5.0 Storm Drainage

5.1 OVERVIEW

A Stormwater Management Report is being submitted concurrently with this report, under separate cover. For more details on the SWM design, please refer to the report entitled "*Half Moon Bay South Phase 4, Barrhaven South, City of Ottawa, Stormwater Management Report*", Stantec Consulting Ltd., dated May 27, 2015.

In order to allow the Meadows in Half Moon Bay (Tamarack lands north of the site) and the Half Moon Bay South (Mattamy lands) development to proceed prior to the update to the Barrhaven South MSS, J. F. Sabourin and Associates (JFSA) undertook an analysis in August 2014 to evaluate the performance of the existing Todd pond and proposed Clarke pond systems by combining several separate models developed by JFSA (Half Moon Bay subdivision), IBI (Meadows in Half Moon Bay) and Stantec (Half Moon Bay South). The analysis has been subsequently revised every time there are changes to the Meadows in Half Moon Bay and/or the Half Moon Bay South developments to assess impacts on the Todd and Clarke Pond storm systems. The results of the latest analyses are summarized in **Appendix A.5**.

In April 2015, J.F. Sabourin & Associates (JFSA) presented a revised Todd pond model as part of their Model Keeper Analysis for Todd Pond making use of the dual routing procedure for DDSWMM outlined in Technical Bulletin ISDTB-2014-01. The resultant increase in storage provided in existing roadways permitted expanded Todd pond drainage boundaries also outlined in the JFSA Model Keeper Analysis. It is the intent of the proposed servicing scheme to make use of all available drainage area allocated to the Todd pond to limit requirements for a minor system sewer to the Clarke Pond to service Half Moon Bay South.

5.2 CRITERIA AND CONSTRAINTS

The following section discusses the criteria and constraints influencing the design of Phase 4 (P4) of the Half Moon Bay South (HMBS) development.

5.2.1 Criteria

Criteria were established through review of the background documentation, supplemented with current design practices outlined by the City of Ottawa Sewer Design Guidelines (City of Ottawa, October 2012) and the City of Ottawa's Technical Memo (City of Ottawa, January 2012).

- Use of the dual drainage principle
- Maximum 100 year flow depth of 0.30 m in road sags
- Standing water depths at road sags not to cause surface flooding on any building or structure

- Rear-yard storage not to be included in stormwater management (SWM) calculations
- Use of standard self-cleansing inlet-control devices where possible
- Ensure that 100 year overland flows from the proposed HMBS development tributary to River Mist Road are captured into the minor system prior to entering the adjacent Meadows in Half Moon Bay development to the north
- Maximum peak release rate from the HMBS development to the Corrigan pond at MH501 (existing manhole in phase 1A) to be 2,152 L/s as obtained from the 100 year XP-SWMM model included in the SWM Report of Phase 1A of the HMBS development (Stantec, July 2011)
- 100 year major flows exiting Phase 1A at Regatta/Pennant Avenue to be less than 2.7 m^3/s as obtained from the 100 year DDSWMM model included in the SWM Report of Phase 1A of the HMBS development (Stantec, July 2011)
- Proposed schools in Phase 4 of the HMBS development to store post development 100 year peak flows on site while restricting minor system flows to 120 L/s/ha
- Proposed park areas in Phase 4 of the HMBS development to restrict minor system peak flows to 60 L/s/ha.
- 100 year hydraulic grade line (HGL) to be a minimum of 0.30 m below building foundation footings (3hr Chicago Storm) for existing and proposed phases.
- Size storm sewers to convey the 5 year storm event under free-flow conditions using 2004 City of Ottawa I-D-F parameters with the exception of the trunk sewer along River Mist Road to the Todd pond which has been sized in XP-SWMM to capture and convey the 100 year post development flows, while meeting the Under Side of Footing (USF) - HGL clearance criteria across the site
- Subdrains required in swales where longitudinal gradient is less than 1.5%
- Account for tributary external drainage through the system
- Provide adequate emergency overflow conveyance off-site
- Quality control is provided in the downstream Barrhaven South Todd and Corrigan Ponds

5.2.2 Site Constraints

As shown in the background documents, the HMBS development is within an area of Barrhaven South that has three separate outlets for both minor and major systems.

The proposed P4 of the HMBS development has several storm sewer outlets. One storm outlet is proposed to the Corrigan Pond via an existing 525mm dia. storm sewer within the Damselfly Way ROW that directs runoff to the trunk sewer along Andre Audet Avenue through phase 2 towards the storm system in phase 1A of the HMBS development, which in turn ultimately discharges into

an existing 1950 mm dia. trunk sewer on the existing Greenbank Road. The minor system allowable release rate to the existing MH501 at the Phase 1A boundary towards the Corrigan Pond is 2,152 L/s.

Three storm outlets in Phase 4 (a 675mm dia. storm sewer on River Mist Road south of Soldats Riendeau Street, a 900mm dia. storm sewer on Soldats Riendeau Street west of Lamprey Street, and a 1200mm dia. storm sewer on Dundonald Street just west of Grand Canal Street) will direct runoff from the proposed phase to the Todd Pond storm system running north along River Mist Road towards the storm system across the Meadows in Half Moon Bay development (see **Drawing SD-1**). The three outlets converge to a single minor system outlet at the northern boundary of the site at River Mist Road. Discharge curves for this outlet as well as detailed drainage area information have been provided to J.F. Sabourin and Associates (JFSA) for their Todd pond model keeper analysis for verification of freeboard to existing units in Half Moon Bay subdivision from Todd pond operating levels, as well as to ensure the pond maintains a sufficient permanent pool volume to satisfy MOE objectives (see **Appendix A.5** for JFSA memo). Additionally, the SWM strategy for the initial draft plan of HMBS indicates a major system target release rate to the Todd pond of 2.7 m^3/s at Regatta/Pennant Avenue and of 0L/s (full capture to minor system) at the northern connection point of River Mist Road in Phase 1, which will be respected in the proposed design (see Table below).

SWM Pond / Outlet	Background Studies		HMBS Phase 4 (100yr 3hr Chicago Event)	
	Minor System Release Rate (L/s)	Major System Release Rate (L/s)	Minor System Release Rate (L/s)	Major System Release Rate (L/s)
Clarke – Realigned Greenbank[1]	700	0	700	0
Todd – River Mist	No Negative Impact to Downstream USFs[3]	0	6,973	0
Todd - Regatta	0	2,700	0	1,124
Corrigan – Greenbank[2]	2,152	0	2,148	0

1. Based on Mattamy-owned portion of school block, controlled to 5-year peak release rate with flows from larger events stored on-site.
2. Background information for the Corrigan pond was obtained from the Corrigan Design Brief (IBI, July 2010) and the HMBS – Phase 1A SWM Report (Stantec, July 2011).
3. Confirmed as part of Todd Pond Model Keeper Analysis by JFSA under separate cover.

5.3 STORMWATER MANAGEMENT PLAN

The following sections describe the stormwater management (SWM) plan for Phase 4 of the HMBS development in the context of the background documents and available governing criteria.

5.3.1 Phase 4 Buildout Conditions

The proposed P4 of the HMBS development (the site) will comprise a combination of townhouse units, terrace homes and single-family residential lots, two schools, park land and associated transportation and servicing infrastructure.

The proposed site is designed using the "dual drainage" principle, whereby the minor (pipe) system is designed to convey the peak rate of runoff from the 5 year design storm (or equivalent flow rate), and runoff from larger events is conveyed by both minor (pipe) and major (overland) channels such as roadways and walkways safely off site. A combination of vertical orifices and IPEX inlet control devices (ICDs) are specified for most street and rear yard catchbasins to limit the inflow to the minor system and thus control the hydraulic grade line from surcharging storm sewers into basements during major storms and to meet the target release rates from the site. Solid covers are proposed for all manholes located in ponding areas to limit inflows to the minor system to that of the ICD. As recommended by the Ottawa Sewer Design Guidelines, no storage will be accounted for in the rear yards. **Drawing SD-1** outlines the proposed drainage areas.

Major system runoff from the proposed P4 development will be directed to two separate outlets. A major system outlet will be provided overland through Andre Audet Avenue which will direct major flows to Regatta Avenue at the Meadows in Half Moon Bay development while a second major system outlet will be provided through the storm trunk sewer along River Mist Road which conveys minor and major system flows to the Todd Pond.

Several unrestricted curb inlets have been installed along the section of River Mist Road within Phase 1A in order to capture the 100 year major flows from the portion of the HMBS development tributary to the River Mist Road outlet, while meeting the USF clearance criteria across the site.

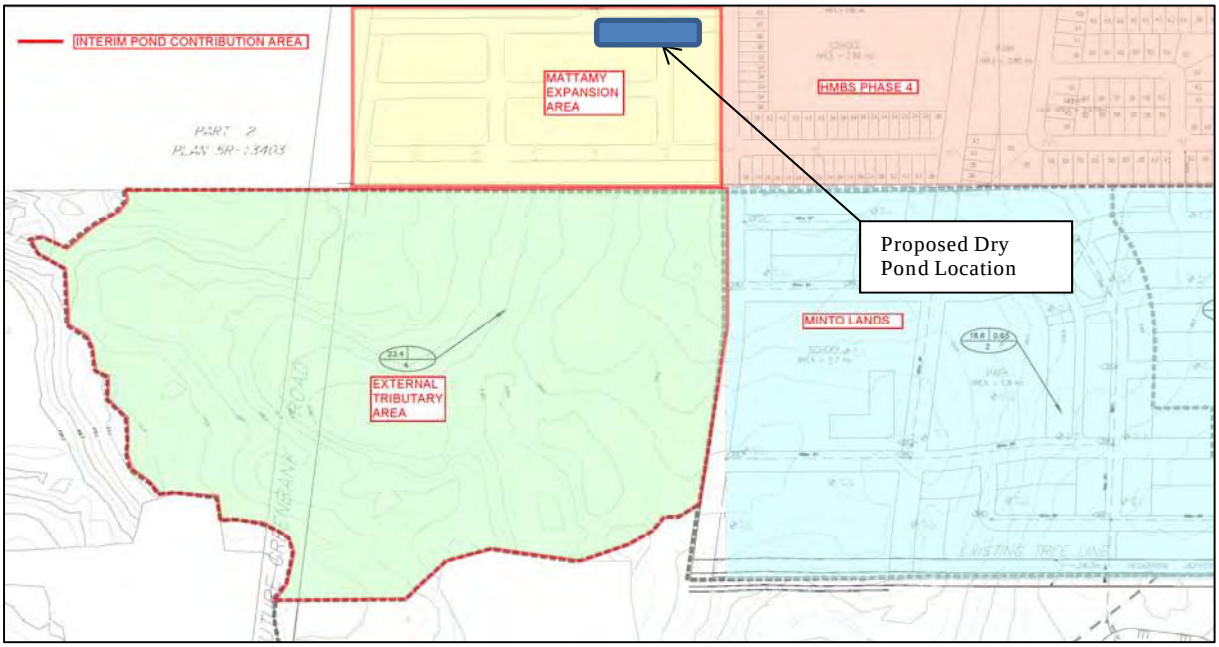
5.3.1.1 Interim Dry Pond

A temporary dry pond is proposed to attenuate flows from external rural tributary areas within the urban boundary but outside of the current CDP owned by Minto (approx. 23.4ha) and Mattamy Homes (approx. 5.64ha) per the results of the Todd Pond Model Keeper Analysis submitted under separate cover (see **Appendix A.5**) and approved by City staff. A PCSWMM model was created for the temporary dry pond and 29.04ha total external drainage area based on the parameters as follows and in accordance with Section 8.3.11.5 of the City of Ottawa Sewer Design Guidelines:

- Pond catchment area: 29.04ha
- Catchment area length parameter: 880m
- Catchment area CN: 74
- Average slope of catchment area: 1.5%
- Catchment imperviousness: 0%
- Bottom of pond elevation: 99.40
- Top of pond elevation: 100.80

- Available pond storage volume: 1305m³
- Outlet orifice size: 375mm circular
- Pond active depth: 1.4m (City of Ottawa requires depth < 2.5m)
- Pond side slopes: max. 4:1

Figure 10: Interim Dry Pond Contributing Lands



The orifice and pond storage volume have been sized to attenuate interim flows to a maximum of 350L/s in the 100yr SCS storm event scenario. The 350L/s figure has been confirmed through correspondence with JFSA as to not negatively impact downstream USFs in the pre-weir expansion scenario (see **Appendix A.6** for model input/output details). Inclusion of the Mattamy owned 5.64ha to the Todd pond drainage boundary has been confirmed by the JFSA Todd pond model keeper analysis and approved by City staff. Per the MSS, overland flows from Minto owned lands will ultimately be diverted to a future SWM facility elsewhere.

5.3.2 Hydrologic Analysis

A comprehensive hydrologic modeling exercise was completed with DDSWMM, accounting for the estimated major and minor flows to evaluate the response of the storm sewer infrastructure and the site's major systems. Two DDSWMM models were created; one for the minor system to the Corrigan pond and major system to Regatta Avenue at the boundary of Phase 1A and a second model for the minor system to the Todd Pond and major system to River Mist Road. The DDSWMM models incorporate subcatchments within the proposed P4 area, the approved Phases 2, 3 and part of the existing Phase 1A, and lumped drainage areas for future development lands southwest of the HMBS development tributary to the Todd Pond. Catchments within the approved phases of the development have been included in order to

assess any impacts to the existing major and minor systems. **Drawing SD-1** shows the drainage catchments in the HMBS development along with the preliminary storm servicing infrastructure.

5.3.2.1 Hydrologic Parameters and Assumptions

Surface storage estimates for the subcatchments within the proposed P4 and the approved and existing phases of the HMBS development were based on the detailed grading plan designs (see **Drawings GP1-4**), while the approximate surface storage available in the lumped catchments within future areas of the HMBS development was assumed based on the proposed road grade slope and type of road. The following assumptions were applied to the DDSWMM models:

- Hydrologic parameters as per Barrhaven South MSS (Stantec, 2007), including Horton infiltration, Manning's 'n' and depression storage values (see Appendix A1)
- 3hr Chicago Storm distribution as outlined in the Barrhaven South MSS (Stantec, 2007)
- 100 year 3hr Chicago and 24hr SCS events, and during the 100 year 3hr Chicago design storm increased by 20%
- Impervious areas were measured in several representative catchments based on the type of units in the catchment (single, townhouse, etc.) and whether they were road or rear yard catchments. Impervious areas for these catchments were based on a maximum unit size based on lot setbacks and as such the impervious areas measured are considered conservative. The imperviousness values calculated were used in similar catchments across the site. Imperviousness values were converted to runoff coefficients for storm sewer sizing purposes using the relationship C = (Imp. x 0.7) + 0.2
- Imperviousness values for rear yard catchments within the proposed P4 were assumed to be 80% effective
- DDSWMM segment lengths defined from high-point to low-point where sags occur
- Subcatchment width equal to two times the average segment length for two-sided catchments, equal to one time the segment length for one-sided catchments, and equal to 225 times the area of the catchment for any other catchments
- Draft Plan #2 catchments were included in the model and the parameters used for these catchments (areas, length, width and inlet information) were obtained from the DDSWMM model included in the HMBS – Draft Plan #2 SWM Report (Stantec, April 2015)
- Phase 2 & 3 catchments were included in the model and the parameters used for these catchments (areas, length, width and inlet information) were obtained from the DDSWMM model included in the HMBS – Phases 2 & 3 SWM Report (Stantec, February 2014)
- Phase 1A catchments tributary to the minor and major system outlet at River Mist Road were included in the model and the parameters used for these catchments (areas,

length, width and inlet information) were obtained from the DDSWMM model included in the HMBS – Phase 1A SWM Report (Stantec, July 2011)

- Existing catchment lengths and road segments were modified to permit double routing per City Technical Bulletin ISDTB-2014-01
- Several segment cross-section types were defined to represent 8.5 m wide roads at different longitudinal slopes, 11.0 m wide roads at different longitudinal slopes, rear yard swales at 1.0% longitudinal slope, and parks
- Minor flows from park areas in the proposed DP3 of the HMBS development to be controlled to 60 L/s/ha (approx. 5 year peak flows from pervious areas)
- School areas to store 100 year peak flows on-site and to restrict minor system inflows to 120 L/s/ha

In general, ICDs have been sized in areas tributary to the Todd pond to convey the 5-year event without surface ponding. Due to inlet restrictions to sewers tributary to the Corrigan pond, surface ponding could not be eliminated in all areas tributary to the Corrigan system. Also, it is of note that the time step used within the DDSWMM model for Phase 4 areas has been revised to be consistent with that used by JFSA in their pond model keeper analysis. As such, existing areas tributary to the Todd pond show surface ponding based on their existing ICD configuration. The following table summarizes the ICD schedule across the proposed Phase 4 of the HMBS development:

Table 10: Schedule of Inlet Control Devices

Catchment ID	ICD Type / Size (mm)	Max. Release Rate (L/s)	# of CBs and Interconnection

5.3.2.2 Interim Condition Hydrologic Analysis Results

Two development events have been analyzed for the purposes of this report: the interim scenario considers a full build-out of Phase 4 lands including an interim dry pond to attenuate flows from external rural tributary areas owned by Minto (approx. 23.4ha) and Mattamy Homes (approx. 5.64ha) and prior to the weir expansion to occur within the Todd pond, whereas the ultimate scenario considers removal of the interim pond, build-out of the Mattamy owned lands ultimately tributary to the Todd pond, as well as a weir expansion within the downstream Todd pond to occur for the purposes of development of the expanded Todd pond drainage area. Weir expansion within the downstream Todd pond is required to attenuate the increased peak discharge expected from the future lands beyond the 350L/s peak discharge rate of the interim dry pond without subjecting existing areas of Half Moon Bay to additional overland flow depth or deleterious surcharge of downstream sewers.

Interim Dry Pond Results

Storm Event	Major System Inflow (L/s)	Minor System Outflow (L/s)	Required Storage (m3)	Drawdown Time After Event (h)
5yr Chicago	53.6	49.2	88	8
100yr Chicago	270.1	237.0	529	12
100yr 24hr SCS	437.8	346.3	1363	24
100yr Chicago +20%	426.8	330.4	1198	13

Table 11 and **Table 12** summarize the minor system inflow and major system sag storage and overflow results for the proposed P4 areas of the HMBS development as well as the existing phase areas that serve as major system outlet for the phase and future development land areas during the 5 and 100 year, 3hr Chicago storms respectively in the interim condition. **Appendix A2** summarizes the DDSWMM modeling results for the various storm events included in this analysis. The total flow depth shown in the tables below is equal to the depth on the segment obtained from DDSWMM plus the maximum ponding depth on street sags, when the storage used obtained from DDSWMM equals the maximum storage available on the street sag.

Table 11: HMBS- Phase 4 – Major and Minor System 5 Year Storm Results

It is of note that segments ST509AA, ST521D, ST522A, and ST509A form part of Phase 1A of the Half Moon Bay South development, which was designed and constructed prior to City of Ottawa requirements to maintain flow depths on street below 0.30m in depth. As segments 509AA and 509A form part of the major overland flow route to Regatta Avenue and maintain a static ponding depth of 0.30m, it is not possible to alleviate flow depth issues in these areas without significant re-grading of the right-of-ways in the existing phase. Effort has been made to size ICDs within Phase 4 to reduce overland flow contribution to these areas without also exceeding the 2,152L/s peak capture rate specified for the Corrigan minor system.

The 100 year, 3 hr Chicago major system overflow to Regatta within Phase 1A of the HMBS development is 1.12 m3/s, which is less than the 2.70 m3/s target. The overall 100 year (3 hr Chicago storm) minor system inflow from the proposed P4 and approved phase areas from the outlet within Phase 1A towards the Corrigan pond is 2,148 L/s as obtained from the XP-SWMM model (see details in **Section 5.3**), which is less than the allowable 2,152 L/s minor system release rate to the Phase 1A outlet.

The DDSWMM results also show no 100 year overland spill flows onto the adjacent Meadows in Half Moon Bay development at River Mist Road (segment ST613A). The actual 100 year peak outflow from the HMBS development to the storm outlet at River Mist Road will be obtained from the XP-SWMM model, which takes into account routing and the differences in time to peak of the inflow hydrographs. The overall peak flow from the HMBS development to the trunk sewer along River Mist Road directed to the Todd Pond does not negatively impact the hydraulic grade line (HGL) elevation and underside of footing (USF) clearance downstream, as confirmed through correspondence with JFSA.

5.3.2.3 Ultimate Condition Hydrologic Analysis Results

Table 13 and Table 14 summarize the ultimate condition DDSWMM modeling results for the proposed areas in P4 and approved and existing phase areas along the Todd major system outlet for the 5 year, and 100 year 3 hr Chicago storms respectively. Ultimate scenario flow

depths and capture rates for areas tributary to the Corrigan system remain unchanged from that of the interim scenario.

Table 13: HMBS - Phase 4 - Major and Minor System 5 Year Storm Results

The results of the hydrologic analyses (DDSWMM input and output files) for the different storm events are summarized in **Appendix A2.**

The following table shows the segments with 100 year total flow depth greater than 30 cm as shown in the above **Table 12 and Table 14**, along with a comparison to the 100 year total flow depth on those segments as per the approved SWM Report for Draft Plan #2 (Stantec, August 2014).

Table 15: 100 Year Total Flow Depth Comparison

Catchment ID	Approved SWM Plan (August 2014) Total Flow Depth (cm)	Interim Phase 4 SWM Plan (July 2015) Total Flow Depth (cm)	Ultimate Phase 4 SWM Plan (July 2015) Total Flow Depth (cm)
Minor System to Corrigan Pond			
'1-1' / ST525A	34.4	31.2	31.2
'1-9' / ST535A	39.3	30.7	30.7
'1-20' / ST551A	34.3	26.9	26.9
Minor System to Todd Pond			
'2-5' / ST616A	33.4	28.9	28.9
'2-7' / ST605A	38.7	36.0	36.0
'2-11' / ST623A	33.7	33.8	33.8
ST630A	<30	31.1	31.1

The above table shows that total flow depths have been reduced in the majority of areas with the exception of area ST630A, which shows a negligible flow depth increase. These areas were previously designed and approved prior to the flow depth requirement and/or are within Draft Plan #2 and were approved with flow depths in excess of the required 30cm. It should be noted that several efforts were made during detailed design of the approved phases in order to reduce the 100 year flow depths on streets as much as possible. The total 100 year flow depth over the proposed Phase 4 segments remains below 30cm.

5.3.3 Hydraulic Grade Line Analysis

In order to assess the hydraulic grade line (HGL) elevation across the Phase #4 areas of the HMBS development, the storm sewers tributary to the Todd Pond outlet at River Mist (EXMH601), to the Corrigan Pond at Sweet Grass Circle (EXMH501), as well as the detailed DDSWMM hydrology for the 100 year, 3 hr Chicago storm were incorporated into two XP-SWMM models. One model represents the minor system to the Corrigan Pond at the boundary with Phase 1A of the HMBS development (EXMH501) and the results of this analysis have been included in **Appendix A.3**. The second model represents the minor system to the Todd Pond including the storm sewer infrastructure across the existing phases (outlet at River Mist Road) and the results of this analysis have also been included in **Appendix A.3**. Given that the storm sewer systems to the Todd Pond have been designed to capture and convey major flows along River Mist Road, the minor system inflows during the 100 year, 3 hr Chicago storm increased by 20% increase considerably and as such, the storm systems were also stress tested during this storm event. The PCSWMM modeled dry pond outflow hydrograph has been added to node 719 to simulate inflows from the temporary dry pond attenuating peak flows from the upstream rural area noted in the Barrhaven South MSS and reassessed by JL Richards & Associates for the future Minto lands to the south (see **Appendix A.5)**. **Appendix A.4** presents the proposed storm sewer design sheet.

The 100 year, 3hr Chicago HGL boundary condition (fixed water level) at EXMH501 to the Corrigan Pond was obtained from the HMBS – Phase 1A SWM Report (Stantec, July 2011) as 92.70 m. The fixed HGL boundary condition at EXMH601 was determined from the overall XPSWMM model inclusive of Todd Pond's outlet and water elevations within the downstream Jock River as created by JFSA (see correspondence included in **Appendix A.5**).

5.3.3.1 Interim Hydraulic Grade Line Results

The DDSWMM hydrology was interfaced with the XP-SWMM models to determine the resulting HGL across the approved Draft Plans #1 and #2, and the proposed Phase 4 of the HMBS development. **Table 16** summarizes the HGL modeling results across the HMBS development and shows the lowest USF elevations and proposed road grades. HGL clearance from lowest USF has been calculated across approved phases, while HGL clearance across the Phase 4 development areas has been estimated based on proposed road elevations. Proposed USF elevations are to be updated in the forthcoming revised grading plans for the region, and will satisfy the 0.30m minimum freeboard requirement from maximum 100yr HGL elevations.

It is of note that as inflow rates to the Corrigan minor system are at their maximum rates during the 100yr Chicago event as defined by the DDSWMM model hydrology, no HGL increases have been observed for the 100yr +20% event for sewers tributary to the Corrigan minor system. The maximum 100yr HGL column for areas tributary to the Todd pond minor system incorporates worst case results from both the 100yr 24hr SCS and 100yr 3hr Chicago events.

Table 16: 3hr Chicago Hydraulic Grade Line Results

Node (CB/MH)	Exist./Prop. Road Elevation (m)	Underside of Footing (m)	Maximum 100yr HGL (m)	Difference (USF – HGL) (m)	Maximum 100yr +20% HGL (m)	Difference (USF – HGL) (m)

NOTE: Worst case HGL for these locations has been interpolated based on proposed building service lateral location – See **Appendix A.3 for calculations.

As can be seen in **Table 16**, the 100 year storm (worst case between 3 hr Chicago and 24 hr SCS) results in HGL elevations that remain at least 0.30 m below the underside of footings (USFs) across the proposed and existing phases of the HMBS development.

The XP-SWMM results also show that the actual 100 year peak outflow to the trunk sewer on River Mist Road is 6,973 L/s. Similarly, the XP-SWMM results show that the actual 100 year peak outflow to EXMH501 in Phase 1A towards the Corrigan Pond is 2,148 L/s.

5.3.3.2 Ultimate Hydraulic Grade Line Analysis Results

Table 17 summarizes the ultimate scenario HGL modeling results for areas tributary to the Todd pond minor system (Corrigan minor system remains unchanged for Interim/Ultimate scenarios) across the HMBS development and shows the lowest USF elevations and proposed road grades. HGL clearance from lowest USF has been calculated across approved phases, while HGL clearance across the Phase 4 development areas has been estimated based on proposed road elevations. Proposed USF elevations are to be updated in the forthcoming revised grading plans for the region, and will satisfy the 0.30m minimum freeboard requirement from maximum 100yr HGL elevations.

Areas of unrestricted minor system capture to the Todd system exist along River Mist within drainage areas ST637A, ST627A, and ST613A and were constructed as part of Phase 1A of the development prior to City of Ottawa requirements to analyze the effects of a climate change event on the system. As a result, during the 100yr + 20% event, a considerable sewer surcharge is experienced in these areas. To reduce the surcharge to manageable levels, it is recommended to install ICDs on each unrestricted catchbasin lead within area ST627A (6 IPEX Type C ICDs restricted to 67L/s each) and area ST637A (8 ICDs restricted to 86L/s each) prior to development of future Mattamy lands to the south beyond Phase 4 to permit major system routing for additional flows over that experienced during a regular 100 year event. Additional routing delays peak inflows from these areas, with the net effect of managing HGL levels across problem areas during the ultimate scenario. No major system discharge through area ST613A to neighboring properties to the north has been noted in the DDSWMM analysis for this scenario.

NOTE: Worst case HGL for these locations has been interpolated based on proposed building service lateral location – See **Appendix A.3 for calculations.

As can be seen in **Table 17**, the worst case results between the 100 year 3 hr Chicago)and 24hr SCS events results in HGL elevations that remain at least 0.30 m below the underside of footings (USFs) across the approved and existing phases of the HMBS development. Maximum elevations for the 100yr +20% climate change event do not exceed basement floor elevations (USF + 0.23m) for existing properties in the region.

Appendix I

Draft BSMSSA – Revised Potable Water and Sanitary Servicing Analysis Memo, Stantec, October 19, 2016

Memo

To:	Jeff Shillington City of Ottawa	From:	Kevin Alemany Stantec Consulting Ltd.
File:	1634-00999	Date:	October 19, 2016

Reference: **Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area**

OVERVIEW

This technical memorandum provides an update to the potable water and sanitary servicing plan for the Barrhaven South Study Area. This update includes revisions to the Barrhaven South Urban Expansion Area. The analysis was completed as part of an addendum to the Barrhaven Master Servicing Study (MSS).

The preliminary sanitary drainage plan and population projections for the Barrhaven South Urban Expansion Area were completed by J.L. Richards & Associates Limited (JLR). The document provided to Stantec from JLR is provided in **Figure 1** below. This document splits the proposed expansion areas into five regions based on the developer and provides preferred sanitary and potable water layouts and connection points for each of these areas.

There have been realignments of the Barrhaven South Master Servicing Study Area since the previous iteration of the sanitary drainage plan (Nov 28th 2014). Using the new sanitary drainage plan provided by J.L. Richards below in **Figure 1**, it has been understood that area 3 was included in previous sanitary design flow projections. All other areas (Area 1, 2, 4 and 5), have been assumed to be new areas which will contribute additional flow to that already accounted for in previous iterations of the sanitary design sheets.

Figure 1: Preliminary Sanitary Drainage Plan for the Barrhaven South Urban Expansion Area

Reference: Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area

SANITARY ANALYSIS

An analysis was completed to determine the preferred sanitary servicing alternatives for the updated urban expansion areas. These areas will generate additional flow that must be conveyed by the existing sanitary trunk sewers.

METHODOLOGY

The sanitary servicing analysis was completed using previous iterations of Stantec's sanitary sewer design sheets for the Barrhaven South Study Area as part of revisions to the Master Servicing Study (MSS). These sheets included estimations of flow generation for all approved development areas proposed to discharge to the Barrhaven South Trunk Sanitary Sewers. As-built sanitary sewer information was used in these sheets where available, to ensure the analysis would represent current conditions.

The analysis required use of the sanitary sewer design sheet for the Barrhaven South Master Servicing Study (MSS) last updated by Stantec on July 29th 2016, as well as the sanitary sewer design sheet for the Half Moon Bay South Subdivision last updated by Stantec on September 24th 2014.

The Half Moon Bay South Subdivision design sheet included area 3 as part of its original drainage area, and thus this area is not included as a separate line in the above mentioned sewer design sheets. No analysis to confirm the serviceability elevations within the development sites was completed.

FLOW GENERATION

The Preliminary Sanitary Drainage Plan, completed by J.L. Richards August 24th 2016, was used to determine the flow generation anticipated from each proposed development area. This plan separated each proposed development area into the following four landuse categories:

- Residential
- Roads
- ICI & Parks
- Ponds, Corridors, and Natural Features

Dry Weather Flow (DWF)

A flow generation of 50,000 L/ha/day was proposed for the ICI & Park areas per JLR's Preliminary Sanitary Design Plan. An approximate population projection was provided in this plan for all residential areas with an estimated flow generation of 350 L/cap/day.

The rates, populations, and areas prescribed by JLR were used in updating Stantec's sanitary sewer design sheets. It was assumed, per the provided information from JLR, that all area identified as belonging to the ICI & Parks land use designation would generate 50,000 L/ha/day. Harmons peaking factor was used for residential areas, with an acceptable value range between 2 and 4. A peak factor of 2.4 was used for industrial type land uses and a peak factor of 1.5 was used for commercial and institutional areas.

Reference: Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area

Wet Weather Flow (WWF)

All roadway area and pond, corridor and natural feature area was used in the approximation of inflow and infiltration, per the previous iterations of the sanitary design using a rate of 0.28L/s/ha. **Table 1** below provides a summary of the flow anticipated to be produced from each sanitary drainage area.

Table 1: Anticipated Flow Generation from Proposed Urban Expansion Areas

Drainage Area	Drainage Area Developer	Flow Generated (L/s)					Infiltration and Inflow (L/s)	Total WWF (L/s)
		Res.	ICI	Peak Res.	Peak ICI	Total DWF		
1	Drummond	0	11.7	0	17.6	17.6	5.7	23.3
2	Brazeau	0	14.4	0	21.5	21.5	6.9	28.4
3	Mattamy	1.2	0.4	4.9	0.6	5.5	1.5	7.0
4	Minto	14.3	4.7	48.4	7.1	55.8	16.8	72.3
5	Mattamy	1.0	0.32	3.9	0.5	4.4	1.1	5.5

SERVICING ALTERNATIVES

The Preliminary Sanitary Drainage Plan provided by JLR included preferred connection points into existing infrastructure for each of the proposed development areas. **Table 2** below summarizes these proposed connection locations, while **Figure 2** provides mapping of these. **Figure 2** also includes locations of other potential connection points and manholes for reference.

Table 2: Proposed Connection Points for Urban Expansion Areas into Existing Sanitary Infrastructure

Drainage Area	Drainage Area Developer	Proposed Connection Location	Proposed Connection Manhole
1	Drummond	Future Collector Road	MA11
2	Brazeau	Re-aligned Greenbank Road & Dundonald Drive	MA14
3	Mattamy	Des Soldats Reindeau Street & Street B (future)	SAN 217
4	Minto	Greenbank Road	205A
5	Mattamy	Re-aligned Greenbank Road & Dundonald Drive	MA14

ASSESSMENT RESULTS

Catchment allocations per JLR's preliminary sanitary drainage plan were analyzed as a primary solution to servicing the Barrhaven South Urban Expansion Area. Where potential capacity limitations were identified, alternatives have been developed by Stantec. The sanitary sewer design sheets and corresponding sewer shed area diagrams that confirm the conclusions below are provided as attachments to this memo. Additional site development information including grading, road layouts and phasing will provide a means of determining a preferred alternative. No hydraulic grade line analysis has been completed as part of this exercise. It is recommended that this be completed where increasing the flow in an existing sewer has been recommended. A figure providing a summary of the servicing alternatives is provided in **Figure 3** below:

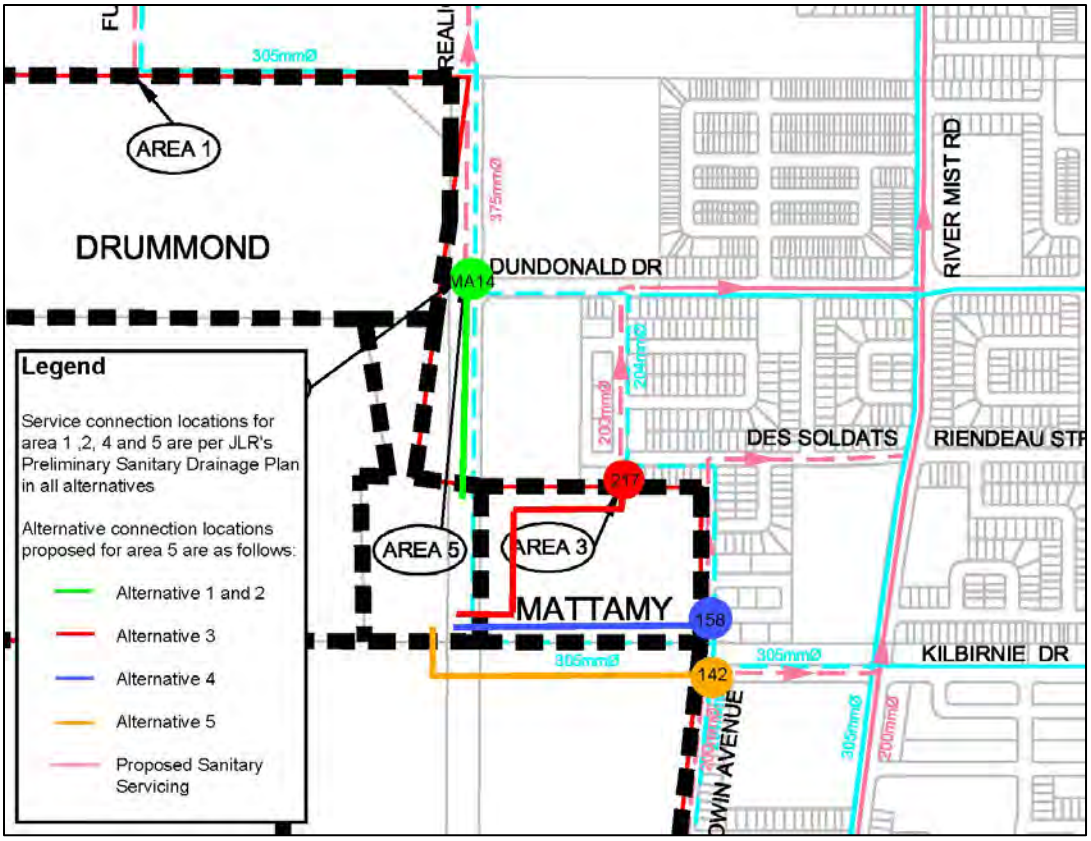

Figure 3: Sanitary Servicing Alternatives

Alternative 1

The proposed allocations provided by JLR were adopted and applied to the Barrhaven South MSS sanitary sewer design sheet. Per this plan, area 4 was allocated to manhole 205A along the Greenbank Road trunk sewer. The Greenbank Road sewer was found to have sufficient residual capacity to accommodate the additional flow from area 4. Area 3 was allocated to sanitary manhole 217, which is a part of the Half Moon Bay South development. Area 3 was accounted for in previous

iterations of the sanitary sewer design sheets for the Half Moon Bay South development and the receiving sewers were found to have adequate residual capacity to accommodate area 3.

Area 1 was proposed by JLR to be allocated to manhole MA11, located at the end of a future collector road, south of Cambrian Road (see **Figure 2**). Area 2 and area 5 were proposed to be allocated to MA14 located at the intersection of Realigned Greenbank Road and Dundonald Drive. The increase in flow allocated to sewer MH13A-MH15A on Cambrian Road from development area 1, 2 and 5 resulted in this existing sewer segment exceeding its capacity by approximately 3%.

A hydraulic grade line (HGL) analysis could be completed to determine if the proposed flow and 3% capacity constraint would result in HGL concerns. The sensitivity of this result could be assessed as the use of design ICI generation rate of 50,000L/ha/d is conservative. A review of the contributing area could also be completed. Sewer flow monitoring could be completed to confirm existing flows and available residual capacity as well.

Alternative 2

An analysis with reduced estimations for flow generation was also considered by Stantec. In alternative 1, the capacity of sewer MH13A-MH15A was exceeded by approximately 4.9 L/s. To maintain flows within the capacity of sewer MH13A-MH15A, while keeping the development area manhole allocations presented by JLR, flow from the development areas would need to be reduced. This reduction could be achieved by decreasing the assumed flow generation rate or by decreasing the sewer shed area proposed to discharge to this sewer. This alternative focuses on the percentage of development area that would need to be removed to meet this flow reduction. Sewer MH13A-MH15A was found to have adequate residual capacity (within 0.25%) for areas 1, 2 and 5, when the development in areas 1 and 2 was limited to 90% of the total developable area.

Alternative 3

It was determined sewer MH13A-MH15A would operate at 100% of its capacity (within 0.25%) if flow from area 5 was reallocated to a different sewer. Stantec opted to examine the alternative of area 5 discharging through area 3, connecting to existing infrastructure at Des Soldats Reindeau Street and future Street B (manhole SAN 217) as part of the Half Moon Bay South subdivision. This alternative proposes area 5 discharge to the River Mist Street trunk sewer through Dundonald Drive. This servicing method was determined not to be feasible as the capacity of constructed sewer EX127-EX126 on Dundonald Drive was exceeded by approximately 16% when the additional flow was added. All other drainage area allocations and characteristics were maintained per alternative 1.

Alternative 4

Alternative 4 proposes the removal of Area 5 from sewer MH13A-MH15A such that the sewer will operate at 100% of its capacity (within 0.25%). Stantec has proposed Area 5 discharge through area 3, and connect to existing infrastructure at Buffalograss Crescent and Aex Polowin Avenue (manhole 158) as part of the Half Moon Bay South development. This alternative proposes area 5 discharge into the River Mist Street trunk sewer through Des Soldats Reindeau Street. All other sewer shed area allocations and characteristics were maintained per alternative 1.

Alternative 4 was found to be serviceable in terms of sewer capacity, however this alternative requires connection into constructed local sewers. It is expected these constructed sewers will have higher invert elevations then what would be required to service area 5 with gravity. There is an area of elevated groundwater within area 3 that necessitated sewers in that area be raised. The requirement for pumping to service area 5 is anticipated, but facility requirements will be dependent on the final grading and road layout selected within the area 5 site. This alternative also requires the sewer to cross realigned Greenbank Road.

Alternative 5

Alternative 5 also proposes the removal of Area 5 from MH13A-MH15A such that the sewer will operate at 100% of its capacity (within 0.25%). In this alternative Stantec has proposed sewers conveying flow from Area 5 connect at River Mist Road and Kilbirnie Drive (manhole MH142) and discharge into the River Mist Road Trunk. All other drainage area allocations and characteristics were maintained per alternative 1.

Adequate capacity exists in the River Mist Road trunk sewer to accommodate flow from area 5. A preliminary sanitary drainage plan for the Kilbirnie sewer area was completed by JLR, including a sanitary design sheet which is provided as an attachment to this memo. The sewer on Kilbirnie Drive is shown to be operating at approximately 20% of its capacity with approximately 13 L/s of residual capacity. Area 5 is anticipated to generate approximately 5.5 L/s of flow. The allocation of flow from Area 5 to the Kilbirnie Drive sewer would need to be confirmed by JLR to ensure this works per their design. It is likely that an area with elevated groundwater in area 4 will necessitate higher sewer elevations. Given the topography and proposed grading of these sites it is anticipated that pumping would be required to service area 5 in this alternative as well.

This alternative requires that area to be developed by Mattamy discharge through area to be developed by Minto. Elements such as phasing and cost-sharing would need to be discussed between the two developers.

SUMMARY

The sanitary servicing analysis showed the preferred servicing as provided by JLR to result in the existing sewer MH13A-MH15A on Cambrian Road exceeding capacity due to the allocation of Areas 1, 2 and 5. The additional flow generated by Area 3 and Area 4 do not result in any sewers exceeded capacity.

The design ICI flow generation rates and attributed contributing areas proposed for development areas 1 and 2 are considered conservative. Flow monitoring may show additional residual capacity to exist in sewer MH13A-MH15A such that Areas 1, 2 and 5 are serviceable with sewer MH13A-MH15A. A hydraulic grade line analysis also may show the slight exceedance above sewer capacity in segment MH13A-MH15A to be negligible. Alternatively, if Area 1 and Area 2 are restricted to produce a maximum flow of 169L/s, which is a reduction of 4.9L/s from what was proposed by JLR, the capacity of sewer MH13A-MH15A will not be exceeded. This is anticipated to be equivalent to developing approximately 90% of the land in areas 1 and 2.

The removal of Area 5 from sewer MH13A-MH15A also results in this sewer operating within its capacity (within 0.25%). Two alternative service connection points were found to be feasible in the servicing of

area 5: alternative 4 at manhole 158 and alternative 5 at MH142. These alternatives propose the connection of Area 5 into the River Mist Road trunk sewer. Alternative 4 requires Area 5 to discharge through constructed internal sanitary sewers. Given the proposed elevations of these sewers, and topography of the area 5 site, it is anticipated pumping of flow generated from area 5 will be required. Alternative 5 requires Area 5 to be serviced through Area 4, which is proposed to be developed by a separate developer. Communication between the two developers will therefore be critical. Pumping of flow generated from area 5 is also anticipated in this alternative, given the proposed elevations of these sewers, and topography of the area 5 site.

POTABLE WATER ANALYSIS

A hydraulic analysis for the potable water portion of the study area was performed to determine whether the previously proposed watermain alignment and sizing would be sufficient in providing the level of service. This analysis herein mainly focuses on urban expansion area.

LEVEL OF SERVICE

Based on the City of Ottawa Water Design Guidelines, the desired range of pressure under basic day (BSDY), maximum day (MXDY) and peak hour (PKHR) demands is 50 to 70 psi and no *less than 40 psi* at ground elevation (i.e. at hydrant level). Furthermore, the maximum pressure at any point in the water distribution should not exceed 100 psi and as such, pressure reducing measures are required to service areas where pressures *greater than 80 psi*.

Under fire flow conditions, the system must be able to supply the MXDY demands and the appropriate fire flow while maintaining a residual pressure of 138kPa (20 psi). A fire flow of 13,000 L/min is used for this analysis following the recommendations presented in the 2013 Water Master Plan (WMP) for system level analysis in the core area.

PROPOSED BACKBONE PIPING

The proposed backbone piping of the Barrhaven South Study Area is shown in **Figure 4**. Changes to the pipe layout since the last issued Barrhaven MSS (Stantec, 2014) include the following:

- The proposed 610mm diameter watermain crossing the river is to extend further west before splitting into two 406mm diameter watermains;
- The 406mm diameter watermain following the 610 river crossing that extends east and along Greenbank Road is to be realigned.

Estimated water demands for the urban expansion area were distributed in model nodes along the backbone watermains feeding into the area as shown in **Figure 4**.

GROUND ELEVATIONS

The topography of the urban expansion area is shown in **Figure 5**. Modeling shows that the HGL in the urban expansion area can reach a minimum of 136m due to headlosses across the distribution system from the South Urban Community (SUC) pump stations. Therefore, areas with a ground elevation greater than 108m can experience pressures below 40 psi at this minimum HGL.

MODEL SET-UP

2013 WMP Criteria

Following the 2013 WMP, the zone/system level criteria for water demands are used for population that exceeds 3,000 persons. Zone level demands are generally used to assess larger service areas and are not generally used to size smaller internal piping.

For residential land-uses, single family and semi-detached homes were considered to have similar demand patterns, and categorized under "single family home" or SFH. Similarly, all free-hold townhomes and stacked townhomes were categorized under "multi-level townhomes" or MLT. All apartments were categorized under APT. Lastly, for any land-use that had a designated number of jobs (mixed-use, retail, and employment land-uses), an employment (EMP) water demand was applied. **Table 3** shows the consumption rate for each unit type used to calculate BSDY demands.

Table 3: Consumption Rate Based on Unit Types

Consumption Rate (L/cap/d)			L/SHF/d
SFH	MLT	EMP	OWD
180	198	137	1049

MXDY demands were estimated by calculating an outdoor water demand (OWD) which uses a consumption rate of 1,049 L/SFH/d for all SFH units in the development and added to the BSDY demands. PKHR demands were determined by applying the City developed diurnal patterns to the maximum day demands. The diurnal patterns are different for each unit type and all vary with time. The overall maximum observed demand when patterns are applied is the PKHR demand.

Updated Water Demands

Based on the estimated population and land use of the urban expansion area provided by J.L. Richards, the water demands were calculated. The persons per unit (PPU) densities used were in accordance to the City of Ottawa's Water Design Guidelines (July, 2010).

It was assumed that the residential lands will be comprised of 50% single family homes and 50% town homes. The PPU densities for single family homes and town homes are 3.4 and 2.7, respectively. Residential demands were calculated using the consumptions rates shown in **Table 3** and presented in **Table 4.**

Table 4: Estimated Residential Demands

Land	Population	SFH	MLT	SFH Units	MLT Units	SFH (L/s)	MLT (L/s)	OWD (L/s)
Mattamy	304	50%	50%	45	56	0.32	0.35	0.54
Minto	3538	50%	50%	520	655	3.69	4.05	6.32
Mattamy	239	50%	50%	35	44	0.25	0.27	0.43

Since information on employment numbers was limited, a consumption rate of 50,000 L/ha/d was used as per the City of Ottawa's Water Design Guidelines (July, 2010) to calculate the commercial water demands. **Table 5** shows the calculated demands for the Drummond and Brazeau lands. It can be see that the water consumption will predominately be commercial use.

Table 5: Estimated Commercial Demands

Land	Area (ha)	Consumption Rate (L/ha/d)	Demand (L/s)
Drummond	20.26	50,000	11.72
Brazeau	24.76	50,000	14.33

Table 6 shows the updated BSDY and MXDY demands for Barrhaven South including the addition of Area 7. The Barrhaven South demand represents 2031 conditions and build-out.

Table 6: Updated BSDY and MXDY Demands Barrhaven South

	BSDY (MLD)	MXDY (MLD)
Barrhaven South (2014 MSS)	16.3	33.2
Area 7	3.0	3.7
Total	***19.3***	***36.9***

HYDRAULIC ANALYSIS

Stantec used the previous Barrhaven MSS hydraulic model and revised it based on the additional water demands of the urban expansion area and the updated watermain sizing and alignment. The hydraulic model was performed under 2031 demand conditions to verify how the proposed network would respond with the complete build-out of the revised configuration.

Since the urban expansion area will be serviced by Zone 3C pressure, only 3C model nodes in the Barrhaven South area is examined during this hydraulic analysis.

Basic Day & Peak Hour Conditions

Similar to the hydraulic modeling results in the previous Barrhaven MSS (Stantec, 2014) some low lying lands with elevations less than 90m will experience pressures above the objective limit of 80 psi and will require pressure reducing measures. **Figure 6** presents the maximum pressure range. Modeling shows maximum pressures ranging between 55 psi and 88 psi during basic day conditions.

During peak hour demands, modeling shows minimum pressures ranging between 40 psi and 73 psi. As shown in **Figure 7**, the model nodes on the backbone watermains that are to feed into the urban expansion area can experience pressures in the range of 40 - 50 psi during peak hours.

Reference: Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area

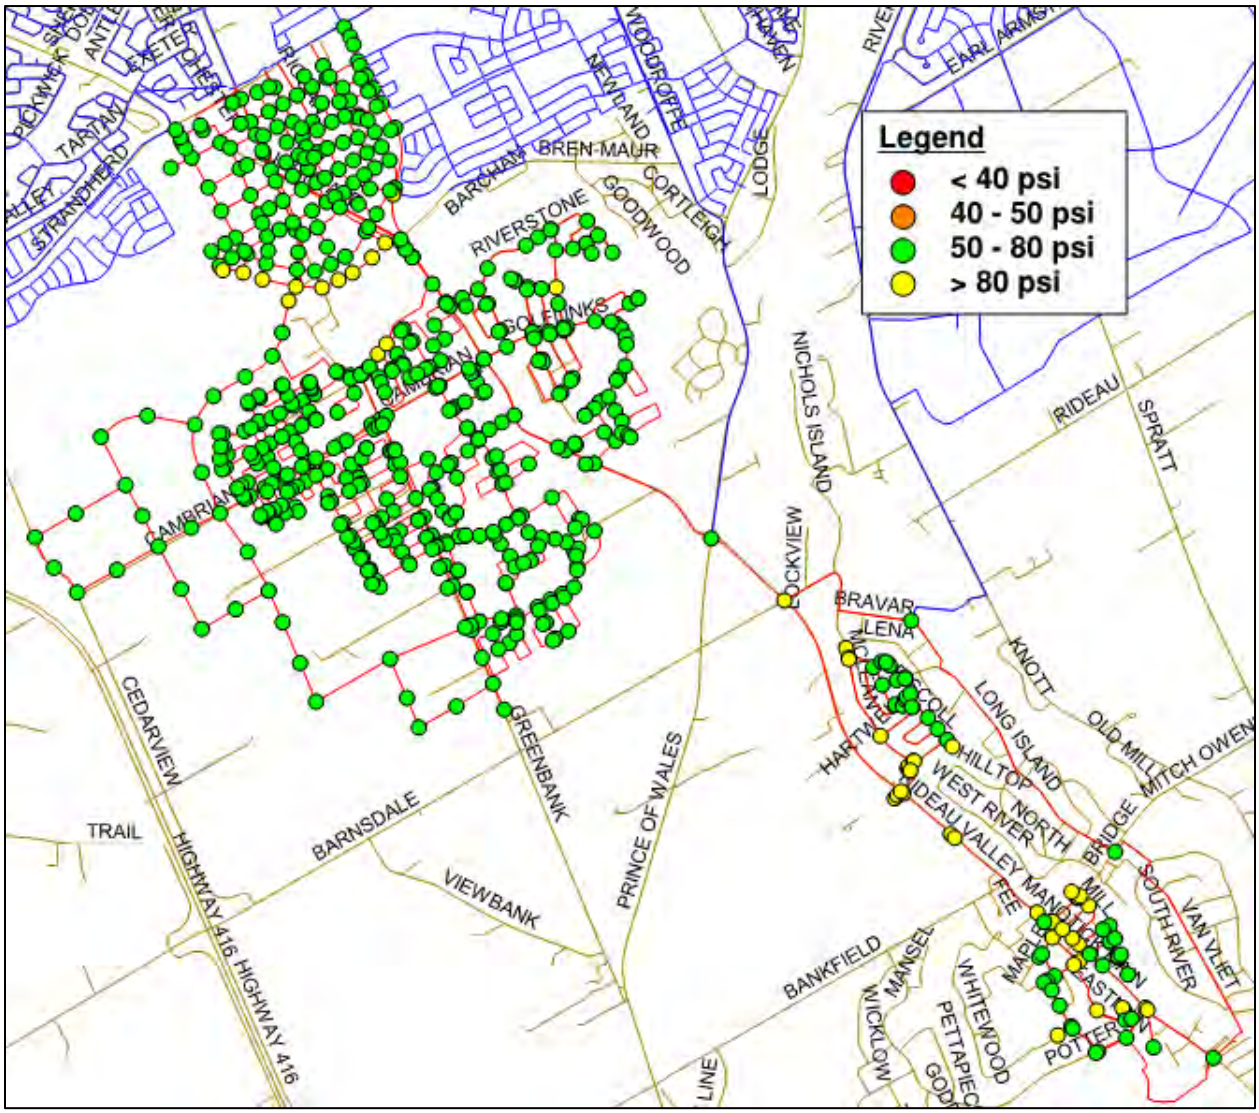

Figure 6: Maximum Pressures during BSDY Conditions

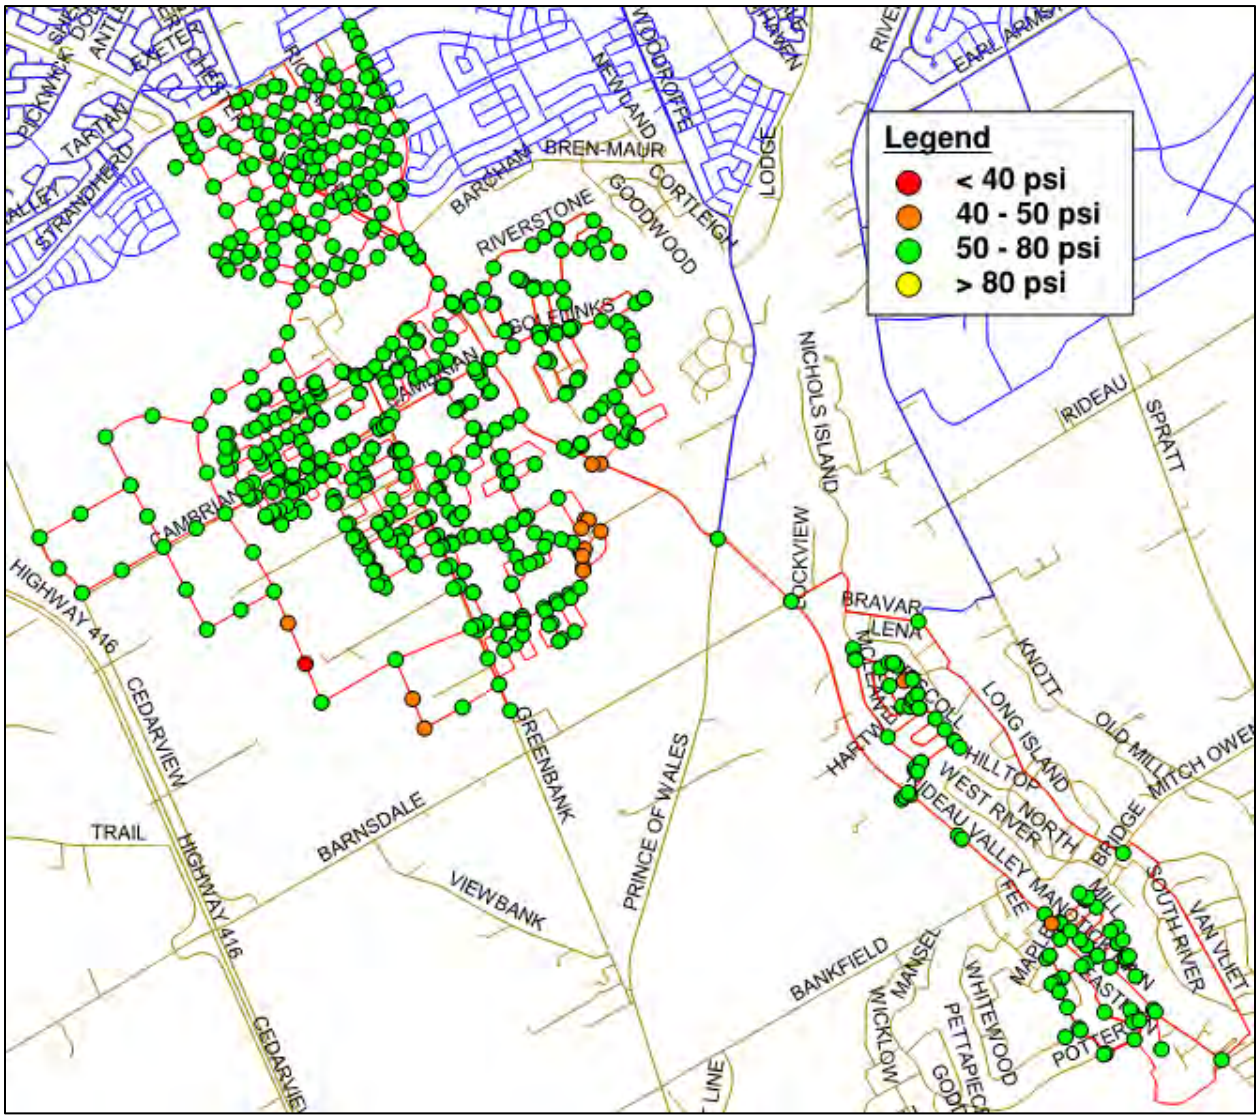

Figure 7: Minimum Pressures during PKHR Conditions

Maximum Day + Fire Flow

The purpose of such an analysis is to ensure the distribution system is able to provide the appropriate fire flow under MXDY demand conditions. The minimum allowable pressure under emergency fire flow conditions is 20 psi.

Figure 8 shows the available flow in study area. It is observed that available flows along the proposed backbone watermains are anticipated to be greater than 13,000 L/min. It is noted that there are existing areas with lower available flows present in Barrhaven South.

Reference: Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area

Upon the subdivision approval phase, local watermains are checked for their ability to provide the objective Fire Underwriter Survey (FUS) fire flows and they are typical less than 10,000 L/min for town home rows or single family units.

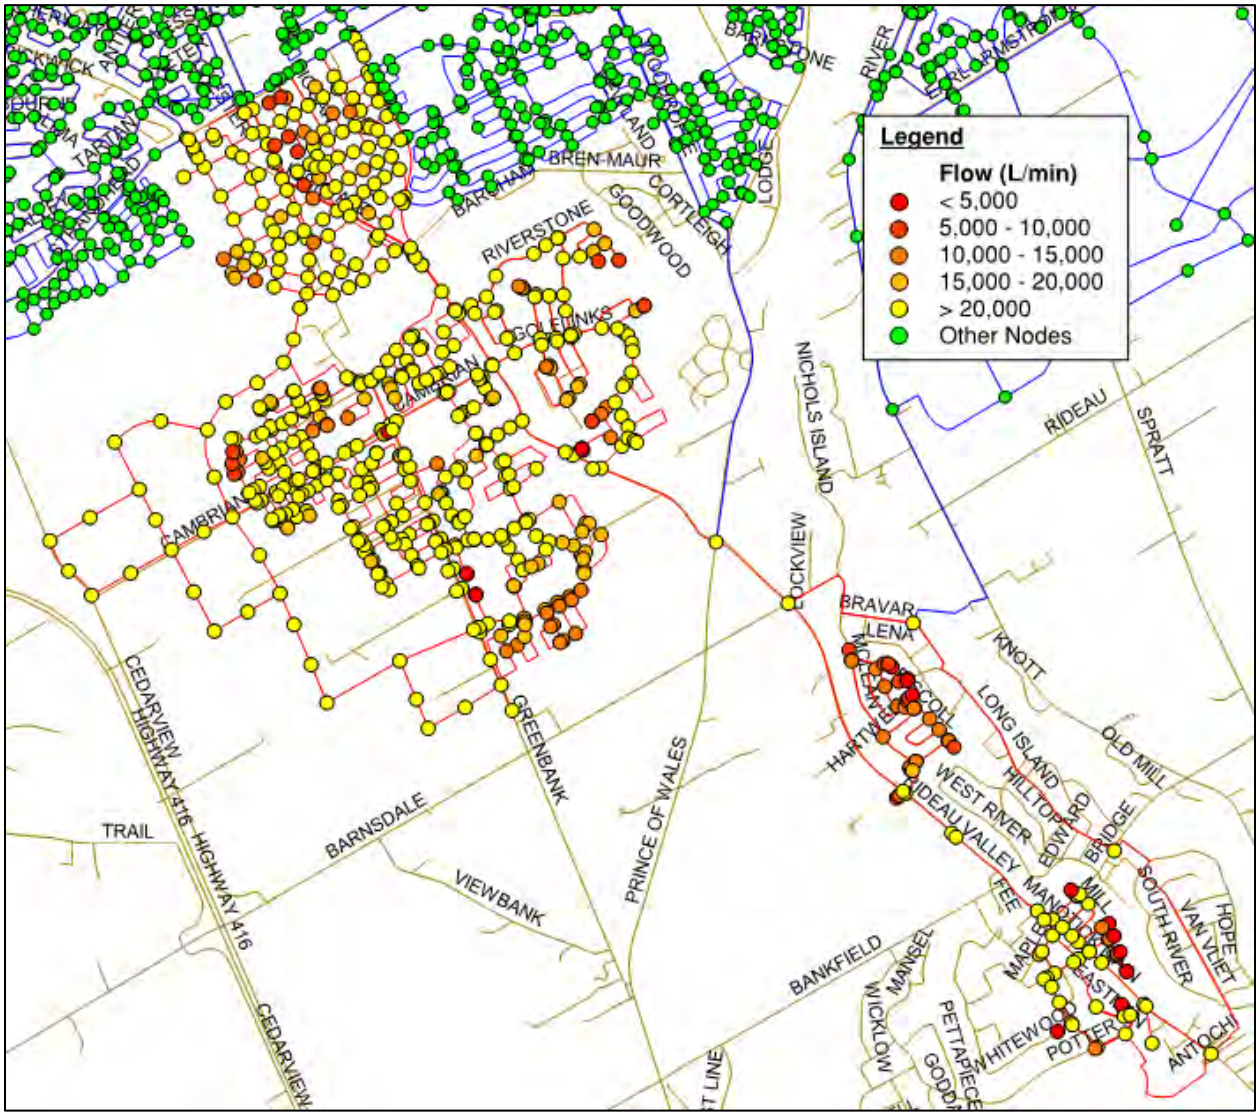

Figure 8: Available Flow in 3C Portion of Barrhaven South

Reference: Barrhaven MSS Addendum - Revised Potable Water and Sanitary Servicing Analysis for the Barrhaven South Urban Expansion Area

SUMMARY

Hydraulic modeling was performed to examine whether the proposed backbone alignment and sizing is capable of supporting the additional demands of Area 7. Modeling showed some low laying lands experiencing pressures greater than 80 psi as noted in the previous Barrhaven MSS (Stantec, 2014). These areas will require pressure reducing measures to operate within the City's objective.

During peak demand conditions, modeling showed that nodes along the backbone watermains which are to feed into the urban expansion area can experience minimum pressures in the range of 40 - 50 psi. Additional headlosses through internal piping may result in pressures below 40 psi during peak demands. This should be noted and confirmed upon detailed design.

In regards to the available fire flows in the 3C portion of Barrhaven South, flows greater than 13,000 L/min were observed in proposed backbone watermains. FUS fire flows will need to be determined and confirmed upon detailed design.

Note: Area 3 (Mattamy) was acocunted for in this spreadsheet orginally as part of catchment N-14 and N-15 and thus values for this catchment have been set to zero.

4 - Barrhaven South MSS Sanitary Sewer Design Sheet - Alternative 2 (revised September 19th 2016)

Barrhaven South MSS Sanitary Sewer Design Sheet - Preferred Servicing Strategy per J.L. Richards with Reduced Assumptions for Flow Generation (Alternative 2)

Area: **BARRHAVEN SOUTH MASTER SERVICING STUDY**

DATE: 10/18/2016
REVISION: 1
DESIGNED BY: MY
CHECKED BY: MF

SANITARY SEWER DESIGN SHEET
(City of Ottawa)

FILE NUMBER: 163400999

Colour code:
- HMB values
- Hard coded values — Most US MH
- Caculated value — Estimated value
- updated segment — Value from subdivision design — MH receiving flow from 2 or more sewers

DESIGN PARAMETERS

MAX PEAK FACTOR (RES.)=	4.0	AVG. DAILY FLOW / PERSON	350 L/p/day	MINIMUM VELOCITY	0.60 m/s	As per CDP (units/ha)

Note: Area 3 (Mattamy) was acocunted for in this spreadsheet orginally as part of catchment N-14 and N-15 and thus values for this catchment have been set to zero.

5 - Half Moon Bay South Sanitary Sewer Design Sheet - Alternative 3 (revised September 19th 2016)

Stantec

SUBDIVISION: HALF MOON BAY SOUTH SUBDIVISION - PHASE 4

DATE: 10/18/2016
REVISION: 1
DESIGNED BY: DT
CHECKED BY:

SANITARY SEWER DESIGN SHEET
(City of Ottawa)

FILE NUMBER: 160400743

DESIGN PARAMETERS

MAX PEAK FACTOR (RES.)=	4.0	AVG. DAILY FLOW / PERSON	350 l/p/day	MINIMUM VELOCITY	0.60 m/s
MIN PEAK FACTOR (RES.)=	2.0	COMMERCIAL	50,000 l/ha/day	MAXIMUM VELOCITY	3.00 m/s
PEAKING FACTOR (INDUSTRIAL):	2.4	INDUSTRIAL (HEAVY)	55,000 l/ha/day	MANNINGS n	0.013
PEAKING FACTOR (COMM., INST.):	1.5	INDUSTRIAL (LIGHT)	35,000 l/ha/day	BEDDING CLASS	B
PERSONS / SINGLE UNIT	3.4	INSTITUTIONAL	50,000 l/ha/day	MINIMUM COVER	2.50 m
PERSONS / TOWNHOME	2.7	INFILTRATION	0.28 l/s/Ha		
PERSONS / APARTMENT	2.3

DATE: 10/18/2016
REVISION: 1
DESIGNED BY: DT
CHECKED BY:

SANITARY SEWER DESIGN SHEET
(City of Ottawa)

FILE NUMBER: 160400743

DESIGN PARAMETERS

MAX PEAK FACTOR (RES.)=	4.0	AVG. DAILY FLOW / PERSON	350 l/p/day	MINIMUM VELOCITY	0.60 m/s
MIN PEAK FACTOR (RES.)=	2.0	COMMERCIAL	50,000 l/ha/day	MAXIMUM VELOCITY	3.00 m/s
PEAKING FACTOR (INDUSTRIAL):	2.4	INDUSTRIAL (HEAVY)	55,000 l/ha/day	MANNINGS n	0.013
PEAKING FACTOR (COMM., INST.):	1.5	INDUSTRIAL (LIGHT)	35,000 l/ha/day	BEDDING CLASS	B
PERSONS / SINGLE UNIT	3.4	INSTITUTIONAL	50,000 l/ha/day	MINIMUM COVER	2.50 m
PERSONS / TOWNHOME	2.7	INFILTRATION	0.28 l/s/Ha		
PERSONS / APARTMENT	2.3

6 - Half Moon Bay South Sanitary Sewer Design Sheet - Alternative 4 (revised September 19th 2016)

Stantec

SUBDIVISION:
HALF MOON BAY SOUTH SUBDIVISION - PHASE 4

DATE: 10/18/2016
REVISION: 1
DESIGNED BY: DT
CHECKED BY:

SANITARY SEWER DESIGN SHEET
(City of Ottawa)

FILE NUMBER: 160400743

DESIGN PARAMETERS

MAX PEAK FACTOR (RES.)=	4.0	AVG. DAILY FLOW / PERSON	350 l/p/day	MINIMUM VELOCITY	0.60 m/s
MIN PEAK FACTOR (RES.)=	2.0	COMMERCIAL	50,000 l/ha/day	MAXIMUM VELOCITY	3.00 m/s
PEAKING FACTOR (INDUSTRIAL):	2.4	INDUSTRIAL (HEAVY)	55,000 l/ha/day	MANNINGS n	0.013
PEAKING FACTOR (COMM., INST.):	1.5	INDUSTRIAL (LIGHT)	35,000 l/ha/day	BEDDING CLASS	B
PERSONS / SINGLE UNIT	3.4	INSTITUTIONAL	50,000 l/ha/day	MINIMUM COVER	2.50 m
PERSONS / TOWNHOME	2.7	INFILTRATION	0.28 l/s/Ha		
PERSONS / APARTMENT	2.3

7 - Barrhaven South MSS Sanitary Sewer Design Sheet - Alternative 5 (revised September 19th 2016)

Alternative 5 Sanitary Sewer Design Sheets

Area: **BARRHAVEN SOUTH MASTER SERVICING STUDY**

DATE: 10/18/2016
REVISION: 1
DESIGNED BY: MY
CHECKED BY: MF

SANITARY SEWER DESIGN SHEET
(City of Ottawa)

FILE NUMBER: 163400999

Colour code:
- HMB values
- Hard coded values — Most US MH
- Caculated value — Estimated value
- updated location — Value from subdivision design — MH receiving flow from 2 or more sewers

DESIGN PARAMETERS

MAX PEAK FACTOR (RES.)=	4.0	AVG. DAILY FLOW / PERSON	350 L/p/day	MINIMUM VELOCITY	0.60 m/s	As per CDP (units/ha)	
MIN PEAK FACTOR (RES.)=	2.0	COMMERCIAL	50,000 L/ha/day	MAXIMUM VELOCITY	3.00 m/s	LOW DENSITY RESIDENTIAL	26
PEAKING FACTOR (INDUSTRIAL):	2.4	INDUSTRIAL (HEAVY)	55,000 L/ha/day	MANNINGS n	0.013	SEMI-DETACHED	52
PEAKING FACTOR (COMM., INST.):	1.5	INDUSTRIAL (LIGHT)	35,000 L/ha/day	BEDDING CLASS	B	TOWN HOUSES	82
PERSONS / SINGLE UNIT	3.4	INSTITUTIONAL	50,000 L/ha/day	MINIMUM COVER	2.50 m	APARTMENTS	120
PERSONS / TOWNHOME	2.7	INFILTRATION	0.28 L/s/ha			COMMUNITY CORE	60
PERSONS / APARTMENT	1.8					AVERAGE PERSONS/ha	107

Sanitary Sewer Design

Alexandre Tourigny

From: Bougadis, John <John.Bougadis@ottawa.ca>
Sent: December 6, 2017 11:40 AM
To: Guy Forget
Cc: Hugo Lalonde; Lucie Dalrymple
Subject: RE: BSUEA - Comments
Attachments: Draft_WastewaterParameterReview_Feb14.pdf

Hi Guy

I have attached the PDF (my apologies). Let me know if you any questions on my questions.

In addition, a discussion on the Brazeau/Drummons lands may be required.

Thanks

John

Subject: BSUEA - Comments

Hi John,

We got the comments last week from the City. As per Comment 19(upcoming revisions to the sanitary design criteria), we did not receive the PDF as noted in that comment. Any chance that you can forward this attachment.

On another note, we may want to meet and discuss a few of the comments received. We will go through Robin and discuss further.

Thanks

Guy

Harmon - Correction Factor	1	0.4-0.6	0.4-0.6	0.8	0.6	0.6
ICI Peak Factor	1.5	1	1	1.5/1 [5]	1	1

* or higher with the support of monitoring data

[1] 280 L/cap/day = 90th percentile based on statistical analysis of new development

[2] 200 L/cap/day = 70th percentile for new development, 60th percentile for old development

[3] 0.53 L/ha/day = interim value to be reviewed in 2017

[4] Values to be reviewed in 2017

[5] ICI Peak Factor = 1.5 if ICI in contributing area is >20%, 1.0 if ICI in contributing area is <20%

Notes:

1) Sewers in new subdivisions shall be designed to operate under free flow conditions during peak flow periods.

2) During a catastrophic failure at a wastewater pump station, the HGL in the sanitary sewer system shall be below the underside of footing for the "Annual Event" flow condition.

3) A minimum freeboard of 0.3 m is required under a "Rare Event" flow condition. For areas serviced by a pump station, assume the station is operating at its rated capacity (rated capacity to be confirmed by ESD staff).

4) Preferably, the elevation of the sanitary overflow conduit should be above the 100 yr stormwater elevation. The overflow elevation can be lowered to the 25 year storm event on a case-by-case basis.

BARRHAVEN SOUTH URBAN EXPANSION AREA (BSUEA)

CITY OF OTTAWA
MINTO COMMUNITIES INC.
JLR NO. 26610

BARRHAVEN SOUTH SANITARY SEWER DESIGN SHEET

Designed by: AT
Checked by:HM

Date: May 2018

PROPOSED AND BSUEA DESIGN PARAMETERS					
Single Family	3.4	pers/unit	q =	280	L/cap/day
Semi-Detached/Townhouse (row)	2.7	pers/unit	I =	0.330	L/s/ha
Apt Units	1.8	pers/unit	Inst./Comm. =	28000	L/ha/day
Manning's Coeff. N =	0.013		Commerial PF*=	1.0/1.5	

*1.5 if ICI in contributing area is >20%, 1.0 if ICI in contributing area is <20%

NOTES:

1. THE STANDARDS INDICATE MINIMUM DIMENSIONS THAT ARE TO BE INCORPORATED INTO THE DESIGN OF ANY NEW DEVELOPMENTS INVOLVING NEW AND EXISTING STREETS. ANY VARIATION TO THIS DESIGN WILL REQUIRE APPROVAL OF THE CITY OF OTTAWA.
2. ALL DRAWINGS TO BE READ IN CONJUNCTION WITH APPLICABLE CITY STANDARDS.
3. ALL COMPOSITE UTILITY PLANS MUST ADHERE TO THE CITY OF OTTAWA'S STANDARD LOCATION OF UTILITY PLANT DRAWINGS IN ORDER TO RECEIVE APPROVAL THROUCH THE SITE PLAN CONTROL AND SUBDIVISION APPROVALS PROCESS.
4. TYPICAL CROSS SECTION BOULEVARD WIDTH SHALL BE MAINTAINED WHEN CONSTRUCTING CUL-DE-SACS AND CORNER LOTS REGARDLESS OF ROAD WAY GEOMETRY.
5. WATERMAIN AND HYDRANTS TO BE INSTALLED ON SOUTH AND EAST SIDE OF R.O.W. WHEN POSSIBLE.
6. SANITARY AND STORM SEWERS MAY BE INSTALLED OFF THE STREET CENTERLINE TO ACCOMMODATE LARGE SIZE SEWER PIPES AND STILL MAINTAIN THE CLEARANCES REQUIRED TO WATERMAINS.
7. THE USE IN-ROAD CATCH BASINS INSTEAD OF CURB INLET CATCH BASINS SHALL BE APPROVED BY AN AUTHORIZED CITY REPRESENTATIVE.
8. THE USE OF BARRIER CURB AND MOUNTABLE CURB SHALL BE APPROVED BY AN AUTHORIZED CITY REPRESENTATIVE. MOUNTABLE CURB SHALL BE SPECIFIED FOR TYPICAL TOWNHOUSE DEVELOPMENTS.
9. BUILDING SEWERS AND WATER SERVICES ARE TO BE CONSTRUCTED IN ACCORDANCE WITH CITY STANDARDS.
10. SANITARY AND STORM SERVICE CONNECTIONS WILL BE EXTENDED A MINIMUM OF 2.0m BEYOND THE PROPERTY LINE TO ALLOW FOR FUTURE CONNECTION. WATER SERVICE PIPE MATERIAL SHALL BE LAID IN ONE CONTINUOUS PIPE LENGTH (i.e. SPLICING AND JOINTING SHALL NOT BE PERMITTED) FROM INSIDE FACE OF THE BUILDING TO THE CURBSTOP AND FROM THE CURBSTOP TO THE MAIN / CORPORATION STOP.
11. 1.5m CLEARANCE TO BE MAINTAINED AROUND WATER SERVICE POST.
12. REFER TO UCC PROCEDURE MANUAL FOR UTILITY SPECIFICATION CONCERNING PLANT INSTALLATIONS.
13. TRANSFORMERS AND PEDESTALS SHALL BE LOCATED BETWEEN TOWNHOUSE BUILDING BLOCKS RATHER THAN ENCUMBERING AND/ OR PREVENTING THE INSTALLATION OF ROAD ALLOWANCE TREES.
14. ALL PEDESTALS TO BE INSTALLED IN LINE WITH HYDRO TRANSFORMERS OR ON HOUSE SIDE OF TRENCH.
15. THE BASE OF A HYDRO TRANSFORMER MUST BE LOCATED A MINIMUM OF 2.0m FROM THE EDGE OF A DRIVEWAY.
16. REQUIREMENTS FOR PROTECTIVE BOLLARDS AT TRANSFORMERS SHALL BE DETERMINED BY HYDRO OR HYDRO ONE ON A CASE BY CASE BASIS.
17. SERVICE LATERALS MUST BE LOCATED A MINIMUM OF 3.0m FROM THE BASE OF A HYDRO TRANSFORMER.
18. STREET LIGHT CABLE SHALL BE PLACED IN JOINT USE TRENCH. STREET LIGHT CABLE SHALL BE AT SAME OFFSET AS STREET LIGHTS WHEN JOINT USE TRENCH NOT CONSTRUCTED.
19. TRAFFIC DUCT ALTERNATIVE PLACEMENT LOCATIONS ARE:
    1) JOINT USE TRENCH (JUT) LOCATION OR
    2) SAME OFFSET AS STREETLIGHT POLES IN A SEPARATE TRENCH.
20. OPTIONAL LOCATION FOR THE TRAFFIC COMMUNICATIONS DUCT IS A TRENCH LOCATED AT THE SAME OFFSET AS THE STREETLIGHT POLES.
21. TRAFFIC ELECTRICAL DUCTS SHALL BE PLACED IN JOINT USE DUCT BANKS.
22. TRAFFIC HANDHOLES MAY BE LOCATED IN THE BOULEVARD AREA ADJACENT TO THE SIDEWALK.
23. USE OF THE FOUR PARTY-UTILITY TRENCH WILL BE CONSIDERED AS AN OPTION, BUT REQUIRES THE AGREEMENT OF ALL UTILITIES PRIOR TO THE DEVELOPMENT OF THE COMPOSITE UTILITY PLAN, AND MUST BE IN CONFORMANCE WITH THE GUIDELINES ESTABLISHED BY THE OTTAWA UTILITY COORDINATING COMMITTEE.
24. THE DEVELOPER SHALL SUPPLY AND INSTALL DUCTS FOR UTILITY CROSSINGS AT INTERSECTIONS.
25. ONE TREE PER LOT TYPICAL 2 TREES ON CORNER LOT WITH ONE OF THE TREES ON THE STREET SIDE OF THE LOT

    SPECIFIC TREE SPECIES SHALL BE SELECTED FOR SOIL TYPES AND AVAILABLE SPACES FOR PLANTINGS.

    TREE PLACEMENT LOCATION AND TREE SPECIES WILL REQUIRE THE APPROVAL OF THE CITY.

    TREE PLANTING SHALL BE HAND EXCAVATED FOR THOSE LOCATIONS WITH LESS THAN 1 METRE CLEARANCE TO THE JUT.

PATERSON GROUP

memorandum

re: **Geotechnical Recommendations – Infilling Existing Stormwater Management Pond**
Proposed Residential Development – Barrhaven South Expansion
3882 Barnsdale Road, Ottawa

to: Minto Communities - Mr. Curtiss Scarlett - CScarlett@minto.com

date: September 11, 2024

file: PG6197-MEMO.01

Further to your request and authorization, Paterson Group (Paterson) has prepared the current memo report to provide our backfilling recommendations for the existing stormwater management pond within the proposed residential development located at the subject site. The following memo should be read in conjunction with Paterson Group report PG6197-1 Revision 1 dated March 25, 2024.

1.0 Background Information

Based on the existing soils information within the stormwater management pond and surrounding area, the subsurface profile consists of compact to dense, brown silty sand extending to approximately 2.4 m below the original ground surface, followed by dense to very dense, grey silty sand to sandy silt. The subsoil profile encountered at nearby test holes are detailed in the Soil Profile and Test Data sheets attached.

The following plan was reviewed as part of our study:

- ❑ C1 C2 Functional Servicing and Grading – Final Option 1 – Barrhaven South Serviceability Study – Project No. 26610-100, undated, prepared by J. L. Richards.

Stormwater Management Pond Details

The existing pond is located within the southwest portion of the subject site and is bordered by the proposed Block 52 to the east, the retained woodlots to the north, and Borrisokane Road to the west and south. The location of the pond is presented in Drawing PG6197-1 – Test Hole Location Plan attached to the current memorandum. Based on a previous bathymetry survey completed by Paterson Group, it is understood that the pond sidewalls slope between a 4.5H:1V to 35H:1V slope from a geodetic elevation of 99.0 m at the top of the side walls to a minimum geodetic elevation of 95.5 m at the bottom of the pond.

Proposed Grading

Based on our review of the aforementioned drawing and correspondence with the client, it is understood that the pond will be infilled to a maximum geodetic elevation of 103.5 m.

2.0 Recommendations

The following backfilling program is recommended for development within the pond area. Our backfilling recommendations take into consideration the subsoils profile within the pond area and the anticipated finished grading. It is recommended that the pond be drained before the backfilling procedure begins and the backfilling operation be completed under dry weather conditions (specifically for the clay placement portion of the program).

Based on correspondence with the client, the pond area may be redeveloped for either residential or recreational use. It is also anticipated that right of ways (ROWs) may be proposed. Paterson has provided recommendations for each option for redevelopment.

Stripping Depth and Site Preparations

Topsoil and deleterious fill, such as those containing significant organic materials, should be stripped from under the proposed in-fill area to be occupied by any buildings, paved areas, pipe bedding and other settlement sensitive structures. Any disturbed or oversaturated areas should be removed by the contractor and reviewed and approved by Paterson at the time of excavation.

Pond Backfilling Recommendations

- ❑ The existing SWMP side slopes should be stepped to provide a minimum 1.5H:1V profile with maximum 600 mm high steps. All existing sediment and fill associated with the pond should be removed.

- ❑ A workable, stiff brown silty clay (moisture contents varying between 20 to 40%) should be placed in maximum 300 mm loose lifts under dry conditions and in above freezing temperatures to in-fill the interim pond. Every lift should be adequately compacted using a sheepsfoot roller and approved by Paterson personnel during placement.

<u>For Residential Building Areas</u>

- ❑ A non-woven geotextile liner such as Terratrack 200 or equivalent should be placed directly above the compacted silty clay backfill material. A minimum 300 mm thick layer of suitable granular backfill such as OPSS Granular A or Granular B Type II should be placed directly below the underside of footing elevations of the proposed lots. The engineered granular fill should be placed in maximum 300 mm loose lifts under dry conditions, compacted to a minimum 98% of the material's SPMDD using suitable compaction equipment and approved by Paterson at the time of backfilling.

This may result in surface water pooling within the granular pad located below the finished floor slabs which may increase humidity. Therefore, it is recommended that a damp-proofing membrane be placed below the basement slabs to reduce the anticipated humidity.

- ❑ Where granular fill is required below only a portion of the proposed building footprint, the remainder of the building footprint should be sub-excavated at least 500 mm below underside of footing.

- ❑ The sub-excavation should extend at least 1 m beyond the building perimeter. A woven geotextile liner, such as Terratrack 200 or equivalent, should be placed across the base of the sub-excavated area. A biaxial geogrid liner, such as Terrafix Geosynthetics TBX1500 or equivalent, should be placed over the geotextile liner and extend at least 1 m beyond the building footprint. The sub-excavated area should be backfilled with granular fill, consisting of a Granular B Type II or Granular A crushed stone placed in maximum 300 mm loose lifts and compacted to 98% of its SPMDD.

- ❑ Backfill between footing level and finished grade at the exterior side of the proposed buildings and landscaping areas should consist of a workable brown silty clay fill. A non-woven geotextile liner, such as Terratrack 200 or equivalent, should be placed over the granular fill surface to prevent soil loss.

<u>For Right of Way (ROW) Areas</u>

- ❑ Up to a maximum of 1 m of engineered fill, such as OPSS Granular A or Granular B crushed stone and/or well-graded blast rock, up to 150 mm in particle size, may be used to in-fill the existing SWMP up to the spring line elevation of the proposed services. The engineered fill should be placed in maximum 300 mm loose lifts under dry conditions, compacted to a minimum 98% of the material's SPMDD using suitable compaction equipment and approved by Paterson at the time of backfilling.

- ❑ Where more than 1 m of in-filling is required, a workable brown silty clay, free of organics and deleterious fill is to be placed from the bottom of the existing pond up to approximately 1 m below the invert elevation of the proposed services. The silty clay is to be placed in maximum 400 mm thick loose lifts and compacted to a minimum 98% of the material's SPMDD using a sheepsfoot roller making several passes, under dry conditions and above freezing temperatures and approved by Paterson personnel.

- Where a transition between clay and granular fill is proposed, a non-woven geotextile liner such as Terrafix 360R or equivalent is to be placed above the silty clay subgrade. The above recommendations for placement of engineered fill and/or blast rock are applicable upon placement of the geotextile liner.

For Recreational Areas (i.e. Non-Settlement Sensitive)

- If recreational areas, where settlement is of minor concern, are proposed within the current pond area, the workable, stiff brown silty clay (placed in maximum 300 mm loose lifts, under dry conditions, compacted using a sheepsfoot roller and approved by Paterson personnel at the time of placement) can be placed to the final proposed geodetic elevation of 103.5 m.

- **It is important to note** that if the pond is infilled using the above noted recreational area methodology and the scope of the redevelopment is changed to include settlement sensitive structures, the upper 1 m may need to be modified to accommodate the new construction, requiring a sub excavation to a geodetic elevation of approximately 102.5 m.

- If settlement sensitive structures area proposed within the recreational areas (such as out buildings, parking lots or asphalt/concrete paved courts), a non-woven geotextile liner such as Terratrack 200 or equivalent followed by a bi-axial geogrid liner, such as Terrafix TBX1500 or approved equivalent, should be placed directly above the compacted silty clay backfill material. A minimum 300 mm thick layer of suitable granular backfill such as OPSS Granular A or Granular B Type II should be placed directly below the underside of the settlement sensitive structure(s). The engineered granular fill should be placed in maximum 300 mm loose lifts under dry conditions, compacted to a minimum 98% of the material's SPMDD using suitable compaction equipment and approved by Paterson at the time of backfilling. This may result in surface water pooling within the granular pad located below the structure(s) which may increase humidity. Therefore, it is recommended that a damp-proofing membrane and/or a minimum 100 mm diameter perforated, corrugated drainage pipe connected to a positive outlet be placed below the underside of the structure(s) to reduce the anticipated humidity.

- For unheated slab-on-grade structures, such as tennis courts, splash pads, etc., frost protection may be required. Therefore, once the landscaping plans are finalized, Paterson should review the final grading and provide frost protection design and details.

Inspections During Construction

- ❑ Periodic inspections during the backfilling operation should be completed by Paterson personnel to confirm the above noted recommendations are adhered to.

We trust that this information satisfies your requirements.

Best Regards,

Paterson Group Inc.

Owen R. Canton, B.Eng.

Faisal I. Abou-Seido, P.Eng.

Isolator Row PLUS TSS Removal:	80.0%
FD-8HC TSS Removal:	37.0%
Combined TSS Removal:	**87.0%**
Total Volume Treated:	**98.8%**

Individual OGS Results		
Model	**TSS Removal**	**Volume Treated**
FD-4HC	23.0%	89.0%
FD-5HC	28.0%	>90%
FD-6HC	32.0%	>90%
FD-8HC	37.0%	>90%
FD-10HC	40.0%	>90%

Overall System Capacities	
Total Sediment Storage Capacity (m3):	2.14
Oil Storage Capacity:	4,239 L
Max. OGS Pipe Diameter:	1,200 mm
Peak OGS Flow Capacity:	1,415 L/s
Peak Stormtech Inlet Flow Capacity:	311 L/s
Peak IR PLUS Water Quality Flow:	1139.6 L/s

OGS Specifications	
Inlet Pipe Diameter (A):	1500 mm
Unit Diameter (B):	2,400 mm
Outlet Pipe Diameter (C):	1500 mm
Rim Elevation (D):	0.00 m
Bottom of Sump Elevation (E):	#N/A
Inlet Pipe Elevation (F):	0.00 m
Outlet Pipe Elevation (G):	0.00 m

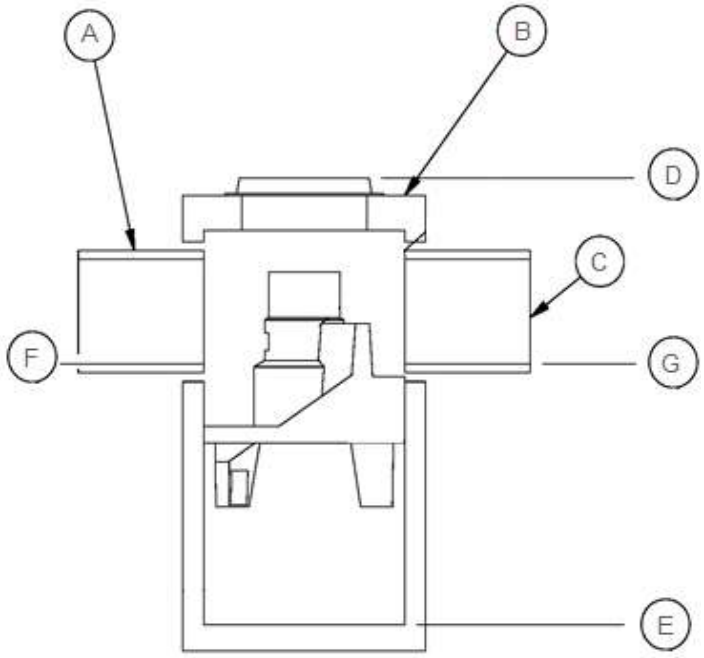
Site Details	
Site Area (ha):	20.585
Rational C:	0.7
Particle Size Distribution:	ETV
Rainfall Station:	Ottawa, ONT

Notes: OGS results based on ETV PSD and results from ETV testing protocols.

Stormtech Details	
Chamber Model:	MC-7200
No. Chambers in Isolator Row PLUS:	88
Volume Treated by Isolator Row PLUS:	98.5%

Notes: Refer to Stormtech drawings for full IR+ configuration.

Isolator Row PLUS must include Flared End Ramp (FLAMP) for proper performance.



Notes:

Isolator Row PLUS removal efficiency based on verified ETV test report. For dimensions and configuration of Isolator Row PLUS, please see Stormtech drawing package.

Project Name: S1 Lands
Consulting Engineer: JL Richards
Location: Ottawa, ON

Net Annual Removal Efficiency Summary

Rainfall Intensity	Fraction of Rainfall	Removal Efficiency		Combined Removal Efficiency	Combined Weighted Removal Efficiency
		FD-8HC	IR PLUS[(2)]		
mm/hr	%	%	%	%	%
0.50	0.1%	51.2%	81.2%	90.8%	0.1%
1.00	14.1%	46.2%	81.2%	89.9%	12.7%
1.50	14.2%	43.3%	81.2%	89.3%	12.7%
2.00	14.1%	41.2%	81.2%	89.0%	12.6%
2.50	4.2%	39.6%	81.2%	88.7%	3.7%
3.00	1.5%	38.3%	81.2%	88.4%	1.3%
3.50	8.5%	37.2%	81.2%	88.2%	7.5%
4.00	5.4%	36.2%	81.2%	88.0%	4.8%
4.50	1.2%	35.4%	81.2%	87.9%	1.0%
5.00	5.5%	34.6%	81.2%	87.7%	4.9%
6.00	4.3%	33.3%	81.2%	87.5%	3.8%
7.00	4.5%	32.2%	81.2%	87.3%	3.9%
8.00	3.1%	31.3%	81.2%	87.1%	2.7%
9.00	2.3%	30.4%	81.2%	86.9%	2.0%
10.00	2.6%	29.7%	81.2%	86.8%	2.2%
20.00	9.2%	24.7%	81.2%	85.8%	7.9%
30.00	2.6%	21.7%	77.5%	82.4%	2.2%
40.00	1.2%	19.7%	58.1%	66.4%	0.8%
50.00	0.5%	18.1%	46.5%	56.2%	0.3%
		Total Net Annual Removal Efficiency			**87.0%**
		Total Runoff Volume Treated			**98.8%**

Notes:

(1) Rainfall Data: 1960:2007, HLY03, Ottawa, ONT, 6105976 & 6105978.

(2) IR PLUS removal based on ETV PSD and ETV protocols.

(3)

(4) Combined removal efficiencies calculated based on NCDENR Stormwater BMP Manual, Section 3.9.4, where Total Removal Efficiency = 1st BMP Efficiency + 2nd BMP Efficiency - (1st BMP Efficiency x 2nd BMP Efficiency)

S1 LANDS

OTTAWA, ON

MC-7200 STORMTECH CHAMBER SPECIFICATIONS

1. CHAMBERS SHALL BE STORMTECH MC-7200.
2. CHAMBERS SHALL BE ARCH-SHAPED AND SHALL BE MANUFACTURED FROM VIRGIN, IMPACT-MODIFIED POLYPROPYLENE COPOLYMERS.
3. CHAMBERS SHALL BE CERTIFIED TO CSA B184, "POLYMERIC SUB-SURFACE STORMWATER MANAGEMENT STRUCTURES", AND MEET THE REQUIREMENTS OF ASTM F2418, "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS" CHAMBER CLASSIFICATION 60x101.
4. CHAMBER ROWS SHALL PROVIDE CONTINUOUS, UNOBSTRUCTED INTERNAL SPACE WITH NO INTERNAL SUPPORTS THAT WOULD IMPEDE FLOW OR LIMIT ACCESS FOR INSPECTION.
5. THE STRUCTURAL DESIGN OF THE CHAMBERS, THE STRUCTURAL BACKFILL, AND THE INSTALLATION REQUIREMENTS SHALL ENSURE THAT THE LOAD FACTORS SPECIFIED IN THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET FOR: 1) LONG-DURATION DEAD LOADS AND 2) SHORT-DURATION LIVE LOADS, BASED ON THE CSA S6 CL-625 TRUCK AND THE AASHTO DESIGN TRUCK WITH CONSIDERATION FOR IMPACT AND MULTIPLE VEHICLE PRESENCES.
6. CHAMBERS SHALL BE DESIGNED, TESTED AND ALLOWABLE LOAD CONFIGURATIONS DETERMINED IN ACCORDANCE WITH ASTM F2787, "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS". LOAD CONFIGURATIONS SHALL INCLUDE: 1) INSTANTANEOUS (<1 MIN) AASHTO DESIGN TRUCK LIVE LOAD ON MINIMUM COVER 2) MAXIMUM PERMANENT (75-YR) COVER LOAD AND 3) ALLOWABLE COVER WITH PARKED (1-WEEK) AASHTO DESIGN TRUCK.
7. REQUIREMENTS FOR HANDLING AND INSTALLATION:
   - TO MAINTAIN THE WIDTH OF CHAMBERS DURING SHIPPING AND HANDLING, CHAMBERS SHALL HAVE INTEGRAL, INTERLOCKING STACKING LUGS.
   - TO ENSURE A SECURE JOINT DURING INSTALLATION AND BACKFILL, THE HEIGHT OF THE CHAMBER JOINT SHALL NOT BE LESS THAN 75 mm (3").
   - TO ENSURE THE INTEGRITY OF THE ARCH SHAPE DURING INSTALLATION, a) THE ARCH STIFFNESS CONSTANT SHALL BE GREATER THAN OR EQUAL TO 500 LBS/FT/%. THE ASC IS DEFINED IN SECTION 6.2.8 OF ASTM F2418. AND b) TO RESIST CHAMBER DEFORMATION DURING INSTALLATION AT ELEVATED TEMPERATURES (ABOVE 23° C / 73° F), CHAMBERS SHALL BE PRODUCED FROM REFLECTIVE GOLD OR YELLOW COLORS.
8. ONLY CHAMBERS THAT ARE APPROVED BY THE SITE DESIGN ENGINEER WILL BE ALLOWED. UPON REQUEST BY THE SITE DESIGN ENGINEER OR OWNER, THE CHAMBER MANUFACTURER SHALL SUBMIT A STRUCTURAL EVALUATION FOR APPROVAL BEFORE DELIVERING CHAMBERS TO THE PROJECT SITE AS FOLLOWS:
   - THE STRUCTURAL EVALUATION SHALL BE SEALED BY A REGISTERED PROFESSIONAL ENGINEER.
   - THE STRUCTURAL EVALUATION SHALL DEMONSTRATE THAT THE SAFETY FACTORS ARE GREATER THAN OR EQUAL TO 1.95 FOR DEAD LOAD AND 1.75 FOR LIVE LOAD, THE MINIMUM REQUIRED BY ASTM F2787 AND BY SECTIONS 3 AND 12.12 OF THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS FOR THERMOPLASTIC PIPE.
   - THE TEST DERIVED CREEP MODULUS AS SPECIFIED IN ASTM F2418 SHALL BE USED FOR PERMANENT DEAD LOAD DESIGN EXCEPT THAT IT SHALL BE THE 75-YEAR MODULUS USED FOR DESIGN.
9. CHAMBERS AND END CAPS SHALL BE PRODUCED AT AN ISO 9001 CERTIFIED MANUFACTURING FACILITY.
10. MANIFOLD SIZE TO BE DETERMINED BY SITE DESIGN ENGINEER. SEE TECHNICAL NOTE 6.32 FOR MANIFOLD SIZING GUIDANCE. DUE TO THE ADAPTATION OF THIS CHAMBER SYSTEM TO SPECIFIC SITE AND DESIGN CONSTRAINTS, IT MAY BE NECESSARY TO CUT AND COUPLE ADDITIONAL PIPE TO STANDARD MANIFOLD COMPONENTS IN THE FIELD.
11. ADS DOES NOT DESIGN OR PROVIDE MEMBRANE LINER SYSTEMS. TO MINIMIZE THE LEAKAGE POTENTIAL OF LINER SYSTEMS, THE MEMBRANE LINER SYSTEM SHOULD BE DESIGNED BY A KNOWLEDGEABLE GEOTEXTILE PROFESSIONAL AND INSTALLED BY A QUALIFIED CONTRACTOR.

©2026 ADS, INC.

IMPORTANT - NOTES FOR THE BIDDING AND INSTALLATION OF MC-7200 CHAMBER SYSTEM

1. STORMTECH MC-7200 CHAMBERS SHALL NOT BE INSTALLED UNTIL THE MANUFACTURER'S REPRESENTATIVE HAS COMPLETED A PRE-CONSTRUCTION MEETING WITH THE INSTALLERS.
2. STORMTECH MC-7200 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH INSTALLATION GUIDE MC-7200 CHAMBER".
3. CHAMBERS ARE NOT TO BE BACKFILLED WITH A DOZER OR EXCAVATOR SITUATED OVER THE CHAMBERS. STORMTECH RECOMMENDS 3 BACKFILL METHODS:
   - STONESHOOTER LOCATED OFF THE CHAMBER BED.
   - BACKFILL AS ROWS ARE BUILT USING AN EXCAVATOR ON THE FOUNDATION STONE OR SUBGRADE.
   - BACKFILL FROM OUTSIDE THE EXCAVATION USING A LONG BOOM HOE OR EXCAVATOR.
4. THE FOUNDATION STONE SHALL BE LEVELED AND COMPACTED PRIOR TO PLACING CHAMBERS.
5. JOINTS BETWEEN CHAMBERS SHALL BE PROPERLY SEATED PRIOR TO PLACING STONE.
6. MAINTAIN MINIMUM - 230 mm (9") SPACING BETWEEN THE CHAMBER ROWS.
7. INLET AND OUTLET MANIFOLDS MUST BE INSERTED A MINIMUM OF 300 mm (12") INTO CHAMBER END CAPS.
8. EMBEDMENT STONE SURROUNDING CHAMBERS MUST BE A CLEAN, CRUSHED, ANGULAR STONE OR RECYCLED CONCRETE; AASHTO M43 #3, 357, 4, 467, 5, 56, OR 57.
9. STONE SHALL BE BROUGHT UP EVENLY AROUND CHAMBERS SO AS NOT TO DISTORT THE CHAMBER SHAPE. STONE DEPTHS SHOULD NEVER DIFFER BY MORE THAN 300 mm (12") BETWEEN ADJACENT CHAMBER ROWS.
10. STONE MUST BE PLACED ON THE TOP CENTER OF THE CHAMBER TO ANCHOR THE CHAMBERS IN PLACE AND PRESERVE ROW SPACING.
11. THE CONTRACTOR MUST REPORT ANY DISCREPANCIES WITH CHAMBER FOUNDATION MATERIAL BEARING CAPACITIES TO THE SITE DESIGN ENGINEER.
12. ADS RECOMMENDS THE USE OF "FLEXSTORM CATCH IT" INSERTS DURING CONSTRUCTION FOR ALL INLETS TO PROTECT THE SUBSURFACE STORMWATER MANAGEMENT SYSTEM FROM CONSTRUCTION SITE RUNOFF.

NOTES FOR CONSTRUCTION EQUIPMENT

1. STORMTECH MC-7200 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH INSTALLATION GUIDE MC-7200 CHAMBER".
2. THE USE OF EQUIPMENT OVER MC-7200 CHAMBERS IS LIMITED:
   - NO EQUIPMENT IS ALLOWED ON BARE CHAMBERS.
   - NO RUBBER TIRED LOADER, DUMP TRUCK, OR EXCAVATORS ARE ALLOWED UNTIL PROPER FILL DEPTHS ARE REACHED IN ACCORDANCE WITH THE "STORMTECH INSTALLATION GUIDE MC-7200 CHAMBER".
   - WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT CAN BE FOUND IN THE "STORMTECH INSTALLATION GUIDE MC-7200 CHAMBER".
3. FULL 900 mm (36") OF STABILIZED COVER MATERIALS OVER THE CHAMBERS IS REQUIRED FOR DUMP TRUCK TRAVEL OR DUMPING.

USE OF A DOZER TO PUSH EMBEDMENT STONE BETWEEN THE ROWS OF CHAMBERS MAY CAUSE DAMAGE TO CHAMBERS AND IS NOT AN ACCEPTABLE BACKFILL METHOD. ANY CHAMBERS DAMAGED BY USING THE "DUMP AND PUSH" METHOD ARE NOT COVERED UNDER THE STORMTECH STANDARD WARRANTY.

CONTACT STORMTECH AT 1-800-821-6710 WITH ANY QUESTIONS ON INSTALLATION REQUIREMENTS OR WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT.

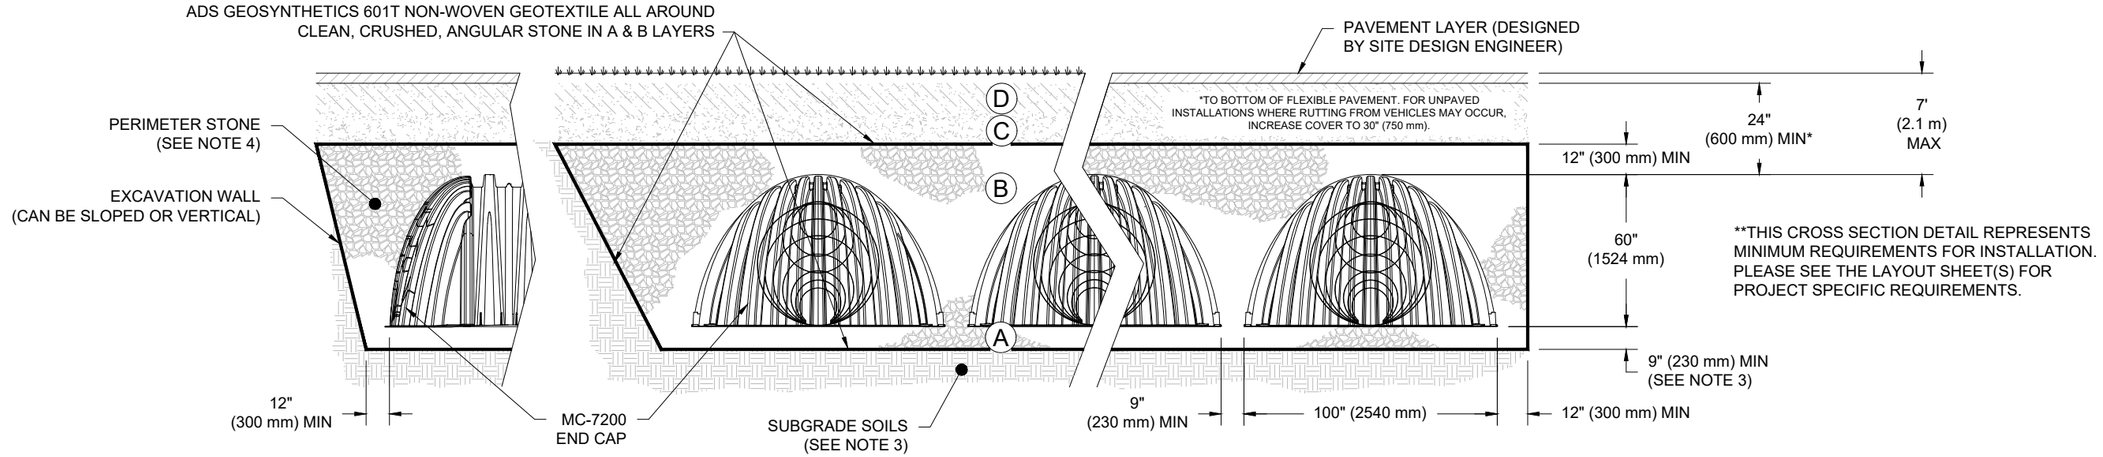
THIS DRAWING IS NOT INTENDED FOR USE IN BIDDING OR CONSTRUCTION WITHOUT THE EOR'S REVIEW OF OTHER PROJECT REPRESENTATIVE.

ACCEPTABLE FILL MATERIALS: STORMTECH MC-7200 CHAMBER SYSTEMS

MATERIAL LOCATION		DESCRIPTION	AASHTO MATERIAL CLASSIFICATIONS	COMPACTION / DENSITY REQUIREMENT
D	**FINAL FILL:** FILL MATERIAL FOR LAYER 'D' STARTS FROM THE TOP OF THE 'C' LAYER TO THE BOTTOM OF FLEXIBLE PAVEMENT OR UNPAVED FINISHED GRADE ABOVE. NOTE THAT PAVEMENT SUBBASE MAY BE PART OF THE 'D' LAYER	ANY SOIL/ROCK MATERIALS, NATIVE SOILS, OR PER ENGINEER'S PLANS. CHECK PLANS FOR PAVEMENT SUBGRADE REQUIREMENTS.	N/A	PREPARE PER SITE DESIGN ENGINEER'S PLANS. PAVED INSTALLATIONS MAY HAVE STRINGENT MATERIAL AND PREPARATION REQUIREMENTS.
C	**INITIAL FILL:** FILL MATERIAL FOR LAYER 'C' STARTS FROM THE TOP OF THE EMBEDMENT STONE ('B' LAYER) TO 24" (600 mm) ABOVE THE TOP OF THE CHAMBER. NOTE THAT PAVEMENT SUBBASE MAY BE A PART OF THE 'C' LAYER.	GRANULAR WELL-GRADED SOIL/AGGREGATE MIXTURES, <35% FINES OR PROCESSED AGGREGATE. MOST PAVEMENT SUBBASE MATERIALS CAN BE USED IN LIEU OF THIS LAYER.	AASHTO M145[1] A-1, A-2-4, A-3 OR AASHTO M43[1] 3, 357, 4, 467, 5, 56, 57, 6, 67, 68, 7, 78, 8, 89, 9, 10	BEGIN COMPACTIONS AFTER 24" (600 mm) OF MATERIAL OVER THE CHAMBERS IS REACHED. COMPACT ADDITIONAL LAYERS IN 12" (300 mm) MAX LIFTS TO A MIN. 95% PROCTOR DENSITY FOR WELL GRADED MATERIAL AND 95% RELATIVE DENSITY FOR PROCESSED AGGREGATE MATERIALS.
B	**EMBEDMENT STONE:** FILL SURROUNDING THE CHAMBERS FROM THE FOUNDATION STONE ('A' LAYER) TO THE 'C' LAYER ABOVE.	CLEAN, CRUSHED, ANGULAR STONE OR RECYCLED CONCRETE[5]	AASHTO M43[1] 3, 357, 4, 467, 5, 56, 57	NO COMPACTION REQUIRED
A	**FOUNDATION STONE:** FILL BELOW CHAMBERS FROM THE SUBGRADE UP TO THE FOOT (BOTTOM) OF THE CHAMBER.	CLEAN, CRUSHED, ANGULAR STONE OR RECYCLED CONCRETE[5]	AASHTO M43[1] 3, 357, 4, 467, 5, 56, 57	PLATE COMPACT OR ROLL TO ACHIEVE A FLAT SURFACE.[2,3]

PLEASE NOTE:
1. THE LISTED AASHTO DESIGNATIONS ARE FOR GRADATIONS ONLY. THE STONE MUST ALSO BE CLEAN, CRUSHED, ANGULAR. FOR EXAMPLE, A SPECIFICATION FOR #4 STONE WOULD STATE: "CLEAN, CRUSHED, ANGULAR NO. 4 (AASHTO M43) STONE".
2. STORMTECH COMPACTION REQUIREMENTS ARE MET FOR 'A' LOCATION MATERIALS WHEN PLACED AND COMPACTED IN 9" (230 mm) (MAX) LIFTS USING TWO FULL COVERAGES WITH A VIBRATORY COMPACTOR.
3. WHERE INFILTRATION SURFACES MAY BE COMPROMISED BY COMPACTION, FOR STANDARD DESIGN LOAD CONDITIONS, A FLAT SURFACE MAY BE ACHIEVED BY RAKING OR DRAGGING WITHOUT COMPACTION EQUIPMENT. FOR SPECIAL LOAD DESIGNS, CONTACT STORMTECH FOR COMPACTION REQUIREMENTS.
4. ONCE LAYER 'C' IS PLACED, ANY SOIL/MATERIAL CAN BE PLACED IN LAYER 'D' UP TO THE FINISHED GRADE. MOST PAVEMENT SUBBASE SOILS CAN BE USED TO REPLACE THE MATERIAL REQUIREMENTS OF LAYER 'C' OR 'D' AT THE SITE DESIGN ENGINEER'S DISCRETION.
5. WHERE RECYCLED CONCRETE AGGREGATE IS USED IN LAYERS 'A' OR 'B' THE MATERIAL SHOULD ALSO MEET THE ACCEPTABILITY CRITERIA OUTLINED IN TECHNICAL NOTE 6.20 "RECYCLED CONCRETE STRUCTURAL BACKFILL".



NOTES:

1. CHAMBERS SHALL MEET THE REQUIREMENTS OF ASTM F2418, "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS" CHAMBER CLASSIFICATION 60x101
2. MC-7200 CHAMBERS SHALL BE DESIGNED IN ACCORDANCE WITH ASTM F2787 "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
3. THE SITE DESIGN ENGINEER IS RESPONSIBLE FOR ASSESSING THE BEARING RESISTANCE (ALLOWABLE BEARING CAPACITY) OF THE SUBGRADE SOILS AND THE DEPTH OF FOUNDATION STONE WITH CONSIDERATION FOR THE RANGE OF EXPECTED SOIL MOISTURE CONDITIONS. REFERENCE STORMTECH DESIGN MANUAL FOR BEARING CAPACITY GUIDANCE.
4. PERIMETER STONE MUST BE EXTENDED HORIZONTALLY TO THE EXCAVATION WALL FOR BOTH VERTICAL AND SLOPED EXCAVATION WALLS.
5. REQUIREMENTS FOR HANDLING AND INSTALLATION:
   - TO MAINTAIN THE WIDTH OF CHAMBERS DURING SHIPPING AND HANDLING, CHAMBERS SHALL HAVE INTEGRAL, INTERLOCKING STACKING LUGS.
   - TO ENSURE A SECURE JOINT DURING INSTALLATION AND BACKFILL, THE HEIGHT OF THE CHAMBER JOINT SHALL NOT BE LESS THAN 3" (75 mm).
   - TO ENSURE THE INTEGRITY OF THE ARCH SHAPE DURING INSTALLATION, a) THE ARCH STIFFNESS CONSTANT AS DEFINED IN SECTION 6.2.8 OF ASTM F2418 SHALL BE GREATER THAN OR EQUAL TO 500 LBS/FT/%. AND b) TO RESIST CHAMBER DEFORMATION DURING INSTALLATION AT ELEVATED TEMPERATURES (ABOVE 73° F / 23° C), CHAMBERS SHALL BE PRODUCED FROM REFLECTIVE GOLD OR YELLOW COLORS.

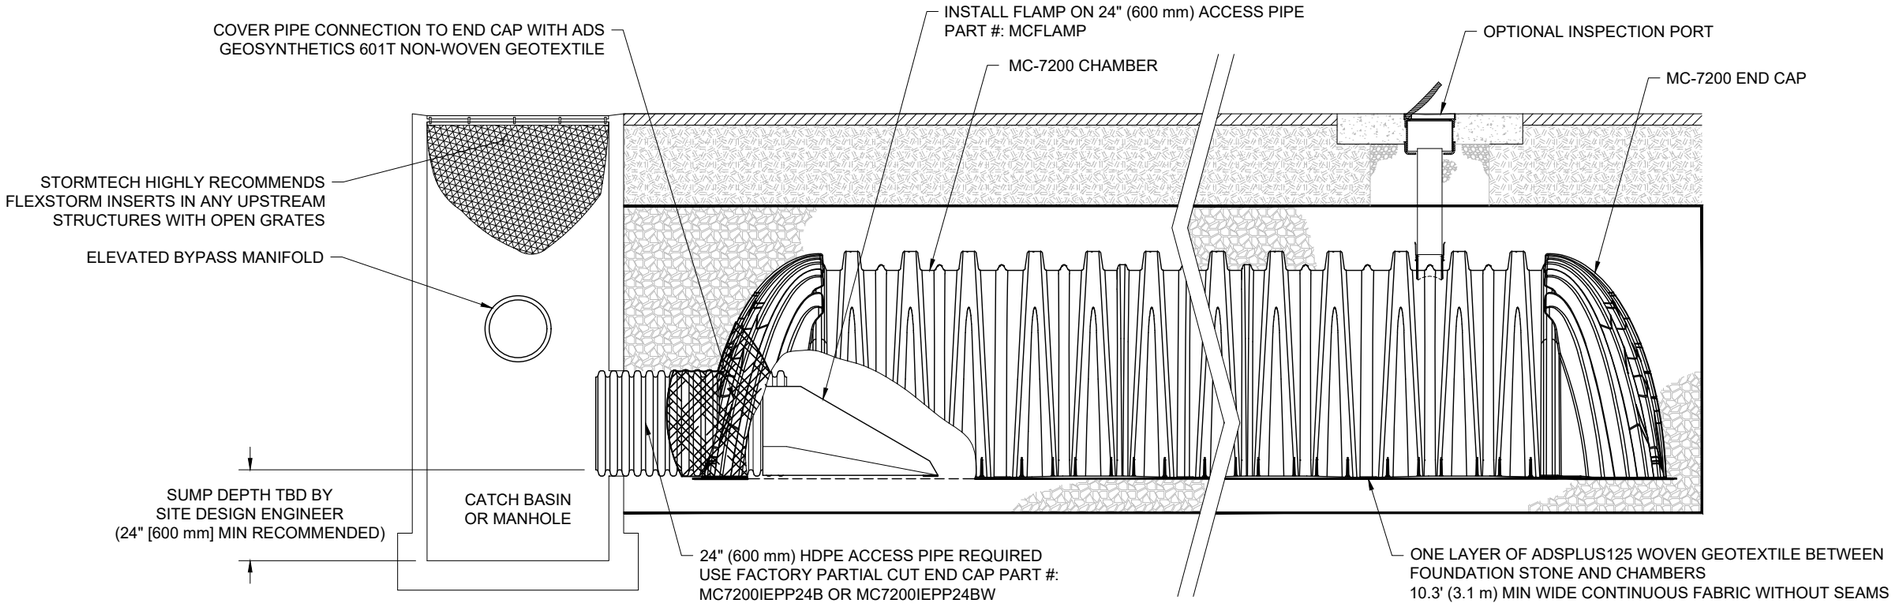
THIS DRAWING HAS BEEN PREPARED BASED ON INFORMATION PROVIDED TO ADS/STORMTECH UNDER THE DIRECTION OF THE PROJECT'S ENGINEER OF RECORD ('EOR') OR OTHER PROJECT REPRESENTATIVE. THIS DRAWING IS NOT INTENDED FOR USE IN BIDDING OR CONSTRUCTION WITHOUT THE EOR'S PRIOR APPROVAL. EOR SHALL REVIEW THIS DRAWING PRIOR TO BIDDING AND/OR CONSTRUCTION. IT IS THE ULTIMATE RESPONSIBILITY OF THE EOR TO ENSURE THAT THE PRODUCT(S) DEPICTED AND ALL ASSOCIATED DETAILS MEET ALL APPLICABLE LAWS, REGULATIONS, AND PROJECT REQUIREMENTS.



MC-7200 ISOLATOR ROW PLUS DETAIL
NTS

INSPECTION & MAINTENANCE

STEP 1) INSPECT ISOLATOR ROW PLUS FOR SEDIMENT
- A. INSPECTION PORTS (IF PRESENT)
  - A.1. REMOVE/OPEN LID ON NYLOPLAST INLINE DRAIN
  - A.2. REMOVE AND CLEAN FLEXSTORM FILTER IF INSTALLED
  - A.3. USING A FLASHLIGHT AND STADIA ROD, MEASURE DEPTH OF SEDIMENT AND RECORD ON MAINTENANCE LOG
  - A.4. LOWER A CAMERA INTO ISOLATOR ROW PLUS FOR VISUAL INSPECTION OF SEDIMENT LEVELS (OPTIONAL)
  - A.5. IF SEDIMENT IS AT, OR ABOVE, 3" (80 mm) PROCEED TO STEP 2. IF NOT, PROCEED TO STEP 3.
- B. ALL ISOLATOR PLUS ROWS
  - B.1. REMOVE COVER FROM STRUCTURE AT UPSTREAM END OF ISOLATOR ROW PLUS
  - B.2. USING A FLASHLIGHT, INSPECT DOWN THE ISOLATOR ROW PLUS THROUGH OUTLET PIPE
    - i) MIRRORS ON POLES OR CAMERAS MAY BE USED TO AVOID A CONFINED SPACE ENTRY
    - ii) FOLLOW OSHA REGULATIONS FOR CONFINED SPACE ENTRY IF ENTERING MANHOLE
  - B.3. IF SEDIMENT IS AT, OR ABOVE, 3" (80 mm) PROCEED TO STEP 2. IF NOT, PROCEED TO STEP 3.

STEP 2) CLEAN OUT ISOLATOR ROW PLUS USING THE JETVAC PROCESS
- A. A FIXED CULVERT CLEANING NOZZLE WITH REAR FACING SPREAD OF 45" (1.1 m) OR MORE IS PREFERRED
- B. APPLY MULTIPLE PASSES OF JETVAC UNTIL BACKFLUSH WATER IS CLEAN
- C. VACUUM STRUCTURE SUMP AS REQUIRED

STEP 3) REPLACE ALL COVERS, GRATES, FILTERS, AND LIDS; RECORD OBSERVATIONS AND ACTIONS.

STEP 4) INSPECT AND CLEAN BASINS AND MANHOLES UPSTREAM OF THE STORMTECH SYSTEM.

NOTES

1. INSPECT EVERY 6 MONTHS DURING THE FIRST YEAR OF OPERATION. ADJUST THE INSPECTION INTERVAL BASED ON PREVIOUS OBSERVATIONS OF SEDIMENT ACCUMULATION AND HIGH WATER ELEVATIONS.

2. CONDUCT JETTING AND VACTORING ANNUALLY OR WHEN INSPECTION SHOWS THAT MAINTENANCE IS NECESSARY.

ISOLATOR® ROW PLUS

The StormTech Isolator Row PLUS is an enhancement to our proven water quality treatment system. This updated system is an NJCAT verified water quality treatment device that can be incorporated into any system layout.

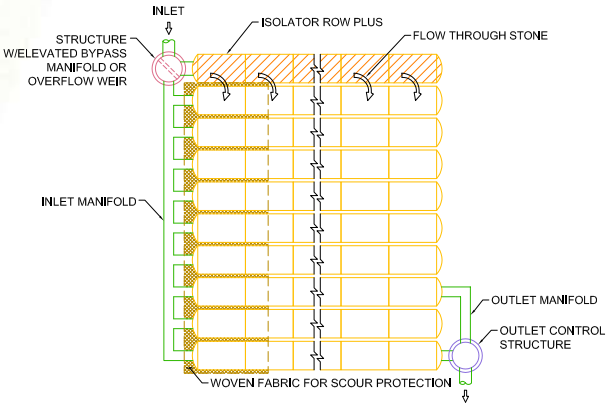
FEATURES:

- Isolator Row PLUS is now NJCAT verified. As a Manufactured Treatment Device it achieves over 81% TSS removal by filtration NJDEP Laboratory Protocol Assessment NJCAT Technology Verification.
- A patented FLAMP™ (Flared End Ramp) provides a smooth transition from pipe invert to fabric bottom. The FLAMP is attached to the inlet pipe inside the chamber end cap and improves chamber function over time by distributing sediment and debris that would otherwise collect at the inlet. It also serves to improve the fluid and solid flow back into the inlet pipe during maintenance and cleaning.
- Proprietary ADS PLUS fabric maintains durability and sediment removal while allowing for higher water quality flow rates. A single layer of ADS PLUS fabric is placed between the angular base stone and the Isolator Row PLUS chambers.

TECHNOLOGY DESCRIPTIONS:

The Isolator Row PLUS is designed to capture the “first flush” runoff and offers the versatility to be sized on a volume or a flow basis. An upstream manhole not only provides access to the Isolator Row PLUS but includes a high/low concept such that stormwater flow rates or volumes that exceed the capacity of the Isolator Row PLUS bypass through a manifold to the other chambers. This is achieved with either an elevated bypass manifold or a high-flow weir. This creates a differential between the Isolator Row PLUS row of chambers and the manifold to the rest of the system, thus allowing for settlement time in the Isolator Row PLUS. After Stormwater flows through the Isolator Row PLUS and into the rest of the StormTech chamber system it is either infiltrated into the soils below or passed at a controlled rate through an outlet manifold and outlet control structure.

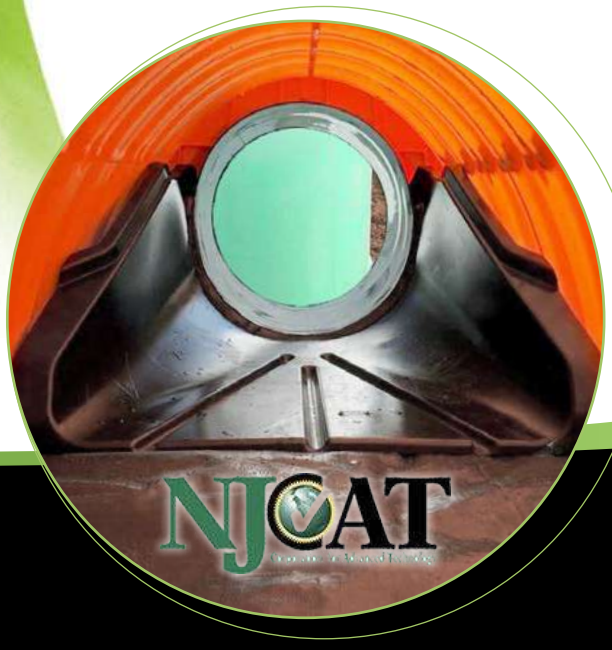
Schematic of the StormTech Isolator Row PLUS System



Summary of Verified Claims[1]

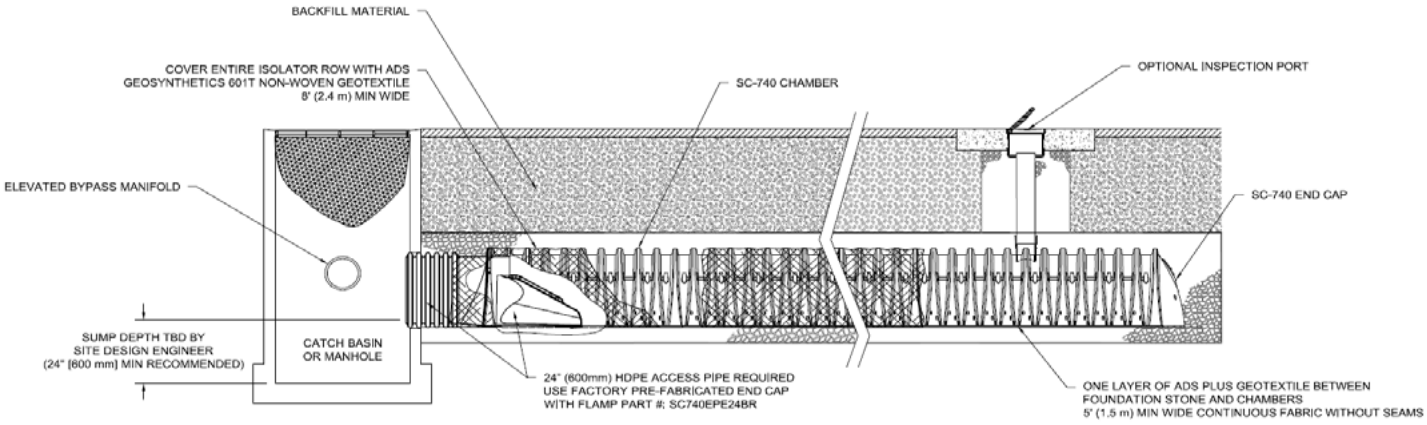
Treatment Rate (gpm/ft²)	4.1
Underlying Geotextile Layers	1
NJDEP Test Sediment	1-1000µ
Mean Particle Concentration (mg/L)	200
TSS Removal Efficiency	81%

[1] Verification testing of the StormTech SC-740 Isolator Row PLUS in accordance with NJDEP Laboratory protocol to access total suspended solids removal by filtration manufactured treatment device, 2013



StormTech Isolator Row PLUS (not to scale)

Note: Non-woven fabric is only required over the chambers for the SC-310 and SC-740 chamber models.



MAINTENANCE

The Isolator Row PLUS was designed to reduce the cost of periodic maintenance. By "isolating" sediment to just one row of the StormTech system, costs are dramatically reduced by eliminating the need to clean out each row of the entire storage bed. If inspection indicates the potential need for maintenance, access is provided via a manhole(s) located on the end(s) of the row for cleanout.

Maintenance is accomplished with the JetVac process. The JetVac® process utilizes a high-pressure water nozzle to propel itself down the Isolator Row PLUS while scouring and suspending sediment. As the nozzle is retrieved, the captured pollutants are flushed back into the manhole for vacuuming. Most sewer and pipe maintenance companies have vacuum/JetVac combination vehicles. Selection of an appropriate JetVac nozzle will improve maintenance efficiency.

StormTech Isolator Row PLUS

Chamber Model	Chamber Storage	Chamber Footprint	Treatment Rate
SC-160LP	15.0 cf (0.42)	11.45 sf (1.06)	0.11 cfs (3.11 L/s)
SC-310	31.0 cf (0.88)	17.7 sf (1.64)	0.16 cfs (4.53 L/s)
SC-740	74.9 cf (2.12)	27.8 sf (2.58)	0.26 cfs (7.36 L/s)
DC-780	78.4 cf (2.22)	27.8 sf (2.58)	0.26 cfs (7.36 L/s)
MC-3500	175.0 cf (4.96)	42.9 sf (3.99)	0.40 cfs (11.32 L/s)

PRODUCT SPECIFICATION:

1. Peak Hydraulic Flow: 50.0 cfs (1415 l/s)
2. Min Sediment Storage Capacity: 2.8 cu. yd. (2.1 cu. m.)
3. Maximum Inlet/Outlet Pipe Diameters: 48 in. (1200 mm)
4. The treatment system shall use an induced vortex to separate pollutants from stormwater runoff.
5. For more product information including regulatory acceptances, please visit https://hydro-int.com/en/products/first-defense

GENERAL NOTES:
1. General Arrangement drawings only. Contact Hydro International for site specific drawings.
2. The diameter of the inlet and outlet pipes may be no more than 48".
3. Multiple inlet pipes possible (refer to project plan).
4. Inlet/outlet pipe angle can vary to align with drainage network (refer to project plans).
5. Peak flow rate and minimum height limited by available cover and pipe diameter.
6. Larger sediment storage capacity may be provided with a deeper sump depth.

****
Node Surcharge Summary
****

Surcharging occurs when water rises above the top of the highest conduit.

Node	Type	Hours Surcharged	Max. Height Above Crown Meters	Min. Depth Below Rim Meters
J74	JUNCTION	0.38	0.412	0.000

****
Node Flooding Summary
****

No nodes were flooded.

Appendix J

Water Distribution

System-Level Demand Parameters

System Level Parameters for MSS (2024)	Consumption Rate[1]	Population Density cap/unit[3]	Average Day Demand (L/unit/day)	Residential Outdoor Water Demand (OWD) (L/unit/day)[4]	Maximum Day Demand (L/unit/day)	Peak Hour Demand
SFH	180	3.4	612	700	Average Day Demand + OWD	2.1 x Maximum Day Demand
MLT	198	2.7	535	350	Average Day Demand + OWD	2.1 x Maximum Day Demand
MLT without rear yards	198	2.7	535	0	Average Day Demand	1.6 x Maximum Day Demand
APT	219	1.8	394	0	Average Day Demand	1.6 x Maximum Day Demand
EMP[2]	138	1	138	N/A	1.5 x Average Day Demand[5]	1.8 x Maximum Day Demand
Water Loss per connection	N/A	N/A	80	N/A	Average Day Demand	Average Day Demand
Total Demand			**Sum above for Total Average Day**		**Sum above for Total Max Day**	**Sum above for Total Peak Hour**

[1] Values represent L/cap/day for residential land uses and L/emp/day for employment areas.

[2] Apply a rate of 17,000 l/h/day if employment totals are unknown. The rate represents the average demand for ICI areas at the 90th percentile.

[3] Occupancy factors should be chosen according to housing type. The values shown were extracted from Section 4.2.8 of the Ottawa Design Guidelines - Water Distribution (2010)

[4] Outdoor water demand is applied to single family, semi-detached and townhome units with rear yards.

[5] The 1.5 multiplier represents the additional outdoor water demand associated with employment areas.

Hi Guy,

As promised, I have attached the updated parameters to be used for expansion areas where the population exceeds 3000 persons. Please let me know if the attached table is unclear or if you have any questions or concerns. Kindly resubmit your demands using the updated parameters.

I'll be sending another message tomorrow regarding servicing the ICI areas fronting Borrisokane.

Thanks,

John

Hi John,

I am assuming that the MSS level demands are still in the works? Any thoughts on when we can expect those so that we can update demands and send another BC request?

Thanks

Guy

Hi all,

After meeting with Erin Moore from the Municipal Drainage (MD) unit this afternoon, it has been clarified that only landowners within the MD's catchment area are eligible to request drainage reports. Therefore, Minto must directly send any requests for information to the MD unit (Erin and Dave). Additionally, the MD unit will meet with landowners to provide guidance on the necessary drainage act processes to accommodate the S1- and S2 lands.

Please copy Robin and Infrastructure Planning (Joe, Eric, and I) when emailing the MD group.

Thanks,

Max Day plus Fire Flow #1	134.6	38.3
Max Day plus Fire Flow #2	130.5	32.4
[1] Ground Elevation =	107.7	m

Connection 4 - Elevation Road

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	146.7	53.2
Peak Hour	137.8	40.6
Max Day plus Fire Flow #1	134.9	36.4
Max Day plus Fire Flow #2	130.9	30.8
[1] Ground Elevation =	109.3	m

Connection 5 - Cappamore Drive

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	146.7	62.1
Peak Hour	137.8	49.4
Max Day plus Fire Flow #1	135.2	45.8
Max Day plus Fire Flow #2	131.6	40.6
[1] Ground Elevation =	103.0	m

Connection 7 - Barnsdale Road

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	146.7	59.1
Peak Hour	137.8	46.5
Max Day plus Fire Flow #1	134.9	42.3
Max Day plus Fire Flow #2	131.0	36.8
[1] Ground Elevation =	105.1	m

Notes

1. Only connections off the public looped system are eligible for boundary conditions. The engineer must calculate headloss off the dead-end main. Proposed Connections 1 & 6 at existing water stubs off Lynn Coulter Street & Moyard Drive are not looped. For the purposes of this boundary condition request, proposed Connections 1 & 6 were combined to a single **Connection 1 – Moyard Drive**, off the public looped watermains. Because of this change, Scenarios 1 & 3 were dropped from 6 to 5 total connections and Scenarios 2 & 4 were dropped from 7 to 6 total connections.
2. Demands for proposed Connection 7 at existing water main along Barnsdale Road were assigned to upstream junction at Realigned Greenbank Road & Barnsdale Road off the public looped watermains. The engineer must calculate headloss off the dead-end main.
3. As per the Ontario Building Code in areas that may be occupied, the static pressure at any fixture shall not exceed 552 kPa (80 psi.) Pressure control measures to be considered are as follows, in order of preference:
    - If possible, systems to be designed to residual pressures of 345 to 552 kPa (50 to 80 psi) in all occupied areas outside of the public right-of-way without special pressure control equipment.
    - Pressure reducing valves to be installed immediately downstream of the isolation valve in the home/ building, located downstream of the meter so it is owner maintained.

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	53.7
Peak Hour	138.6	41.7
Max Day plus Fire Flow #1	134.6	35.9
Max Day plus Fire Flow #2	130.3	29.9
[1] Ground Elevation =	109.3	m

Connection 2 - Kilbirnie Drive

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	57.2
Peak Hour	138.7	45.2
Max Day plus Fire Flow #1	134.8	39.7
Max Day plus Fire Flow #2	130.6	33.7
[1] Ground Elevation =	106.9	m

Connection 3 - Obsidian Street

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	56.1
Peak Hour	138.7	44.1
Max Day plus Fire Flow #1	135.1	39.0
Max Day plus Fire Flow #2	131.1	33.3
[1] Ground Elevation =	107.7	m

Connection 4 - Elevation Road

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	53.8
Peak Hour	138.7	41.8
Max Day plus Fire Flow #1	135.4	37.1
Max Day plus Fire Flow #2	131.6	31.7
[1] Ground Elevation =	109.3	m

Connection 5 - Cappamore Drive

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	62.6
Peak Hour	138.6	50.6
Max Day plus Fire Flow #1	135.8	46.6
Max Day plus Fire Flow #2	132.3	41.6
[1] Ground Elevation =	103.0	m

Connection 6 - Barnsdale Road

Demand Scenario	Head (m)	Pressure[1] (psi)
Maximum HGL	147.1	59.7
Peak Hour	138.6	47.7
Max Day plus Fire Flow #1	135.4	43.1
Max Day plus Fire Flow #2	131.7	37.8
[1] Ground Elevation =	105.1	m

Disclaimer

The boundary condition information is based on current operation of the city water distribution system. The computer model simulation is based on the best information available at the time. The operation of the water distribution system can change on a regular basis, resulting in a variation in boundary conditions. The physical properties of watermains deteriorate over time, as such must be assumed in the absence of actual field test data. The variation in physical watermain properties can therefore alter the results of the computer model simulation. Fire Flow analysis is a reflection of available flow in the watermain; there may be additional restrictions that occur between the watermain and the hydrant that the model cannot take into account.

Hi Ally,

Please find the updated BC results attached with the looped 300mm WM included as requested.

A couple of notes on the results:

- As the 300mm WM was included, the connection locations 4 & 5 were moved to their originally requested locations (because they are now part of the looped network).
- We see a generally higher HGL throughout the entire boundary condition except at connection 4's new location. This is due to the increase in node elevation compared to its previous location. The node elevations are pulled from our DEM.

Please let me know if you have any questions,

Gianmarco

Hi Gianmarco,

Thanks for the clarification.

I just wanted to follow up on the progress of the updated boundary conditions with the 300mm watermain in the model.

Appreciate your help with this.

Thank you,
Ally

Good afternoon Ally,

Sorry for the confusion concerning the results. The differences in results comes down to the Infrastructure & Water Services Dept updating our base water boundary conditions (BC) model. The previous BC results were provided using the old BC model. These updated results are using the new updated BC model. The drop in HGLs can be entirely explained by these factors which were the result of our base model update:

- Under existing conditions scenarios, the pump control rules at Barrhaven PS were updated to better reflect the real-life configuration of the 3SW pressure zone and the relationship between the Moodie Tank and the Barrhaven PS. This resulted in around a 3-meter drop in HGLs throughout the zone during Max Day scenarios. This change only affected existing conditions scenarios (pre SUC zone reconfig) and the 3-meter drop in HGLs can be noticed by comparing the Max HGL results from the previous model results to the updated model results.
- The demands on all nodes throughout the model were updated with our most recent data. These updated demands influenced Max Day demand HGLs throughout the model, but especially in zone 3SW. The nodes surrounding the S1 UEA lands previously had zero demands (new developments growth). This updated model, thus, had a significant increase in neighboring demands. These increases were updated for pre SUC zone reconfig and post-SUC zone reconfig scenarios.

We've verified the previous boundary condition results model with this updated model and can attribute all the head loss, despite the decreased demands and the additional connection locations, to these stated factors above. Apologies for the confusion, I should've explained these changes when sharing the updated results.

Concerning your second point about the addition of the 300mm watermain in the model, I will run new results with this addition and share them with you.

Hopefully this clears things up. Have a great weekend,

Gianmarco

Hi Gianmarco,

Thank you for sending over the updated boundary conditions, we appreciate the quick turnaround from the City

We've had a chance to review the information and after comparing it with the boundary conditions we received in June 2024 (attached for your reference) for the same project, we just had a few follow-up comments that we would like to clarify. I've attached the previous boundary conditions for reference.

1. Upon comparing the two sets of boundary conditions, we observed a reduction in pressures in the updated boundary condition (from Sept 2025), summarized as follows:
    - An average decrease of approximately 4 psi (27 kPa) in the maximum HGL scenario
    - An average decrease of approximately 2 psi (14 kPa) in the peak hour scenario
    - An average decrease of approximately 10 psi (69 kPa) in the maximum day plus fire flow scenario

    We understand that the Tullaghan connection was removed in the latest boundary condition request, however, given its proximity to the Moyard connection, we were not expecting such a noticeable reduction in pressure. In addition, the total demands for the development have decreased.

2. As part of this development, Elevation Road and Cappamore Drive are proposed to be extended from the existing subdivisions. As both are classified as collector roads, it is anticipated that a 300 mm diameter trunk watermain will be required to service these extensions. If this has not already been taken into account, could you please consider it in the boundary conditions results?

We appreciate your help with this. If you have any questions please let me know.

Thank you,
Ally

Good afternoon Ally,

Please find the completed BC attached. Please note, as mentioned in the notes, the combination of proposed connections 1 & 6 into a single connection since our group only completes BC results off the public looped watermains.

Please let me know if you have any questions.

Thanks,

Gianmarco

Hi Ally,

The request has been forwarded to Gianmarco, who will be updating the water boundary conditions. He will share the updated results with you once they are available.

For your reference, fire flow requirements typically govern the design of local watermains, while peak hourly demands often determine the sizing of watermains 400 mm and larger. If there have been no significant changes to the fire flow rates or peak hourly demands, the water boundary conditions are expected to remain largely unchanged.

Thanks,

John

Subject: RE: S1 Lands - Boundary Condition Request

Hi Zoe,

Following up on our previous boundary condition request (July 5th 2024, see attached), we are requesting updated boundary conditions for the Barrhaven S1 lands, based on a revised concept plan with updated population figures and revised connection points.

As with our previous boundary condition request, this document summarizes the upcoming potable water assessment that will be carried out as part of the upcoming Servicing Study for Minto's S1 Urban Expansion Area (S1 UEA). The subject site is located north of Barnsdale Road, east of Borrisokane Road, south of the existing The Ridge Subdivision and west of the existing Quinn's pointe Subdivision.

Given that the population for overall S1 UEA exceeds 3,000 equivalent population, the analysis is to be carried out based on system-level demand parameters as per the attached. The potable water assessment will identify water servicing requirements for the future stages of the S1 UEA as depicted on Minto's Concept Plan.

Please note that since Quinn's Pointe Stage 5 is still under review, its associated demands and connection points have been included in this request. The connection points have also been slightly revised from our previous submission to reflect updates to the servicing strategy for the subdivision.

We are requesting boundary conditions for the following scenarios. Note that each scenario will have the same demand assumptions:

- Scenario 1: Existing Pressure Zone without Connection to Barnsdale Road (Connection 7) on the attached figure

- Scenario 2: Existing Pressure Zone with Connection to Barnsdale Road (Connection 7) on the attached figure
- Scenario 3: Future "SUC Zone" Pressure Zone Reconfiguration without Connection to Barnsdale Road (Connection 7) on the attached figure
- Scenario 4: Future "SUC Zone" Pressure Zone Reconfiguration with Connection to Barnsdale Road (Connection 7) on the attached figure

Scenario 1 - Existing Pressure Zone without Connection to Barnsdale Road

The requested connections for scenario 1 are as follows:

1. Location 1 – Connection to existing 300 mm WM north of Moyard on Lynn Coulter Street;
2. Location 2 – Connection to existing 300 mm WM at Kilbirnie Drive;
3. Location 3 – Connection to existing 300 mm WM at Obsidian Street;
4. Location 4 – Connection to existing 300 mm WM at Elevation Road;
5. Location 5 – Connection to existing 300 mm WM at Cappamore Drive; and
6. Location 6 – Connection to existing 200 mm WM at Moyard Drive.

Scenario 2 Existing Pressure Zone with Connection to Barnsdale

The requested connections for scenario 2 are as follows:

6. Location 1 – Connection to existing 300 mm WM at North of Moyard on Lynn Coulter Street;
7. Location 2 – Connection to existing 300 mm WM at Kilbirnie Drive;
8. Location 3 – Connection to existing 300 mm WM at Obsidian Street;
9. Location 4 – Connection to existing 300 mm WM at Elevation Road.
10. Location 5 – Connection to existing 300 mm WM at Cappamore Drive;
11. Location 6 – Connection to existing 200 mm WM at Moyard Drive; and
12. Location 7 – Connection to existing 200 mm WM at Barnsdale Road.

Scenario 3 - Future "SUC Zone" Pressure Zone Reconfiguration without Connection to Barnsdale Road

The requested connections for scenario 3 are as follows:

13. Location 1 – Connection to existing 300 mm WM at North of Moyard on Lynn Coulter Street;
14. Location 2 – Connection to existing 300 mm WM at Kilbirnie Drive;
15. Location 3 – Connection to existing 300 mm WM at Obsidian Street;
16. Location 4 – Connection to existing 300 mm WM at Elevation Road.
17. Location 5 – Connection to existing 300 mm WM at Cappamore Drive; and
18. Location 6 – Connection to existing 200 mm WM at Moyard Drive.

Scenario 4 Future "SUC Zone" Pressure Zone Reconfiguration with Connection to Barnsdale Road

The requested connections for scenario 4 are as follows:

19. Location 1 – Connection to existing 300 mm WM at North of Moyard on Lynn Coulter Street;
20. Location 2 – Connection to existing 300 mm WM at Kilbirnie Drive;
21. Location 3 – Connection to existing 300 mm WM at Obsidian Street;
22. Location 4 – Connection to existing 300 mm WM at Elevation Road.
23. Location 5 – Connection to existing 300 mm Mat Cappamore Drive;
24. Location 6 – Connection to existing 200 mm WM at Moyard Drive; and
25. Location 7 – Connection to existing 200 mm WM at Barnsdale Road.

As previously noted, the water demands were calculated based on the provided system-level demand parameters. The estimated water demands for the proposed development are listed below (refer to the attachment for the breakdown):

Demands Including:

Average Day Demand = 16.69 L/s

Maximum Day Demand = 24.56 L/s

Peak Hour Demand = 43.47 L/s

Fire Flow 1 = 167 L/s

Fire Flow 2 = 217 L/s

If we could receive the requested boundary conditions at your earliest convenience it would be much appreciated.

Should you have any questions or require anything further, please do not hesitate to call.

Thank you,

Subject: S1 Lands - Boundary Condition Request

John & Robin,

We are requesting boundary conditions for the S1 Urban Expansion Area (S1 UEA). This request follows recent discussions held with John and was prepared based on the system-level parameters provided by the City of Ottawa given that Stage 5 and the S1 UEA exceed a population of 3,000.

As per the recent discussions, this request solely reflects Minto's Stage 5 and S1 UEA as a separate request was made by DSEL for the Logistics and Industrial/Commercial lands.

The upcoming potable water assessment that will be prepared as part of an upcoming MSS that will identify water servicing requirements for Stage 5 as well as the future stages of the S1 UEA as depicted on Minto's Concept Plan (see the phasing limit in red on the attached). It should be noted that Stage 5 as shown on the attached relates to the last stage of the previous expansion lands (BSUEA) while Stages 6-9 relates to the S1 UEA. As shown on the attached Concept Plan, the unit breakdown for each of the stages is shown in the upper left corner of the PDF. Also shown on this PDF, Stage 5 will connect to existing watermains at four (4) while future Stages 6-9 part of the S1 UEA will be connected with an additional four (4) connections to existing watermains, labelled as Connection 5 to 8 as shown on the attached Concept Plan. These connections are described below:

- Location 1 – Connection to existing 300 mm WM at North of Moyard and Lynn Coulter Street;
- Location 2 – Connection to existing 200 mm WM at North of Tullaghan Heights and Moyard Drive;
- Location 3 – Connection to existing 300 mm WM at Kilbernie Road;
- Location 4 – Connection to existing 300 mm WM at Obsidian Street;
- Location 5 – Connection to existing 200 mm WM at Barnsdale Road;
- Location 6 – Connection to existing 300 mm WM at Cappamore Drive;
- Location 7 – Connection to existing 200 mm WM at Moyard Drive; and
- Location 8 – Connection to existing 300 mm WM at Elevation Road.

The following provides the calculated demands and fire flow requirements for Stage 5 part of the approved BSUEA, as well as the cumulative demands for Stage 5 with Stages 6-9 using the system level parameters. The system level parameters and demand calculations are attached to this Email.

Stage 5:

Average Day Demand = 5.06 L/s

Maximum Day Demand = 5.38 L/s

Peak Hour Demand = 6.47 L/s

Fire Flow 1 = 167 L/s

Fire Flow 2 = 217 L/s

Fire Flow 3 = 250 L/s

Fire Flow 4 = 300 L/s

Stages 5 - 9:

Average Day Demand = 19.66 L/s

Maximum Day Demand = 27.63 L/s

Peak Hour Demand = 44.18 L/s

Fire Flow 1 = 167 L/s

Fire Flow 2 = 217 L/s

Fire Flow 3 = 250 L/s

Fire Flow 4 = 300 L/s

Based on the above information, can boundary conditions be provided at the connection points noted above under Stage 5, as well as for Stage 6, 7, 8 and 9 to reflect Minto's phasing Plan. The BC should be generated under Peak Hour, Max. Day plus Fire Flows and Maximum Pressure Check scenarios. We have also assumed that the BC will reflect current supply conditions as well as the future pressure zone reconfiguration.

If we could receive the requested boundary conditions at your earliest convenience it would be much appreciated.

Should you have any questions or require anything further, please do not hesitate to call.

Thanks,

Tatyana

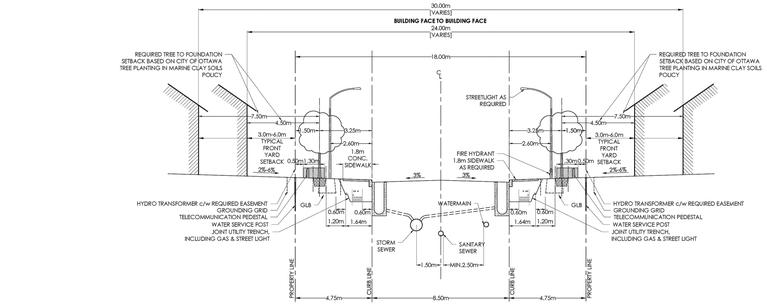
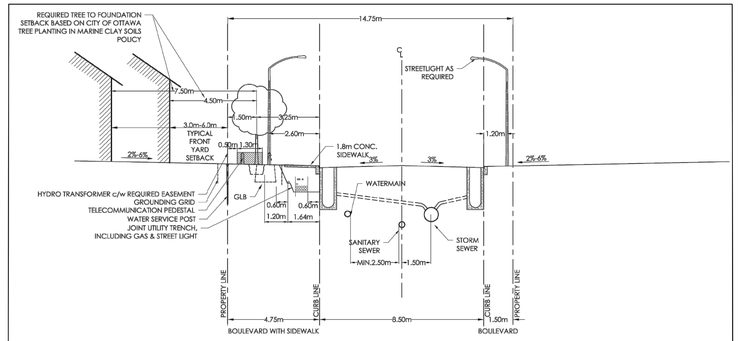
1. STANDARD CROSS-SECTIONS TO BE READ IN CONJUNCTION WITH THE GENERAL STANDARD CROSS-SECTION NOTES AND OTHER APPLICABLE CITY AND UTILITY PLANS AND DETAILS.
2. 18M RIGHT-OF-WAY NOT TO BE USED ON STREETS WITH BUS SERVICE.
3. CONCRETE CURBS TO BE CONSTRUCTED AS PER CITY OF OTTAWA STANDARD DETAILS.
4. TYPICAL FRONT YARD SETBACK IS TO BE CLEAR AND UNENCUMBERED OF ANY SUBSURFACE BUILDING ENCROACHMENTS.
5. FIRE HYDRANTS TO BE LOCATED ON THE WATERMAIN SIDE OF THE STREET.
6. CATCH BASINS TO BE PER CITY OF OTTAWA DETAIL S2.
7. GAS MAIN SHALL HAVE A MINIMUM OF 0.6M CLEARANCE FROM STRUCTURES E.G. CATCH BASINS AND HYDRANTS) AND 1.2 M FROM TREE ROOT BALL.
8. STREETLIGHTS CAN BE LOCATED ON EITHER SIDE OF THE RIGHT-OF-WAY.
9. JOINT-USE UTILITY TRENCH (JUT) UNDER SIDEWALK AS PER DETAIL UDS0049. HELD BY HYDRO OTTAWA.
10. GRADE LEVEL BOX (GLB) AS DRAWN SHOWS GLB3660. EXACT LOCATION TO BE CONFIRMED.
11. THIS CROSS-SECTION CANNOT BE USED WHERE A CONCRETE ENCASED HYDROELECTRIC DUCT OR ANOTHER SEPARATE UTILITY DUCT IS REQUIRED.
12. TREE CLEARANCES TO HYDRO OTTAWA PLANT SHALL FOLLOW GCS0038.
13. CLEARANCES SHOWN ARE MINIMUMS.



Ottawa	18.0m ROW CROSS SECTION
REV.DATE:	AUG. 2022
DWG. No.	ROW-18.0



NOTES:

1. STANDARD CROSS-SECTIONS TO BE READ IN CONJUNCTION WITH THE GENERAL STANDARD CROSS-SECTION NOTES AND OTHER APPLICABLE CITY AND UTILITY PLANS AND DETAILS
2. 14.75m RIGHT-OF-WAY NOT TO BE USED ON STREETS WITH BUS SERVICE
3. CONCRETE CURBS TO BE CONSTRUCTED AS PER CITY OF OTTAWA STANDARD DETAILS
4. TYPICAL FRONT YARD SETBACKS ARE TO BE CLEAR AND UNENCUMBERED OF ANY SUBSURFACE BUILDING ENCROACHMENTS
5. FIRE HYDRANTS SHALL BE LOCATED ON THE WATERMAIN SIDE OF THE STREET.
6. CATCH BASINS TO BE PER CITY OF OTTAWA DETAIL S2.
7. STREETLIGHTS MAY BE LOCATED ON EITHER SIDE OF THE RIGHT-OF-WAY.
8. GAS MAIN SHALL HAVE A MINIMUM OF 0.6m CLEARANCE FROM STRUCTURES (E.G. CATCH BASINS AND HYDRANTS) AND 1.2m FROM TREE ROOT BALL
9. JOINT-USE UTILITY TRENCH (JUT) UNDER SIDEWALK AS PER DETAIL UDS0049. HELD BY HYDRO OTTAWA
10. GRADE LEVEL BOX (GLB) AS DRAWN SHOWS GLB3660. EXACT LOCATION TO BE CONFIRMED
11. THIS CROSS-SECTION CANNOT BE USED WHERE A CONCRETE ENCASED HYDROELECTRIC DUCT OR ANOTHER SEPARATE UTILITY DUCT IS REQUIRED
12. TREE CLEARANCES TO HYDRO OTTAWA PLANT SHALL FOLLOW GCS0038
13. BOULEVARD MAXIMUM SLOPE 1:3
14. NO RETAINING WALLS WITHIN 2.0m OF THE CURB LINE
15. CLEARANCES SHOWN ARE MINIMUMS

Ottawa	TITLE: 14.75m ROW CROSS SECTION
DATE:	AUG 2022
REV:	JULY 2024
DWG No:	ROW-14.75

NOTES:

1. THE STANDARD ROW CROSS SECTIONS INDICATE MINIMUM DIMENSIONS THAT ARE TO BE INCORPORATED INTO THE DESIGN OF ANY NEW DEVELOPMENTS INVOLVING NEW AND EXISTING STREETS. ANY VARIATIONS TO THE STANDARD ROW CROSS SECTIONS ARE SUBJECT TO THE INFRASTRUCTURE SERVICES DEVIATION PROCESS. CONTACT THE STANDARDS UNIT AT STANDARDSSECTION@OTTAWA.CA FOR MORE INFORMATION.
2. ALL DRAWINGS SHALL BE READ IN CONJUNCTION WITH APPLICABLE CITY STANDARDS, GUIDELINES, AND POLICES, INCLUDING COORDINATED UTILITY PLANS, GRADING PLANS AND LOCAL AREA PLANS. REFER ALSO TO UTILITY PARTNER STANDARD PLANT LOCATIONS.
3. ALL CROSS SECTIONS MAY BE SUBJECT TO SUBSEQUENT TRAFFIC CALMING MEASURES, TO BE DETERMINED THROUGH PLAN OF SUBDIVISION OR SEPARATE TRANSPORTATION STUDIES.
4. TYPICAL CROSS SECTION BOULEVARD WIDTH SHALL BE MAINTAINED WHEN CONSTRUCTING CUL-DE-SACS AND CORNER LOTS, REGARDLESS OF ROADWAY GEOMETRY.
5. WATERMAINS, WATER SERVICES, AND ASSOCIATED APPURTENANCES SHALL BE CONSTRUCTED PER THE WATER DESIGN GUIDELINES.
6. WATERMAIN AND HYDRANTS TO BE INSTALLED ON SOUTH AND EAST SIDE OF ROW, WHERE POSSIBLE.
7. SEWERS AND SEWER SERVICES SHALL BE CONSTRUCTED PER THE SEWER DESIGN GUIDELINES.
8. IN-ROAD CATCH BASINS SHALL ONLY BE USED ON RESIDENTIAL ROADS WITHOUT BUS TRAFFIC OR AS OTHERWISE DIRECTED BY THE SEWER DESIGN GUIDELINES.
9. BARRIER CURB SHALL BE USED ON ALL RESIDENTIAL ROADS WITH SINGLE FAMILY DWELLINGS. MOUNTABLE CURB MAY ONLY BE USED FOR AREAS WITH FREQUENT CURB-CUTS, SUCH AS TOWNHOME DEVELOPMENTS, WITH APPROVAL FROM THE CITY.
10. WATER AND SEWER SERVICES SHALL BE LAID AS PER CITY STANDARD DETAIL DRAWINGS, THE COORDINATED UTILITY PLAN, AND IN COORDINATION WITH ALL OTHER ELEMENTS IN THE ROW.
11. WHERE LOCATING WATER AND SEWER SERVICES UNDERNEATH LANDSCAPED AREAS WOULD PREVENT THE PLANTING OF A TREE, THEY MAY BE RUN UNDERNEATH THE DRIVEWAY OR OTHER HARDSCAPED AREAS.
12. MINIMUM 1.5 M CLEARANCE, AT-GRADE, TO BE MAINTAINED AROUND WATER SERVICE POST FROM TREE, TRANSFORMER, UTILITY PEDESTAL, TRAFFIC POLE, AND STREETLIGHT.
13. UTILITY PEDESTALS ARE TO BE GROUPED TOGETHER WITH THE HYDROELECTRIC TRANSFORMER, OR ON THE HOUSE SIDE OF THE UTILITY TRENCH.
14. STREETLIGHT CABLE SHALL BE LOCATED IN JOINT USE TRENCH (JUT). WHERE NO JUT EXISTS, ENSURE CLEARANCES TO TREE, HYDRANTS, AND WATER SERVICE POST.
15. TRAFFIC SIGNAL CABLE SHALL BE LOCATED IN THE JUT OR AT THE SAME OFFSET AS STREETLIGHT POLES IN A SEPARATE TRENCH.
16. TRAFFIC COMMUNICATIONS CABLE SHALL BE LOCATED IN THE JUT OR IN A TRENCH LOCATED AT THE SAME OFFSET AS THE STREETLIGHT POLES.
17. THE PREFERRED LOCATION FOR TRAFFIC HANDHOLES IS IN HARD SURFACES. WHEN HANDHOLES ARE PLACED IN THE BOULEVARD, A CONCRETE COLLAR SHALL BE PROVIDED.
18. THE DEVELOPER SHALL SUPPLY AND INSTALL DUCTS FOR UTILITY CROSSINGS AT INTERSECTIONS.
19. TREE PLACEMENT, NUMBER, AND SPECIES SHALL BE PER CITY POLICY, THE LANDSCAPE PLAN, COORDINATED-UTILITY-PLAN, AND THE DEVELOPMENT AGREEMENTS.
20. THE HYDRO TRANSFORMER BASE SHALL BE LOCATED A MINIMUM OF 2.0 M FROM THE DRIVEWAY EDGE.

DRAFT

Document Control

This Draft Manual was prepared to serve as guidance for the operation and maintenance of the Etobicoke Exfiltration System (EES), intended to be constructed within the S1 Area. Similar to the systems that are currently operational within the Quinn's Pointe Subdivision, the proposed EES will be part of the city's wastewater/stormwater collection system.

This Draft OMM includes: (i) a training program for City of Ottawa wastewater/stormwater operators; (ii) operation and maintenance requirements; and (iii) a project-specific monitoring plan template that must be completed and approved before implementation.

Project / Facility Name	[Insert]
Project Location	[Insert]
Sewer Shed / Service Area	[Insert]
Owner	City of Ottawa
Prepared By	[Insert Consultant/Engineer]
Issue/Revision	Rev. 1 – Integrated O&M, Training, and Monitoring Plan Template

How to Use This Manual

Sections 2–6 are intended for operations staff and field use. Section 7 provides the monitoring plan framework that must be developed prior to commissioning. Appendices include inspection forms, checklists, and maintenance record templates.

1. Background and System Overview

1.1 Background (Etobicoke Exfiltration System History)

The Etobicoke Exfiltration System (EES) was originally developed in 1993 in the former City of Etobicoke (now City of Toronto) and constructed in 1993–1994 as part of municipal road reconstruction projects. Three (3) systems totaling approximately 2.1 km were installed to provide water quality enhancement for existing serviced areas and were designed to capture runoff from a 15 mm, 1-hour AES rainfall event. Experience from these installations, together with broader guidance for underground infiltration practices, informs the recommended operation and maintenance procedures in this manual.

1.2 EES Details and Key Design Components

An EES is a linear perforated-pipe system installed within a clear stone trench (and filter separation where specified) to promote controlled exfiltration/infiltration to surrounding soils. Within the Quinn's Pointe Subdivision and future S1 Area, the EES consist of 2x300 mm diameter perforated sewer surrounded by a clear stone envelope varying in size depending on the storm sewer diameter.

DRAFT

Where applied to wastewater/stormwater collection infrastructure, operations must ensure reliable conveyance while managing risks related to sediment accumulation, clogging, and unintended infiltration/inflow pathways. Its key design components are as follows:

- Upstream and downstream maintenance holes (MHs) / access chambers and cleanouts.
- Carrier sewer and associated perforated pipes within a granular stone envelope.
- Granular trench and any specified geotextile/filter separation.
- Catch basins/inlets (where connected) and inlet control devices (ICDs) where applicable.
- Mechanical plugs generally at the downstream end with manholes servicing as inspection points.
- Optional bypass, or overflow provisions where included in design.

1.3 Ottawa Operating Context and Constraints

- Seasonal groundwater fluctuations may reduce the exfiltration gradient and influence drawdown times.
- Winter conditions (frost) can reduce infiltration capacity and affect maintenance access.
- Construction-phase sediment loading is a principal cause of early clogging—sediment control during staged development is critical.
- Road works and utility conflicts can disturb trench materials and create preferential pathways for unintended I/I.
- Grease/biofilm accumulation and root intrusion can reduce perforation capacity in systems receiving sanitary flows.

2. Roles, Responsibilities, and Contacts

Prior to putting the EES into service, the following summarizes responsibilities and escalation pathways in Tabular format.

Role	Responsibility (Minimum)
Wastewater/Stormwater Collection Operations	Routine inspections, cleaning/jetting, work orders, and record keeping.
Collection System Engineering / Asset Management	Performance trending, CCTV program integration, renewal planning, and monitoring plan review.
Environmental Compliance	Review of any monitoring wells/sampling requirements and spill response coordination.
Design Engineer / Consultant (Turnover Period)	Commissioning support, baseline CCTV, monitoring plan finalization, and training support.

DRAFT

Emergency / escalation contacts: [Insert City group, phone numbers, and after-hours procedures].

3. Training Program – City of Ottawa Wastewater/Stormwater Operators

A structured training program is required prior to assumption of operations. Training shall be documented, repeated for new staff, and refreshed periodically. The program also applies to the operator of the system prior to ownership being transferred to the Municipality.

3.1 Training Objectives

- Understand EES intent, limitations, and differences from conventional sewers.
- Safely access and inspect linear infrastructure (confined space, traffic control, PPE).
- Perform routine inspections including drawdown checks and sediment measurements.
- Execute cleaning/jetting procedures specific to perforated pipes (including plug handling where applicable).
- Recognize early warning signs of clogging, surcharge, and unintended infiltration/inflow.
- Collect monitoring data and maintain records suitable for compliance and asset management.

3.2 Training Delivery (Recommended)

1. Classroom module (2–3 hours): system concept, components, failure modes, and documentation requirements.
2. Field walkdown (2–4 hours): locate access points, identify ICDs (not applicable in the S1 Area), demonstrate tools and safe set-up.
3. Hands-on practicum (1 shift): supervised inspection and controlled jetting/flush of a representative segment.
4. Competency check: short written/field assessment; issue training record.
5. Annual refresher (1–2 hours) and post-incident debrief training if failures occur.

3.3 Required Competencies & Certifications

- Confined Space Entry (current).
- Traffic Control / Temporary Workplace Safety (as required).
- WHMIS and PPE training.
- Use of calibrated gas detectors and rescue equipment.
- Competency with CCTV inspection, jetting equipment, sediment measurement tools, and plug handling (where applicable).

DRAFT

4. Operation Requirements

4.1 Normal Operation

- Operate as a gravity collection system; no routine operator action is required under normal flow conditions.
- Maintain access points so they remain visible and accessible (no buried lids, no obstructions).
- Ensure upstream sources remain free of debris and illegal discharges.
- Confirm any bypasses/overflow provisions are unobstructed and configured per design.

4.2 Seasonal / Winter Operation

Some infiltration systems may require seasonal operational adjustments in areas of high salt/sand loading. However, for the proposed EES within the S1 Area, it will only be installed along local roads where winter salting inputs are very minimal. Thus, the system will not be installed in higher-risk winter maintenance zones. It is, however, recommended that the city's operation group consider the following:

Winter Operations Plan: where increase catch basin cleaning to free up catch basin grates from ice buildup to ensure that the system is operational all year round.

Spring Operations Plan: where street sweeping efforts are increased from the typical one time to minimum 2 times during springtime immediately after snowmelt followed by a second sweep within a 3-week span. This is intended to reduce grit from accessing the perforated sewers.

4.3 Operational Constraints

- Avoid aggressive cleaning chemicals unless reviewed by environmental compliance staff.
- Use controlled jetting pressures/nozzles to avoid damaging perforations or displacing stone bedding.
- Prevent construction sediment or slurry from entering the system; implement upstream protection during road works and building construction.
- Coordinate with winter operations to manage fine sediment loading near connected inlets.

5. Maintenance Program

5.1 Inspection and Maintenance Frequencies (Minimum)

Task	Frequency	Method / Notes	Record / Deliverable
System inspection and drawdown confirmation	1–2 times/year and after significant storm events	Inspect MHs; confirm catch basin's sump	Inspection form + photos + drawdown notes

DRAFT

	(especially first 2 years)	drawdown to below perforated pipe invert within ~48 hours after storm	
Remove trash/debris from catchbasin sumps and grates	2 times/year (spring/fall) and as needed	Coordinate with street sweeping and inlet maintenance.	Catch basin cleaning record
Measure accumulated sediment depth (catchbasins and accessible points)	1 time/year (more frequently during/after construction) to reduce loadings to the EES	Track deposition; apply trigger thresholds for cleaning.	Sediment log
Preventative jetting / flushing of carrier and perforated pipes	As needed based on triggers; otherwise included in long-term cycle	Standard flushing, radial washing, or jet flushing per SOP; capture and dispose of removed material.	Cleaning record
CCTV condition assessment	Baseline Year 1; targeted every ~5 years (risk-based); full reach at least every 20 years	Use PACP-compatible coding; prioritize segments with slow drawdown, high sedimentation, or complaints.	CCTV report + defect log

5.2 Sediment and Cleaning Triggers

Real-time monitoring of the EES, at three (3) locations, was made as a condition of approval within Quinn's Pointe Subdivisions, the existing development east of the S1 Area. To facilitate monitoring in Quinn's Pointe, the city advised that it should be completed using the SmartLevel™ technology supported by Link Utility Technology as it has been tested and adopted by the City's Operation Group. In parallel, monitoring of rainfall events was to be carried out using the SmartRain™ system to collect real-time precipitation data.

The objective of the monitoring was as follows:

- Initiate cleaning when sediment in perforated pipes or sumps is observed to be accumulating or when deposition approaches operational thresholds.
- A practical trigger for pipe cleaning is sediment depth on the order of ~100 mm (or per project-specific criteria) and/or when sediment occupies ~10–20% of pipe diameter.
- Clean catchbasins when there is visible accumulation of sediment in the sump or when sump water remains above normal levels 48 hours after a storm event.
- Increase inspection/cleaning frequency during early years of operation and during/after construction phases.

DRAFT

5.3 Measures to Reduce Maintenance (Design Features)

Where specified in the design, inlet control devices (ICDs) fitted with goose necks can reduce maintenance by limiting the entry of floating debris and directing inflow from a deeper water column into the catch basin lead. These features must be included in operator training so staff can verify functionality during inspections.

6. Maintenance Procedures (SOPs)

6.1 Standard Cleaning Methods

6. Standard flushing: conventional sewer flushing from upstream to downstream access points.
7. Radial washing: pressurize the perforated pipe to force water through perforations to dislodge sediment within the stone envelope interface (where appropriate and safe).
8. Jet flushing: use a pressurized hose/nozzle designed to direct water through perforations to remove accumulated sediment (use controlled pressures and appropriate nozzle selection).

6.2 Plug Handling (Where Applicable)

Some EES configurations include mechanical plugs at downstream ends of perforated pipes. Operators must follow safe handling procedures, document plug locations, and ensure plugs are reinstalled correctly after cleaning.

6.3 Maintenance Effort Estimate (Planning Template)

The following planning approach may be used to estimate crew hours for jetting/flushing activities. Replace placeholders with project values.

Example estimate (template):
• Assumed jetting/flush productivity: [e.g., 150 m/hour].
• Total EES pipe length to flush (carrier + perforated pipes): [L_total, m].
• Time to flush = L_total / productivity.
• If mechanical plugs are present: time for plug removal/reinstallation = N_plugs × t_plug (e.g., 0.25 hours each).
• Total estimated crew time = flushing time + plug handling time + set-up/traffic control allowance.

7. Monitoring Plan (Must Be Developed Before Implementation)

A project-specific monitoring plan shall be developed, reviewed, and approved before the EES is placed into service. The Plan is to be developed during detailed design of linear infrastructure. It is intended to verify hydraulic performance, confirm drawdown behavior, track sedimentation/clogging trends, and support adaptive maintenance.

7.1 Minimum Monitoring Elements

- Baseline (pre-commissioning) CCTV survey and as-built verification.

DRAFT

- Routine drawdown checks at representative access points (target: drawdown within ~48 hours after significant events, unless otherwise justified and approved).
- Sediment depth measurements in catchbasins and accessible segments.
- Complaints/backup tracking and correlation to asset IDs.
- Optional instrumentation (where feasible/required): water level loggers in MHs, flow monitoring, and/or groundwater level monitoring (piezometers).

7.2 Monitoring Schedule (Recommended)

Monitoring Item	Year 0–1 (Commissioning)	Years 1–2	Year 3+
CCTV	Baseline full reach	Targeted if issues; consider risk-based	Integrate into City CCTV cycle; full reach at least every 20 years
Drawdown checks	After significant storm events	After significant storm events; then 1–2x/year	1–2x/year (risk-based)
Sediment measurements	Initial + 2x/year if construction nearby	1x/year (min)	1x/year (min)
Cleaning/jetting	As needed based on baseline findings	Trigger-based	Trigger-based + long-term cycle

7.3 Data Management, QA/QC, and Reporting

- Assign asset IDs to EES segments and link inspections, cleanings, and CCTV results to the City's asset management system.
- Establish QA/QC procedures for CCTV coding consistency, logger calibration (if used), and record retention.
- Prepare a commissioning summary report and annual performance summaries for the first two years, then incorporate into routine collection system reporting.

Appendix A – Field Inspection Form (Template)

- Asset ID / Segment: _____
- Date/Time: _____ Crew: _____
- Weather / Recent Rainfall: _____
- Access Point (MH/CO) Condition (lid, frame, corrosion): _____
- Gas readings (O2, H2S, CO, LEL): _____
- Water level / surcharge evidence: _____
- Drawdown observed within 48 hours? Yes / No / N/A
- Sediment depth estimate (CB and/or pipe): _____
- Odours/unusual appearance: _____
- Photos taken: Y / N Photo IDs: _____
- Actions required / Work order #: _____
- Signature: _____

DRAFT

Appendix B – Preventative Maintenance Checklist

- Confirm access points are visible and accessible (no obstructions).
- Confirm lids are seated and locked where required.
- Check ICD/goose neck (if present) for blockage and confirm function.
- Remove debris from grates and catchbasin sumps.
- Measure sediment and compare to trigger thresholds.
- Review complaints/backup logs and correlate to segment.
- Schedule CCTV/cleaning if trending indicates increased risk.

Appendix C – Cleaning Record (Template)

- Asset ID / Segment: _____
- Date: _____ Equipment: _____
- Cleaning method (flush/radial wash/jet): _____
- Jetting pressure/nozzle (if applicable): _____
- Debris/sediment volume removed and disposal method: _____
- Plug handling (if applicable): N_plugs = _____ ; issues noted: _____
- Post-cleaning observations / verification: _____
- Follow-up required: _____

Appendix D – Legacy Maintenance Schedule (Reference Table)

The table below summarizes a legacy maintenance schedule that has been applied to EES installations and is provided for reference and comparison.

Task	Frequency	Compared to conventional systems
Inspection to ensure adequate operation (including confirmation of sump drawdown below perforated pipe invert and goose neck function)	Once or twice per year – 48 hours or more after a significant storm event	Not required in conventional systems (preventative practice)
Removal of accumulated trash and debris from sumps and grates	Twice per year	Best practice in conventional systems
Monitoring of accumulated sediment depth in catch basins	Once a year	Best practice in conventional systems
Jet pressure wash and CCTV inspection of sewer and perforated pipes	At least every 20 years or when sediment levels reach ~150 mm depth	Comparable to conventional systems, but includes additional perforated pipes

DRAFT
