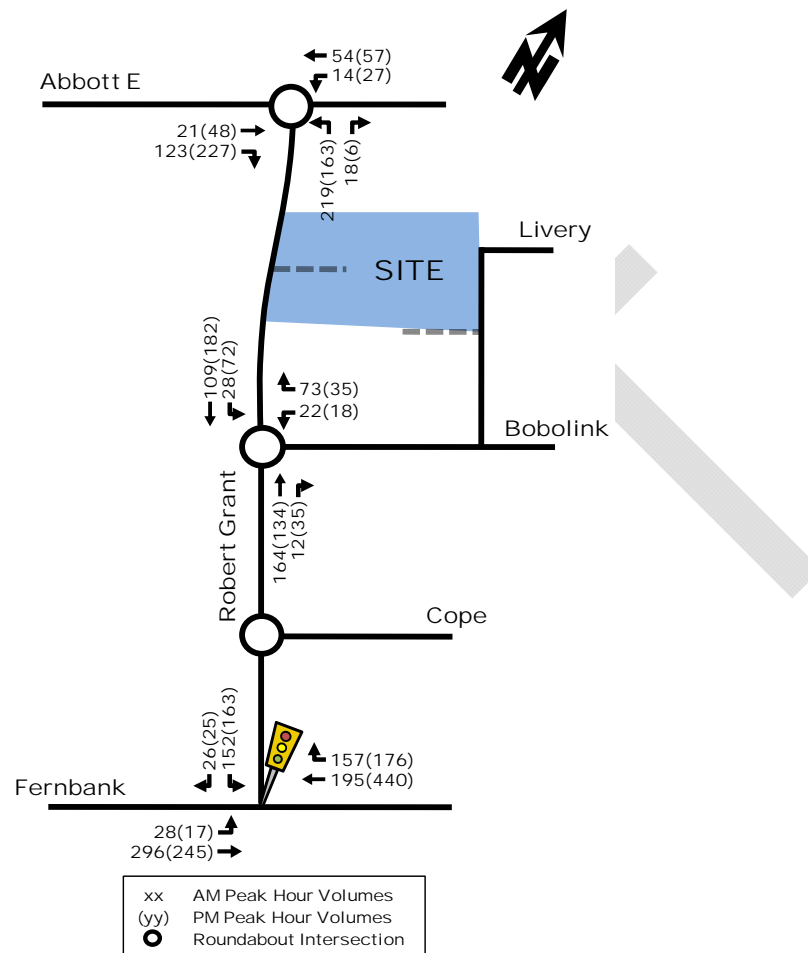

Peak Hour Travel Demand

The existing peak hour traffic volumes within the study area, as illustrated in Figure 5, were obtained from the City of Ottawa or conducted by Parsons. The peak hour traffic volume count data has been provided in **Appendix C**.

Note, the traffic volumes on Robert Grant between Bobolink and Abbott E were balanced to the higher approach volume to represent the worst-case scenario. Furthermore, vehicles using the west leg of the Bobolink/Robert Grant roundabout were not included in the traffic volume figures as they represent a small number of vehicles accessing the construction site west of Robert Grant Ave.

Figure 5: Existing Peak Hour Traffic Volumes

Existing Road Safety Conditions

The local road network is relatively new, hence there is limited history of collisions along the boundary streets. The collision data available for Robert Grant Avenue indicates that there were two collisions since the road was built: a sideswipe collision in July 2016 and an angle collision in October 2017. Both collisions resulted in property damage only and no pedestrians and cyclists were involved. The collision data as provided by the City of Ottawa and related analysis has been provided in Appendix D.

2.1.3. PLANNED CONDITIONS

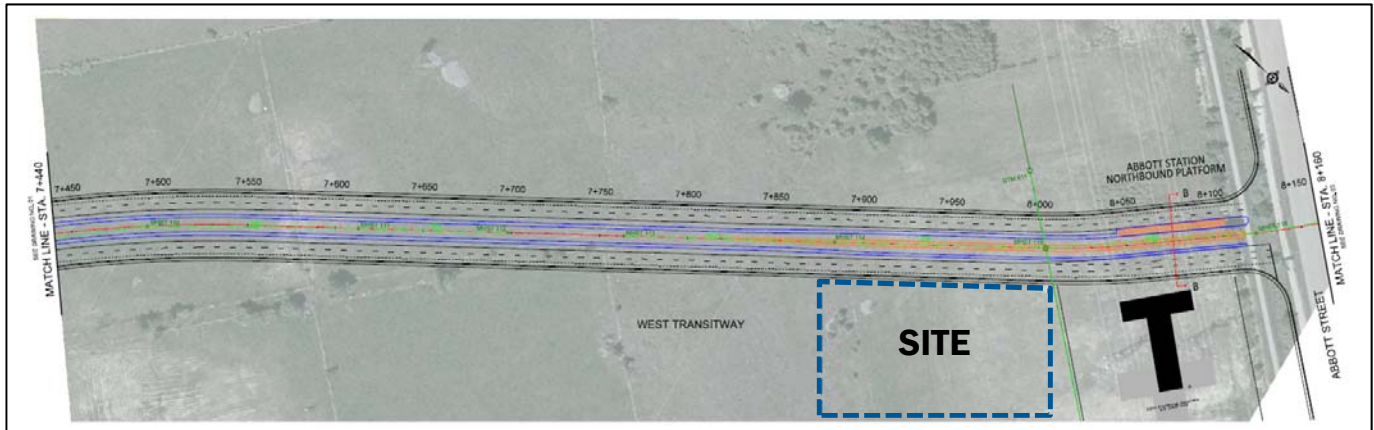

Planned Study Area Transportation Network Changes

Fernbank Road is identified as a transit priority corridor with isolated measures (City of Ottawa Transportation Master Plan (TMP) 2013, Ultimate Network) and widening has been proposed in the Network Concept Map 10 (TMP).

Robert Grant Avenue is identified as a transit priority corridor with isolated measures in the Affordable Network Plan and a future Bus Rapid Transit (BRT) corridor in the Network Concept Plan. Additionally, Park and Rides have been proposed at the Abbot E/Robert Grant and Fernbank/Robert Grant intersections in the Affordable Network Plan, the Network Concept Plan and the Fernbank Community Design Plan.

A high-level design for Robert Grant Ave was completed as part of the West Transit Way Connections (Terry Fox Dr. to Fernbank Rd) EA study. The section of this design, along the proposed development frontage is shown in **Figure 6**. This section includes exclusive bus lanes along the roadway centreline, the future Abbott BRT station, and park and ride location.

Figure 6: Future Robert Grant Ave Concept

Other Area Developments

The following developments are planned near the subject site based on the latest information from the City:

365 Haliburton Heights (Abbott-Fernbank Lands)

Eight two-storey buildings comprised of 96 apartments are proposed at the above noted address, located 750m south of the subject development. The Transportation Impact Assessment (prepared by Novatech) projected approximately 45 to 50 veh/h during peak hours.

5611 Fernbank Road (Abbott-Fernbank Lands)

eQHomes is proposing a residential development, also in the Abbott-Fernbank Lands, located at the above address, directly south of the subject development. Based on a site visit completed January 14th, 2019, it was determined that this development has almost reached full build-out. As such, it is reasonable to assume the majority of traffic generated by this development has been captured by the traffic counts completed in January 2019 and will not be accounted for in background traffic.

570 Hazeldean Road

Mattamy Homes is proposing a subdivision development consisting of approximately 227 single homes and 518 townhomes, located 1km north of the subject development. The Transportation Brief (prepared by Stantec) projected approximately 230 veh/h during the morning peak hour and 360 veh/h during the afternoon peak hour.

590 Hazeldean Road

Richcraft Homes is proposing a subdivision development consisting of approximately 600 units, located 1km north of the subject development. The Transportation Impact Study (prepared by Stantec) projected approximately 300 veh/h during the morning peak hour and 375 veh/h during the afternoon peak hour.

5505 Fernbank Road (Blackstone South)

Mattamy Homes is proposing a subdivision development consisting of approximately 609 units, located 1.2km southeast of the subject development. The Transportation Impact Assessment (prepared by Parsons) projected approximately 264 veh/h during the morning peak hour and 327 veh/h during the afternoon peak hour.

5786 Fernbank Road (CRT Lands)

In 2011, the IBI Group submitted a Transportation Letter to the City of Ottawa for the development known as Claridge Homes – Fernbank Subdivision, taking place west of Robert Grant Ave, across from the future Lépine Development. It is to our understanding that the development has been put on hold since then.

The location of the site and the adjacent future developments are shown below in **Figure 7**.

Figure 7: Other Area Developments

2.2. STUDY AREA AND TIME PERIODS

As the proposed site is largely a residential development, the time periods assessed will be the weekday morning and afternoon peak hours. The proposed study area is outlined below and highlighted in **Figure 8**.

Figure 8: Study Area

- Abbott E/Robert Grant intersection;
- Bobolink/Robert Grant intersection;
- Fernbank/Robert Grant intersection;
- Bobolink/Livery intersection;
- Site Access/Robert Grant intersection;
- Site Access/Livery intersection;
- Robert Grant Avenue adjacent to the site; and,
- Livery Street adjacent to the site.

2.3. EXEMPTION REVIEW

Based on the City's TIA guidelines and the subject site, the following modules/elements of the TIA process, summarized in **Table 1**, are recommended to be exempt in the subsequent steps of the TIA process:

Table 1: Exemptions Review Summary

Module	Element	Exemption Consideration
Design Review Component (4.1 – 4.4)	All elements	Not required for rezoning applications.
4.8 Review of Network Concept	All elements	The site is not expected to generate 200 trips more than the established zoning. This will be confirmed in Step 3.

3. FORECASTING

3.1. DEVELOPMENT GENERATED TRAVEL DEMAND

3.1.1. TRIP GENERATION AND MODE SHARES

The proposed development will consist of 566 apartment dwelling units, housed within one mid-rise and two high-rise buildings. Appropriate trip generation rates were obtained from the 2009 TRANS Trip Generation Residential Trip Rates report, **Table 6.3**, which have been summarized in **Table 2**.

Table 2: TRANS Trip Generation Residential Trip Rates

Land Use	Data Source	Trip Rates	
		AM Peak	PM Peak
Mid-Rise Apartments (3-10 floors)	TRANS	T = 0.29(du);	T = 0.37(du);
High-Rise Apartments (10+ floors)	TRANS	T = 0.29(du);	T = 0.36(du);
Notes: T = Average Vehicle Trip Ends du = Dwelling unit			

Using the trip rates shown in **Table 2**, the number of vehicles per hour were determined as shown in **Table 3** below.

Table 3: Apartment Units Vehicle Trip Generation

Land Use	Dwelling Units	AM Peak (Vehicles/h)			PM Peak (Vehicles/h)		
		In	Out	Total	In	Out	Total
Mid-Rise Apartments (3-10 floors)	146	10	32	42	33	21	54
High-Rise Apartments (10+ floors)	420	29	93	122	93	58	151

The total vehicle trips shown in **Table 3** for the apartment units were then converted to total person trips using the auto mode share values in Table 3.13 of the TRANS report. New mode share percentages were then applied to the resulting total person trips values, based on the 2011 NCR Household Origin-Destination (OD) Survey and the Kanata/Stittsville district. **Table 4** provides the resulting person trips/h values for each of the travel modes.

Table 4: Mode Shares for the Residential Buildings Development

Travel Mode	Mode Share	AM Peak (Person Trips/h)			PM Peak (Person Trips/h)		
		In	Out	Total	In	Out	Total
Auto Driver	60%	53	171	224	172	107	279
Auto Passenger	15%	14	41	55	42	27	69
Transit	15%	12	44	56	43	28	71
Non-motorized	10%	8	29	37	28	19	47
Total Person Trips	100%	87	285	372	285	181	466
Total 'New' Auto Trips		53	171	224	172	107	279

As shown in **Table 4**, the resulting number of total person trips expected to be generated by the proposed development are approximately 370 and 465 in the morning and afternoon peak hours respectively. The projected 'new' vehicle trips are approximately 225 and 280 in the weekday morning and afternoon peak hours respectively.

3.1.2. TRIP DISTRIBUTION AND ASSIGNMENT

Based on the 2011 NCR Household Origin-Destination Survey (Kanata – Stittsville district) and the location of adjacent arterial roadways and neighbourhoods, the distribution of site-generated traffic volumes was estimated as follows:

- 5% to/from the north;
- 40% to/from the south;
- 50% to/from the east; and,
- 5% to/from the west.

The expected site-generated auto trips in **Table 4** were then assigned to the road networks as shown in **Figure 9** below.

Figure 9: Residential Development Site-Generated Traffic

The development is proposing two access points, one on Robert Grant Ave and one on Livery St. The Robert Grant access is expected to be a right-in/right-out access only. As such, traffic coming from the north may either turn left at the Bobolink/Robert Grant roundabout and access the development from Livery St or make a U-turn at the roundabout to access the RIRO from the south.

3.2. BACKGROUND NETWORK TRAFFIC

3.2.1. TRANSPORTATION NETWORK PLANS

Refer to **Section 2.1.3: Planned Study Area Transportation Network Changes**.

3.2.2. BACKGROUND GROWTH

Historically, Fernbank Rd has experienced a decline in background growth, as observed by historical traffic counts data (years 2009, 2010, 2012, 2014 and 2017) on the West Leg of Fernbank/Eagleson. The percent change from 2009 has been summarized in **Table 5**. Detailed background traffic growth analysis is provided in **Appendix E**.

Table 5: Fernbank/Egleson Historical Traffic Growth (2009-2017)

Time Period	Percent Change
	West Leg
8 hrs	-1.51%
AM Peak	-4.91%
PM Peak	-1.17%

Accounting for future developments, which are expected to reach full build-out by 2025, a 2% background growth rate per year was considered appropriate to estimate interim traffic growth along existing roadways within the study area. **Figure 10** and **Figure 11** show the estimated future background peak hour traffic volumes in the 2020 and 2025 horizons.

Figure 10: Future Background 2020

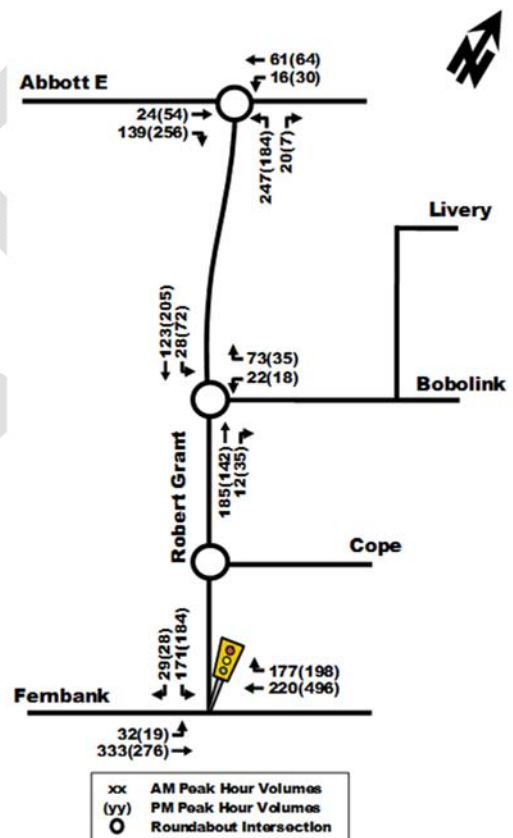

Figure 11: Future Background 2025

3.2.3. OTHER DEVELOPMENTS

Descriptions of the adjacent developments in the surrounding area that have initiated the development application process with the City were provided in **Section 2.1.3: Other Area Developments**.

The following surrounding developments were expected to be fully constructed within the analysis periods of the proposed development, based on the latest information available from the City.

- Fernbank Crossing, Phase 3 (2015)
- Fernbank Crossing, Phase 4 (2017)
- Blackstone Subdivision, Phases 4-8 (2017) – 5505 Fernbank Rd
- CRT Lands, Phases 1-2 (2011) – 5786 Fernbank Rd

To produce the most accurate analysis results, the estimated trips generated by adjacent developments were recalculated and redistributed according to the current (2017) TIA requirements from the City. Many of the traffic studies supporting these developments were completed using the previous 2006 TIA requirements.

The most relevant changes were the trip generation rates and the mode share percentages; both were updated to follow the same trip generation process discussed in **Section 3.1.1**. The trip distribution applied to the adjacent developments was assumed to be the same as the percentages applied to the Lépine Development (see **Section 3.1.2**).

Fernbank Crossing, Phases 3 and 4

A site visit confirmed the majority of Phase 3 was already constructed by the time traffic counts were conducted at intersections within the study area in January of 2019. However, it was assumed approximately 10% (20 Single-Detached Units) of Phase 3 have yet to be constructed, as a conservative estimate. These remaining residential units were added to the trip generation calculations of Phase 4, which has not begun construction at the time of the report. Phase 4 proposes 100 Single-Detached units and 46 Townhouse units. **Table 6** below provides the expected number of auto trips generated by Phases 3 and 4.

Table 6: Fernbank Crossing Total New Auto Trips Generated

Land Use	Dwelling Units	AM Peak (Vehicles/h)			PM Peak (Vehicles/h)		
		In	Out	Total	In	Out	Total
Single-Detached Units	120	26	66	92	62	39	101
Townhouse Units	46	9	18	27	16	16	32
Total	166	35	84	119	78	55	133

As shown in **Table 6** the expected number of trips generated by the remainder of Phase 3 and the entirety of Phase 4 are 119 and 133 veh/h in the morning and afternoon peak hours of travel. These auto trips are then distributed at Haliburton Heights, future Defense St and future Cope Dr extension. The majority of the trips would use the future Cope Dr to access eastern and northern regions of Ottawa. The remaining trips would access Defense St via Fernbank Rd (or vice-versa) and a small percentage would utilize Robert Grant Ave.

Blackstone South, Phase 4-8

The Blackstone South development is expected to reach full build-out by 2025 and features a total of 376 Townhouses, 423 Single-Detached Houses, a Residential Condominium Block, a Public High School and a Public Elementary School. Since this future development will connect to Fernbank Rd, Terry Fox Dr and the future extensions of Cope Dr and Rouncey Rd, it was assumed the majority of this development traffic will use those access points. For the following analysis, it was assumed approximately 10% of Townhouse units (45 Units) and 10% of Single-Detached units (40 Units) would utilize Robert Grant Ave. **Table 7** below provides the expected number of auto trips generated by the Blackstone South Development.

Table 7: Blackstone South Total New Auto Trips Generated

Land Use	Dwelling Units	AM Peak (Vehicles/h)			PM Peak (Vehicles/h)		
		In	Out	Total	In	Out	Total
Single-Detached Units	40	8	23	31	20	13	33
Townhouse Units	45	9	18	27	16	15	31
Total	166	17	41	58	36	28	64

As shown in **Table 7**, the expected number of auto trips generated by the Blackstone South Development within the vicinity of the Lépine Development study area are 58 and 64 veh/h during the morning and afternoon peak hours of travel. The auto trips were then distributed reasonably at intersections within the study area.

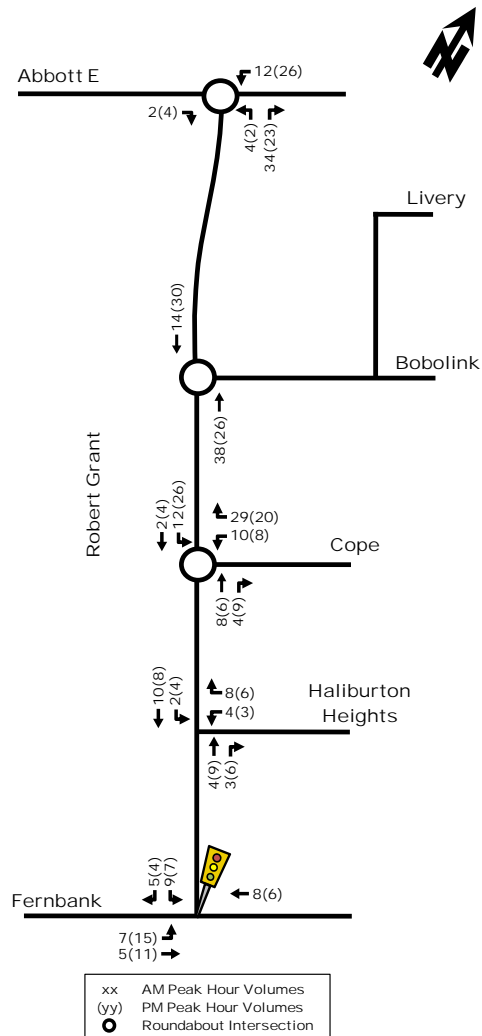

CRT Lands, Phases 1-2

The most recent traffic information regarding this development is a Transportation Brief, submitted by the IBI Group in 2011. The City confirmed the CRT Lands development application has been put on hold and no recent TIA reports have been officially submitted. Due to the uncertainty of the future of this development, the CRT Lands Development was not included in this report.

Total Adjacent Development Traffic

Figure 12 illustrates the traffic volumes expected to be generated by adjacent developments within the study area.

Figure 12: Total Adjacent Development Traffic Volumes

3.2.4. TOTAL BACKGROUND TRAFFIC

Total background traffic represents the summation of background traffic growth (based on the 2% growth rate) and adjacent development traffic.

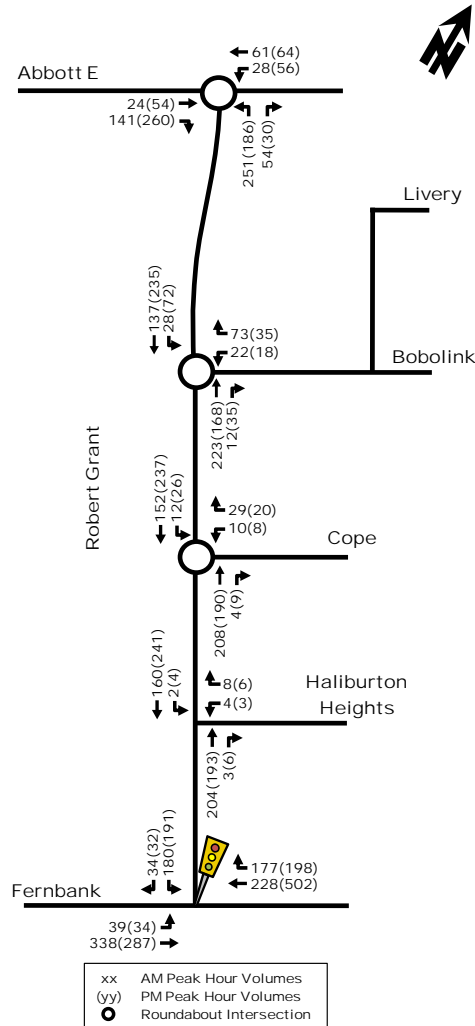

It was assumed that all adjacent development units would be constructed after 2020. Any construction completed over the course of 2019 was expected to be accounted for in the 2% growth rate noted in the Future Background 2020 traffic

projections. Therefore, the estimated Total Background 2020 traffic volumes were the same as the Future Background 2020 traffic volumes shown in **Figure 8**.

By 2025, all adjacent development traffic was accounted for. This assumption represents the worst-case scenario, since the rate of development is highly dependent on future market conditions and its probable 100% buildout of all adjacent developments noted in this study will not be achieved by 2025.

The Future 2025 Total Background traffic volumes are shown in **Figure 13**, which is the sum of the Future 2025 Background traffic volumes from **Figure 11** and Total Adjacent Development traffic volumes from **Figure 12**.

Figure 13: Future 2025 Total Background

3.3. DEMAND RATIONALIZATION

The study area road network is expected to accommodate projected volumes. There are currently no anticipated capacity issues. The capacity of the roadways will be further explored in a more detailed review of the total projected traffic volumes and intersection design in the ensuing Strategy Report.

4. ANALYSIS

4.1. DEVELOPMENT DESIGN

Exempt – see **Section 2.3**.

4.2. PARKING

Exempt – see **Section 2.3**.

4.3. BOUNDARY STREET DESIGN

Exempt – see **Section 2.3**.

4.4. ACCESS INTERSECTION DESIGN

Exempt – see **Section 2.3**.

4.5. TRANSPORTATION DEMAND MANAGEMENT

The TDM checklist is attached in **Appendix F**.

4.6. NEIGHBOURHOOD TRAFFIC MANAGEMENT

The following section discusses the development's impact on local or collector roads of the surrounding neighbourhoods. Robert Grant Ave is classified as an arterial, which means it can be excluded from this analysis.

Bobolink Ridge is classified as a Local Road; the highest observed existing one-way traffic volume east of Robert Grant Ave was 107 veh/h in the afternoon peak hour. By the 2025 horizon year, with full buildout of proposed development and noted adjacent developments, the estimated one-way traffic volume at the same location was 193 veh/h in the afternoon peak hour. As per the City of Ottawa's TIA Guidelines (2017), the one-way traffic volume threshold of a Local Road is 120 veh/h.

In this case, no changes were recommended in the road network for the following reasons (refer to **Figure 14**):

1. Although Bobolink is classified as a local road, the section between Elfin Grove and Robert Grant Ave has been constructed as a collector road, which has a threshold of 300 veh/h. The pavement width is approximately 11.5m and there is no direct frontage. This transition is necessary when connecting a local road to an arterial road;
2. There are three intersecting streets along the collector road section, Janka, Shinny and Elfin, which will reduce traffic volumes as Bobolink transitions to a local road; and,
3. It is anticipated that once the Rouncey Rd and Cope Dr roadways are fully built further east, more adjacent development traffic will divert away from Robert Grant, thereby relieving traffic pressure on Bobolink as it transitions to a local road.

Overall, the design of Bobolink was considered appropriate in this context.

Figure 14: Bobolink Cross-section

4.7. TRANSIT

Refer to **Section 2.1.2: Transit Network**, for a description of the existing bus services within the study area. For future conditions, the “Rapid Transit and Transit Priority Network – 2031 Affordable Network” map of the City of Ottawa’s Transportation Master Plan, identifies Robert Grant Ave as a future Transit Priority Corridor (Isolated Measures), with three Park and Ride areas located at Robert Grant/Hazeldean, Robert Grant/Abbott (immediately north of the Lépine Development) and Robert Grant/Fernbank. As such, transit services are expected to be able to accommodate the future transit demand of the Lépine Development and other developments along Robert Grant Ave.

4.8. REVIEW OF NETWORK CONCEPT

Exempt – see **Section 2.3**.

4.9. INTERSECTION DESIGN

4.9.1. INTERSECTION CONTROL

Bobolink/Robert Grant and Abbott/Robert Grant are both roundabouts, while the Fernbank/Robert Grant intersection is controlled by traffic signals. These are appropriate designs based on approved studies for Robert Grant completed by the City.

4.9.2. INTERSECTION DESIGN

Existing Conditions

Table 8 below provides a summary of intersection and roundabout operational results within the study area based on existing traffic volumes, previously shown in **Figure 5**. At signalized intersections, movements were assessed based on the volume-to-capacity (v/c) ratio and the corresponding Level of Service (LOS) for the most critical movement as per City standards. The intersection ‘as a whole’ for signal-controlled intersections was based on the weighted v/c ratio for all the

movements at the intersection and the corresponding Level of Service (LOS) for critical movements that showed a LOS 'E' or worse.

Roundabouts within the study area were assessed using Sidra, results were based on the average delay of the critical movement and the overall delay. The Synchro and Sidra model outputs for existing conditions have been provided in **Appendix G**.

Table 8: Existing Conditions Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection 'As a Whole'		
	LOS	max. v/c or avg. delay (s)	Movement	Delay (s)	LOS	v/c
Fernbank/Robert Grant (S)	B(C)	0.61(0.80)	WBT(WBT)	20.6(26.6)	A(B)	0.43(0.66)
Bobolink/Robert Grant (R)	A(A)	9.6(9.4)	WBL(WBL)	4.9(5.3)	A(A)	-
Abbott/Robert Grant (R)	A(A)	8.8(9.0)	NBL(NBL)	6.1(5.2)	A(A)	-
Note: Analysis of signalized intersections assumes a PHF of 0.95 and a saturation flow rate of 1800 veh/h/lane. (S) - Signalized intersection. (R) - Roundabout intersection.						

As shown in **Table 8**, the signalized intersection of Fernbank/Robert Grant 'as a whole' operates at a LOS 'B' in the critical afternoon peak hour. The critical movement operating at a LOS 'C' in the afternoon peak hours.

The roundabout intersections operate 'as a whole' with a LOS 'A' during both peak hours and the critical movements are also operating at a LOS 'A' during both peak hours.

Future 2020 Total Background Conditions

The Future 2020 Background traffic volumes were shown in **Figure 10**. **Table 9** below provides a summary of the critical Synchro analysis results at intersections within the study area, based on the future background 2020 traffic volumes. The Synchro and Sidra model outputs for Future 2020 Background conditions are provided in **Appendix H**.

It should be noted that the Fernbank/Robert Grant intersection signal timing was optimized in all future scenarios to ensure the most efficient operations.

Table 9: Future 2020 Total Background Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection 'As a Whole'		
	LOS	max. v/c or avg. delay (s)	Movement	Delay (s)	LOS	v/c
Fernbank/Robert Grant (S)	A(C)	0.60(0.80)	WBT(WBT)	20.3(24.9)	A(B)	0.42(0.65)
Bobolink/Robert Grant (R)	A(A)	9.6(9.4)	WBL(WBL)	4.9(5.2)	A(A)	-
Abbott/Robert Grant (R)	A(A)	8.8(9.0)	NBL(NBL)	6.1(5.2)	A(A)	-
Note: Analysis of signalized intersections assumes a PHF of 1.00 and a saturation flow rate of 1800 veh/h/lane. (S) - Signalized intersection. (R) - Roundabout intersection.						

As shown in **Table 9**, the study area intersections 'as a whole' were shown to operate at a LOS 'B' or better during peak hours. The critical movements were shown to operate at a LOS 'C' or better during peak hours.

Future 2025 Total Background Conditions

The Future 2025 Total Background traffic volumes were shown in **Figure 13**. Synchro analysis results are summarized in **Table 10** for critical movements and the intersection 'as a whole'. The Synchro and Sidra model outputs for Future 2025 Total Background conditions are provided in **Appendix I**.

Table 10: Future 2025 Total Background Intersection Performance

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection 'As a Whole'		
	LOS	max. v/c or avg. delay (s)	Movement	Delay (s)	LOS	v/c
Fernbank/Robert Grant (S)	B(D)	0.63(0.82)	WBT(WBT)	20.8(26.0)	A(B)	0.45(0.67)
Bobolink/Robert Grant (R)	A(A)	9.9(9.6)	WBL(WBL)	4.9(5.1)	A(A)	-
Abbott/Robert Grant (R)	A(A)	8.9(9.0)	NBL(NBL)	6.1(5.4)	A(A)	-

Note: Analysis of signalized intersections assumes a PHF of 1.00 and a saturation flow rate of 1800 veh/h/lane.
 (S) - Signalized intersection.
 (R) - Roundabout intersection.

As shown in **Table 10**, the study area intersection 'as a whole' were shown to operate at a LOS 'B' or better during peak hours. The critical movements were shown to operate at a LOS 'D' or better during peak hours.

Future 2020 Total Projected Conditions – Full Build-Out

The total projected 2020 traffic volumes were derived by superimposing the site-generated traffic volumes (**Figure 9**) onto projected 2020 background traffic volumes (**Figure 10**). The resulting total projected traffic volumes are illustrated in **Figure 15**.

Figure 15: Future 2020 Total Projected Traffic Volumes

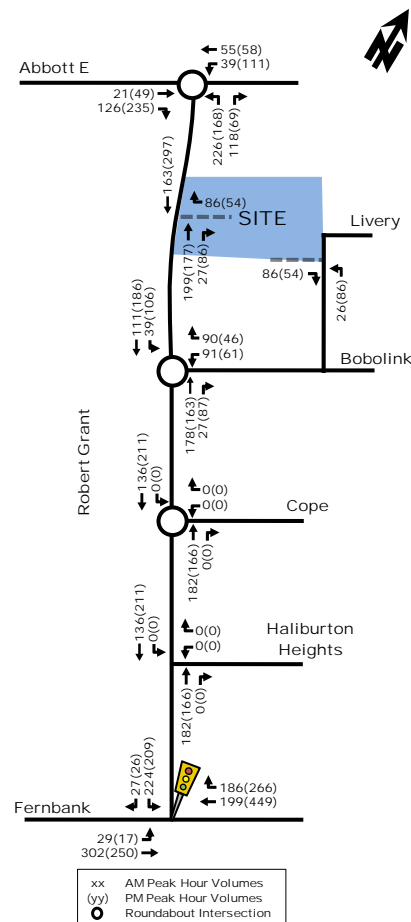

Table 11 below provides a summary of the critical Synchro analysis results at intersections within the study area, based on Future 2020 Total Projected traffic volumes. The Synchro and Sidra model outputs for 2020 Future Total Projected conditions are provided in **Appendix J**.

Table 11: Future 2020 Total Projected Performance at Study Area Intersections

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection 'As a Whole'		
	LOS	max. v/c or avg. delay (s)	Movement	Delay (s)	LOS	v/c
Fernbank/Robert Grant (S)	A(C)	0.60(0.80)	WBT(WBT)	20.6(24.8)	A(B)	0.45(0.65)
Bobolink/Robert Grant (R)	A(A)	9.7(9.6)	WBL(WBL)	5.7(5.8)	A(A)	-
Abbott/Robert Grant (R)	A(A)	8.8(9.0)	NBL(NBL)	5.9(5.6)	A(A)	-

Note: Analysis of signalized intersections assumes a PHF of 1.00 and a saturation flow rate of 1800 veh/h/lane.
 (S) - Signalized intersection.
 (R) - Roundabout intersection.

As shown in **Table 11**, the study area intersection 'as a whole' were shown to operate at a LOS 'B' or better during peak hours. The critical movements were shown to operate at a LOS 'C' or better during peak hours.

Future 2025 Total Projected Conditions –Build-Out plus Five Years

The Future 2025 Total Projected traffic volumes, shown in **Figure 16**, were derived by superimposing the site-generated traffic volumes (**Figure 9**) onto Future 2025 Total Background traffic volumes (**Figure 13**).

Figure 16: Future 2025 Total Projected Traffic Volumes

Table 12 below provides a summary of the critical Synchro analysis results at intersections within the study area, based on Future 2025 Total Projected traffic volumes. The Synchro and Sidra model outputs for Future 2025 Total Projected conditions is provided in **Appendix K**.

Table 12: Future 2025 Total Projected Performance at Study Area Intersections

Intersection	Weekday AM Peak (PM Peak)					
	Critical Movement			Intersection 'As a Whole'		
	LOS	max. v/c or avg. delay (s)	Movement	Delay (s)	LOS	v/c
Fernbank/Robert Grant (S)	B(D)	0.64(0.82)	WBT(WBT)	21.4(25.8)	A(B)	0.48(0.67)
Bobolink/Robert Grant (R)	B(A)	10.0(9.8)	WBL(WBL)	5.7(5.7)	A(A)	-
Abbott/Robert Grant (R)	A(A)	8.9(9.0)	NBL(NBL)	5.9(5.8)	A(A)	-
Note: Analysis of signalized intersections assumes a PHF of 1.00 and a saturation flow rate of 1800 veh/h/lane. (S) - Signalized intersection. (R) - Roundabout intersection.						

As shown in **Table 12**, the study area intersection 'as a whole' were shown to operate at a LOS 'B' or better during peak hours. The critical movements were shown to operate at a LOS 'D' or better during peak hours.

5. FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

Based on the results summarized herein the following transportation related conclusions are offered:

Proposed Development

- The proposed single-phase development will consist of 566 residential units, within two high-rise and one mid-rise apartment buildings and is expected to reach full build-out by 2020.
- Primary vehicle access is proposed via Robert Grant Avenue, which leads to an internal roundabout, a ramp to the underground parking garage and six surface parking spaces for visitors.
- The main access intersection with Robert Grant Ave is expected to permit right-in/right-out only vehicular movements only.
- Secondary vehicular access is proposed via a full-movement driveway connection to Livery St, which leads directly to the underground parking garage.
- The proposed development is projected to generate 'new' two-way vehicle volumes of approximately 160 veh/h and 205 veh/h during the weekday morning and afternoon peak hours respectively.

Existing and Background Conditions

- The existing signalized intersection at Fernbank/Robert Grant 'as a whole' currently operates at a LOS 'B' or better during peak hours, while the existing roundabout intersections Bobolink/Robert Grant and Abbott/Robert Grant currently operate at a LOS 'A' during peak hours.
- Background traffic growth rate was assumed to be 2% at all study area intersections.
- The operational analysis of Future 2020 and 2025 Total Background conditions indicated the following:
 - The signalized intersection at Fernbank/Robert Grant 'as a whole' is expected to operate at a LOS 'B' or better during peak hours, which is within City standards; and,
 - The roundabout intersections Bobolink/Robert Grant and Abbott/Robert Grant are expected to operate at a LOS 'A' during peak hours.

Projected Conditions

- The operational analysis of Future 2020 and 2025 Total Projected conditions indicated the following:

- The signalized intersection at Fernbank/Robert Grant 'as a whole' is expected to operate at a LOS 'B' or better during peak hours; and,
- The roundabout intersections Bobolink/Robert Grant and Abbott/Robert Grant are expected to operate at a LOS 'A' during peak hours.
- The study area intersections are expected to operate within City standards through to the 2025 horizon year. No modifications to the adjacent transportation network will be required to support this development.

Based on the foregoing, the proposed Lépine Development can be accommodated by the adjacent transportation network and is recommended to proceed from a transportation perspective.

DRAFT

City of Ottawa 2017 TIA Guidelines

TIA Screening Form

Date

12/12/2018

Project

Lépine - Fernbank TIA

Project Number

476799-01000

Results of Screening	Yes/No
Development Satisfies the Trip Generation Trigger	Yes
Development Satisfies the Location Trigger	Yes
Development Satisfies the Safety Trigger	Yes

Module 1.1 - Description of Proposed Development

Municipal Address	1000 Robert Grant
Description of location	Midblock between Fernbank Road and Abbott Street East, located on the east side of Robert Grant Avenue. Currently vacant lots.
Land Use	Residential - Apartment
Development Size	566 units
Number of Accesses and Locations	2 Total: 1 off Robert Grant/ 1 off Livery St
Development Phasing	Assume Single Phase for Zoning
Buildout Year	2024 (5 year horizon)
Sketch Plan / Site Plan	See Figure 2

Module 1.2 - Trip Generation Trigger

Land Use Type	Townhomes or Apartments	
Development Size	566	Units
Trip Generation Trigger Met?	Yes	

Module 1.3 - Location Triggers

Development Proposes a new driveway to a boundary street that is designated as part of the City's Transit Priority, Rapid Transit, or Spine Bicycle Networks (See Sheet 3)	Yes
Development is in a Design Priority Area (DPA) or Transit-oriented Development (TOD) zone. (See Sheet 3)	Yes
Location Trigger Met?	Yes

Module 1.4 - Safety Triggers

Posted Speed Limit on any boundary road	<80	km/h
Horizontal / Vertical Curvature on a boundary street limits sight lines at a proposed driveway	No	
A proposed driveway is within the area of influence of an adjacent traffic signal or roundabout (i.e. within 300 m of intersection in rural conditions, or within 150 m of intersection in urban/ suburban conditions) or within auxiliary lanes of an intersection;	Yes	
A proposed driveway makes use of an existing median break that serves an existing site	No	
There is a documented history of traffic operations or safety concerns on the boundary streets within 500 m of the development	No	
The development includes a drive-thru facility	No	
Safety Trigger Met?	Yes

Comments

Robert Grant Avenue not constructed north of Abbott Street. The majority of the eastbound U-Turns are associated with school related activity. There are quite a few homes under construction in this area with more land to be developed.

Notes:

- Includes all vehicle types except bicycles and electric scooters.
- Expansion factors are not applied to turning movement counts if they are less than 8-hours in duration.
- When expansion and AADT factors are applied, the results will differ slightly due to rounding.

Note

The values in the summary table below and the flow diagram represent the number of pedestrian crossings **NOT** the number of individual pedestrians crossing. For example, some pedestrians will cross one approach, then another to reach their destination. Accordingly, one pedestrian crossing two approaches will be recorded as two crossings.

Equivalent 12 & 24-hour Vehicle Volumes Including the Annual Average Daily Traffic (AADT) Factor

Applicable to the Day and Month of the Turning Movement Count

➔ Expansion factors are applied exclusively to standard weekday 8-hour turning movement counts ◀

Equivalent 12-hour vehicle volumes. These volumes are calculated by multiplying the 8-hour totals by the 8 ➔ 12 expansion factor of 1.39

Equ. 12 Hr	24	8	35	0	67	190	8	532	1	733	799	38	1295	217	1	1551	468	1158	31	3	1660	3211	4010
------------	----	---	----	---	----	-----	---	-----	---	-----	-----	----	------	-----	---	------	-----	------	----	---	------	------	------

Average daily 12-hour vehicle volumes. These volumes are calculated by multiplying the equivalent 12-hour totals by the AADT factor of: 1.0

AADT 12-hr	24	8	35	0	67	190	8	532	1	733	799	38	1295	217	1	1551	468	1158	31	3	1660	3211	4010
------------	----	---	----	---	----	-----	---	-----	---	-----	-----	----	------	-----	---	------	-----	------	----	---	------	------	------

24-Hour AADT. These volumes are calculated by multiplying the average daily 12-hour vehicle volumes by the 12 ➔ 24 expansion factor of 1.31

Comments

Bobolink Ridge, west of Robert Grant Avenue, is not yet open to traffic. It is currently a construction access only.

Notes:

- Includes all vehicle types except bicycles and electric scooters.
- Expansion factors are not applied to turning movement counts if they are less than 8-hours in duration.
- When expansion and AADT factors are applied, the results will differ slightly due to rounding.

TDM Checklist

DRAFT

TDM-Supportive Development Design and Infrastructure Checklist: *Residential Developments (multi-family or condominium)*

Legend	
REQUIRED	The Official Plan or Zoning By-law provides related guidance that must be followed
BASIC	The measure is generally feasible and effective, and in most cases would benefit the development and its users
BETTER	The measure could maximize support for users of sustainable modes, and optimize development performance

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
1. WALKING & CYCLING: ROUTES		
1.1 Building location & access points		
BASIC	1.1.1 Locate building close to the street, and do not locate parking areas between the street and building entrances	<input type="checkbox"/>
BASIC	1.1.2 Locate building entrances in order to minimize walking distances to sidewalks and transit stops/stations	<input type="checkbox"/>
BASIC	1.1.3 Locate building doors and windows to ensure visibility of pedestrians from the building, for their security and comfort	<input type="checkbox"/>
1.2 Facilities for walking & cycling		
REQUIRED	1.2.1 Provide convenient, direct access to stations or major stops along rapid transit routes within 600 metres; minimize walking distances from buildings to rapid transit; provide pedestrian-friendly, weather-protected (where possible) environment between rapid transit accesses and building entrances; ensure quality linkages from sidewalks through building entrances to integrated stops/stations (<i>see Official Plan policy 4.3.3</i>)	<input checked="" type="checkbox"/>
REQUIRED	1.2.2 Provide safe, direct and attractive pedestrian access from public sidewalks to building entrances through such measures as: reducing distances between public sidewalks and major building entrances; providing walkways from public streets to major building entrances; within a site, providing walkways along the front of adjoining buildings, between adjacent buildings, and connecting areas where people may congregate, such as courtyards and transit stops; and providing weather protection through canopies, colonnades, and other design elements wherever possible (<i>see Official Plan policy 4.3.12</i>)	<input checked="" type="checkbox"/>

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
REQUIRED	1.2.3 Provide sidewalks of smooth, well-drained walking surfaces of contrasting materials or treatments to differentiate pedestrian areas from vehicle areas, and provide marked pedestrian crosswalks at intersection sidewalks (<i>see Official Plan policy 4.3.10</i>)	<input checked="" type="checkbox"/>
REQUIRED	1.2.4 Make sidewalks and open space areas easily accessible through features such as gradual grade transition, depressed curbs at street corners and convenient access to extra-wide parking spaces and ramps (<i>see Official Plan policy 4.3.10</i>)	<input checked="" type="checkbox"/>
REQUIRED	1.2.5 Include adequately spaced inter-block/street cycling and pedestrian connections to facilitate travel by active transportation. Provide links to the existing or planned network of public sidewalks, multi-use pathways and on-road cycle routes. Where public sidewalks and multi-use pathways intersect with roads, consider providing traffic control devices to give priority to cyclists and pedestrians (<i>see Official Plan policy 4.3.11</i>)	<input checked="" type="checkbox"/>
BASIC	1.2.6 Provide safe, direct and attractive walking routes from building entrances to nearby transit stops	<input type="checkbox"/>
BASIC	1.2.7 Ensure that walking routes to transit stops are secure, visible, lighted, shaded and wind-protected wherever possible	<input type="checkbox"/>
BASIC	1.2.8 Design roads used for access or circulation by cyclists using a target operating speed of no more than 30 km/h, or provide a separated cycling facility	<input type="checkbox"/>
1.3 Amenities for walking & cycling		
BASIC	1.3.1 Provide lighting, landscaping and benches along walking and cycling routes between building entrances and streets, sidewalks and trails	<input type="checkbox"/>
BASIC	1.3.2 Provide wayfinding signage for site access (where required, e.g. when multiple buildings or entrances exist) and egress (where warranted, such as when directions to reach transit stops/stations, trails or other common destinations are not obvious)	<input type="checkbox"/>

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
2. WALKING & CYCLING: END-OF-TRIP FACILITIES		
2.1 Bicycle parking		
REQUIRED	2.1.1 Provide bicycle parking in highly visible and lighted areas, sheltered from the weather wherever possible (see <i>Official Plan policy 4.3.6</i>)	<input checked="" type="checkbox"/>
REQUIRED	2.1.2 Provide the number of bicycle parking spaces specified for various land uses in different parts of Ottawa; provide convenient access to main entrances or well-used areas (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/>
REQUIRED	2.1.3 Ensure that bicycle parking spaces and access aisles meet minimum dimensions; that no more than 50% of spaces are vertical spaces; and that parking racks are securely anchored (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/>
BASIC	2.1.4 Provide bicycle parking spaces equivalent to the expected number of resident-owned bicycles, plus the expected peak number of visitor cyclists	<input type="checkbox"/>
2.2 Secure bicycle parking		
REQUIRED	2.2.1 Where more than 50 bicycle parking spaces are provided for a single residential building, locate at least 25% of spaces within a building/structure, a secure area (e.g. supervised parking lot or enclosure) or bicycle lockers (see <i>Zoning By-law Section 111</i>)	<input checked="" type="checkbox"/>
BETTER	2.2.2 Provide secure bicycle parking spaces equivalent to at least the number of units at condominiums or multi-family residential developments	<input type="checkbox"/>
2.3 Bicycle repair station		
BETTER	2.3.1 Provide a permanent bike repair station, with commonly used tools and an air pump, adjacent to the main bicycle parking area (or secure bicycle parking area, if provided)	<input type="checkbox"/>
3. TRANSIT		
3.1 Customer amenities		
BASIC	3.1.1 Provide shelters, lighting and benches at any on-site transit stops	<input type="checkbox"/>
BASIC	3.1.2 Where the site abuts an off-site transit stop and insufficient space exists for a transit shelter in the public right-of-way, protect land for a shelter and/or install a shelter	<input type="checkbox"/>
BETTER	3.1.3 Provide a secure and comfortable interior waiting area by integrating any on-site transit stops into the building	<input type="checkbox"/>

TDM-supportive design & infrastructure measures: <i>Residential developments</i>		Check if completed & add descriptions, explanations or plan/drawing references
4. RIDESHARING		
4.1 Pick-up & drop-off facilities		
BASIC	4.1.1 Provide a designated area for carpool drivers (plus taxis and ride-hailing services) to drop off or pick up passengers without using fire lanes or other no-stopping zones	<input type="checkbox"/>
5. CARSHARING & BIKESHARING		
5.1 Carshare parking spaces		
BETTER	5.1.1 Provide up to three carshare parking spaces in an R3, R4 or R5 Zone for specified residential uses (see <i>Zoning By-law Section 94</i>)	<input type="checkbox"/>
5.2 Bikeshare station location		
BETTER	5.2.1 Provide a designated bikeshare station area near a major building entrance, preferably lighted and sheltered with a direct walkway connection	<input type="checkbox"/>
6. PARKING		
6.1 Number of parking spaces		
REQUIRED	6.1.1 Do not provide more parking than permitted by zoning, nor less than required by zoning, unless a variance is being applied for	<input checked="" type="checkbox"/>
BASIC	6.1.2 Provide parking for long-term and short-term users that is consistent with mode share targets, considering the potential for visitors to use off-site public parking	<input type="checkbox"/>
BASIC	6.1.3 Where a site features more than one use, provide shared parking and reduce the cumulative number of parking spaces accordingly (see <i>Zoning By-law Section 104</i>)	<input type="checkbox"/>
BETTER	6.1.4 Reduce the minimum number of parking spaces required by zoning by one space for each 13 square metres of gross floor area provided as shower rooms, change rooms, locker rooms and other facilities for cyclists in conjunction with bicycle parking (see <i>Zoning By-law Section 111</i>)	<input type="checkbox"/>
6.2 Separate long-term & short-term parking areas		
BETTER	6.2.1 Provide separate areas for short-term and long-term parking (using signage or physical barriers) to permit access controls and simplify enforcement (i.e. to discourage residents from parking in visitor spaces, and vice versa)	<input type="checkbox"/>

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
