Attention: **Mr. Wally Dubyk**
Project Manager, Infrastructure Approvals

Dear Sir:

Reference: **70 Gloucester Street & 89-91 Nepean Street**
Transportation Impact Assessment
Our File No. : 111007

This Transportation Impact Assessment has been prepared on behalf of Claridge Homes in support of a Zoning By-law Amendment application for their approved mixed-use tower development that is currently under construction at 70 Gloucester Street and 89-91 Nepean Street.

The proposed Zoning By-law Amendment is required to add the "parking garage" as a permitted use. No changes are proposed to the previously approved buildings.

The structure and format of this report is in accordance with the City of Ottawa Transportation Impact Assessment Guidelines (June 2017).

If you have any questions or comments regarding this report, please feel free to contact the undersigned.

Yours truly,

NOVATECH

B. Byvelds

TIA Plan Reports

On 14 June 2017, the Council of the City of Ottawa adopted new Transportation Impact Assessment (TIA) Guidelines. In adopting the guidelines, Council established a requirement for those preparing and delivering transportation impact assessments and reports to sign a letter of certification.

Individuals submitting TIA reports will be responsible for all aspects of development-related transportation assessment and reporting, and undertaking such work, in accordance and compliance with the City of Ottawa's Official Plan, the Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines.

By submitting the attached TIA report (and any associated documents) and signing this document, the individual acknowledges that s/he meets the four criteria listed below.

CERTIFICATION

1. I have reviewed and have a sound understanding of the objectives, needs and requirements of the City of Ottawa's Official Plan, Transportation Master Plan and the Transportation Impact Assessment (2017) Guidelines;
2. I have a sound knowledge of industry standard practice with respect to the preparation of transportation impact assessment reports, including multi modal level of service review;
3. I have substantial experience (more than 5 years) in undertaking and delivering transportation impact studies (analysis, reporting and geometric design) with strong background knowledge in transportation planning, engineering or traffic operations; and
4. I am either a licensed[1] or registered[2] professional in good standing, whose field of expertise [check √ appropriate field(s)] is either transportation engineering ☑ or transportation planning ☐.

[1,2] **License of registration body that oversees the profession is required to have a code of conduct and ethics guidelines that will ensure appropriate conduct and representation for transportation planning and/or transportation engineering works.**

EXECUTIVE SUMMARY

This Transportation Impact Assessment has been prepared on behalf of Claridge Homes in support of a Zoning By-law Amendment application for their approved mixed-use tower development that is currently under construction at 70 Gloucester Street and 89-91 Nepean Street.

The proposed Zoning By-law Amendment is required to add the "parking garage" as a permitted use. No changes are proposed to the previously approved buildings.

The subject site is bounded by the following:

- to the south, two public parking lots and an apartment building (88, 96 Nepean Street and 180 Metcalfe Street),
- to the east, a commercial/office building, a restaurant and a chiropractic clinic (170 Metcalfe Street & 160-162 Metcalfe Street),
- to the west, a public parking lot and apartment building (84 Gloucester Street & 171 O'Connor Street),
- to the north, a church and ancillary dwelling unit (152 Metcalfe Street).

The subject sites are currently zoned Residential Fifth Density – R5B [1811] and [1834]. The subject sites were previously approved through separate Zoning By-law Amendment and Site Plan Control applications. The current development proposal conforms to the previous approvals, with the exception of a new amendment to add the "parking garage" land use to the properties.

The approved development consists of two residential towers. The residential tower at 70 Gloucester Street consists of 231 dwelling units and 1,300ft^2 of retail gross floor area (GFA) on the ground floor. The tower at 89-91 Nepean Street consists of 257 dwelling units and 1,050ft^2 of retail GFA on the ground floor. Access to the approved development is located on Gloucester Street. A total of 502 parking spaces will be provided in an underground parking garage containing five levels.

No changes to the approved development are proposed. The proposed Zoning By-law amendment will permit parking in the underground parking garage to be used as a public parking lot. For the purposes of this analysis, it has been assumed that 253 of the parking spaces within the underground parking garage could be offered for public use. This represents all proposed parking in excess of the minimum zoning requirement.

The approved development is currently being constructed in two phases, commencing with the full underground parking lot, and the mixed-use tower located at 70 Gloucester Street. The second phase includes the 89-91 Nepean Street mixed-use tower.

Based on the TIA Screening Form, the proposed development meets the trip generation, and a TIA is required.

The main conclusions and recommendations of this report are as follows:

Development Design and Parking

- No changes to the approved site plan are proposed as part of this application. Pedestrian connections will be provided between adjacent sidewalks and the main building entrances to the residential towers and the commercial floor space. The sidewalk will be depressed and continuous across the proposed underground parking access, in accordance with City standards.

- The proposed underground parking garage will contain 502 parking spaces. The proposed parking adheres to the requirements of the City's Zoning By-law.

- Bicycle parking will be provided in accordance with the Zoning By-law.

Boundary Street MMLOS

- Both Nepean Street and Gloucester Street meet the target BLOS and Auto LOS, however they do not meet the target PLOS. To achieve the target PLOS along Nepean Street, either an increased boulevard width of 2.0m, or an increased sidewalk width of 2m and a boulevard width greater than 0.5m is required. To achieve the target PLOS along Gloucester Street, either a reduction in the Average Annual Daily Traffic or operating speed is required.

- As part of the approved Site Plan, street trees will be provided behind the existing sidewalk and unit paver connections will be provided to the main building entrances along these roadways. The above alternatives are identified for the City's consideration as funding permits.

Access Design

- Access to the underground parking garage will be provided through a 6.0 metre ramp located along Gloucester Street. The proposed underground access is located approximately 8m from the western property line, and 26m from the eastern property line. The access for this development was approved as part of the previous Site Plan Control application.

- Depressed curb and a continuous concrete sidewalk shall be provided across the full width of the access.

Neighbourhood Traffic Management and Transit

- Speed humps are currently provided on Gloucester Street and Nepean Street adjacent to the site in an effort to limit area travel speeds to approximately 30km/hr.

- The subject site is located midblock between two arterial roadways (Metcalfe Street and O'Connor Street). As such, the development proposal is not anticipated to have a significant impact on the adjacent communities.

- Supplementary parking for public use will be provided in the underground parking lot, alleviating the demand for on-street parking along the adjacent roadways. As such, parking infiltration onto area roadways is not anticipated.

- The proposed parking garage use is not anticipated to generate transit trips and is not anticipated to impact transit operations in the vicinity of the subject site.

Intersection MMLOS

- The signalized study area intersections meet the target BLOS, TkLOS and Auto LOS. However these intersections do not meet the target PLOS.

- To achieve the target PLOS at the signalized study area intersections a reduction in the east-west crossing distance is required. A reduction in the number of travel lanes along O'Connor Street and Metcalfe Street is not recommended due to the high northbound/southbound traffic volumes during peak hours.

- The unsignalized O'Connor Street/Nepean Street intersection is currently operating with a LOS F during the weekday AM and PM peak hours.

- The failing conditions and extensive delays on the eastbound approaches to the Nepean Street/O'Connor Street intersection is likely a contributing factor to the near-miss collisions observed in December 2016 and the high collision history at this intersection. Drivers that experience lengthy delays at a stop sign may become frustrated and are more likely to accept smaller gaps in cross traffic. The implementation of the separated bi-directional bikeway on the east side of O'Connor Street has increased the driver workload by introducing cyclists approaching from both directions.

- Traffic signal justification warrants in accordance with Ontario Traffic Manual (OTM) *Book* 12 were completed for the O'Connor Street/Nepean Street intersection. The warrant suggests this intersection is currently 76% justified.

- Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions. As O'Connor Street is an arterial road and signalization is required as a result of heavy traffic on O'Connor Street, it is recommended that the installation of traffic control signals be considered by the City as funding permits.

Background Traffic

- Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS A the weekday AM and PM peak hours.

- The O'Connor Street/Nepean Street intersection is anticipated to continue to operate with a LOS F during the weekday AM and PM peak hours under side street stop control. Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

Total Traffic

- Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS C or better the weekday AM and PM peak hours.

- The access along Gloucester Street is anticipated to operate with a LOS C during the weekday AM and PM peak hours.

- The unsignalized O'Connor Street/Nepean Street intersection is anticipated to deteriorate further and continue to operate with a LOS F during the weekday AM and PM peak hours.

Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

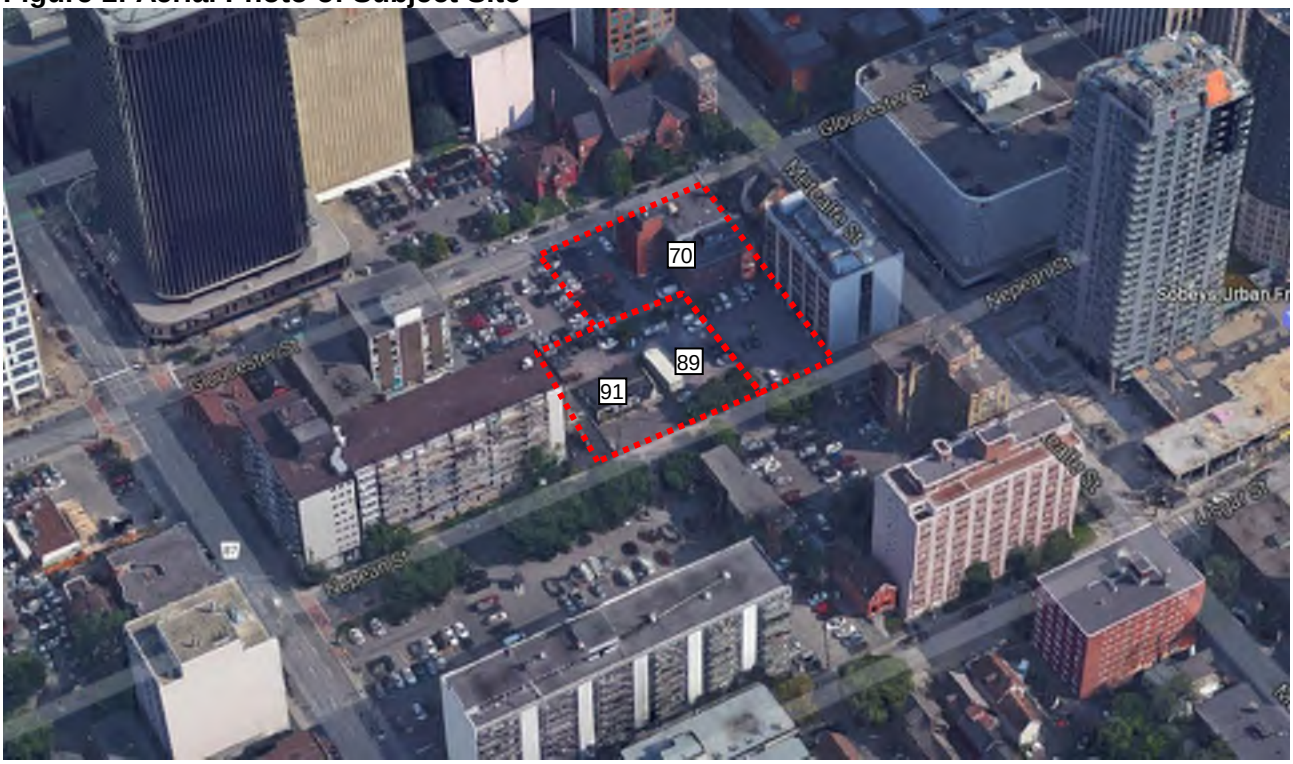
1.0 INTRODUCTION

This Transportation Impact Assessment has been prepared on behalf of Claridge Homes in support of a Zoning By-law Amendment application for their approved mixed-use tower development that is currently under construction at 70 Gloucester Street and 89-91 Nepean Street.

The proposed Zoning By-law Amendment is required to add the "parking garage" as a permitted use. No changes are proposed to the previously approved buildings.

The subject properties are located south of Gloucester Street and north of Nepean Street, mid-block between O'Connor Street and Metcalfe Street as shown in **Figure 1**.

Figure 1: Aerial Photo of Subject Site



The subject site is bounded by the following:

- to the south, two public parking lots and an apartment building (88, 96 Nepean Street and 180 Metcalfe Street),
- to the east, a commercial/office building, a restaurant and a chiropractic clinic (170 Metcalfe Street & 160-162 Metcalfe Street),
- to the west, a public parking lot and apartment building (84 Gloucester Street & 171 O'Connor Street),
- to the north, a church and ancillary dwelling unit (152 Metcalfe Street).

The subject sites are currently zoned Residential Fifth Density – R5B [1811] and [1834]. The subject sites were previously approved through separate Zoning By-law Amendment and Site Plan Control applications. The current development proposal conforms to the previous approvals, with the exception of a new amendment to add the "parking garage" land use to the properties.

2.0 PROPOSED DEVELOPMENT

The approved development consists of two residential towers. The residential tower at 70 Gloucester Street consists of 231 dwelling units and 1,300ft^2 of retail gross floor area (GFA) on the ground floor. The tower at 89-91 Nepean Street consists of 257 dwelling units and 1,050ft^2 of retail GFA on the ground floor. Access to the approved development is located on Gloucester Street. A total of 502 parking spaces will be provided in an underground parking garage containing five levels.

No changes to the approved development are proposed. The proposed Zoning By-law amendment will permit parking in the underground parking garage to be used as a public parking lot. For the purposes of this analysis, it has been assumed that 253 of the parking spaces within the underground parking garage could be offered for public use. This represents all proposed parking in excess of the minimum zoning requirement.

The approved site plan is included in **Appendix A**. The approved development is currently being constructed in two phases, commencing with the full underground parking lot, and the mixed-use tower located at 70 Gloucester Street. The second phase includes the 89-91 Nepean Street mixed-use tower.

Full build-out of the proposed development is anticipated to be completed by 2023.

3.0 SCREENING AND SCOPING

3.1 Screening Form

The City's 2017 TIA Guidelines identify three triggers for completing a TIA report, including trip generation, location, and safety. The criteria for each trigger are outlined in the City's TIA Screening Form. A copy of the TIA Screening Form is included in **Appendix B**.

Based on the TIA Screening Form, the proposed development meets the trip generation, and a TIA is required.

3.2 Existing Conditions

3.2.1 Roadways

Metcalfe Street is a one-way arterial roadway, carrying northbound traffic. In the vicinity of the subject site, Metcalfe Street consists of three travel lanes. On-street parking is permitted on the east side of the roadway with restrictions between 7:00-9:00AM and 3:30-5:30PM on weekdays. On-street parking is also permitted on the west side of the roadway with parking restrictions between 9:00AM and 3:30PM, and stopping restrictions between 7:00-9:00AM and 3:30-5:30PM. Between Laurier Avenue and Somerset Street, Metcalfe Street is a designated truck route with restricted loads. Metcalfe Street has a regulatory speed limit of 50km/hr under the *Ontario Highway Traffic Act*.

Nepean Street is a one-way local roadway, carrying eastbound traffic. Through lane delineation is not provided, however the existing roadway width is sufficient for one lane of traffic with on-street parking along both sides. In the vicinity of the subject site, two hour on-street pay and display parking is provided during peak hours (7:00AM – 7:00PM) on the both sides of Nepean Street. On-street parking is permitted free of charge during off-peak hours (7:00 PM – 7:00 AM). Nepean Street has a regulatory speed limit of 50km/hr under the *Ontario Highway Traffic Act*.

Gloucester Street is a one-way local roadway, carrying westbound traffic. As with Nepean Street, through lane delineation is not provided, however the existing roadway width is sufficient for one lane of traffic with on-street parking along both sides. In the vicinity of the subject site, one hour on-street pay and display parking is provided on both sides of Gloucester Street. On-street parking is permitted free of charge during off-peak hours (7:00 PM – 7:00 AM). Gloucester Street has a regulatory speed limit of 50km/hr under the *Ontario Highway Traffic Act*.

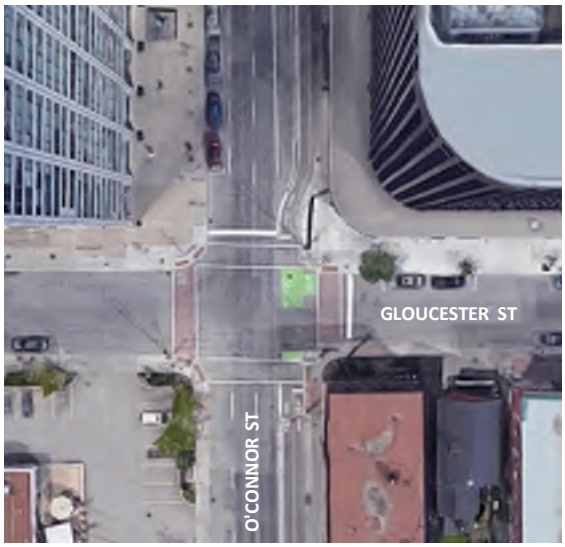
O'Connor Street is a one-way arterial roadway, carrying southbound traffic. O'Connor Street has two travel lanes and a parking lane on the west side in the vicinity of the subject site. O'Connor Street has a regulatory speed limit of 50km/hr under the *Ontario Highway Traffic* Act and is a designated truck route with no restrictions in the vicinity of the subject site.

3.2.2 Intersections

A review of the existing lane configurations and traffic control at the study area intersections is provided below.

O'Connor Street/Gloucester Street

- Signalized intersection
- Southbound: two through lane and one shared through/right turn lane
- Westbound: One approach lane; left turn on red restriction
- Separated bi-directional north-south cycling facility on the east side of the roadway
- Textured (unit paver) crosswalks are provided on east and west legs
- Standard crosswalks are provided on the north and south legs



Metcalfe Street/Gloucester Street

- Signalized intersection
- Northbound: two through lanes and one shared through/left turn lane
- Westbound: one approach lane
- Standard crosswalks are provided on all legs

Metcalfe Street/Nepean Street

- Signalized intersection
- Northbound: two through lanes and one shared through/right turn lane
- Eastbound: one approach lane
- Standard crosswalks are provided on all legs

O'Connor Street/Nepean Street

- Unsignalized intersection; stop control on Nepean Street
- Southbound: One through lane and one shared through/left turn lane
- Eastbound: One approach lane
- Textured (unit paver) crosswalk is provided on the east leg
- Standard crosswalk is provided on the west leg

3.2.3 Driveways

A review of adjacent driveways along Gloucester Street is summarized below:

Gloucester Street

North Side:

- Driveway to St Peter and St Paul's Anglican Church at 152 Metcalfe Street
- Two driveways to public parking lot at 97-99 Gloucester Street
- Driveway to commercial/office development at 234 Laurier Avenue

South Side:

- Driveway to mixed-use development at 100 Gloucester Street
- Driveway to public parking lot at 84 Gloucester Street
- Driveway to restaurant development at 160 Metcalfe Street

Nepean Street

North Side:

- Driveway to residential development at 171 O'Connor Street

South Side:

- Driveway to public parking lot at 108 Nepean Street and residential development at 257 Lisgar Street
- Two driveways to public parking lot at 180 Metcalfe Street

3.2.4 Existing Pedestrian Facilities

Sidewalks are provided along both sides of Metcalfe Street, Nepean Street, Gloucester Street, and O'Connor Street. Within the study area, the sidewalk is primarily of concrete construction. Unit pavers are used on the east side of Metcalfe Street between Gloucester Street and Nepean Street, and in localized areas on O'Connor Street. A unit paver boulevard with tree planters and a 2.4m concrete sidewalk is provided along the west side of Metcalfe Street between Nepean Street and Gloucester Street. Extra wide sidewalks (in excess of 3m) are provided along the following roadway sections within the study area:

- on the east side of Metcalfe Street, north of Nepean Street;
- the west side of O'Connor Street, north of Gloucester Street; and
- on the north side of Gloucester Street east of O'Connor Street, close to the Gloucester/O'Connor intersection.

3.2.5 Existing Bicycle Facilities

A bi-directional cycling facility is currently provided on the east side of O'Connor Street. The O'Connor Street bikeway extends from Laurier Avenue in the north to Fifth Avenue in the south. The O'Connor Street bikeway is a combination of separated bike lanes, painted bike lanes and shared use lanes. Cycling facilities along O'Connor Street are shown in **Appendix C**, and can be summarized as follows:

- Laurier to Pretoria: A separated bi-directional bikeway on the east side of the roadway;
- Pretoria to Strathcona: A uni-directional bike lane on the west side and a contraflow bike lane on the east side of the roadway;
- Strathcona to Patterson: A painted bike lane on each side of the roadway;
- Patterson to Monkland: A painted bike lane on the west side and a shared use lane on the east side of the roadway;
- Monkland to Glebe: A painted bike lane on each side of the roadway;
- Glebe to First: A painted bike lane on the west side and shared use lane on the east side of the roadway;
- First to Fifth: A shared use lane on each side of the roadway.

The following observations regarding the O'Connor Street bikeway were noted during traffic counts on Wednesday December 14th, 2016.

- Two conflicts between eastbound drivers proceeding straight on Nepean Street at O'Connor Street and cyclists in the dedicated bike lane.
    - Cyclist applied brakes to avoid the collision with vehicle.
- One 'near miss' at 5:40PM when a driver proceeding eastbound on Nepean Street missed striking a cyclist in the dedicated bike lane.

    - Neither driver or cyclist applied brakes, but cyclist came approximately 1m from colliding with the vehicle.
- Visibility of cyclists in the cycling lanes is impeded by queued vehicles during the PM peak hours.

Metcalfe Street and O'Connor Street are designated as Spine Cycling Routes in the City of Ottawa's Ultimate Cycling Network. No cycling facilities are provided along the other study area roadways in the vicinity of the subject site.

3.2.6 Existing Transit Facilities

A copy of the OC Transpo system map for the study area is included in **Appendix D**. This report describes all existing transit facilities within a five-minute walk of the subject site, which equates to a distance of 400 metres.

OC Transpo bus stop #3001 and #3008 are located on Albert Street and Slater Street east of Metcalfe Street, at a walking distance of approximately 370 metres and 280 metres respectively. These stations provide service to numerous transit routes, providing comprehensive transit coverage across the City.

OC Transpo bus stops #8465 and #7675 are located at the northwest and southeast corners of the Elgin Street/Nepean Street intersection respectively, at a walking distance of approximately 250 metres from the subject site. These stops provide service to regular routes 5 and 14. Route details are provided in **Appendix D**.

OC Transpo bus stops #2486 and #2484 are located at the northwest and southeast corners of the Bank Street/Gloucester Street intersection respectively, at a walking distance of approximately 300 metres from the subject site. These stops are served by regular routes 6, 7 and 11. Route details are provided in **Appendix D**.

3.2.7 Area Traffic Management

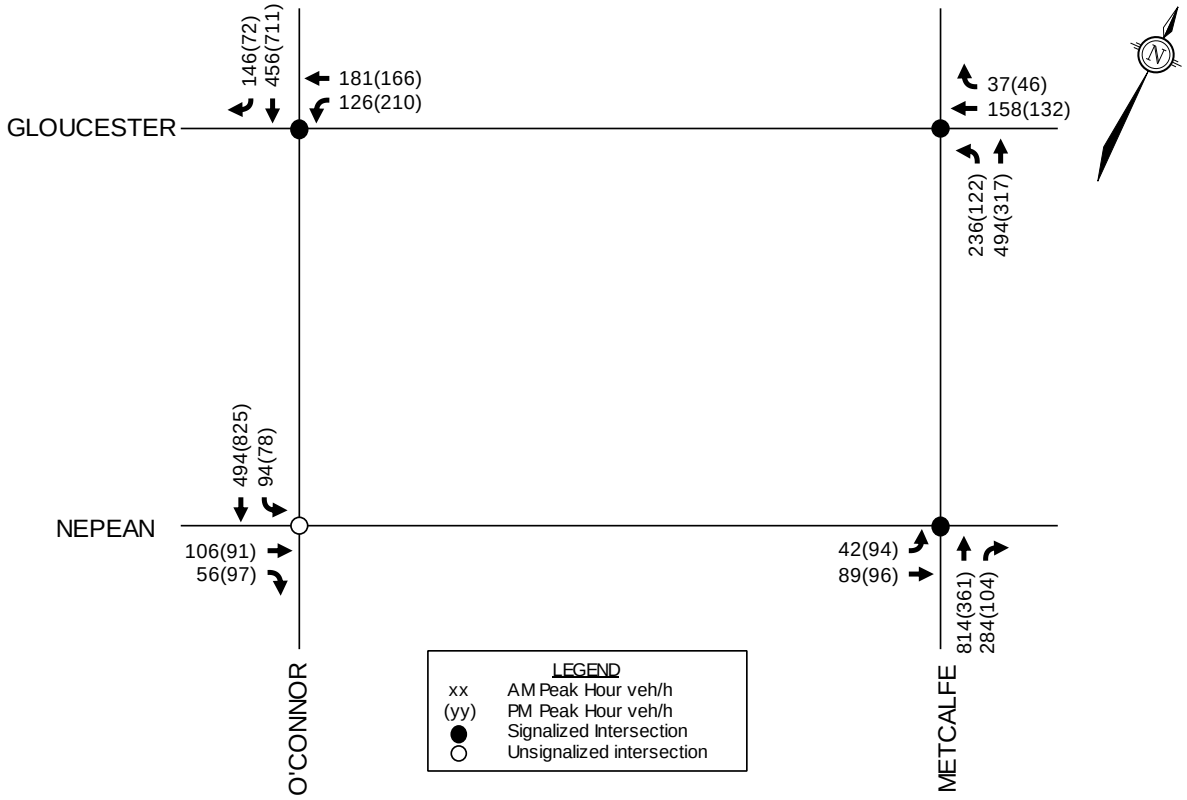
A midblock speed hump is currently provided along Gloucester Street and Nepean Street between O'Connor Street and Metcalfe Street. Curb bulb-outs are currently along Nepean Street at the O'Connor Street and Metcalfe Street intersections.

3.2.8 Existing Traffic Volumes

An eight-hour traffic count was completed by the City of Ottawa at the Gloucester Street/Metcalfe Street intersection in August 2014. Eight-hour traffic counts were coordinated by Novatech at the Gloucester Street/O'Connor Street, Nepean Street/O'Connor Street and Nepean Street/Metcalfe Street intersections in December 2016.

Existing traffic volumes are shown in **Figure 2**. Peak hour summary sheets for the above traffic counts are included in **Appendix E**.

Figure 2: Existing Traffic Volumes



3.2.9 Collision Records

Historical collision data from the last five years was obtained from the City's Public Works and Service Department for all study area intersections. Copies of the collision summary reports are included in **Appendix F**. The following table summarizes the number of collisions reported at each intersection from January 1, 2013 to December 31, 2017.

Table 1: Reported Collisions

Intersection	Number of Collision					
	SMV[1]/ Other	Rear-End	Angle	Turning Mvmt	Side-swipe	Total
O'Connor Street/ Gloucester Street	4	1	1	0	2	8
Metcalfe Street/ Gloucester Street	2	1	0	1	3	7
O'Connor Street/ Nepean Street	1	2	11	4	2	20
Metcalfe Street/ Nepean Street	2	0	5	0	0	7

1. SMV = Single Motor Vehicle

O'Connor Street/Gloucester Street

A total of eight collisions were reported at the O'Connor Street/Gloucester Street intersection over the last five years. Four of the collisions were single vehicle impacts, two were sideswipe impacts, one was a rear-end impact and one was an angle impact. All four of the single vehicle impacts

involved pedestrians and resulted in non-fatal injuries. All other collisions resulted in property damage only.

Metcalfe Street/Gloucester Street
A total of seven collisions were reported at the Metcalfe Street/Gloucester Street intersection over the last five years. Three of the collisions were sideswipe impacts, two were single vehicle impacts, one was a rear-end impact and one was a turning movement impact. The single vehicle impact involved a pedestrian, occurred under clear conditions, and resulted in non-fatal injuries. All other collisions resulted in property damage only.

O'Connor Street/Nepean Street
A total of 20 collisions were reported at the O'Connor Street/Nepean Street intersection over the last five years. Eleven of the collisions were angle impacts, four were turning movement impacts, two were rear-end impacts, two were sideswipe impacts, and one was a single vehicle impact. Five of the angle impacts occurred under either wet or snowy surface conditions, while four resulted in non-fatal injuries. One of the angle impacts and one of the turning movement impacts involved cyclists. One of the collisions involved a pedestrian.

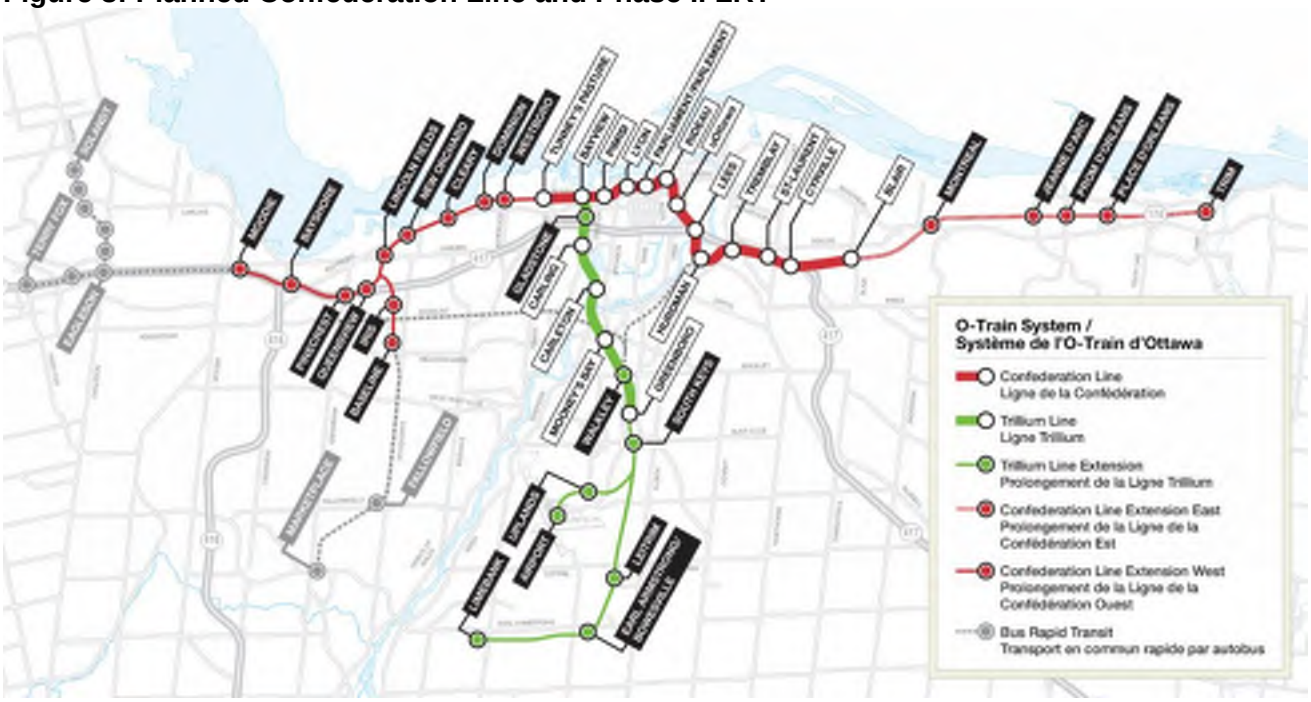
Metcalfe Street/Nepean Street
A total of seven collisions were reported at the Metcalfe Street/Nepean Street intersection over the last five years. Five of the collisions were angle impacts and two were single vehicle impacts. One of the angle impacts involved a cyclist, and all angle impacts resulted in property damage only. One of the single vehicle impacts involved a pedestrian, while the other involved an unattended vehicle.

3.3 Planned Network Changes

The City of Ottawa is currently constructing Phase I of Light Rail Transit (LRT), also known as the Confederation Line. The Confederation Line will convert the existing transitway between the Tunney's Pasture and Blair Stations to LRT, improving transit in the vicinity of the subject site. Phase II of the LRT has been approved by City Council, and is anticipated to commence construction in 2019-2020. Phase II of the LRT will extend the Trillium Line south from Greenboro to Limebank Road in Riverside South, along with an additional three-kilometre spur line to provide a connection to the Macdonald-Cartier International Airport. It will also extend the Confederation Line east from Blair Road to Trim Road and west from Tunney's Pasture to Moodie and Baseline Stations. Phase II of the LRT is anticipated to further improve transit in the vicinity of the subject site. The following figure illustrates the planned Confederation Line and Phase II LRT within the City of Ottawa.

For the purposes of this analysis, no reduction in vehicular background traffic has been applied to account for the modal shift from cars/buses to LRT. This will provide a conservative and robust analysis of the operating conditions along the study area roadways.

Figure 3: Planned Confederation Line and Phase II LRT



3.4 Other Area Developments

A review of the City's Development Application Search Tool was conducted to determine other area developments in the vicinity of the subject site, and are summarized below.

- 96 Nepean Street – Community Transportation Study/Transportation Impact Study, dated March 2012, prepared by Novatech in support of Zoning By-law Amendment and Site Plan Control applications. Development consists of 201 residential units.
- 180 Metcalfe Street – Transportation Impact Assessment, dated September 2018, prepared by Parsons in support of a Site Plan Control application. Development consists of 303 residential units and 5,275ft^2 GFA of retail.

3.5 Study Area and Time Periods

The study area for this report includes the proposed access on Gloucester Street as well as the following intersections:

- Nepean Street/Metcalfe Street
- Nepean Street/O'Connor Street
- Gloucester Street/Metcalfe Street
- Gloucester Street/O'Connor Street

The selected time periods for analysis are the weekday AM and PM peak hours. The weekday AM and PM peak hours are considered to represent the 'worst-case' combination of site-generated traffic and adjacent street traffic. Existing traffic conditions within the study area have been examined, along with background and total traffic conditions.

3.6 Exemptions Review

This module reviews possible exemptions from the final TIA, as outlined in the TIA Guidelines. The applicable exemptions for the subject lands are shown in **Table 3**.

Table 2: TIA Exemptions

Module	Element	Exemption Criteria	Exemption Applies
Design Review Component			
4.1 Development Design	*4.1.2* Circulation and Access	• Only required for site plans	Yes
	4.1.3 New Street Networks	• Only required for plans of subdivision	Yes
4.2 Parking	*4.2.1* Parking Supply	• Only required for site plans	No
	4.2.2 Spillover Parking	• Only required for site plans where parking supply is 15% below unconstrained demand	Yes
Network Impact Component			
4.5 Transportation Demand Management	*All elements*	• Not required for non-residential site plans expected to have fewer than 60 employees and/or students on location at any given time	Yes
4.6 Neighbourhood Traffic Management	*4.6.1* Adjacent Neighbourhoods	• Only required when the development relies on local or collector streets for access and total volumes exceed ATM capacity thresholds	No
4.8 Network Concept	*All elements*	• Only required when proposed development generates more than 200 person-trips during the peak hour in excess of the equivalent volume permitted by the established zoning	Yes

4.0 FORECASTING

4.1 Development-Generated Traffic

4.1.1 Trip Generation

Trips generated by the previously approved development have been estimated using relevant land use codes in the ITE *Trip Generation Manual, 10th Edition*. For comparison, trips generated by the residential units have also been estimated using the City's *2009 TRANS Trip Generation Manual*.

Trips generated by the previously approved retail development have been estimated using the ITE Convenience Market Land Use Code 851. Trips generated by the residential units have been estimated using the ITE Multi-Family Housing (High-Rise) Land Use Code 222 which uses data from apartments, townhouses and condominiums that have more than 10 levels (floors). For comparison, trips generated by the residential development have also been estimated using the TRANS recommended rates for high rise apartments.

The number of vehicle trips generated by the proposed public parking use has been estimated using typical peak hour rates presented in the ITE *Traffic Engineering Handbook, 5th Edition*. An excerpt from the ITE Handbook is included in **Appendix G**.

Trips generated using ITE rates have been converted to person trips using a 1.28 ITE trip to person trip adjustment factor. Trips generated using the TRANS rates have been converted to person trips using the assumed modal shares in the *2009 TRANS Trip Generation Manual*. Trips generated by the previously approved development and proposed parking garage are summarized in the following table. For the purposes of this analysis the vehicle trips generated by the parking garage use are considered person trips.

Table 3: Person Trip Generation

Land Use	ITE Code	Units/ GFA	AM Peak			PM Peak		
			IN	OUT	TOT	IN	OUT	TOT
ITE Trip Generation								
Multi-Family Housing (High Rise)	222	488 units	46	146	192	136	87	223
Convenience Market	851	2,350 ft^2	94	94	188	75	72	147
Public Parking	-	253 spaces	152	51	203	76	152	228
		Total	**292**	**291**	**583**	**287**	**311**	**598**
TRANS Trip Generation								
High-Rise Apartments	-	488 units	74	233	307	207	132	339
Convenience Market	851	2,350 ft^2	94	94	188	75	72	147
Public Parking	-	253 spaces	152	51	203	76	152	228
		Total	**320**	**378**	**698**	**358**	**356**	**714**

It is recognized that use of the *2009 TRANS Trip Generation Manual* is preferred by the City of Ottawa to estimate the trip generation of residential developments. However, person trip generation using the TRANS rates are approximately 50%-60% higher than the ITE rates during the AM and PM peak hours respectively. The TRANS rates are based on local data from 2009, using Origin-Destination survey data from 2005, and have a smaller sample size. The person trip conversion has not been as thoroughly tested as the conversion of ITE rates using a person trip adjustment factor of 1.28. Based on the foregoing, the ITE rates for residential developments have been carried forward for the residential scenario. As such, trip generation based on the ITE rates has been carried forward in this analysis.

The modal shares for the previously approved residential and retail developments have been developed based on the City's modal share targets for Transit Oriented Developments, and have been tailored based on the specific land uses to reflect existing modal shares associated with the Central Area. All trips generated by the proposed public parking use have been assumed to be vehicle trips. A full breakdown of the projected person trips by modal share are shown in the below table.

Table 4: Person Trips by Modal Share

Travel Mode	Modal Share	AM Peak			PM Peak		
		IN	OUT	TOT	IN	OUT	TOT
	Residential Trips	*46*	*146*	*192*	*136*	*87*	*223*
Auto Driver	15%	7	22	29	20	13	33
Auto Passenger	5%	2	7	9	7	4	11
Transit	65%	30	95	125	89	57	146
Non-Auto	15%	7	22	29	20	13	33
	Retail Person Trips	*94*	*94*	*188*	*75*	*72*	*147*
Auto Driver	15%	14	14	28	11	11	22
Auto Passenger	5%	5	5	10	3	4	7
Transit	30%	28	28	56	23	21	44
Non-Auto	50%	47	47	94	38	36	74
	Public Parking Person Trips	*152*	*51*	*203*	*76*	*152*	*228*
Auto Driver	100%	152	51	203	76	152	228
	Total Person Trips	**292**	**291**	**583**	**287**	**311**	**598**
	Auto Driver	173	87	260	107	176	283
	Auto Passenger	7	12	19	10	8	18
	Transit	58	123	181	112	78	190
	Non-Auto	54	69	123	58	49	107

Based on the foregoing, the proposed public parking garage is anticipated to generate an additional 203 vehicle trips during the AM peak hour and 228 vehicle trips during the PM peak hour. The overall development (previously approved development and proposed parking garage) is anticipated to generate a total of 260 vehicle trips during the AM peak hour and 283 vehicle trips during the PM peak hour.

4.1.2 Trip Distribution

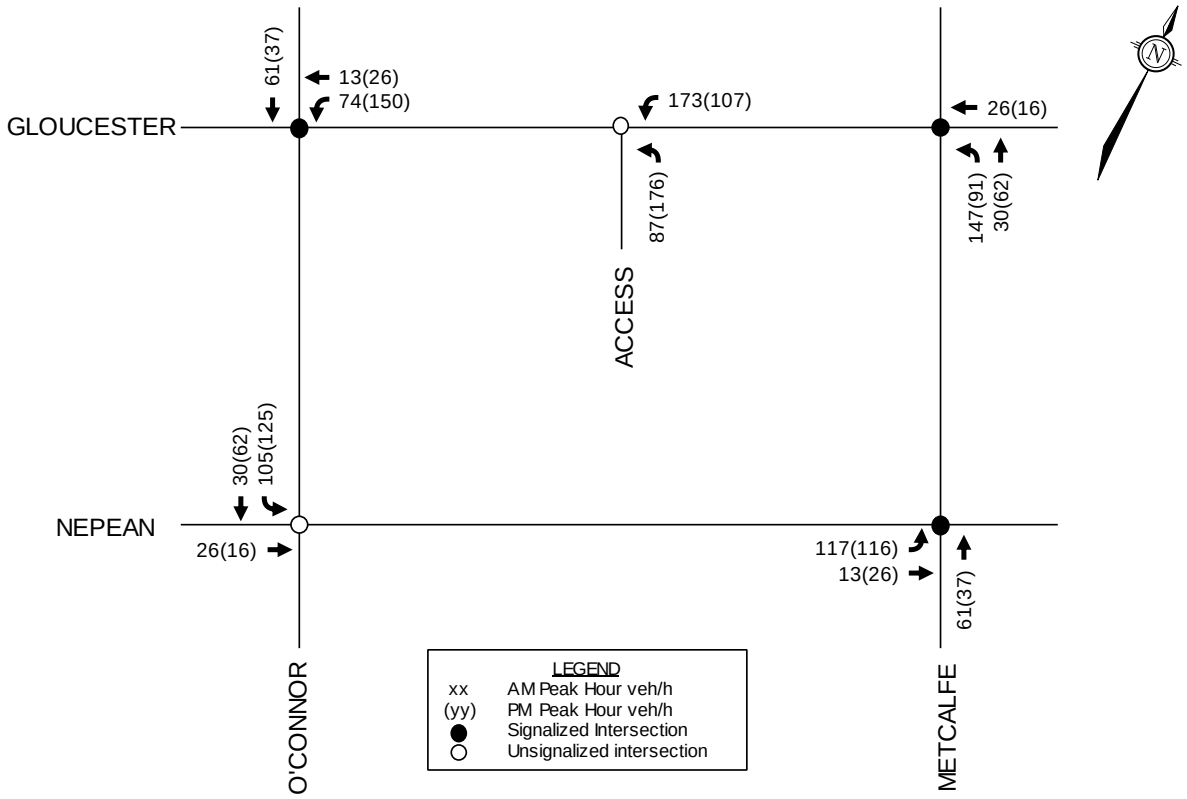
The distribution of primary trips generated by the overall development was determined based on the existing traffic patterns and the location of the site access with respect to the adjacent roadway system. The trip distribution used in this report is consistent with the previously approved report.

The distribution of primary trips is summarized as follows:

- 35% to/from the north,
- 35% to/from the south,
- 15% to/from the west,
- 15% to/from the east.

Trips generated by the proposed development are shown in **Figure 4**.

Figure 4: Site Generated Traffic



4.2 Background Traffic

4.2.1 General Background Growth

With the opening of the Confederation Line, traffic within the study area is not anticipated to grow significantly within the horizon year. For the purposes of this analysis, traffic within the study area is anticipated to remain generally consistent with the existing condition. No growth rate has been applied to the existing traffic volumes within the study area.

4.2.2 Other Area Development Traffic

As identified in Section 3.4, the following developments are proposed in the vicinity of the subject site:

- 96 Nepean Street;
- 180 Metcalfe Street;

Traffic generated by these developments have been added to the study area roadways under the 2023 and 2028 background traffic conditions. Relevant excerpts from other developments are included in **Appendix H**.

Background traffic volumes within the study area are shown in **Figure 5**. Total traffic volumes within the study area are shown in **Figure 6**.

Figure 5: 2023 and 2028 Background Traffic

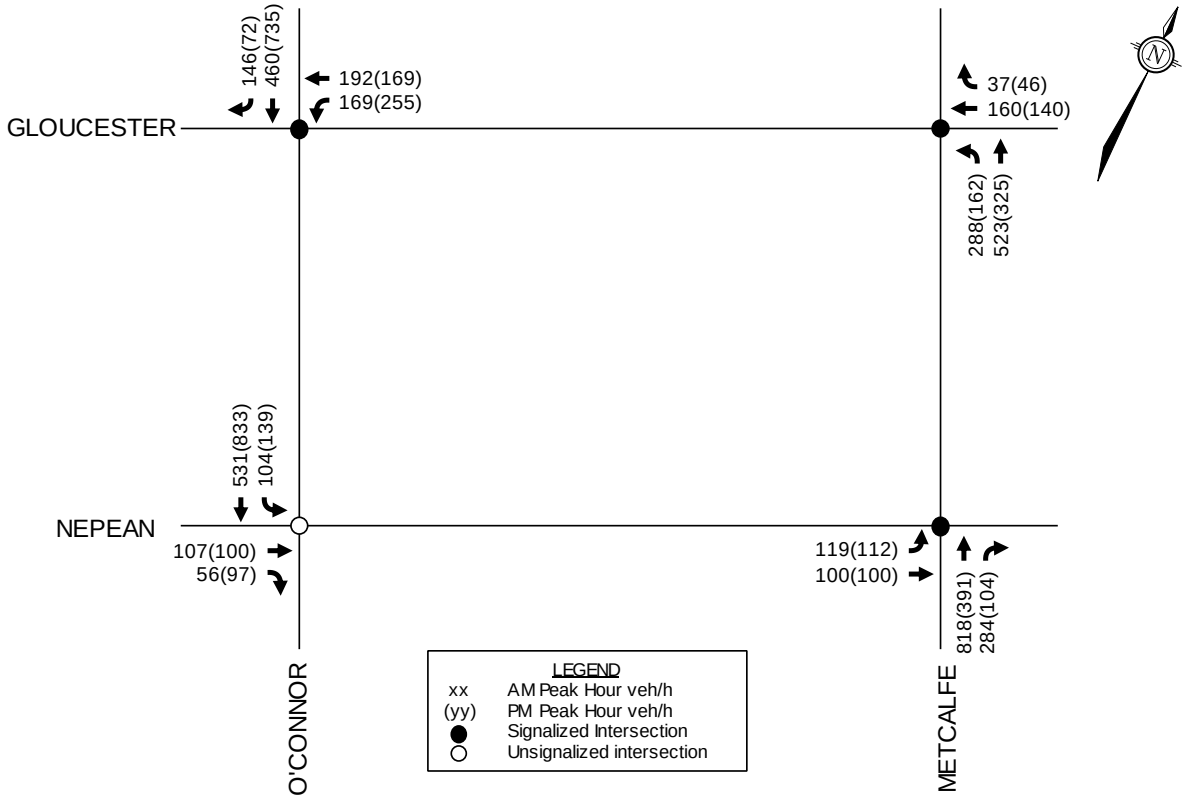


Figure 6: 2023 and 2028 Total Traffic

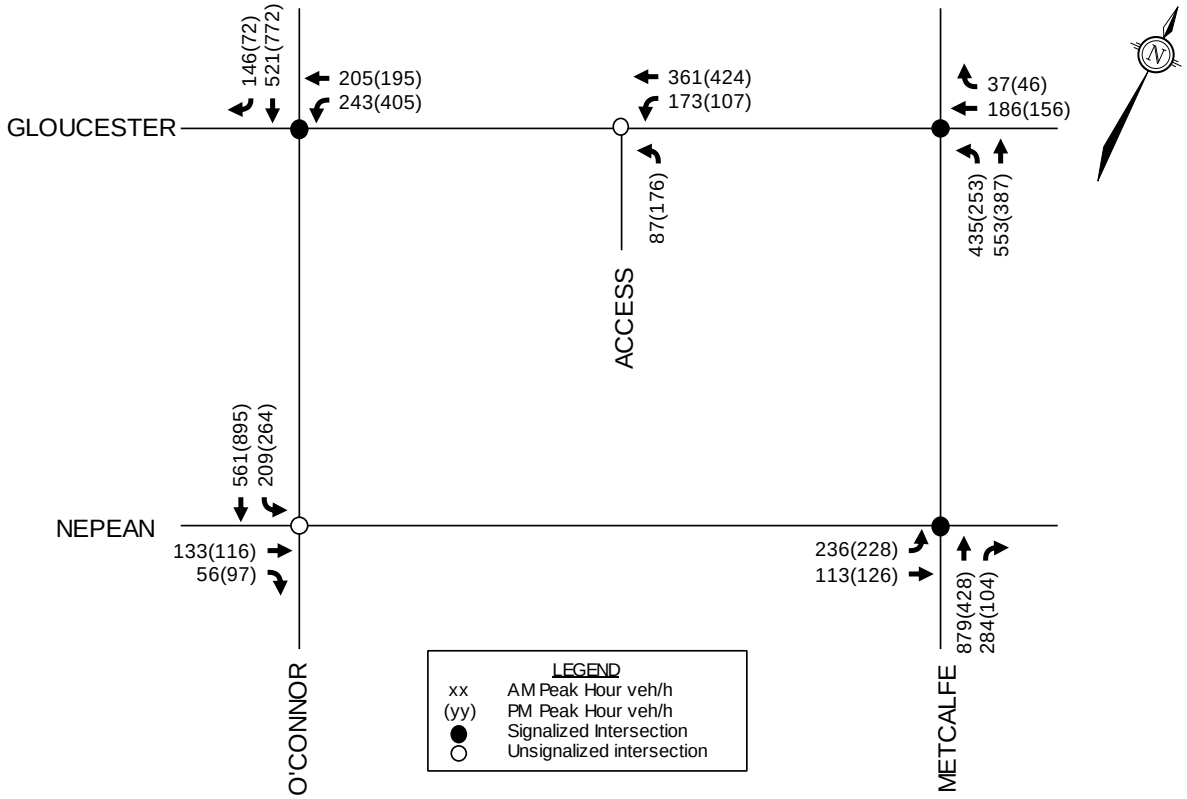

5.0 ANALYSIS

5.1 Development Design

No changes to the approved site plan are proposed as part of this application. Pedestrian connections will be provided between adjacent sidewalks and the main building entrances to the residential towers and the commercial floor space. The sidewalk will be depressed and continuous across the proposed underground parking access, in accordance with City standards.

Bicycle parking will be provided in accordance with the requirements of the Zoning By-law. The minimum requirements are outlined in Section 7.0 below.

OC Transpo bus stops #3001, #3008, #8465, #7675, #2486 and #2484 are located within a 400m walking distance of the of the site.

5.2 Parking

The subject site is located in Area X of Schedule 1A and Area B of Schedule 1 to the Zoning By-law and is located within 600m of a rapid transit station. Based on the Zoning By-law, a minimum of 0.5 resident parking spaces are required for all units in excess of 12. Based on the Zoning By-law Zone Exception [1834], a minimum of 0.09 visitor parking spaces per unit are required for a mid/high rise apartment at 70 Gloucester Street. Based on Zoning By-law Zone Exception [1811], a minimum of 0.077 visitor parking spaces per unit are required for a mid/high rise apartment at 89-91 Nepean Street.

Section 101(6)(c) of the Zoning By-law suggests where all parking spaces provided or required for a permitted land use are located below grade in the same building as that land use, the parking required may be reduced by the lesser of: 10% of the required spaces; or 20 parking spaces.

Based on the foregoing, the Zoning By-law identifies a minimum requirement of 99 tenant parking spaces and 20 visitor parking spaces for the 70 Gloucester Street tower, and 111 tenant parking spaces and 19 visitor parking spaces for the 89-91 Nepean Street tower. As such, a total of 257 parking spaces are required for the two towers combined. It is noteworthy that the Zoning By-law identifies a maximum parking restriction of 1.75 spaces per dwelling unit (combined total of resident and visitor parking), which equates to 854 parking spaces.

The proposed underground parking garage will contain 502 parking spaces. The proposed parking adheres to the requirements of the City's Zoning By-law. For the purposes of this analysis, it has been assumed that all parking beyond the minimum required by the Zoning By-Law will be utilized for public parking purposes. This equates to approximately 245 public parking spaces in the underground parking garage.

The ZBL identifies a minimum of 0.5 bicycle parking spaces per dwelling unit for the proposed residential land use and 1 bicycle parking space per 250m^2 for the proposed convenience store. Bicycle parking will be provided in accordance with the Zoning By-law.

5.3 Boundary Streets

This section provides a review of the boundary streets using complete streets principles. The Multi-Modal Level of Service (MMLOS) guidelines produced by IBI Group in 2015 were used to evaluate the Level of Service (LOS) of the boundary roadways for each mode of transportation. Schedule B of the City of Ottawa's Official Plan indicates Nepean Street is in the General Urban Area, while

Gloucester Street is in the Central Area. Both Nepean Street and Gloucester Street are also located within 600m of the Parliament LRT Station. Photos of the boundary Streets (provided by Google Streetview) are provided below.

Figure 7: Nepean Street (Looking East)

Figure 8: Gloucester Street (Looking East)

Target Pedestrian LOS (PLOS), Bicycle LOS (BLOS), Transit LOS (TLOS), Truck LOS (TkLOS) and Auto LOS for the study area roadways are based on the targets within 600m of a rapid transit station, as identified in Exhibit 22 of the MMLOS guidelines. The following table summarizes the findings of the MMLOS segment analysis. Detailed segment MMLOS calculations are included in **Appendix I**.

Table 5: Segment MMLOS Summary

Segment	PLOS	BLOS	TLOS	TkLOS	Auto LOS
Nepean Street	E	B	-	-	A
Target	**A**	**D**	**-**	**-**	**E**
Gloucester Street	E	B	-	-	E
Target	**A**	**D**	**-**	**-**	**E**

Both Nepean Street and Gloucester Street meet the target BLOS and Auto LOS, however they do not meet the target PLOS. To achieve the target PLOS along Nepean Street, either an increased boulevard width of 2.0m, or an increased sidewalk width of 2m and a boulevard width greater than 0.5m is required. To achieve the target PLOS along Gloucester Street, either a reduction in the Average Annual Daily Traffic or operating speed is required.

As part of the approved Site Plan, street trees will be provided behind the existing sidewalk and unit paver connections will be provided to the main building entrances along these roadways. The above alternatives are identified for the City's consideration as funding permits.

5.4 Access Intersection Design

Access to the underground parking garage will be provided through a 6.0 metre ramp located along Gloucester Street. The proposed underground access is located approximately 8m from the western property line, and 26m from the eastern property line. The access for this development was approved as part of the previous Site Plan Control application.

Depressed curb and a continuous concrete sidewalk shall be provided across the full width of the access.

5.5 Transportation Demand Management

As identified in Section 3.6, this module is exempt.

5.6 Neighbourhood Traffic Management

The site is surrounded by high density residential buildings, office/commercial developments, a church, and several surface parking lots. Speed humps are currently provided on Gloucester Street and Nepean Street adjacent to the site in an effort to limit area travel speeds to approximately 30km/hr.

The subject site is located midblock between two arterial roadways (Metcalfe Street and O'Connor Street). As such, the development proposal is not anticipated to have a significant impact on the adjacent communities.

On-site underground parking will be provided in accordance with the requirements of the Zoning By-law. Supplementary parking for public use will be provided in the underground parking lot, alleviating the demand for on-street parking along the adjacent roadways. As such, parking infiltration onto area roadways is not anticipated.

5.7 Transit

The overall development is anticipated to generate a total of 181 transit trips during the AM peak hour and 190 transit trips during the PM peak hour. However, the proposed parking garage use is not anticipated to generate transit trips and is not anticipated to impact transit operations in the vicinity of the subject site.

5.8 Review of Network Concept

As identified in Section 3.6, this module is exempt.

5.9 Intersection Design

5.9.1 Existing Intersection MMLOS Analysis

This section provides a review of the signalized study area intersections using complete streets principles. The MMLOS guidelines produced by IBI Group in October 2015 were used to evaluate the LOS of all signalized study area intersections for each mode of transportation. Schedule B of the City of Ottawa's Official Plan indicates all signalized study area intersections fall within the Central Area. All intersections are also located within 600m of the Parliament LRT Station.

As all intersections within the study area do not serve public transit, the TLOS is exempt from the MMLOS analysis. The following table summarized the findings of the MMLOS intersection analysis. Detailed intersection MMLOS calculations are included in **Appendix J**.

Table 6: Intersection MMLOS Summary

Segment	PLOS	BLOS	TLOS	TkLOS	Auto LOS
O'Connor Street/ Gloucester Street	C	B	-	D	A
Target	**A**	**C**	**-**	**D**	**E**
Metcalfe Street/ Gloucester Street	B	B	-	D	A
Target	**A**	**C**	**-**	**D**	**E**
Metcalfe Street/ Nepean Street	C	B	-	D	A
Target	**A**	**C**	**-**	**D**	**E**

O'Connor Street/Gloucester Street
The O'Connor Street/Gloucester Street intersection meets the target BLOS, TkLOS and Auto LOS. However, this intersection does not meet the target PLOS.

To achieve the target PLOS at this intersection, a reduction in the east-west crossing distance is required. A reduction in the number of travel lanes along O'Connor Street is not recommended due to the high southbound traffic volumes during the PM peak hour.

Metcalfe Street/Gloucester Street
The Metcalfe Street/Gloucester Street intersection meets the target BLOS, TkLOS and Auto LOS. However, this intersection does not meet the target PLOS.

To achieve the target PLOS at this intersection a reduction in the east-west crossing distance is required. A reduction in the number of travel lanes along Metcalfe Street is not recommended due to the high northbound traffic volumes during the AM peak hour.

Metcalfe Street/Nepean Street
The Metcalfe Street/Nepean Street intersection meets the target BLOS, TkLOS and Auto LOS. However this intersection does not meet the target PLOS.

To achieve the target PLOS at this intersection a reduction in the east-west crossing distance is required. A reduction in the number of travel lanes along Metcalfe Street is not recommended due to the high northbound traffic volumes during the AM peak hour.

O'Connor Street/Nepean Street (Unsignalized Intersection)
The unsignalized O'Connor Street/Nepean Street intersection is currently operating with a LOS F during the weekday AM and PM peak hours.

The 95th percentile eastbound queue along Nepean Street at O'Connor Street is approximately 45m and 70m during the weekday AM and PM peak hours respectively. The failing conditions and extensive delays on the eastbound approaches to the Nepean Street/O'Connor Street intersection is likely a contributing factor to the near-miss collisions observed in December 2016 and the high collision history at this intersection, as described in **Sections 3.2.5** and **3.2.9**. Drivers that experience lengthy delays at a stop sign may become frustrated and are more likely to accept smaller gaps in cross traffic. The implementation of the separated bi-directional bikeway on the east side of O'Connor Street has increased the driver workload by introducing cyclists approaching from both directions.

Traffic signal justification warrants in accordance with Ontario Traffic Manual (OTM) *Book* 12 were completed for the O'Connor Street/Nepean Street intersection. The warrant suggests this intersection is currently 76% justified. Traffic signal warrant forms are included in **Appendix K**.

Additional analysis has been completed to show the operating conditions at the O'Connor Street/Nepean Street intersection if unwarranted traffic signals are installed with pre-timed signal timing. The results of the analysis are summarized in the following table.

Table 7: Intersection Analysis – Existing Traffic (Mitigated)

Intersection	AM Peak			PM Peak		
	Max V/C or Delay	LOS	Movement	Max V/C or Delay	LOS	Movement
O'Connor Street/ Nepean Street[1]	0.41	A	SBT/R	0.65	B	SBT/R

1. Signalized

Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions. As O'Connor Street is an arterial road and signalization is required as a result of heavy traffic on O'Connor Street, it is recommended that the installation of traffic control signals be considered by the City as funding permits.

5.9.2 Background Traffic Intersection Operations

Intersection capacity analysis has been completed for the 2023 and 2028 background traffic conditions. The intersection parameters used in the analysis are consistent with the TIA guidelines (saturation flow rate: 1800vphpl, PHF: 1.0). The lane configurations at the study area intersections are consistent with the existing intersection analysis presented in the MMLOS review above. The results of the analysis are summarized in the following table for the weekday AM and PM peak hours. Detailed reports are included in **Appendix L**.

Table 8: Intersection Analysis – Background Traffic

Intersection	AM Peak			PM Peak		
	Max V/C or Delay	LOS	Movement	Max V/C or Delay	LOS	Movement
O'Connor Street/ Gloucester Street[1]	0.39	A	SBT/R	0.50	A	WBL
Metcalfe Street/ Gloucester Street[1]	0.48	A	WBT/R	0.33	A	WBT/R
Metcalfe Street/ Nepean Street[1]	0.42	A	NBT/R	0.23	A	NBT/R
O'Connor Street/ Nepean Street[2]	52 sec	F	EBT/R	127 sec	F	EBT/R

1. Signalized
2. Unsignalized Intersection

Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS A the weekday AM and PM peak hours. The O'Connor Street/Nepean Street intersection is anticipated to continue to operate with a LOS F during the weekday AM and PM peak hours under side street stop control.

As described above, the O'Connor Street/Nepean Street intersection does not currently meet OTM traffic signalization warrants. A sensitivity analysis has been completed to show the operating conditions at the O'Connor Street/Nepean Street intersection if unwarranted traffic signals are installed. The results of the analysis are summarized in the following table.

Table 9: Intersection Analysis – Background Traffic (Mitigated)

Intersection	AM Peak			PM Peak		
	Max V/C or Delay	LOS	Movement	Max V/C or Delay	LOS	Movement
O'Connor Street/ Nepean Street[1]	0.40	A	SBT/R	0.64	B	SBT/R

1. Signalized

Based on the foregoing analysis, signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

5.9.3 Total Traffic Intersection Operations

Intersection capacity analysis has been completed for the 2023 and 2028 total traffic conditions. The results of the analysis are summarized in the following table for the weekday AM and PM peak hours. Detailed reports are included in **Appendix L**.

Table 10: Intersection Analysis – Total Traffic

Intersection	AM Peak			PM Peak		
	Max V/C or Delay	LOS	Movement	Max V/C or Delay	LOS	Movement
O'Connor Street/ Gloucester Street[1]	0.50	A	WBL	0.79	C	WBL
Metcalfe Street/ Gloucester Street[1]	0.55	A	WBT/R	0.36	A	WBT/R
Metcalfe Street/ Nepean Street[1]	0.65	B	EBL	0.46	A	EBL
O'Connor Street/ Nepean Street[2]	202 sec	F	EBT/R	550 sec	F	EBT/R
Gloucester Street/ Access	18 sec	C	NBL	20 sec	C	NBL

1. Signalized
2. Unsignalized Intersection

Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS C or better the weekday AM and PM peak hours. The access along Gloucester Street is anticipated to operate with a LOS C during the weekday AM and PM peak hours.

The unsignalized O'Connor Street/Nepean Street intersection is anticipated to deteriorate further and continue to operate with a LOS F during the weekday AM and PM peak hours. The results obtained from the Synchro analysis indicate that with the addition of site traffic, delay on the eastbound approach is anticipated to increase significantly. These results should be treated with caution as the Synchro software is unable to compute accurate results for intersections deteriorating to this extent.

Traffic signal justification warrants in accordance with OTM *Book* 12 were completed for the O'Connor Street/Nepean Street intersection under the 2023 total traffic conditions. The warrant used the Average Hourly Volumes (AHV = [AM + PM]/4). The warrant suggests the O'Connor Street/Nepean Street intersection will be 54% justified. The traffic signal justification warrant form is included in **Appendix K**.

A sensitivity analysis has been completed to show the operating conditions at the O'Connor Street/Nepean Street intersection if unwarranted traffic signals are installed. The results of the analysis are summarized in the following table.

Table 11: Intersection Analysis – Total Traffic (Mitigated)

Intersection	AM Peak			PM Peak		
	Max V/C or Delay	LOS	Movement	Max V/C or Delay	LOS	Movement
O'Connor Street/ Nepean Street[1]	0.49	A	SBT/R	0.77	C	SBT/R

1. Signalized

Based on the foregoing analysis, signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the foregoing analysis, the main conclusions and recommendations of this report are as follows:

Development Design and Parking

- No changes to the approved site plan are proposed as part of this application. Pedestrian connections will be provided between adjacent sidewalks and the main building entrances to the residential towers and the commercial floor space. The sidewalk will be depressed and continuous across the proposed underground parking access, in accordance with City standards.

- The proposed underground parking garage will contain 502 parking spaces. The proposed parking adheres to the requirements of the City's Zoning By-law.

- Bicycle parking will be provided in accordance with the Zoning By-law.

Boundary Street MMLOS

- Both Nepean Street and Gloucester Street meet the target BLOS and Auto LOS, however they do not meet the target PLOS. To achieve the target PLOS along Nepean Street, either an increased boulevard width of 2.0m, or an increased sidewalk width of 2m and a boulevard width greater than 0.5m is required. To achieve the target PLOS along Gloucester Street, either a reduction in the Average Annual Daily Traffic or operating speed is required.

- As part of the approved Site Plan, street trees will be provided behind the existing sidewalk and unit paver connections will be provided to the main building entrances along these roadways. The above alternatives are identified for the City's consideration as funding permits.

Access Design

- Access to the underground parking garage will be provided through a 6.0 metre ramp located along Gloucester Street. The proposed underground access is located approximately 8m from the western property line, and 26m from the eastern property line. The access for this development was approved as part of the previous Site Plan Control application.

- Depressed curb and a continuous concrete sidewalk shall be provided across the full width of the access.

Neighbourhood Traffic Management and Transit

- Speed humps are currently provided on Gloucester Street and Nepean Street adjacent to the site in an effort to limit area travel speeds to approximately 30km/hr.

- The subject site is located midblock between two arterial roadways (Metcalfe Street and O'Connor Street). As such, the development proposal is not anticipated to have a significant impact on the adjacent communities.

- Supplementary parking for public use will be provided in the underground parking lot, alleviating the demand for on-street parking along the adjacent roadways. As such, parking infiltration onto area roadways is not anticipated.

- The proposed parking garage use is not anticipated to generate transit trips and is not anticipated to impact transit operations in the vicinity of the subject site.

Intersection MMLOS

- The signalized study area intersections meet the target BLOS, TkLOS and Auto LOS. However these intersections do not meet the target PLOS.

- To achieve the target PLOS at the signalized study area intersections a reduction in the east-west crossing distance is required. A reduction in the number of travel lanes along O'Connor Street and Metcalfe Street is not recommended due to the high northbound/southbound traffic volumes during peak hours.

- The unsignalized O'Connor Street/Nepean Street intersection is currently operating with a LOS F during the weekday AM and PM peak hours.

- The failing conditions and extensive delays on the eastbound approaches to the Nepean Street/O'Connor Street intersection is likely a contributing factor to the near-miss collisions observed in December 2016 and the high collision history at this intersection. Drivers that experience lengthy delays at a stop sign may become frustrated and are more likely to accept smaller gaps in cross traffic. The implementation of the separated bi-directional bikeway on the east side of O'Connor Street has increased the driver workload by introducing cyclists approaching from both directions.

- Traffic signal justification warrants in accordance with Ontario Traffic Manual (OTM) *Book* 12 were completed for the O'Connor Street/Nepean Street intersection. The warrant suggests this intersection is currently 76% justified.

- Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions. As O'Connor Street is an arterial road and signalization is required as a result of heavy traffic on O'Connor Street, it is recommended that the installation of traffic control signals be considered by the City as funding permits.

Background Traffic

- Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS A the weekday AM and PM peak hours.

- The O'Connor Street/Nepean Street intersection is anticipated to continue to operate with a LOS F during the weekday AM and PM peak hours under side street stop control. Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

Total Traffic

- Critical movements at the signalized intersections within the study area are anticipated to operate with a LOS C or better the weekday AM and PM peak hours.

- The access along Gloucester Street is anticipated to operate with a LOS C during the weekday AM and PM peak hours.

- The unsignalized O'Connor Street/Nepean Street intersection is anticipated to deteriorate further and continue to operate with a LOS F during the weekday AM and PM peak hours.

Signalization of the O'Connor Street/Nepean Street intersection would create acceptable operating conditions for all approaches and help alleviate potential collisions.

APPENDIX B

TIA Screening Form

City of Ottawa 2017 TIA Guidelines Screening Form

1. Description of Proposed Development

Municipal Address	**70 Gloucester Street and 89-91 Nepean Street**
Description of Location	**Midblock between O'Connor Street and Metcalfe Street**
Land Use Classification	**Public Parking**
Development Size (units)	**253 parking spaces**
Development Size (m^2)	
Number of Accesses and Locations	**One on Gloucester Street**
Phase of Development	**One**
Buildout Year	**2023**

If available, please attach a sketch of the development or site plan to this form.

2. Trip Generation Trigger

Considering the Development's Land Use type and Size (as filled out in the previous section), please refer to the Trip Generation Trigger checks below.

Land Use Type	Minimum Development Size
Single-family homes	40 units
Townhomes or apartments	90 units
Office	3,500 m^2
Industrial	5,000 m^2
Fast-food restaurant or coffee shop	100 m^2
Destination retail	1,000 m^2
Gas station or convenience market	75 m^2

** If the development has a land use type other than what is presented in the table above, estimates of person-trip generation may be made based on average trip generation characteristics represented in the current edition of the Institute of Transportation Engineers (ITE) Trip Generation Manual.*

If the proposed development size is greater than the sizes identified above, the Trip Generation Trigger is satisfied.

3. Location Triggers

	Yes	No
Does the development propose a new driveway to a boundary street that is designated as part of the City's Transit Priority, Rapid Transit or Spine Bicycle Networks?		X
Is the development in a Design Priority Area (DPA) or Transit-oriented Development (TOD) zone?*		X

**DPA and TOD are identified in the City of Ottawa Official Plan (DPA in Section 2.5.1 and Schedules A and B; TOD in Annex 6). See Chapter 4 for a list of City of Ottawa Planning and Engineering documents that support the completion of TIA).*

If any of the above questions were answered with 'Yes,' the Location Trigger is satisfied.

4. Safety Triggers

	Yes	No
Are posted speed limits on a boundary street are 80 km/hr or greater?		X
Are there any horizontal/vertical curvatures on a boundary street limits sight lines at a proposed driveway?		X
Is the proposed driveway within the area of influence of an adjacent traffic signal or roundabout (i.e. within 300 m of intersection in rural conditions, or within 150 m of intersection in urban/ suburban conditions)?		X
Is the proposed driveway within auxiliary lanes of an intersection?		X
Does the proposed driveway make use of an existing median break that serves an existing site?		X
Is there is a documented history of traffic operations or safety concerns on the boundary streets within 500 m of the development?		X
Does the development include a drive-thru facility?		X

If any of the above questions were answered with 'Yes,' the Safety Trigger is satisfied.

5. Summary

	Yes	No
Does the development satisfy the Trip Generation Trigger?	✓	
Does the development satisfy the Location Trigger?		X
Does the development satisfy the Safety Trigger?		X

If none of the triggers are satisfied, the TIA Study is complete. If one or more of the triggers is satisfied, the TIA Study must continue into the next stage (Screening and Scoping).

Crommelin, *Entrance-Exit Design and Control for Major Parking Facilities*, a seminar presentation (Encino, Calif., 1972); and Anthony P. Chest, Mary S. Smith, and Sam Bhuyan, *Parking Structures Planning, Design, Construction, Maintenance and Repair* (New York: Van Nostrand Reinhold, 1989).

on the type of generator served, user characteristics (employee, shopper, etc.), and parking capacity. Volumes are typically expressed as a ratio of the number of vehicles to the number of parking stalls in the facility. Table 14–1 gives peak-hour ratios for a number of activities.

The number of vehicles that can enter (acceptance rate) or leave a parking facility, per lane, is related to the angle of approach (sharp turns have less capacity then straight-in runs), whether any control is used, the familiarity of the driver with the facility, the freedom of internal circulation (for entry), the amount of vehicular traffic on the streets (for exit) and the degree of conflict with pedestrians crossing the driveway. In general, for a self-parking facility with no control, the capacity per lane ranges up to 800 vph. One engineer has recommended a design value of 400 vph.[5] Guidelines have been developed for considering capacities related to control methods, and also to street traffic (but not pedestrian sidewalk conflicts).[6]

Table 14–2 Vehicle Acceptance Rates of Large Parking Areas

Approach to Entrance	Number of Studies	Average Acceptance Rates Vehicles per Hour per Lane: Unfamiliar Entrance[1]	Average Acceptance Rates Vehicles per Hour per Lane: Familiar Entrance[2]
Straight approach (no turn movement)	20	850	1,100
90° right turn	15	750	1,000
90° left turn	24	830	900
Oblique angle, right	8	650	1,000
Oblique angle, left	4	720	[3]

[1] Includes racetracks, stadiums, and other facilities not frequently visited by the same individuals.
[2] Includes industrial plants, military bases, and other facilities where the same drivers enter daily.
[3] No data available.

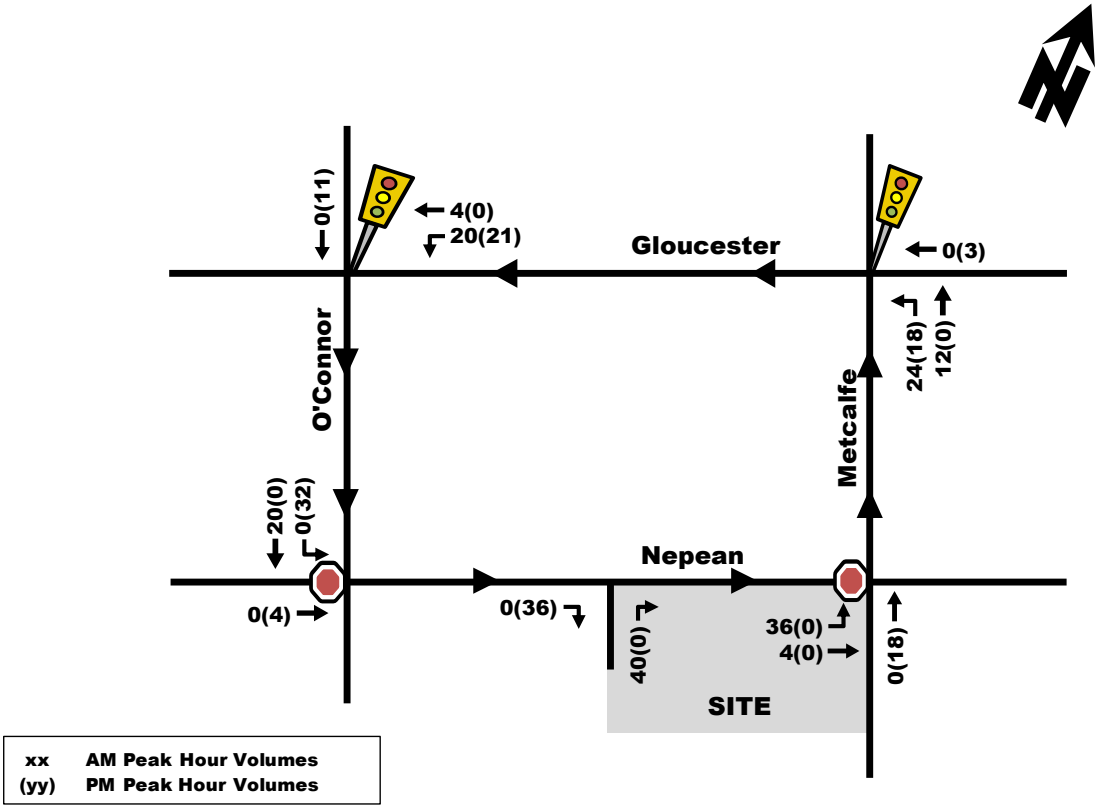
Figure 6: "Net" New Site-Generated Peak Hour Traffic



7.0 BACKGROUND TRAFFIC NETWORK

7.1 Transportation Network Changes

Recent/planned transportation network changes in the broader study area include:

- Replacement of the surface transit lanes on Albert and Slater with the below-grade LRT line (November 2018);
- Road modifications on Queen Street including wider sidewalks, raised intersections, and some reduction in turn lanes;
- Road modifications on Albert and Slater Streets with wider sidewalks and replacement of the bus-only lanes with a raised cycle track; and
- Reconstructing Elgin Street as a more "complete street" with wider sidewalks, reduced speed limit, some loss of on-street parking and loss of peak hour traffic lanes due to permanent on-street parking.

7.2 Background Traffic Growth

This is not applicable to new downtown developments.

7.3 Other Area Development

See Section 3.2.

APPENDIX I

Metcalfe Street/ Nepean Street	0.46	A	NBT/R	0.24	A	NBT/R
O'Connor Street/ Nepean Street	60 sec	F	EBT/R	108 sec	F	EBT/R

Notes:

- Intersection parameters used in the analysis are consistent with the TIA guidelines (saturation flow rate: 1800vphpl, PHF: 0.90).
- The southbound approach to the O'Connor Street/Gloucester Street intersection is assumed to consist of one through lane and one through/right turn lane during the AM peak hour due to on-street parking located on the west side of O'Connor Street.
- The westbound approach to the O'Connor Street/Gloucester Street and eastbound approach to the Metcalfe Street/ Nepean Street intersection are assumed to consist of one through lane and one left turn lane due to the wide road platform and parking prohibitions in proximity to the intersection.
- Traffic signal timings obtained from City of Ottawa, included in Appendix E.
- Detailed Synchro reports are included in Appendix L.

TRAFFIC SIGNAL JUSTIFICATION

LOCATION: O'CONNOR at NEPEAN

DATE: DEC 14, 2016

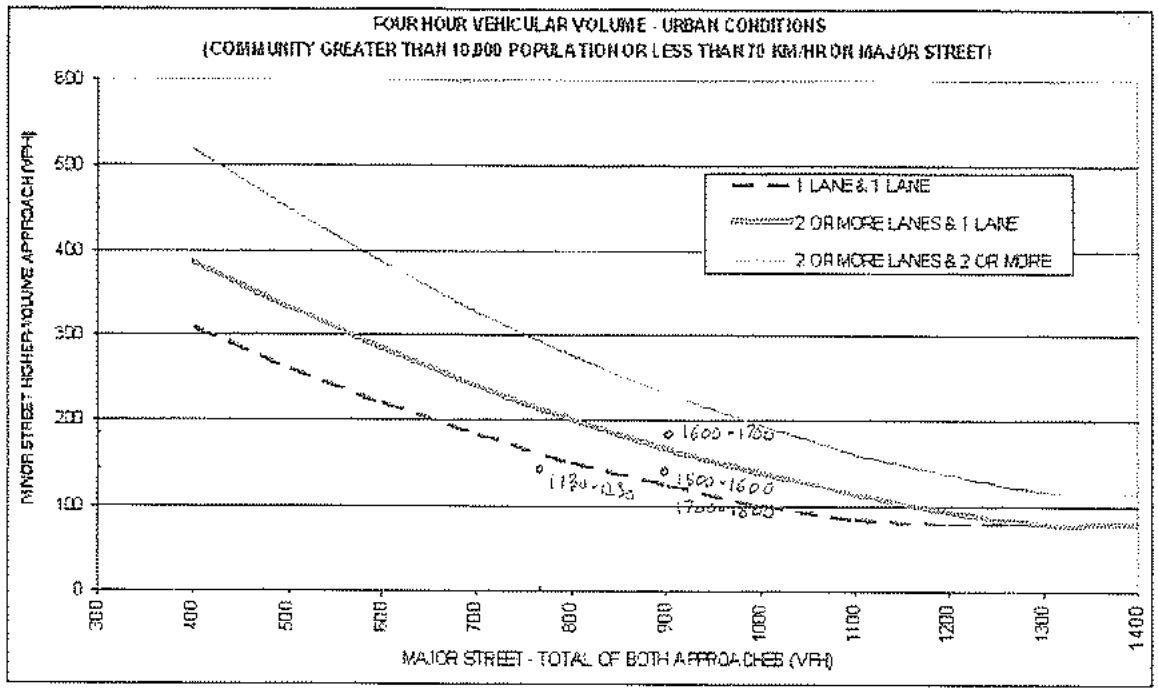
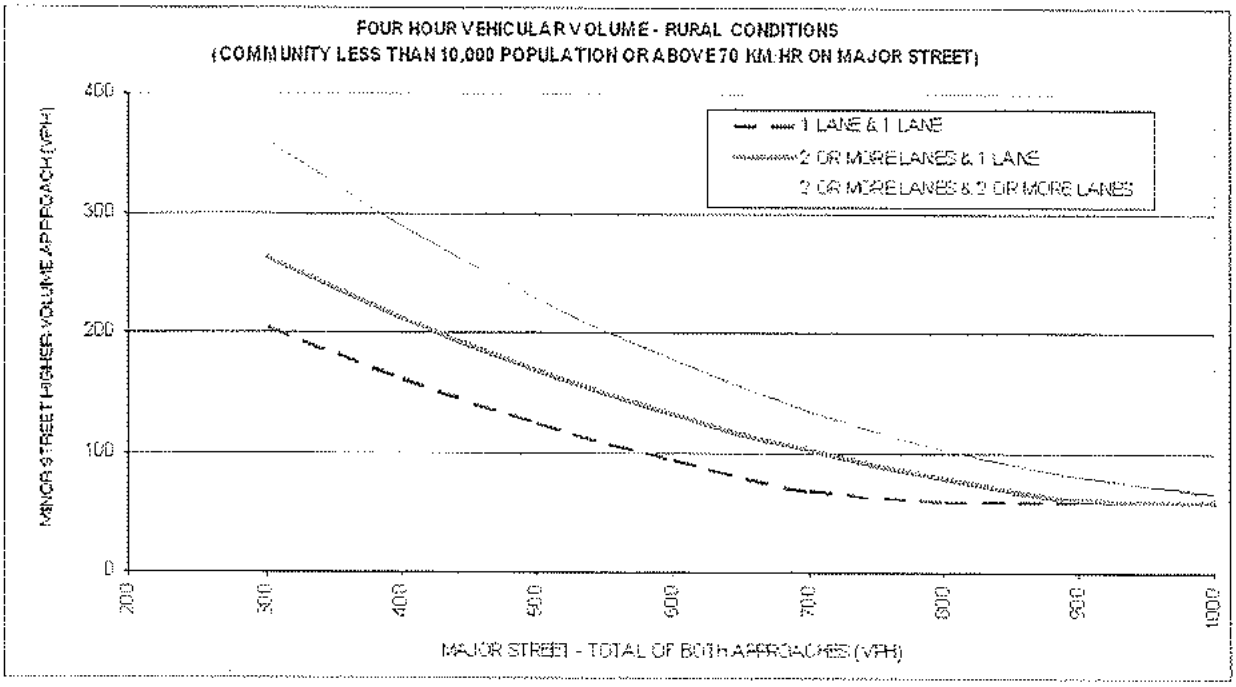
JUSTIFICATION 4 – Minimum Four-Hour Vehicle Volume

A. Restricted Flow



B. Free Flow



NOVATECH
Engineers, Planners & Landscape Architects

TRAFFIC SIGNAL JUSTIFICATION SUMMARY TABLE

LOCATION: O'CONNOR at DEPEAU

DATE: DEC 14, 2016

JUSTIFICATION	DESCRIPTION	MINIMUM REQUIREMENT		COMPLIANCE	
		FREE FLOW	RESTRICTED FLOW	SECTIONAL %	ENTIRE % [2]
		OPERATING SPEED ≥ 70KM/H	OPERATING SPEED < 70 KM/H		
1. MINIMUM VEHICULAR WARRANT	A. Vehicle volume, all approaches for each of the heaviest 8 hours of an average day, and	480 600 (2 or more lane approach	720 900 (2 or more lane approach	85%	82%
	B. Vehicle volume, along minor street, for each of the same 8 hours.	120 180 (tee intersection)	170 255 (tee intersection)	82%	
2. DELAY TO CROSS TRAFFIC	A. Vehicle volume, along major street for each for the heaviest 8 hours of an average day, and	480 600 (2 or more lane approach)	720 900 (2 or more lane approach	76%	76%
	B [1]. Combined vehicle and pedestrian volume crossing the major street for each of the same 8 hours	50	75	100%	
3. VOLUME/DELAY COMBINATION	The above Justifications (1 and 2) both satisfied to the extent of 80% or more	Yes ☐		No ☑	NO
4. MINIMUM FOUR HOUR VEHICLE VOLUME	Plotted point representing hourly volume for minor approach vs. major approach for four highest hours of an average day fall above the applicable curve	Yes ☐		No ☑	NO
5. COLLISION EXPERIENCE	A. Total reported accidents of types susceptible to correction by a traffic signal, per 12 month period averaged over a 36 month period, and	5			
	B. Adequate trial of less restrictive remedies, where satisfactory observance and enforcement have failed to reduce the number of accidents	Yes ☐		No ☐	
6. PEDESTRIAN VOLUME AND DELAY	A. Plotted point representing 8 hour pedestrian volume vs. 8 hour vehicular volume fall in justified zone, and	Yes ☐		No ☑	NO
	B. Plotted point representing 8 hour volume of pedestrian experiencing delays of 10 s or more vs. 8 hour pedestrian volume fall in justified zone	Yes ☐		No ☐	

NOTES
1) For definition of crossing volume refer to the Ontario Traffic Manual Book 12, Section 4.5 (Nov. 2007).
2) The lowest sectional percentage governs the entire Justification.

1. MINIMUM VEHICULAR WARRANT	A. Vehicle volume, all approaches (average hour)	480 600 (2 or more lane approach	720 900 (2 or more lane approach	583	65%	59%
	B. Vehicle volume along minor street (average hour)	120 180 (tee intersection)	170 255 (tee intersection)	101	59%	
2. DELAY TO CROSS TRAFFIC	A. Vehicle volume along major street (average hour)	480 600 (2 or more lane approach)	720 900 (2 or more lane approach	482	54%	54%
	B [1]. Combined vehicle and pedestrian volume crossing the major street (average hour)	50	75	84	112%	

NOTES

1) For definition of crossing volume refer to the Ontario Traffic Manual Book 12, Section 4.5 (Nov. 2007).
2) The lowest sectional percentage governs the entire Justification.
3) Average hourly volumes estimated from peak hour volumes, AHV = PM / 2 or AHV = (AM + PM) / 4.
