#### **Executive Summary**

This Site Servicing and Stormwater Management Report presents the proposed potable water, sanitary and storm servicing for the Fastfrate Ottawa Warehouse and Distribution Facility. This report will be used in support of the Site Plan Approval process.

Sanitary servicing of the site will be achieved with an on-site wastewater treatment system. This system consists of a sewer, septic tank, pumping chamber, Level IV treatment unit, shallow-buried trench system and mantle. It is anticipated that and Environmental Compliance Approval (ECA) from the MECP will be required, as the system will treat over 10,000 L/d of sanitary sewage.

Potable water will be supplied to the site by a new drinking water well, with sufficient capacity to service the intended development. Since the site is not serviced by municipal watermains, and since the proposed drinking water well will not have the capacity required to provide fire protection, the fire protection volumes will be provided from the permanent pool of the proposed stormwater management wet pond. The fire protection system consists of two (2) dry hydrants, a Siamese connection, and a building sprinkler system.

The stormwater management (SWM) for the Fastfrate site is subject to the overall SWM of the Hawthorne Industrial Park, as presented in the Hawthorne Industrial Park Stormwater Management Report (HIP SWM report), prepared by J.L. Richards & Associates, and dated May 2009. This report also demonstrates how the proposed SWM strategy conforms to the requirements of the HIP SWM report and of the regulatory authorities. Overall, the SWM strategy will be achieved with a system of ditches, culverts, and a wet pond which will provide stormwater quality and quantity control for the site.

## 1. Introduction

CIMA+ was retained by CIVITAS & Fastfrate to prepare a Site Servicing and Stormwater Management Report for the proposed construction of a warehouse containing cross-docks and office building, at 301 Somme Street in Ottawa, Ontario.

The purpose of this assessment is to confirm that the proposed development will be serviced adequately by the proposed water supply well, septic system and stormwater management. This assessment shall be used in support of the application for Site Plan Approval.

The detailed design of sediment and erosion control measures, site servicing (storm, sanitary, water) and grading, as well as measures for the control of stormwater runoff, are considered in this report, in general accordance with the Ottawa Sewer Design Guidelines (2012), the Ottawa Design Guidelines – Water Distribution (2010) and associated Technical Bulletins.

## 1.1 Site Description and Proposed Development

The Site is located near the intersection of Rideau Road and Somme Street. The subject site is currently vacant and measures approximately 4.05 ha. The site is bounded by Somme Street to the south and west, by Rideau Road and Christie Creek to the north and by vacant land to the east. The proposed development is a 76,505 sq. ft. warehouse building with associated loading dock areas and employee parking stalls. Refer to the project drawings for the site plan of the proposed development (prepared by CIVITAS).

Figure 1-1 : Site Location & Key Plan

The objective of this study is to assess current site servicing conditions through the review of available background documents and to present detailed concepts, calculations, and results to provide adequate site servicing for the new building and associated parking lot.

## **1.2 Existing Infrastructure**

The proposed site is part of the Hawthorne Industrial Park (HIP) which is currently serviced by roads and an existing open ditch system and SWM facility that convey stormwater and provide SWM quantity control for the entire HIP. The site is not serviced by municipal sewers or municipal watermains.

### **1.3 Summary of Applicable Background Documents**

- + MOE SWM Manual (2003)
- + 2012 Ottawa Sewer Design Guidelines, as amended by technical bulletins
- + 2010 Ottawa Design Guidelines for Water Supply, as amended by technical bulletins
- + Existing Master SWM Report (prepared by J.L. Richards Associates Ltd., May 2009)
- + Hydrogeological Assessment Report (prepared by GHD, 2022)
- + Septic Assessment Report (prepared by GHD, 2022)
- + Environmental Impact Study (prepared by GHD, 2022)
- 1.3.1 Stormwater Management Report, Hawthorne Industrial Park By J.L. Richards & Associates Limited May 2009.

This report addresses stormwater management within the Hawthorne Industrial Park (**Appendix A – JL Richards SWM Plan**). The contents of this report are discussed in more detail in **Section 4**.

1.3.2 Hydrogeological Assessment Report by GHD, 2022.

This report addresses the hydrogeological characteristics of the site and assessing the capacity of the on-site well (GHD, 2021a).

**1.3.3 Septic Assessment Report by GHD, 2022.** 

This report addresses the percolation rate of the site and assessing the capacity of the on-site septic system (GHD, 2021b).

1.3.4 Environmental Impact Study by GHD, 2022.

A scoped environmental impact study was prepared for this project. This report summarised the investigations of potential environmental impacts and required mitigation measures, & setbacks to be respected during construction of this project.

### **1.4 Consultation and Permits**

In response to the pre-consultation requirements defined in the City's Development Servicing Study Checklist, the following agencies were consulted in support of the preparation of this report. The Development Servicing Study Checklist as well as all relevant correspondence with the consulted agencies can be found in **Appendix F**.

#### **City of Ottawa**

A Pre-Application Consultation meeting was done with the City of Ottawa. The meeting discussions revolved around planning, engineering, and transportation requirements. Details of this consultation are included in **Appendix F**.

CIMA+ had a second meeting with Harry Alvey from the City of Ottawa on May 18, 2021. The discussion was mostly about SWM strategies and fire protection. Details of this consultation are included in **Appendix F.** 

#### South Nation Conservation Authority (SNCA)

The subject site falls under the jurisdiction of the South Nation Conservation Authority (SNCA). CIMA+ contacted James Holland from the SNCA to identify the any Natural Heritage/Hazards features that may impact the development as well as any Storm Water Management Criteria for the site and required approvals/permits. Correspondence with James Holland has been included in **Appendix F**.

#### Ministry of the Environment, Conservation and Parks (MECP)

CIMA+ expects that the proposed development will require an Environmental Compliance Approval (ECA) as the development requires an on-site wastewater treatment system treating over 10,000 L/d.

It is expected that the application can be submitted directly to the MECP, and not through the City of Ottawa's Transfer of Review (ToR) Program. The correspondence with the City project manager has been provided in **Appendix F**.

## 2. Sanitary Servicing

## 2.1 Existing Conditions

The HIP and the subject site are not serviced by municipal sanitary sewers.

#### 2.2 Sanitary Sewer

#### **Design Criteria**

The design criteria for determining the sanitary peak flow rates for the proposed development follow the parameters outlined in Figure 4.3 – Peak Flow Design Parameters Summary of the City of Ottawa Sewer Design Guidelines, 2012 as amended by all applicable Technical Bulletins. These criteria was used to size the sanitary sewers on this project. Namely, the following parameters have been used in determining the peak sanitary flow rates:

Table 2-1: Sanitary Peak Flow Determination Design Criteria

Design Criterion	Commercial Areas
Commercial Average Flow	2.80 L/m²/day
Commercial Peaking Factor	1.5
Total Infiltration Allowance	0.33 L/s/effective gross hectare (for all areas)

#### **Proposed Sanitary Peak Flows for Sanitary Sewer Sizing**

The estimated peak flows from the proposed development based on the design criteria listed in **Table 2-1** are outlined in the following Table.

Table 2-2: Peak Sanitary Flows – Sanitary Sewer Sizing

Flow Type	Total Flow Rate (L/s)
Average Dry Weather Flow Rate	0.23
Peak Dry Weather Flow Rate	0.35
Peak Wet Weather Flow Rate	0.35

Detailed calculations for peak sanitary flows for sanitary sewer sizing are presented in **Appendix D**.

#### Sanitary Sewer Sizing

The flows indicated above will be directed from the building to the onsite wastewater disposal system through a new 200mm diameter PVC sanitary sewer. This sewer sizing is acceptable per the calculations and sewer design sheets (refer to **Appendix D**).

## 2.3 Onsite Wastewater Disposal System

#### 2.3.1 Daily Design Sewage Flow

Onsite wastewater treatment systems are regulated under the Ontario Regulation 332/12, the Building Code Act (1992) (OBC), Part 8 of Division B provides the information required the design, construction, installation, operation, and maintenance of these system. The Fastfrate warehouse facility requires a Class 4 system to accept both greywater and human waste.

The proposed Fastfrate facility will be developed with a maximum of 41 loading bays and will be provided with a total of 7 water closets. The daily design sewage flow for the Fastfrate facility was calculated to be 12,800 L/d in accordance with Table 8.2.1.3.3.B of the OBC. For non-residential occupancies, the septic tank working capacity shall be three times the daily design sanitary sewage flow. Therefore, the septic tank must have a minimum working volume of 38,400 L. A summary of the daily sewage design flow calculations are provided in **Table 2-3** below.

Parameter as per OBC – Table 8.2.1.3.B.	Volume (L) as per OBC	Design Basis for Fastfrate	Flow (L/d) <sup>(1)</sup>	
Warehouse				
a) Per water closet, <b>and</b>	950 7 6,650			
b) Per loading bay	150 41 6,150			
	12,800			
Minimum Septic Tank Volume (3x the Daily Design Flow) (L) 38,400				
Notes: 1. Column 2 x Column 3 = Column 4 (e.g. $950 \pm x.7 = 6.650 \pm (d)$				
1. Column 2 x Column 3 = Column 4 (e.g., 950 L x 7 = 6,650 L/d)				

Table 2-3: Daily Design Sewage Flow Rate and Septic Tank Volume

#### 2.3.2 System Design

A Class 4 septic system typically consists of a septic tank and leaching bed. Depending on the system, a pumping chamber to dose the leaching bed and/or a level IV treatment unit may be required. The design of the septic system is based on the following two factors:

- + Daily sewage design flowrate
- + Percolation Time of the native soil (T-Time)

The percolation time (T-Time) of the native soil is defined as the amount of time it takes for water to travel 1 cm. Typical T-times of soils ranges from 1 to 50 minutes, with some soils up to 125 minutes. GHD limited (GHD) was retained to excavate test pits to help determine soil stratigraphy and the T-time. Five test pits were advanced to depths ranging from 2.4 to 3.4 m within the proposed septic system area and SWM pond. The soil stratigraphy consisted of fill at each location and described as gravelly sand with silt trace clay to a silty sand with gravel and clay. Fill was observed to the bottom of each test pit. Refer to GHD's septic assessment (GHD, 2021b) for more information. Groundwater seepage was encountered at each test pit and was observed between 1.8 and 2.4 m below ground surface. GHD estimated the T-time to have an average value of 12 to 20 min/cm, based upon gradation test results only. As a conservative approach, a Design T-time of 20 min/cm was selected for sizing the leaching bed for this site.

There are 5 types of leaching beds regulated in Ontario under the OBC:

- 1. Conventional Leaching Bed
- 2. Sand Filter Bed
- **3.** Shallow Buried Trench (SBT)
- 4. Type A Dispersal Bed
- 5. Type B Dispersal Bed

For the Fastfrate site, a raised SBT leaching bed was selected as it would meet all space and site constraints. The footprint of the SBT system is smaller than a conventional absorption trench system such as a conventional leaching or sand filter bed because the soil is not relied upon for any significant portion of the treatment.

A SBT is an alternative to a conventional leaching bed and are always used in conjunction with a treatment unit capable of consistently providing effluent with 10 mg/L five-day carbonaceous biochemical oxygen demand (cBOD<sub>5</sub>) and 10 mg/L suspended solids (SS). A SBT leaching bed is a pressurized distribution system which delivers regular timed doses of effluent to small diameter laterals (typically 25 mm PVC pipe) supported inside of a plastic chamber. The laterals are perforated at regular intervals on the top of the pipe with an adequate number of orifices on the bottom to provide self-drainage to prevent freezing during cold weather. When the dosing pump starts, effluent is forced along the entire length of the lateral and sprayed upwards where it hits the chamber and trickles down into the soil. The pump is sized to account for friction losses, static losses, and a residual pressure head of at least 600 mm at the furthest point from the pump. This ensures the entire footprint of the leaching bed is utilized and provides a more efficient distribution and use of the soil absorption system. For soils with T-times of up to 50 min/cm, hourly dosing is generally sufficient to allow the ponded water in the trench to infiltrate into the soil.

#### Septic Tank, Pumping Chamber & Level IV Treatment Unit Clearances

As per Section 8.2.1.6.(1), the septic tank, level IV treatment unit and the pumping chamber will meet the minimum clearances for treatment unit listed in the OBC Table 8.2.1.6.A. In addition, as per 8.7.4.0.(11), the distances set out in column 2 of Table 8.2.1.6.B. shall be increased by twice the height that the leaching bed is raised above the original grade. The current grade at the site where the septic system will be installed is 90.950 meters above sea level (m ASL). The SBT will be raised with a sand mantle below the SBT. The top of grade of the SBT at the highest elevation is 91.6 m. Therefore, the minimum clearances must be increased by 1.3m. A summary of the clearances required for the treatment units (septic system, pumping chamber, and level IV treatment unit) and the SBT leaching bed at the Fastfrate facility septic system is given in **Table 2-4** and **Table 2-5** below, respectively.

It is noted that there will be a SWM facility located east of the septic system, which will be considered as a pond for establishing minimum separation requirements.

Object <sup>(1)</sup>	Treatment Units Minimum Clearance, m	Additional Clearance required for the Treatment Units at Fastfrate, m <sup>(2)</sup>	Total Clearance required for the Treatment Units at Fastfrate, m <sup>(3)</sup>

2. [SBT Top of Grade (91.6 m) - Original ground elevation (90.95 m)] x 2 = 1.3 m

Total Clearances required for the Treatment Units for the Fastfrate facility 3.

#### **Pumping Chamber**

In accordance with sentence 8.7.6.1(3) of the OBC, the pump chamber should have a volume between 50% and 75% of the daily design capacity is recommended. Therefore, it is recommended the pump chamber have a minimum working capacity of 19,200 L.

#### Submersible Pumps

Wastewater will flow by gravity to the septic tank, and then by gravity to the pumping chamber. The discharge from the pumping chamber and the rest of the system will be pressurized and require submersible pumps. Submersible, readily available and replaceable pumps are wired and rated for an effluent with 3 mm to 20 mm solids handling capacity. An alternating duplex pump configuration is recommended to allow time for service in the event of a pump failure. The specified pump must have a capacity equal to or greater than the calculated maximum pressure requirement as per the SBT design at the design flow. Five submersible pumps will be required:

- + Two pumps for the pumping chamber discharge which will operate in a duty / standby configuration with rotation on stop, time, and failure
- + Two pumps for the level IV treatment discharge which will operate in a duty / standby configuration with rotation on stop, time, and failure
- One pump for the level IV treatment discharge that will recycle effluent upstream of the septic + tank.

The submersible pumps will be provided by the level IV treatment unit supplier, Waterloo Biofilter. Waterloo Biofilter typically specifies Little Giant WS Effluent Series submersible pumps. As per item 8.6.1.3.(4), when a pump or siphon is required the pump or siphon shall be designed to discharge a dose of at least 75% of the internal volume of the distribution pipe within a time period not exceeding fifteen minutes. Therefore, the volume required to dose 75% of 175 m of 50 mm diameter schedule 40 PVC pipe is approximately 64.5 L within 15 minutes, or a required pump flow rate of 4.30 L/min (0.07 L/s). Sentence 8.7.6.1.(2) requires residual pressure (minimum 600 mm as per sentence 8.7.6.1.(2) at the furthest lateral) to ensure the entire bed is dosed.

The Little Giant WS Effluent Series includes submersible pumps capable of dosing 1.70 L/s to 9.5 L/s, depending on the model. With a minimum flow rate of 0.07 L/s, the Little Giant submersible pumps will provide more than the minimum required dosing flowrate. There are several Little Giant WS Effluent Series submersible pump models. The Hazen William formula was used to calculate the theoretical total dynamic head (TDH) in meters of each of the three pumping scenarios and plotted against the different Little Giant submersible pump curves to find the theoretical operating flowrate. A summary of the results in listed in Table 2-6 below. Refer to **Appendix E** for the pump system curves and calculations.

System	Recommended Pump Model	Theoretical Operating Point
Pumping Chamber Discharge	WS50HM-12-20	3.2 L/s at 12.8 m TDH
Level IV Treatment Discharge to SBT	WS100HM-12-20	2.2 L/s at 23.8 m TDH
Level IV Treatment Discharge Recycle Line	WS50M-20	5.7 L/s at 3.1 m TDH

Table 2-6	Theoretical	Pumpina	Flow Rates
10010 2 0.	ricorcuca	i uniping	11011110105

#### Level IV Treatment Unit

A Level IV Treatment is required for SBT type leaching beds. The Waterloo Biofilter level IV treatment unit will be designed to meet the level IV treatment effluent requirements of 10 mg/L for both SS and cBOD<sub>5</sub>, as listed in Table 2-7 (adapted from OBC Table 8.6.2.2.).

ltem	Column 1 Classification of Treatment Unit <sup>(1)</sup>	Column 2 Suspended Solids <sup>(2)</sup>	Column 3 CBOD <sub>5</sub> <sup>(2)</sup>
1.	Level II	30	25
2.	Level III	15	15
3.	Level IV	10	10
			the levels of treatment described in
CAN/BNQ 3680-600, "Onsite F	Residential Wastewater Treatr	nent Technologies"	
2. Maximum concentration in n	ng/L based on a 30-day avera	ge.	

Table 2-7: OBC	Treatment Unit	I evels and	Required	Ffluent	Concentrations
		Lovoid una	rtogunou	LIIIGOII	00110011010110

The level IV treatment unit must be certified to CAN/BNQ 3680-600 "Onsite Residential Water Treatment Technologies". The treatment units installed in Ontario typically either use aeration or a filter media to provide treatment. Aeration treatment units have higher operation and maintenance costs and effort as blowers are required in addition to pumps. Filter media type treatment units do not require blowers and require the filter media to be replaced approximately every 10+ years or to the manufacturer's recommendation. A filter media type level IV treatment unit such as a Waterloo Biofilter is recommended for this application. The sanitary waste from the warehouse will flow by gravity to the septic tank, where settling will occur, and the effluent will flow by gravity to a pumping chamber. The pumping chamber will consist of 2 pumps (duty/ standby configuration with frequent rotation via an alternating timer), which will pump the effluent to the level IV treatment unit to evenly dose the filter media. The filtered water will then be either pumped to the shallow buried trench by one of two pumps (duty / standby configuration with frequenting rotation on an alternating timer) or recycled to the inlet of the septic tank by a third dedicated pump. This recycle line from the level IV treatment unit post nitrification will allow for partial denitrification of the effluent – the reduction in effluent nitrates. All pumps will be controlled and monitored by a common control panel for remote monitoring, control, and data logging over a stable cellular network to Waterloo Biofilter who will contact personnel from the Fastfrate facility. Alarms include high water, float failure and pump failure from the Waterloo Smart Panel. A flow schematic of the system is given in Figure 2-1 below.

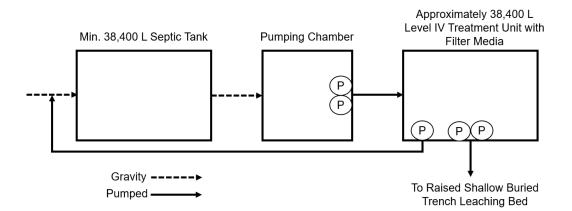

Figure 2-1: Septic System Process Flow Schematic

#### Shallow Buried Trench Leaching Bed

Due to the shallow groundwater seepage observed at 1.8 to 2.4 m below the surface and the requirement that the bottom of the leaching bed must be a minimum of 900 mm above the top of the high ground water table, the leaching bed must be raised. Due to the limited available space on the site, a SBT system with a sand mantle is recommended to minimize the system footprint. The sand mantle will be approximately 15 m in total length with the last 3 meters of the mantle changing direction slightly more north-west than the first 12 m of the mantle. Even with the irregular shape of the mantle, effluent will flow through the mantle as the T-time of the sand mantle will be imported sand fill with a percolation rate of 6 to 10 minutes/cm and have a maximum 5% if fines passing through a No. 200 sieve.

The length of the SBT distribution pipe laterals is calculated based on the T-time and the Table 8.7.3.1 in the OBC. The percolation tests of the native soil in the area of the proposed septic bed yield 12 to 20 minutes/cm according the GHD report. As per Table 8.7.3.1 in the OBC, a percolation between 1 to 20 minutes/cm corresponds to the following formula to calculate the length of distribution pipe required:

$$L = \frac{Q}{75}$$

Where:

L = The length of distribution pipe in m

Q = Total Daily Design Flow Rate (12,800 L/d for the Fastfrate Facility)

Therefore, the SBT must have a minimum distribution pipe length of 171 m (rounded up to the nearest meter). The OBC stipulates the maximum length of a SBT distribution run is 30 m as specified in clause 8.7.3.2(2)(a). To accommodate the clearances for the SWM pond and property line, 7 distribution pipe runs of 25 m (175 m total) is recommended.

Each lateral shall include a test port at the end of each line. Each test port will have a long radius sweep bend at the end, equipped with a normally closed ball valve and a removal plug with a drilled orifice the same diameter as the lateral spray orifices. The test ports are intended to allow individual line squirt testing and testing of all lines at once. The plugs will be removable to allow line flushing and cleaning as necessary.

The spray orifice size is important in the flow/pressure calculation, and it is recommended that 3 mm sizing be used as a default. OOWA best practices recommends orifices are spaced between 0.6 to 1.2 m along the lateral for even distribution of effluent. The orifices for the Fastfrate facility are specified to be spaced 0.6 m apart.

In addition to the spray orifices, drain orifices are recommended to be evenly spaced, facing downward, on each lateral to allow for drain-out and prevent freezing between pump cycles. It is recommended to have a drain orifice every 2 to 4 spray orifices, offset from the spray orifices and having orifice shields installed to prevent erosion of the trench base. The drain orifices will be spaced every 3 m apart and will be offset from the spray orifices.

OOWA Best Practices recommends the manifold should be at least one trade size larger than the laterals, typically between 32 mm (1.25" nominal) and 50 mm (2" nominal). The distribution laterals will be 25 mm diameter Schedule 40 PVC, and the manifold will be 50 mm diameter Schedule 40 PVC. Each lateral will include a ball valve for isolation and a 50 mm to 25 mm reducer. The components of the SBT leaching bed are given in the section below.

Fill will be required for the raised SBT system. The contact area at the base of the fill system was carefully considered. The contact area between the fill and the native receiving soils is important in order to safely transition treated effluent from the fill to the native soils without causing environmental risks. Due to inconsistent native soil type at the site and as a precaution, a sand mantle is recommended.

The mantle for the Fastfrate septic system was designed according to Option 2 of the Ontario Onsite Wastewater Association (OOWA) Best Practices: Shallow Buried Trench Guidance Document:

The contact area between the native soils and the fill material is which the SBT bed and mantle area should be at least equal to the following formula:

$$A = \frac{Q \times T}{850}$$

Where:

 $A = \text{Contact Area} (m^2)$ 

T = The T-time of the receiving soils (a conservative T-time of 20 minutes/cm was used)

Q = Total Daily Design Flow Rate (12,800 L/d for the Fastfrate facility)

Therefore, the minimum recommended mantle area is 302 m<sup>2</sup>. The total mantle surface area provided (extended and beneath the SBT) has an approximate contact surface area of 660 m<sup>2</sup> and is over double the minimum surface area as calculated by the OOWA Best Practices.

Each lateral shall include a test port at the end of each line this may be an individual access port at the end of each lateral. Each test port will have a long radium sweep bend at each test port equipped with a normal closed ball valve and a removal plug with a drilled orifice the same diameter as the lateral spray orifices. The test ports are intended to allow individual line squirt testing and testing of all lines at once. The plugs will be removable to allow line flushing and cleaning as necessary.

The orifice size is important in the flow/pressure calculation, and it is recommended that 3 mm sizing be used as a default. OOWA Best Practices recommends orifices are spaced between 0.6 to 1.2 me along the later for even distribution of effluent. The orifices for the Fastfrate facility septic system are specified to be spaced 0.6 m apart.

The drain orifices are evenly spaced, facing downward, on each lateral to allow for drain-out and prevent freezing during pump cycles. It is recommended to have a drain orifice every 2 to 4 spray orifices, offset from the spray orifices and having orifice shields installed to prevent erosion of the trench base. The drain orifices will be spaced every 3 m apart and will be offset from the spray orifices.

OOWA Best Practices recommends the manifold should be at least one trade size larger than the laterals, typically between 32 mm (1.25" nominal) and 50 mm (2" nominal). The distribution laterals will be 25 mm diameter Schedule 40 PVC pipe, and the manifold will be 50 mm diameter Schedule 40 PVC pipe. Each lateral will include a ball valve for isolation and a 50 mm to 25 mm reducer. To summarize, the components of the SBT system for the Fastfrate facility include:

- Treatment Unit certified to Level IV CAN/BNQ 3680-600 "Onsite Residential Wastewater Treatment Technologies"
- + Dosing pump chamber and pumps equipped with timer controls.
- + Forcemain from dosing chamber to distribution manifold which typically is PVC schedule 40
- + Manifold (header) assembly, consisting of 50 mm (2") pressure pipe (PVC Schedule 40)
- Laterals in the leaching bed consisting of 25 mm (1") pressure pipe (PVC Schedule 40) with 3 mm orifice holes spaced evenly along the top of the pipe and 3 mm drain holes on the bottom
- + Pipe support to keep the lateral off the bottom of the trench
- Leaching chamber covering the laterals. Large diameter pipe cut in half is not acceptable, as the footprint of the sidewalls is not sufficient to prevent settling of the chambers over time. Chambers with a wide resting foot are preferred.
- + Filter cloth over the chambers
- + "Sweep 90' fitting extending within 10 cm of the finished grade at the end of each lateral. The vertical piece may be equipped with a ball valve if desired, and terminate with a threaded cap.

#### **Ground Water Elevation and Native Fill**

The septic, pump chamber, and level IV treatment unit tanks will require to be wrapped in a waterproof material to prevent groundwater infiltration. Due to the inconsistency of the fill material observed and the shallow groundwater seepage encountered by GHD, the leaching bed will be required to be raised. The 100-year flood elevation is 90.1 m ASL, therefore the SBT leaching bed and sand mantle have been designed to be above this elevation as not to flood out the septic system during a 100-year storm event. It is recommended prior to placement of the imported fill that any surficial organics are to be removed from the tile bed and mantle area. Additionally, the existing fill material is recommended to be compacted to ensure uneven settlement does not occur.

## 2.4 Sanitary Servicing Summary and Conclusions

The sanitary servicing design for the proposed development conforms to the requirements of the City of Ottawa Sewer Design Guidelines, 2012, as amended by all applicable Technical Bulletins.

The on-site wastewater disposal system (Septic Tank, Level IV treatment unit and shallow-buried trench system) conform to the requirements of the Ontario Building Code part 8. However, due to the Total Daily Design Sewage Flow being >10,000L, and ECA from the MECP will be required for this system.

## 3. Potable Water Servicing

## 3.1 Existing Conditions

The site is currently undeveloped and is not serviced by municipal watermains. As such potable water for this site will be provided by a groundwater supply well. Refer to the GHD's Hydrogeological Assessment (GHD, 2022) for more information.

## 3.2 Building Water Demands (Domestic and Fire Protection)

#### 3.2.1 Potable Water Quantity Requirements

Based on design flows from the OBC, the average daily water use for the facility is **8.9 L/min** (**Table 3-1**). Considering a peak demand of 35.6 L/min (average demand \* 4), the well discharge of 60 L/min in the Hydrogeological Report will sufficiently meet the water demand requirements of the facility.

Parameter as per OBC – Table 8.2.1.3.B.	Volume (L) as per OBC	Design Basis for Fastfrate	Flow (L/d) <sup>(1)</sup>
Warehouse			
a) Per water closet, and	950	7	6,650
b) Per loading bay	150	41	6,150
	Total Daily	/ Design Flow (L/d)	12,800
Notes:			
1. Column 2 x Column 3 = Column 4 (e.g	g., 950 L x 7 = 6,	650 L/d)	

Table 3-1 Potable Water D	esian Flows
---------------------------	-------------

The above water demands were also compared with ones obtained following the City of Ottawa Design Guidelines – Water Distribution, 2010 as amended by all applicable Technical Bulletins. The peak water demand obtained using this method is **0.75 L/s (45.0 L/min).** This value is also within well discharge capacity. (**Table 3-2**).

Table 3-2 Potable Water Design Flows – City of Ottawa Design Guidelines – Water Distribution

Demand Type	Average Daily Demand (L/s)	Maximum Daily Demand (L/s)	Maximum (Peak) Hour Demand (L/s)
Commercial	0.28	0.42	0.75
Total	0.28	0.42	0.75

#### 3.2.2 Fire Protection Quantity Requirements

The facility is not connected to a municipal water supply and will therefore require other means of fire protection. The fire protection flow and volumes have been determined by Civilec in a report. Refer to (**Appendix C**).

#### 3.2.2.1 Fire Protection Flow

The Fire Protection flow identified in Civilec report is 7500L/min (125L/s). Refer to (**Appendix C**). The fire flow will be divided between one intake pipe to supply the sprinkler system and two dry fire hydrants. The intake pipe to supply the sprinkler system has been designed for the entire fire flow.

#### 3.2.2.2 Fire Protection Volume

The Fire Protection Volume required for this site as per Civilec report is  $675m^3$ . Refer to (**Appendix C**). The current pond configuration has a storage capacity of  $683m^3$  of volume between the max ice thickness (88.610) and the top of the intake pipe (87.550).

#### 3.2.2.3 Fire Protection System

The proposed SWM wet pond shall be used for storing water for fire protection. Refer to **Section 4.5** for more information on the design of the proposed SWM pond.

A fire pump located in a 2-hour fire rated mechanical room in the building shall serve the Fire Protection system. The fire pump inlet shall be connected to an 8.0 m deep sump, to be hydraulically connected to the pond via an intake pipe at the base of Pond.

To ensure that the fire protection volumes are adequate during winter conditions, the maximum ice thickness on the permanent pool of the SWM wet pond was determined based on the Annual Freezing Degree Days method. Based on an Ice cover condition coefficient of 2.4 and the Annual Freezing Degree Days value 785 °C-day for 2019, the ice thickness of 67.24 cm was obtained. Based on this calculation, the design ice thickness used is of 69 cm. Detailed calculations are presented in **Appendix C**.

The permanent pool of the proposed SWM pond provides fire protection volumes of 683 m<sup>3</sup> with Ice cover, and 1305 m<sup>3</sup> without ice cover. This volume will provide sufficient volume of water to supply the building, fire protection intake, and two (2) dry hydrants.

A free-standing Siamese connection will be located outside the front entrance and would be used to supply the sprinkler system if the pump within the shaft were unable to draw water from the fire protection pond.

To prevent exfiltration and maintain the water level of the permanent pool, the SWM pond will be constructed with a liner. Specifications for the liner are provided in **Appendix G**. In the event the water level in the sump & pond drops below the minimum level, makeup water will be provided to the sump and pond from the well to mitigate losses due to infiltration and evaporation. Alarm indicators will monitor the levels in the sump & pond, and will control the supply of makeup water to the pond and sump from the well.

The building fire protection system requires 6624 US gal. per minute (110 L/s) per NFPA 13. As such, the building fire protection intake was sized as a 450mm pipe, slopes at 0.2% with a capacity of 127 L/s under gravity free flow conditions (Factor of safety = 1.15). An intake screen capacity of 220 L/s is also specified for the building fire protection intake (Factor of safety = 2.0).

### 3.3 **Proposed Water Supply Well**

#### 3.3.1 Well Quality

Samples tested from an existing water supply well confirmed that there were no health-related parameters in exceedance of the Ontario Drinking Water Standards (ODWS). There were several parameters that exceeded their respective ODWS for aesthetic objectives including hardness, total dissolved solids, turbidity, manganese, and iron. These parameters will require commercially available treatment equipment (for example a water softener for treatment of hardness). The treatment systems will be determined later in the design process. A detailed breakdown of test results is presented in GHD's Hydrogeological Assessment (GHD, 2022).

As a proactive measure, it is recommended that bacteriological treatment (i.e., ultraviolet treatment) be used at a minimum. It is anticipated that the well system will be regulated and will require treatment to meet appropriate standards to ensure potable water is available to employees and visitors. A water treatment specialist should be retained for treatment and a qualified engineer should review the final treatment system before use.

#### 3.3.2 Well Quantity

The water supply well referred to as TW-2 in the Hydrogeological Assessment is capable of providing long-term quantities of groundwater at a pumping rate of 60 L/min based upon the pumping test completed (GHD, 2022). After 6 hours of pumping, the well drawdown was 1.15 m with 23.9 m of available drawdown remaining. A total of 21,600 L was pumped from the well during the testing.

Based upon the septic total daily design values of 12,800 L/day, the well exceeds the daily design quantities estimated. The actual water volume required for the development on a daily basis is expected to be much less than 10,000 L/day. The water supply well and the aquifer that it is drilled into can safely provide the long-term quantities required for this development based upon the testing completed without significant interference to future and existing neighbouring wells.

#### 3.4 Conclusion – Potable Water Servicing

The proposed well will provide sufficient potable water supply for the development, while the proposed SWM pond permanent pool will provide sufficient fire protection volume for the development.

## 4. Storm Water Management

## 4.1 Background

As previously mentioned, the subject site is currently vacant and is part of the Hawthorne Industrial Park (HIP). The site is generally flat and slopes towards the North-East corner before it reaches the 6m tall embankment and reaches Christie Creek on Rideau Road. There is a fill layer of approx. 6m thick across most of the site.

The HIP sector and the Fastfrate site are subject to the HIP Stormwater Management Report and associated drawings (**Appendix A**), developed by J.L. Richards and dated May 2009. This report established the Stormwater Management design for the HIP, which was then used as the design basis for the roads, open ditch system, and HIP SWM facility (refer to Drawings issued for MOE Approval; **Appendix A**).

The HIP SWM facility, located east of the industrial site, only provides stormwater quantity control for the HIP sector. The HIP SWM facility controls storm events up to the 2 - year post-development peak flow to 50% of the 2-year pre-development peak flow; and controls post-development peak flows to pre-development levels for storm events ranging from the 2-year to the 100-year recurrence. The HIP SWM report specifies that individual parcels of the HIP must provide stormwater quality control.

## 4.2 Stormwater Management Strategy

4.2.1 Deviations from the HIP SWM Report & Drainage Plan

The proposed SWM strategy for this site deviates from that of the HIP SWM report.

The drainage plan for the HIP divides the drainage of the Fastfrate site between two outlets. Part of the site drains to Christie Creek while the remainder drains to the HIP SWM facility via the open ditch system along Somme Street. (**Figure 4-1**).

To simplify the SWM strategy the drainage distribution between both outlets has been altered from what was presented in the HIP SWM report, redirecting more runoff towards the HIP SWM facility (**Figure 4-1**). This simplifies the site grading and allows all quality control measures to be in a single location. Therefore, the proposed conditions require quantity control (through on-site retention) to respect the allowable release flowrates up to the 100-year storm stipulated in the HIP SWM report.

Figure 4-1 SWM Drainage Area from HIP SWM (left), and from Proposed SWM (right)

The original drainage plans and sewer design sheets for the HIP sector, as well as the proposed SWM plan for the Fastfrate site are provided in **Appendix B**.

#### 4.2.2 Allowable Post Development Flow Rates and Quantity Control Requirements

The allowable release rate for the proposed site was determined based on parameters of the HIP SWM report, sewer design sheets and SWM plans. Since the Fastfrate site is smaller than its corresponding catchments of the HIP SWM report, the allowable release rate for the catchments to the HIP SWM facility was re-calculated to account for this. For this calculation, the runoff coefficient, time of concentration and rainfall intensity were kept identical to the HIP SWM report.

Based on this calculation, the allowable release rate for the site to the HIP SWM facility is of **906.9 L/s**, up to and including the 100-year storm event to comply with the HIP SWM report (**Table 4-1**). Supporting calculations and location of sourced information can be found in **Appendix B**.

Catchment ID	Catchment	Runoff	Time of	Rainfall	Allowable
	area	Coefficient	Concentration	Intensity	Release Flow
	(ha)	(factored)	(minutes)	(mm/hr)	(L/s)
Fastfrate Site – HIP SWM Report	3.06	0.88	19.43	122.15	906.87

Table 4-1: Post-development Allowable 100-year Release Flows – HIP SWM Facility

The uncontrolled release flow for the proposed site was calculated and compared with the values determined in **Table 4-1**. This comparison is summarised in **Table 4-2**.

Quantity control is therefore required for this site due to the catchment redistribution discussed in Section 4.2.1. Supporting calculations and location of sourced information can be found in **Appendix B.** 

Catchment ID	Catchment area (ha)	Runoff Coefficient (factored)	Uncontrolled Release Flow – 100year (L/s)	Allowable Release Flow – 100-year (L/s)	Allowable Release Rate – 100-year (L/s/ha)
Fastfrate Site – HIP SWM Report	3.06	0.88	906.9	906.9	296.89
Fastfrate Site – Proposed SWM	3.66	0.92	1093.2	906.9	247.78

Table 4-2: Post-development Allowable 100-year Release Rates – HIP SWM Facility

Similar calculations for the redistribution of catchments that outlet to Christie Creek were undertaken and are included in **Appendix B.** 

#### 4.3 Design Criteria and Assumptions

- + Quality control requirements: 80% TSS Removal must be provided for our site as required by the South Nation Conservation Authority (SNCA).
- + Per the HIP SWM report, the existing open ditch system is designed to the 100-year event, and the existing culverts are designed to the 10-year event.
- The current site plan deviates from the HIP SWM report. To conform with the original SWM, the 100-year allowable release rate to the SWM facility must remain at 906.9 L/s (refer to Section 4.2.2).

## 4.4 **Proposed Storm Servicing**

All detailed SWM calculations and plans are presented in Appendix B.

#### 4.4.1 Stormwater Quality Control

As specified in the HIP SWM report, the HIP SWM facility was not designed to provide quality control. It was anticipated that each individual parcel was to provide its own quality control and achieve the normal level of protection (70% TSS Removal).

Through consultation with the South Nation Conservation Authority (SNCA, refer to **Appendix F**) the quality control requirements for the HIP parcels have been revised to the enhanced level of protection (80% TSS removal).

The portion of the site that naturally drains into Christie Creek will not require quality treatment since this area will remain undeveloped and vegetated. Therefore, only the developed portion of the site draining towards the Somme Street ditches and to the existing HIP SWM facility will be treated for quality.

The quality control requirements will be achieved using a combination of grassed swales and a wet pond, operating as a "treatment train". The grassed swales, which are sloped to promote infiltration and low channel velocities (<0.5 m/s) will provide the required pre-treatment for the wet pond.

The wet pond was designed based on the volumetric water quality criteria, interpolated Table 3.2 of the MECP SWM guidelines (2003). Since the proposed site has an imperviousness ratio of 74%, the total storage requirement for quality control is of 231.67 m<sup>3</sup>/ha. The wet pond requires a total water Quality Storage of 847m<sup>3</sup>. In the pond dimensioning, at least 701.5 m<sup>3</sup> will be provided in the permanent pool and at least 147m<sup>3</sup> will be provided as extended detention (**Table 4-3**).

For this facility, the extended detention volume will be retained for a period of at least 12 hours, as per the MECP SWM Guidelines on wet ponds with < 8 ha of drainage area.

Quality Control Volumes	MECP Storage Requirement (m³/ha)	Catchment Area (ha)	Required Storage Volume (m³)
Permanent Pool	191.67	3.66	701.5
Extended Detention	40	3.00	146.4
Total	231.67	3.66	847.9

Table 4-3: Wet Pond Volume Calculations – 74% Impervious; 80% TSS Removal

#### 4.4.2 Stormwater Quantity Control

The anticipated post-development flow rates and required storage when controlled to the allowable post-development release rate are summarized below.

The site's SWM outlet will likely to be submerged during the 100-year storm due to the water level in the Somme street ditch. Considering this, the storage volumes for this site were determined assuming constant discharge at **half of the allowable release rate**. This method is used to provide the additional retention required because of the hydraulic grade line at the outlet. The storage requirements at the full and half release rates are compared in **Table 4-4**, and Supporting calculations can be found in **Appendix B**.

At a release rate of **435.4** L/s, a storage volume of **716**  $m^3$  is proposed in the SWM pond and a storage volume of **115**  $m^3$  is proposed on roofs for a total of **831**  $m^3$ . This volume can be accumulated on the site available storage volume. The available storage volumes do not account for surface storage in storm sewers, culverts or other ponding areas.

For the roof sub-areas of the warehouse and office building, the proposed release rate is **236.7** L/s. This release rate generates **115**  $m^3$  of roof storage, which is conservative with respect to the maximum available storage on the building roof (**Table 4-4**). This release rate cannot be reduced further without exceeding available roof storage.

Retention Areas	100-year – Full Release Rate (L/s)	100-year – Half Release Rate (L/s)	100-year Storage Volume – Full Release Rate (m³)	100-year Storage Volume – Half Release Rate (m³)	Available Storage Volume (m³)
Roof Sub- Area	236	.7	11	5.0	143.9

Table 4-4: Post-development Flowrate and Storage Summary

Client Project Number : GA18-0631-01

SWM Pond & Swales	670.2	216.76	329.9	716.0	996.1
Total Site	906.9	453.4	444.9	831.0	1140.0

To protect the site from a backwater in the Somme street Ditch, the outlet pipe will be equipped with an inline backflow preventer (**Appendix G**). This coupled with the ample available storage capacity on site will be sufficient to ensure the site SWM functions properly in the event of prolonged surcharging of the receiving open ditch system during the 100-year event.

As mentioned in section 3.2.2.3, the SWM Pond will be equipped with an impermeable liner. In order to mitigate any impact of seasonal groundwater infiltration into the SWM pond the liner is to be installed up to the surface.

#### 4.4.3 Site Culverts, Stormwater Outlet and Backwater Elevations

The site culverts were sized based the 100-year peak flow and resulting backwater elevations. The backwater elevations were determined based on elevations culvert headwater, calculated assuming steady-state flow conditions and a constant tailwater elevation.

To simplify the headwater calculation, upstream culverts used the downstream culvert's headwater elevation as the upstream tailwater elevation.

The 100-year water level in the municipal ditch (90.07 m ASL) was used as the tailwater elevation for the site's stormwater outlet. This depth was determined from grades in the Somme Street Ditch and its 100-year flow depth determined in the HIP SWM report.

Because of the flat nature of the site, the site's culverts are designed for the 100-year design storm due to the limited freeboard between the site and Somme street catchments.

A summary of the site culvert design under freeflow and submerged condition of the site outlet are presented in **Table 4-5** and **Table 4-6**, respectively. Detailed calculations supporting the culvert sizing are available under **Appendix B**.

Culvert	Size	Catchment	Q <sub>100y</sub> (L/s)	нw	HW/D	HW elevation	TW elevation
East Ditch	1x CSPA 1030x740	A2	446	0.56	0.76	90.09	89.82
West Ditch	1x CSPA 910x660	A1	231	0.575	0.87	90.09	89.82
STM Pond Transfer Culvert	2x CSPA 1030x740	A1-A7	907	0.595	0.80	89.82	89.50

Table 4-5: Culvert Sizing Summary – Freeflow
--

Culvert	Size	Catchment	Q <sub>100y</sub> (L/s)	HW	HW/D	HW elevation	TW elevation
East Ditch	1x CSPA 1030x740	A2	446	0.92	1.24	90.45	90.300
West Ditch	1x CSPA 910x660	A1	231	0.92	1.39	90.51	90.300
STM Pond Transfer Culvert	2x CSPA 1030x740	A1 to A7	907	1.00	1.35	90.300	90.150

Further to the tables above, the backwater elevations resulting from the 100-year design storm are summarized below, for both the Freeflow and Submerged Outlet conditions. Based on these elevations, the water surface elevation on the site remains at 0.300 from the building underside of footing in both conditions.

Location	Headwater Elevation – Freeflow Outlet Condition	Headwater Elevation – Surcharged Outlet Condition	Reference to Supporting Calculations		
	(m)	(m)			
Outlet Pipe	90.09	90.150			
Culvert #1	90.09	90.51	HW for "West Site – 100y"		
Culvert #2	90.16	90.45	HW for "East Site – 100y"		
Culvert #3	90.55	90.55	HW for "West Entrance"		
Culvert #4	90.22	90.22	HW for "East Entrance"		
Culvert #5	89.82	90.30	HW for "Transfer Culvert – 100y"		

Table 4-7: Summary of Backwater Elevations – 100-year

Spill points have been included in the site to mitigate the risk of localised flooding should site culverts be blocked during the 100-year design storm (**Table 4-8**).

Table 4-8: Summary of Site Spill Points

10010 1 0.				
Site Spill Points	Spill Elevation			
	(m)			
SWM Pond Overflow to Somme Street Ditch	90.200			
West Site Spill to Christie Creek	90.280			
East Site Spill to Christie Creek	90.280			
SWM Pond Overflow u/s of Transfer Culvert	90.375			

Site ditches have been designed to convey the 100-year flow with a manning`s 'n'-value of 0.03 for long grassed swale. Detailed calculations with input values shown in **Table 4-9** have been provided in **Appendix B**, . A summary of inputs to the calculations is provided

Table 4-9: Ditch Sizing Summary

Ditch Catchment		Q <sub>100y</sub> (L/s)
East Ditch	A2	446
West Ditch	A1	231

#### 4.4.4 Municipal Ditch and Road Culverts

The east and west entrances to the site cross the existing open ditch system and require installation of culverts. The sizing of the culverts was determined with consideration of the upstream municipal culverts since the SWM system outlet for stormwater is situated downstream of these culverts. The culverts were sized for the 10-year storm, as per the HIP SWM report. Culvert sizing suitability calculations can be found in **Appendix B**.

#### 4.4.5 Building Service Connection

A 600 mm storm sewer service connection will be provided on the south side of the proposed building and will be directed towards the SWM pond. The storm sewer will convey controlled runoff from the roof and uncontrolled runoff from catchments A4 and A5 (refer to **Appendix B**).

#### 4.4.6 Deviations from the Ottawa Sewer Design Guidelines – Swale Minimum Slope

The slope of the swales conveying stormwater for this site are inferior to the minimum slope specified in section 6.4.1 of the Sewer Design guidelines.

The grassed swales are intended to contribute to runoff quality control, operating with the proposed wet pond as a "treatment train". The reduced slope of grassed swales promotes infiltration and low channel velocities (<0.5 m/s). This improves the effectiveness of grassed swales for runoff quality control (LID SWM Planning and Design Manual).

Based on the interpretation from percolation tests for this site, the soil infiltration rate can be estimated to range between 30 to 50mm/hr. With dry swales, an underdrain is typically recommended if the soil infiltration rate is <15 mm/hr.

As such, the risk of prolonged ponding of water in the ditches is mitigated by the soil infiltration rate and presence of on-site existing fill and well draining soil.

#### 4.4.7 Culvert Ends

Given the addition of localized clear zone with recoverable slopes at the culvert location is not feasible, an assessment of roadway safety implications for the culvert ends were completed by CIMA+ in accordance with the MTO Roadside Design Manual and MTO

Roadside Evaluation Manual. The assessment focused on the installation of guiderails to shield the culvert ends.

Although the culvert ends are located within the clear zone, the installation of new guide rail is also considered a hazard within the clear zone, and thus the collision risk and severity with the new guiderail may outweigh the benefits of shielding the culvert ends. The installation of guide rail is generally recommended where the Cost/Benefit (CB) ratio is  $\geq$  1. The findings of the analysis produced a CB Ratio of -4.27 for the west entrance and -2.23 for the east entrance meaning that the collision risk and severity with a new guiderail is greater than that of the culvert ends. Refer to **Appendix B.16** for the MTO Roadside Evaluation spreadsheet and calculations.

## 4.5 Proposed SWM Pond Sizing

This section presents the proposed sizing of the SWM Pond for this project. A summary of the required volumes to be provided in the Wet Pond is presented in **Table 4-10**, and a breakdown of the pond levels and provided volumes is presented in **Table 4-11**.

Parameter	Required Volume (m³)	Source
Retention Volume	Full Release Rate: 329.9 Half Release Rate: 716.04	Table 4-4
Extended Detention	146.4	Table 4-3
Fire Protection Volume	675	Section 3.2.2.2
Permanent Pool for Quality Control	701.5	Table 4-3
Sediment Accumulation Volume (25 years)	226.8	Section 4.6.1

Table 4-10: Summary of Required SWM Pond Volumes

Contro	Bottom Elevation	Top Elevation	Depth	Provided Volume	Required Volume			
		(m ASL)	(m ASL)	(m)	(m³)	(m³)		
to 90.375           to 90.200		90.150	90.375	0.225	232.9	-		
		90.150	90.200	0.050	50.8			
Retention Volume		89.500	90.150	0.650	Pond: 610.3 Swales: 436.0 <u>Total:</u> 1046.3	Full Release Rate 329.9	Half Release Rate 716.04	
Extende	d Detention		89.300	89.500	0.200	169.1	146.4	
	Fire Protection	With Ice Cover	87.550	88.610	1.06	683		675
	Volume	Normal	87.550	89.300	1.60	1305	-	
Permanent Pool (PP) Depth of Fire Protection Intake		87.100	87.550	0.450	209	-		
	Sediment Accumulation Volume		86.100	87.100	1.0	327	226.8	
	Total PP Volume		86.100	89.300	3.2	1946	701.5	

#### Table 4-11: Summary of Provided SWM Pond Volumes

## 4.6 Calculations

#### 4.6.1 Sediment Accumulation Volume

Based on the MECP SWM planning and design guidelines, a conservative estimate of the sediment accumulation volume required for a duration of 25 years is 226.8 m<sup>3</sup> assuming an annual TSS loading of  $3.10 \text{ m}^3$ /ha/year and a removal efficiency of 80%.

#### 4.6.2 Pond Controls

As defined in the City of Ottawa Sewer Design Guidelines (2012), the Rational Method is a valid approach to determination of peak flows and pipe capacity for drainage areas of less than 40 ha in size. Thus, the Rational Method has been used in the determination of required storage volumes to store the 100-year storm events to the pre-determined allowable release rates.

4.6.2.1 Extended Detention Control (Quality)

The wet pond will use a 200mm reverse pipe with **one 80 mm dia. orifice plate** to control the detention time to the minimum detention time of 12h, per MOE Guidelines for drainage areas less than 8 ha.

Using equation 4.10 from the MECP SWM guidelines resulted in a drawdown time of 15.53 hours.

$$t = \frac{2 A_p}{C A_o (2g)^{0.5}} \left( h_1^{0.5} - h_2^{0.5} \right)$$

Equation 4.10: Drawdown Time

Where:

t = drawdown time in seconds

 $A_p$  = surface area of pond (m<sup>2</sup>)

C = discharge coefficient

 $A_0$  = cross-sectional area of the orifice (m<sup>2</sup>)

g = gravitational acceleration constant

 $h_1$  = starting water elevation above the orifice (m)

 $h_2$  = ending water elevation above the orifice (m)

$$t = \frac{2A_p}{CA_0(2g)^{0.5}} \left(h_1^{0.5} - h_2^{0.5}\right)$$
$$t = \frac{2(876.75)}{(0.63)(0.005)(2*9.81)^{0.5}} (0.2^{0.5} - 0^{0.5})$$
$$t = 55906 \, s = 15.53 \, hours$$

#### 4.6.2.2 Release Rate Control (Quantity)

The release rate control, under free flow conditions, will be achieved by **one 450x830 mm rectangular orifice** set at an invert elevation of **89.500 m ASL** and **one 200x775 mm rectangular orifice** set at an invert elevation of **89.925 m ASL**. The outlet structure will control the 100-year release rate to 906.6 L/s under freeflow outlet conditions, and to 470.8 L/s under submerged outlet conditions (Table 4-12).

Release Rate Control Flow condition	Controlled Release Flow (L/s)	Max. Water Surface Elevation at pond outlet (m ASL)
Free Flow Outlet Condition	906.6	90.090
Submerged Outlet Condition	470.8	90.170

Table 4-12 Resulting Release Flow with Proposed Controls

#### 4.6.3 Watercourse Protection Measures

Erosion protection of the soils is required at the inlet and outlet ends of the culverts across the site to provide channel stabilization and scour resistance of the flowing water based on the outlet velocity generated by the check flow for scour, which is the 100-year event.

Design Chart 2.17 of the MTO Drainage Management Manual specifies the maximum permissive flow velocities for a channel based on the channel's native lining material (i.e. soil type). The maximum permissible velocity of a silty sand channel shall be 1.5m/s for water carrying fine silts. In accordance with HDDS WC-3, section 3.2, where the velocity is exceeded the stone size for scour and erosion protection shall be as follows.

		Table	4-13. Scour	FIDIECIIDIT	Siziriy		
Stone Sizes for Scour and Erosion Protection-Low Volume Roads							
Velocity (m/s)	<2.0	<2.6	<3.0	<3.5	<4.0	<4.7	<5.0
Nominal Stone Size* (mm)	100	200	300	400	500	800	1000

Table 1-13. Scour Protection Sizing

\* Maximum size of stone to be 1.5 times the nominal stone size. 80% of stones (by mass) must have a diameter of at least 60% of nominal stone size.

The proposed culverts for the Fastfrate site all have velocities below 1.5m/s during the 100-year event and therefore would not require any scour protection. However, to be conservative, CIMA+ recommends scour protection at each culvert entrance and outlet. A nominal stone size of 100mm for erosion protection at the disturbed areas of the watercourse, upstream and downstream within the vicinity of the structure required. The protective apron shall consist of a minimum thickness of 1.5 times the nominal stone size and shall extend for a distance of two times the total culvert rise. Protection along the inlet and outlet embankments to an elevation of 0.3m above the high-water mark is also recommended.

#### 4.7 SWM Conclusions

The storm servicing design for the proposed development generally conforms to the requirements of the City of Ottawa Sewer Design Guidelines, 2012, as amended by all applicable Technical Bulletins. The storm servicing design also conforms to the HIP SWM report (J.L. Richards, 2009). Justifications have been provided where deviations were proposed by the SWM strategy.

The allowable release rate for the site post-development was calculated to be 906.9 L/s. It is expected that this can be achieved via roof storage and the proposed SWM wet pond.

A Roof Flow Control Declaration will be provided upon completion of the Mechanical and Structural design.

## **5.** Conclusion

The current study demonstrates how the proposed servicing of the site will be achieved, in that the proposed SWM strategy conforms to the existing SWM plan and that the proposed Potable Water, Fire Protection and Sanitary Servicing works will be sufficient to service the proposed development.

Within the site, all services have been designed in keeping with the City of Ottawa design requirements and the requirements of the HIP SWM Report.

We trust this site servicing and stormwater management report is to your satisfaction. If you have any questions regarding this report, please do not hesitate to contact the undersigned.

# STORMWATER MANAGEMENT REPORT

# HAWTHORNE INDUSTRIAL PARK

#### **1.0 INTRODUCTION**

#### 1.1 Background

In 1999, J.L. Richards & Associates Limited (JLR) completed a Stormwater Management Study, on behalf of Beaver Road Builders Ltd., for the development of a proposed area previously referred to as the Hawthorne Road Industrial Subdivision. The main objective of the1999 Study was to develop a conceptual storm servicing alternative (including stormwater management) that would support the proposed development without adversely affecting the hydrological regimes of receiving streams. The 1999 Study provided a conceptual design of the conveyance system and on-site storage requirements for the proposed development in order to satisfy the regulatory agencies of the time, namely the Region of Ottawa-Carleton, the City of Gloucester and the South Nation Conservation Authority (SNC).

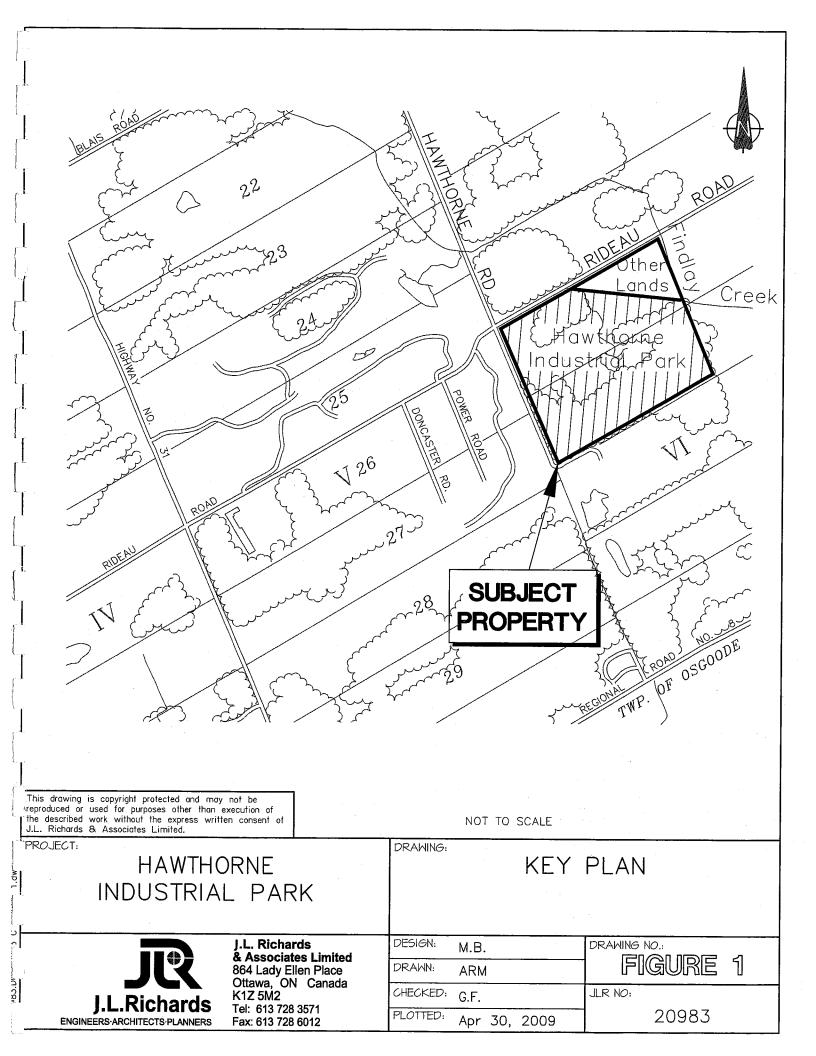

The current landowner, R.W. Tomlinson Limited (Tomlinson), now wishes to complete the development of the subject land, herein referred to as the Hawthorne Industrial Park (HIP).

#### 1.2 General

The proposed 70 hectare (ha) site is located immediately southeast of the Hawthorne Road/ Rideau Road intersection (refer to Figure 1) in the City of Ottawa (formerly in the City of Gloucester) and is expected to service future industrial operations varying in size. Over the past decade, the site has been used to dispose of fill materials resulting from Tomlinson's construction activities. The fill material has been placed in areas where fill was required for the construction of the proposed HIP.

Currently, Orgaworld Canada Ltd. (Orgaworld), has leased approximately 10 ha within HIP, which will house the source separated organics program being implemented by the City of Ottawa in 2009. The Orgaworld site includes a Stormwater Management Facility with a capacity of 15,994 m<sup>3</sup> providing on-site water quantity and quality control.

In addition, a permanent facility within the above subject lands is a total suspended solids (TSS) treatment facility. Consisting of three (3) ponds, this facility was designed

to provide aggregate wash water management to Tomlinson's existing quarry operations on the west side of Hawthorne Road (refer to Appendix 'l' for a copy of the Ministry of the Environment (MOE) Certificate of Approval (C of A) related to these works). In addition to the existing aggregate wash treatment facility, it is proposed to construct separate stormwater management facilities to service water quantity and quality requirements for the HIP.

## 1.3 Objectives

This Stormwater Managment Report (SWMR) was prepared to demonstrate that the subject lands can be developed as an Industrial Park Subdivision in compliance with the current surface water objectives of the watershed. Since the subject lands drain to Findlay Creek, which is tributary to the North Castor River, storm runoff criteria for this development must be in accordance with the recommendations of the document entitled "Shield's Creek Subwatershed Study, Totten Sims Hubicki Associates, June, 2004", referred throughout this Report as SCSS. More specifically, the above Report provided the following design criteria with regard to stormwater:

#### Water Quantity

Peak Flow Post-development peak flows must be controlled to pre-development levels for storm events ranging from a 1:2 year to a 1:100 year recurrence.

Infiltration Section 5.5 of the SCSS recommends that the quantity and quality of groundwater infiltration be maintained to pre-development rates.

<u>Erosion</u> The stormwater management strategy for the proposed HIP must be developed to maintain the erosion potential to current levels.

# Water Quality

The proposed stormwater management strategy for HIP must be developed to meet a Normal Level of Protection (as per the MOE's publication entitled "Stormwater Management Planning and Design Manual, March, 2003", referred throughout this Report as SWMPDM, which corresponds to a standard approach used in urban development to obtain a targeted total suspended solids (TSS) removal rate of 70%.

#### 2.0 STORM DRAINAGE

#### 2.1 General

Storm servicing for the HIP was designed using the dual drainage concept, also known as the minor/major drainage system. The minor drainage system is mainly comprised of an on-site open ditch and culvert system. The minor system was designed to capture and convey runoff during frequent storm events up to a 1:10 year recurrence. The major system formed by swales/ditches, streets, etc. was sized to accommodate runoff during storm events exceeding 1:10 year up to the 1:100 year recurrence.

The open ditches, culverts and swales were sized using the Rational Method. An inlet time of 15 minutes and runoff coefficients (C-factors) ranging from 0.20 to 0.90 were used in the sizing of the conveyance systems. It should be noted, however, that C-factors used were increased by 10% for the 1:25 year peak flow calculations and by 25% for the 1:100 year recurrence, as per Section 5.4.5.2.1 of the City of Ottawa's Sewer Design Guidelines (November 2004). Rainfall intensities (i.e., Intensity-Duration-Frequency curves (IDF)) required by the Rational Method were also extracted from the City of Ottawa's Sewer Design Guidelines. Peak flow rates for the HIP and Hawthorne Road and Rideau Road are summarized in Table 1 (refer to Appendix 'A' for copies of the Rational Method Design Sheets for the 1:10 year and 1:100 year storm events).

Description	Peak Flows (L/s)		
	10 Year	100 Year	
Hawthorne Industrial Park (HIP)	5,422	12,814	
Hawthorne Road / Rideau Road	3,192	5,417	

## Table 1 - Summary of Peak Flow Rates

#### 2.2 Design Criteria

The municipal infrastructure associated with the HIP was designed using the following criteria:

- The <u>HIP open ditch system</u> was sized with sufficient capacity to convey, under free-flowing conditions, the <u>1:100 year peak flow rate</u>, as calculated by the Rational Method (refer to Appendix 'A' for a copy of the 1:100 year Design Sheet).
- The <u>Hawthorne Road open ditch system</u> was sized with sufficient capacity to convey, under free-flowing conditions, the <u>1:100 year peak flow rate</u>, as calculated by the Rational Method (refer to Appendix 'A' for a copy of the 1:100 year Design Sheet).
- The existing downstream ditch system along <u>Rideau Road</u> was evaluated to ensure sufficient capacity to convey, under free-flowing conditions, <u>the 1:100 year</u> <u>peak flow rate</u>, as calculated by the Rational Method (refer to Appendix 'A' for a copy of the 1:100 year Design Sheet).
- The <u>culverts</u> included in the HIP and along Hawthorne Road/Rideau Road were sized with sufficient capacity to convey the <u>1:10 year peak flow rate</u> without overtopping the roadway embankment (refer to Appendix 'A' for a copy of the 1:10 year Design Sheet).
- Given that the receiving watercourse was found to shelter fisheries, the SCSS recommended that a <u>"normal" level of protection</u> be achieved for quality control. To fulfill this requirement, industrial sites must direct runoff to an appropriately sized oil/grit separator unit before stormwater can be conveyed off site to the open roadside ditch/culvert system. To achieve quality control for the internal roads, it is proposed to provide infiltration storage volume in the roadside open ditch system, as per the requirements presented in Table 3.2 of the SWMPDM.
- The SCSS recommended that the erosion potential be maintained to current levels for the receiving water course. To fulfill the above requirement, the two year post-development peak flow will be controlled to 50% of the pre-development peak flow rate.
  - Storage volume is to be implemented for the control of the post-development peak flows to pre-development levels for storm events ranging from a 1:2 year to a 1:100 year recurrence to comply with the recommendations of the SCSS.

This Stormwater Management Report (SWMR) has been written to demonstrate that the subject land could be developed in compliance with the above surface water criteria and also prepared in accordance with the SWMPDM. The proposed stormwater management strategy for the HIP was developed to meet a "normal" level of protection, which corresponds to a standard approach used in land development to obtain a targeted TSS removal rate of 70%.

## 3.0 STORM SERVICING

#### 3.1 General

Peak flow estimation is an important task that is carried out for any proposed development. There are several reasons that explain why flood flow rates are computed as part of site development. The main purpose of these calculations, however, is to allow for the proper configuration and sizing of the proposed conveyance systems to minimize the risk of flooding.

Drainage works are designed for a real or hypothetical storm event that may or may not happen during the lifetime of the facilities. At the onset of the design process, design criteria are adopted that may vary with the type of project, in recognition of the impacts of failure. For this particular project, the level of protection adopted (storm events up to a 1:100 year recurrence) was based on design storm characteristics of an infrequent storm event having a low probability to occur.

#### 3.2 Description of Conveyance Systems and Design Basis

Flowing water can be conveyed to an outlet by either open-channel flow or pipe flow. Storm runoff generated by the subject lands is to be collected and conveyed by a roadside ditch/culvert system before discharging to Findlay Creek via an end-of-pipe stormwater management facility (SWMF).

Sizing of the conveyance systems was carried out using various levels of service. The open ditch system was sized with sufficient capacity to convey, under free-flowing conditions, storm runoff up to the 1:100 year recurrence, while roadway culverts were sized to provide conveyance of the 1:10 year peak flow rates without overtopping the roadway embankments.

As part of this sizing exercise, Storm Drainage Area Plans were prepared and included in this Report (refer to Drawing D-ST1 for the HIP and Drawing D-ST2 for Hawthorne and Rideau Road) that show the delineated area for each of the conveyance segments (i.e., from node location to node location), along with its assigned runoff coefficient (C-factor) based on the type of surface. Since the final development of Hawthorne Industrial Park is unknown at this time, a conservative on-site runoff coefficient (C-factor) of 0.70 was used. Table 2 illustrates the breakdown of a typical site that would generate a weighted runoff coefficient of 0.70.

Type of Surface	Area (%)	C-Factor
Building	10	1.0
Asphalt Parking	35	0.90
Gravel	35	0.70
Grass	20	0.20
Overall	100	0.70

# Table 2 - Typical Potential Land Use Breakdown

It should be noted that the C-factors shown on the Storm Drainage Area Plans denote those associated with 1:10 year peak flow calculations. As recommended in Section 5.4.5.2.1 of the City of Ottawa's Sewer Design Guidelines, C-factors shown on drawings were increased by 10% and 25% for the 1:25 year and 1:100 year peak flow calculations, respectively (refer to Appendix 'A' for copies of the Rational Method Design Sheets).

# 3.2.1 Open Ditch System

An open ditch channel is a conduit used to convey flowing water from one location to another, with a free surface. A channel can be classified as either artificial (i.e., manmade) or natural. Artificial channels are those constructed or developed as a result of human activity. This type of conveyance system is usually implemented as a long and mild-sloped channel built in the ground, which provides conveyance of water between two points, with sections of regular geometry and shape. An open ditch system is generally designed to follow site topography and the vertical profile of the adjacent roadway. The most commonly used shapes for open channel ditches are trapezoidal and triangular, with the latter shape utilized mainly for ditches servicing small drainage areas. The open ditches associated with the HIP and Hawthorne Road were sized with sufficient capacity to convey 1:100 year peak flow rates. As previously noted, the Rational Method Design Sheets (refer to Appendix 'A' for copy of the 1:100 year design sheet) were used to quantify the 1:100 year peak flow rates. The open ditch configuration was carried out utilizing Manning's relationship, along with the proposed geometry and slope of the channel. Two Storm Drainage Area Plans were prepared (refer to Drawings D-ST1 and D-ST2) showing proposed ditch inverts that match those shown on the Rational Method Design Sheets. Based on the ditch sizing exercise, it was determined that triangular shape ditches with 3:1 side slopes and variable depths provided the necessary conveyance of the 1:100 year peak flow rate. The Site Servicing and Grading Plan (refer to Drawing SG) was developed to provide the configuration of open ditch segments.

The existing open ditches along Rideau Road were also evaluated to ensure sufficient capacity was able to convey the 1:100 year peak flow rates resulting from upstream construction works (i.e., construction of Hawthorne Road). The Rational Method Design Sheets (refer to Appendix 'A' for copy of the 1:100 year design sheet) were used to quantify the 1:100 year peak flow rates. An existing 900 mm diameter culvert crossing under Hawthorne Road conveys flow along the north side of Rideau Road (refer to Drawing D-ST2). The capacity of this existing culvert was estimated at 1,400 L/s under a 1.5 m headwater (refer to Appendix 'B' for Culvert Design Summary Table). Upon the review of existing topography, any headwater depths greater than 1.5 m resulted in runoff being directed northerly along Hawthorne Road towards Findlay Creek. In light of the above, the existing open ditches along Rideau Road were evaluated using a conservative plug flow of 1,400 L/s in addition to surface runoff generated by the contributing areas.

# 3.2.2 Culvert System

The principal function of a culvert is to convey water through an embankment while, at the same time, supporting the weight of the overlying fill and vehicular movement. Culverts can be made of many different materials; steel, polyvinylchloride (PVC), high density polyethylene (HDPE) and concrete. Culverts selected for the HIP and Hawthorne Road are made of corrugated steel, in either round or arch shape. Field observations have shown that there are two major types of culvert flow conditions: inlet control and outlet control.

-7-

#### 1. Flow Under Inlet Control

Flow with inlet control means that the discharge capacity of a culvert is controlled at the culvert entrance by the depth of headwater and by the entrance geometry, including the barrel shape, cross sectional area and the type of inlet edge. The roughness and length of the culvert barrel, and the outlet conditions are not factors in determining the culvert capacity. The longitudinal slope reduces headwater only to a small degree and can normally be neglected for conventional culverts flowing in inlet control.

# 2. Flow Under Outlet Control

Flow with outlet control means that the discharge capacity of a culvert is controlled by the depth of tailwater, including the velocity head within the barrel, the entrance and friction losses. The roughness, length of the culvert barrel, and slope are factors in determining the culvert capacity; the inlet geometry is of lesser importance.

To avoid having to conduct detailed hydraulic computations that would determine the type of flow under which a culvert will probably operate, the procedure recommended by the MTO (refer to MTO's Drainage Management Manual) was utilized. This methodology, referred to as the Conventional Culvert Design procedure, requires that MTO's Design Charts and Design Nomographs be used for both inlet and outlet control conditions. The higher headwater depth that is calculated from those two operating conditions would indicate the type of control and would provide the governing headwater depth. This methodology was utilized to size each culvert crossing, along with the 1:10 year peak flow rates calculated by the Rational Method Design Sheets (refer to Appendix 'A') for each of the conveyance segments. Furthermore, this calculation sheet also provides proposed culvert sizes, along with the type of control and governing depth found when using the conventional culvert design procedure. A summary of the various parameters estimated using MTO's nomographs at each of the culverts has been tabulated using MTO's Form D4-I (refer to Appendix 'B' for Conventional Culvert Design Sheet). This analysis shows that the proposed culvert crossings within the HIP and along Hawthorne Road are capable of conveying the 1:10 year peak flow rates as a minimum, without overtopping any of the roadway embankments. The hydraulic calculations were carried out assuming a roughness coefficient of 0.024 for any of the CSP and CSPA culverts. The Site Servicing and Grading Plan (Drawing SG) shows proposed culvert sizes, lengths and invert elevations at each of the crossings.

The proposed 1030 x 740 mm CSPA culvert crossing under the entrance of the pond access road was of concern due to the high flow rate during the 1:100 year storm event.

There was a possibility that the excess flow overtopping this culvert could short circuit into SWMF via the pond access road. Therefore, an analysis of the flow overtopping the proposed entrance culvert was conducted and the results confirmed that the residual flow would indeed be contained within the right-of-way corridor (refer to Appendix 'J' for desktop calculation).

## 4.0 WATER BALANCE

Water balance analyses are typically carried out to assess any changes in infiltration to subsurface water-bearing zones as a result of the urbanization (i.e., increase of hard surfaces) of land. The SCSS has identified the need to maintain a necessary level of quantity and quality groundwater recharge via infiltration. Groundwater recharge is required to maintain subsurface base flow to streams and wetlands in addition to maintaining groundwater levels for private and municipal wells. The Hydrogeological Study completed by Golder Associates Limited in 2008 for the HIP identified the site as being underlain by a shallow and deep aquifer separated by an impermeable rock layer. The upper aquifer provided subsurface groundwater flow to streams, while the lower aquifer was the main source for well water supply. Therefore, groundwater recharge for this site was intended to provide subsurface base flow into the receiving Findlay Creek.

Construction fill operations have been active for the HIP since 1994. The results of the geotechnical field investigation conducted by Inspec-Sol Incorporated in 2008 indicates that as much as 5.5 m of fill material (MW7-08) has been placed on parts of the site. The non-native heterogenous fill material is comprised mainly of silty clay and contains trace amounts of road and construction materials. Although the soil component of the fill material exhibits the characteristics of silty clay, the varying composition and density of the remaining portion of the fill affects its permeability in localized areas. Given the above existing conditions, it is difficult to determine how groundwater recharge will behave as subsurface flow in the existing fill matrix, particularly from individual sites within the HIP. The MOE expressed concerns about the use of infiltration strategies on the individual sites given the past history as a construction fill site. Furthermore, the MOE SWMPDM does not endorse the use of infiltration basins on lands zoned for industrial use as there is an increased risk of groundwater contamination should a spill occur on site.

An option was considered to provide infiltration for the entire site at the base of the endof-pipe Dry Pond facility. Upon further investigation, the geotechnical report indicated that there was a high groundwater table at the proposed pond location. In addition, insitu soils in the area exhibited poor drainage properties which would have resulted in long retention times at the base of the pond, making it difficult to meet the water balance deficit requirements for the entire site while attempting to mimic the pre-development hydrological cycle.

Representatives from the City and SNC were consulted, and it was concluded that the SCSS groundwater balance targets for this site would be difficult to meet. It was also recognized that on-site infiltration strategies for this industrial subdivision could have a detrimental effect on groundwater quality and jeopardize the natural ecological integrity of receiving waters. In light of the above, it was decided by the approval authorities that the requirement for the water balance would be waived for the HIP development.

#### 5.0 WATER QUALITY

#### 5.1 General

Urbanization has been found to modify the hydrological regime of a receiving stream if inadequate stormwater management measures are implemented. The potential impacts associated with runoff arise primarily from the amount of urban area that is impervious to rain and snowmelt water. These impervious surfaces increase the amount of direct surface runoff that is generated and is conveyed more efficiently to the receiving stream. As part of the SCSS, fisheries resources have been inventoried along this watercourse, along with its associated tributaries. Given that the receiving watercourses were found to shelter fisheries, the approved document recommended that a "normal" level of protection be achieved. To fulfil this requirement, it is proposed that each individual site provide an oil/grit separator and infiltration storage be provided within the roadside open ditch system, as per the requirements presented in the SWMPDM.

#### 5.2 Water Quality Requirement

Stormwater servicing for the HIP has been developed in accordance with the water quality recommendations of the SCSS (70% TSS removal). To fulfil this requirement, individual sites will be required to provide an oil/grit separator be installed to provide quality treatment (i.e., 70% TSS removal) of surface runoff before entering the roadside open ditch/culvert system. In addition, the oil/grit separator will be able to capture and contain hydrocarbons in the event of an on-site accidental spill.

To fulfill the water quality objectives for the paved portion of the HIP internal roads, it is proposed to provide infiltration within the open roadside ditch system to meet the storage volume requirements presented in Table 3.2 of the SWMPDM. Based on the normal level of service required and an imperviousness of 100% for the internal roads, Table 3.2 yields an extrapolated storage volume requirement of 35 m<sup>3</sup>/ha. To achieve this storage volume, a clear stone envelope complete with a 200 mm diameter perforated pipe will be installed at the base of the roadside ditches to meet the required storage volume (Refer to Appendix C for calculations).

The following table presents the calculated infiltration volume required for water quality control and those provided by the roadside open ditch system to meet the recommended MOE Design Guidelines.

Phase	Area (ha)	Infiltration Volume Requirement (m <sup>3</sup> )	Infiltration Method	Length of 200 mm diameter Perf. Pipe (m)	Infiltration Volume Provided (m <sup>3</sup> )
1	1.58	55.1	Open Ditch	1760	55.3
2	0.21	7.4	Open Ditch	240	7.5
Total	1.79	62.5	Open Ditch	2000	62.8

# Table 3 - Water Quality Infiltration Requirements

As shown in the above Table, the infiltration volume provided by the proposed open roadside ditch network (62.8 m<sup>3</sup>) exceeds that obtained from Table 3.2 (62.5 m<sup>3</sup>) of the SWMPDM. It should be noted that additional storage within the void space of the clear stone envelope was not accounted for and would increase the actual infiltration storage volume shown in Table 3.

# 6.0 HYDROLOGICAL ANALYSIS

# 6.1 General

To satisfy the surface water objectives presented in Subsections 1.3 and 2.2, a hydrological analysis was carried out to quantify peak flow rate variations resulting from the development of the proposed HIP. To quantify this variation, the SWMHYMO Stormwater Management Hydrological Model (Version 4.02, July, 1999) was utilized to calculate peak flows during severe storm events.

To carry out the hydrological analysis, three storm drainage plans were developed; one representing the pre-development drainage conditions, one representing the post-development conditions for the current study area, Phase 1, and the other for the post-development drainage conditions, including future development, Phase 2. For each of these plans, subwatershed boundaries were delineated based on existing topography of the site and the proposed overland flow direction following development of the site (refer to Figures 2, 3 and 4 for details).

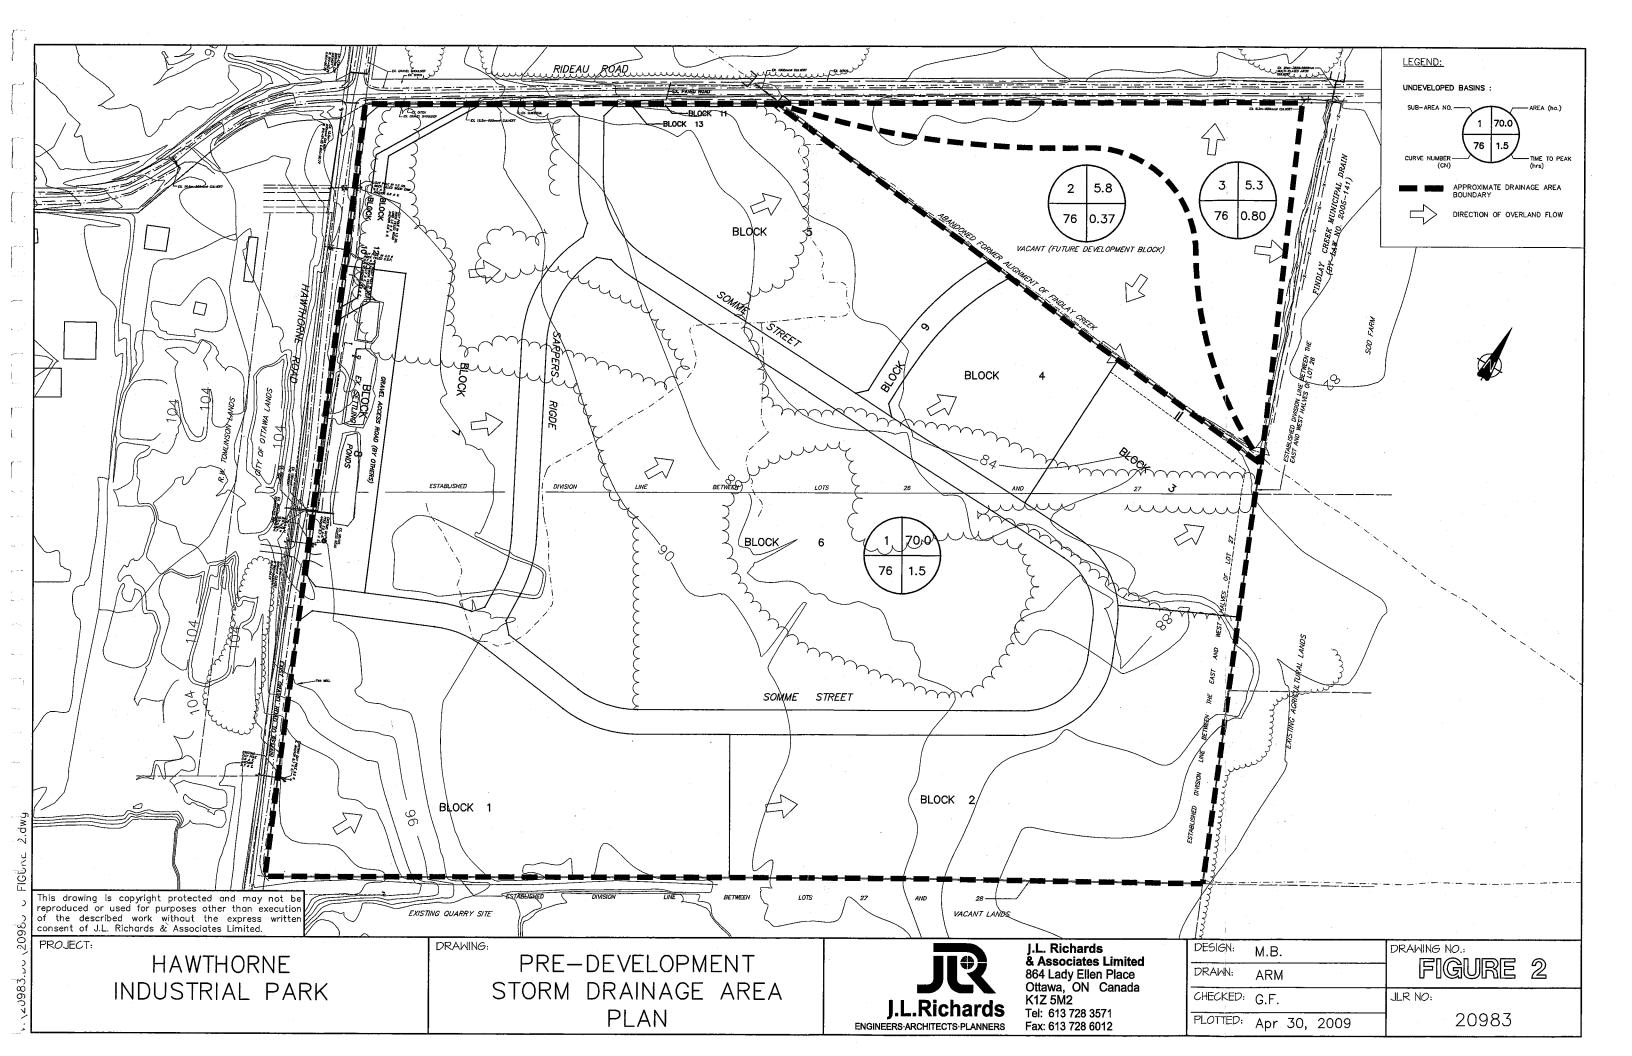

## 6.2 Synthetic Design Storm Simulation and Hydrological Parameters

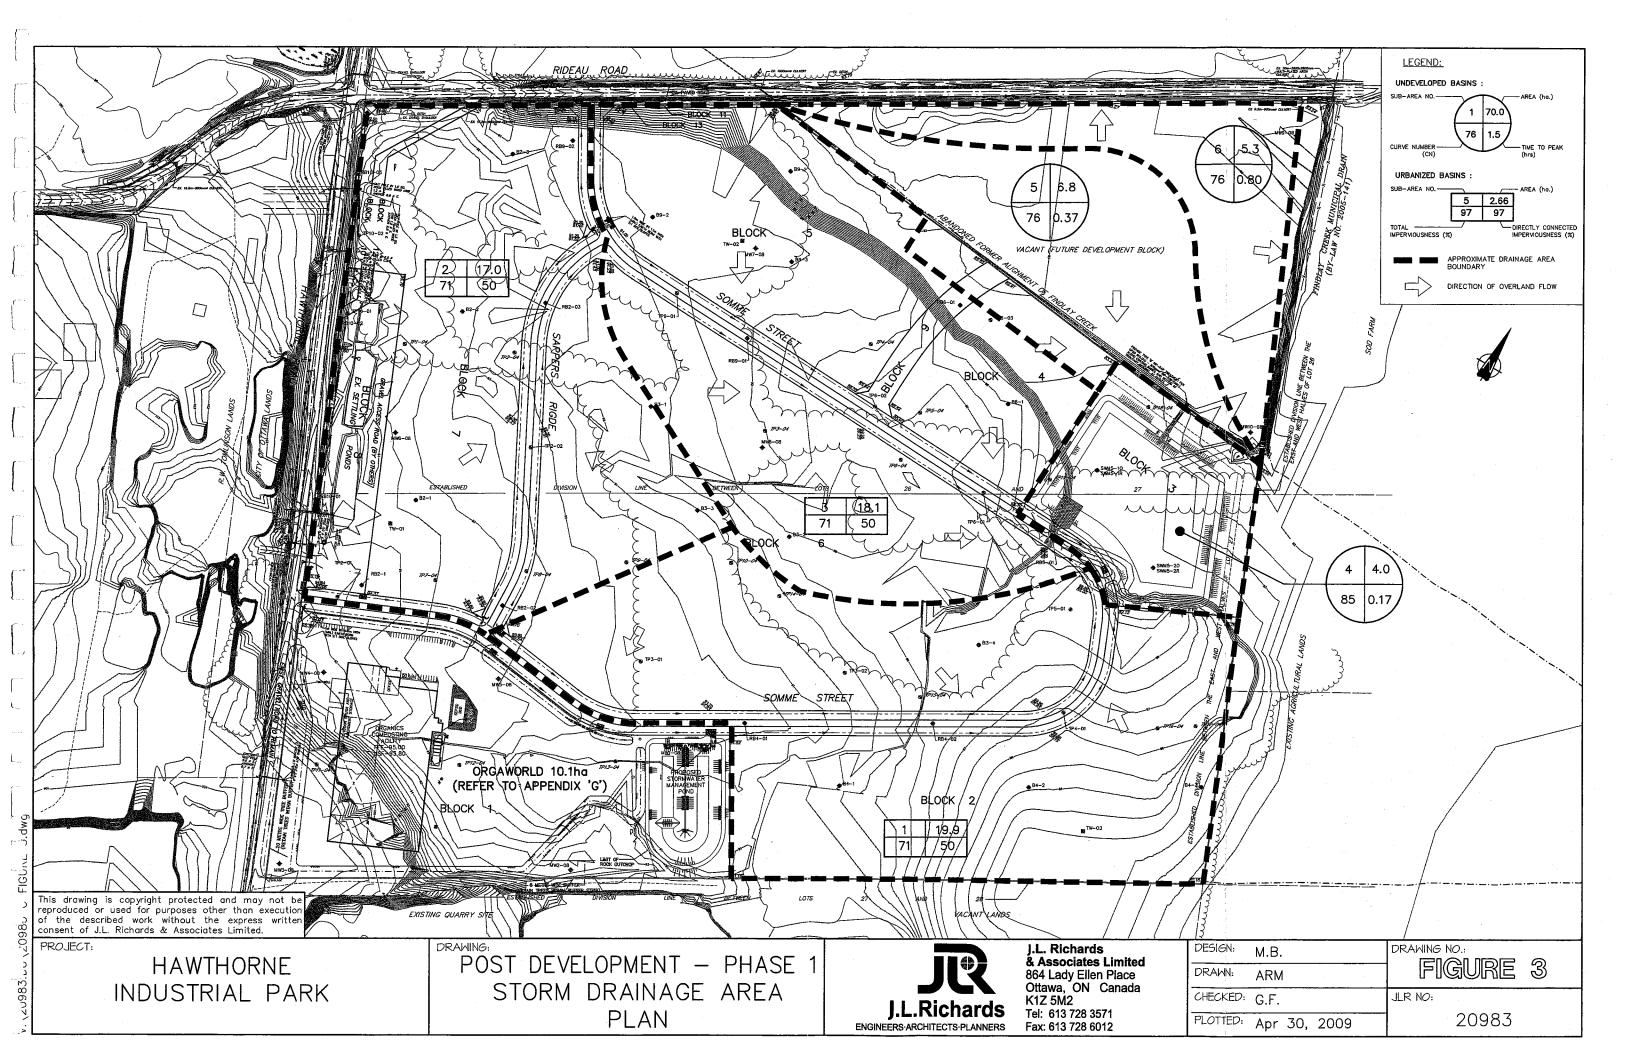

Peak runoff rates were calculated for both pre- and post-development conditions using synthetic design storm event modelling. Peak flow rates were estimated using the 3-hour Chicago Design Storm Event, as this synthetic storm event has been recognized as the most critical event for urban runoff applications (refer to Section 5.4.3.1 of the City of Ottawa's Sewer Design Guidelines). The design storm analysis was completed using volumes derived from the Intensity-Duration-Frequency (IDF) curve equation shown in Section 5.4.2 of the City of Ottawa Sewer Design Guidelines compiled using data from 1967 to 1997.

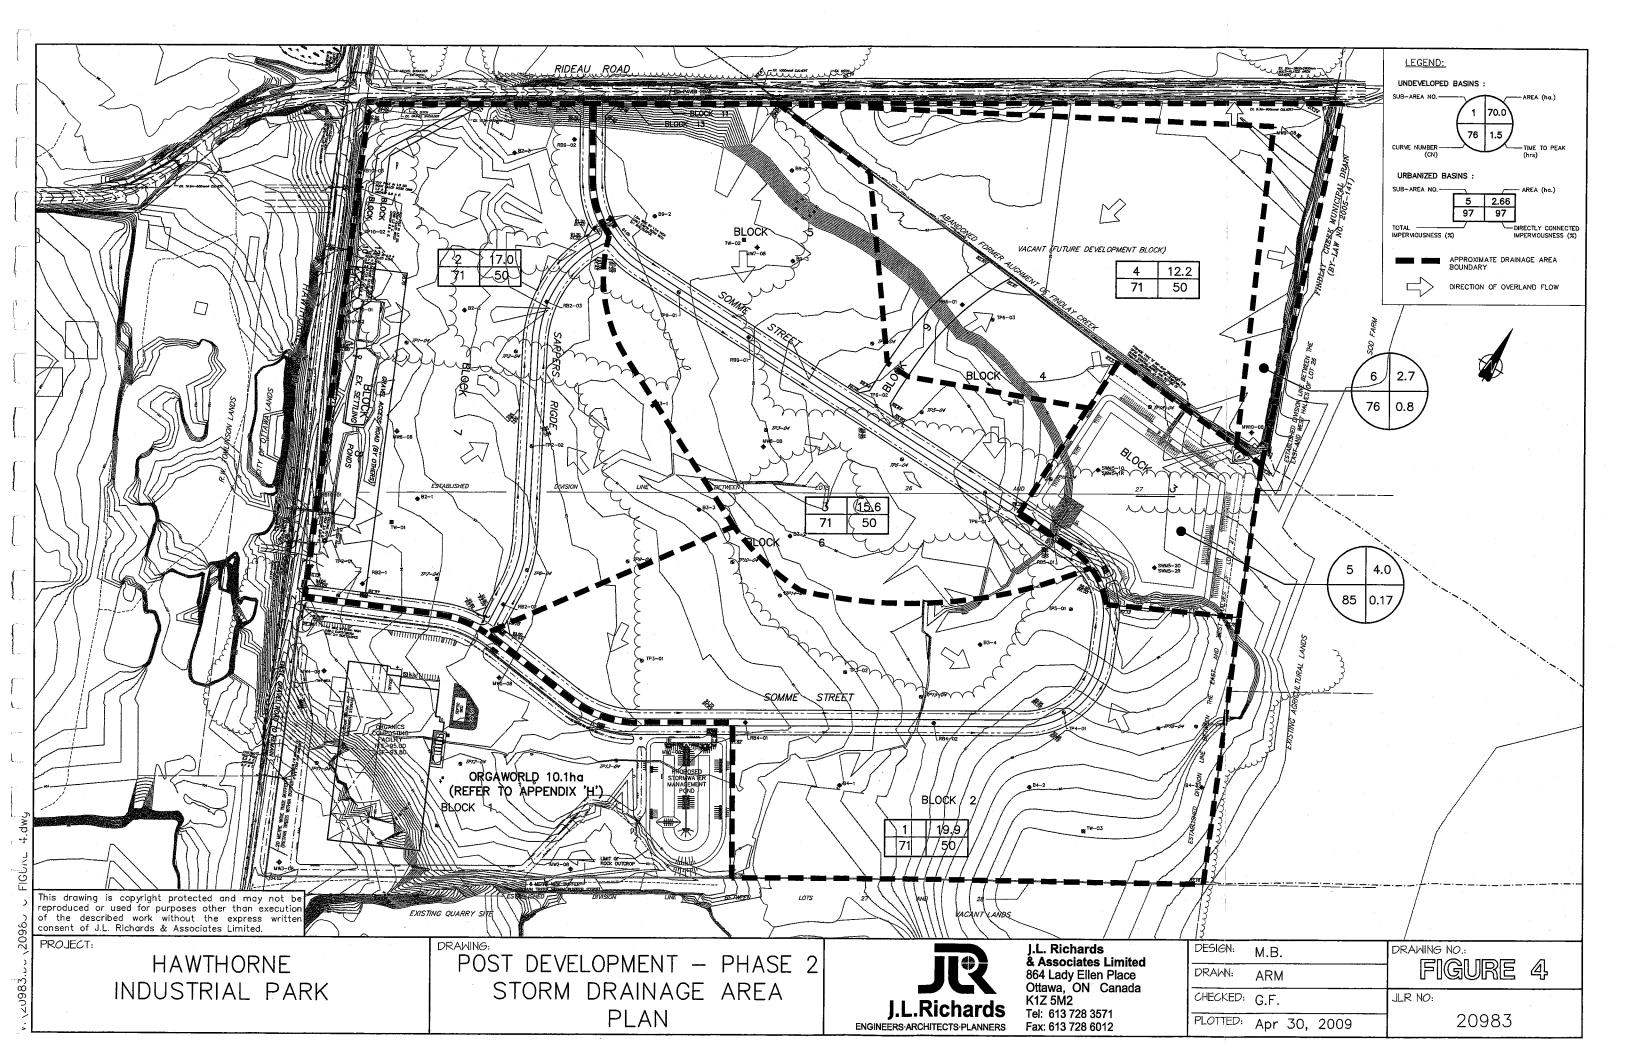

A SWMHYMO data file was developed to represent both pre- and post-development conditions of the subject area. Simulation of surficial runoff generated from undeveloped subwatersheds was carried out using the "DESIGN NASHYD" command along with the SCS procedure to compute rainfall losses. The SCS procedure uses the Curve Number (CN) method to compute rainfall losses and the Nash unit hydrograph to simulate the hydrological response from undeveloped watersheds. To simulate surface runoff from urban subwatersheds, the "CALIB STANDHYD" command was utilized. Hydrological parameter selection and methodology is described below:

# **Curve Number (CN)**

In order to estimate a Curve Number that represents pre-development conditions, the geotechnical investigation completed by Inspec-Sol, entitled "Geotechnical Study Subdivision Plan, Hawthorne Industrial Park, Lots 26 and 27 Concession 6, Southeast of Hawthorne and Rideau Roads, Ottawa, Ontario" dated December 19, 2008 was used. At the time of this investigation, large amounts of fill material were encountered over the majority of the site, which does not reflect the pre-development conditions. As such, only native soils encountered below fill material were used to establish pre-development condition Curve Numbers. The review of the geotechnical investigation shows native

soils ranging from silty sand in Blocks 4 and 5, to silty clay in Blocks 3, 5, 7 and 8, to sandstone and limestone in parts of Blocks 2 and 3. These soils have been classified by Inspec-Sol as being associated with hydrologic soil groups (HSG), ranging from "B" to "D" for silty sand to silty clay, respectively. Areas where rock was encountered (i.e., Sandstone and Limestone) were classified as "Rockland." Based on this information and current land usage, as interpreted from aerial photography, a pre-development Curve Number (CN) of 76 has been calculated using the Ministry of Transportation of Ontario (MTO) Chart H2-8. Detailed calculations for the HIP have been included in Appendix 'D'.

Under post-development conditions, it is proposed to provide sufficient grade differential to allow for positive drainage to meet City of Ottawa Design Standards. As the subject lands are to be developed as an Industrial Park with a significant increase in hard surfaces (i.e., buildings, asphalt and gravel), the post-development conditions were, therefore, analysed taking into consideration the low potential of these surfaces to infiltrate storm runoff.

#### Imperviousness

Surface runoff under post-development conditions is greatly impacted by the imperviousness of its tributary area. Since the final development of the HIP is unknown, a conservative assumption for typical surfaces encountered in similar industrial parks was developed, as illustrated in Table 2. To determine the imperviousness based on the assumed breakdown presented in Table 2, an imperviousness calculation was carried out and is presented in Appendix 'D'. The imperviousness calculation was based on the following assumptions:

- an imperviousness of 100% was assigned for building footprints;
- an imperviousness of 100% was assigned for all asphalt parking surfaces.
- an imperviousness of 70% was assigned for all gravel surfaces; and
- it was assumed that 50% of the total imperviousness (TIMP) 50 % was modelled as directly connected imperviousness (XIMP).

Based on the above, a total imperviousness of 70% was calculated, which is equivalent to a runoff coefficient of 0.7. The hydrological analysis was, therefore, carried out using

a total imperviousness of 70%, consistent with the runoff coefficient used for sizing the open ditch/culvert system.

## Time to Peak (T,)

Time to peak calculations were carried out under pre-development conditions. Time of concentration was first estimated using the Uplands Method Chart based on the various flow paths. Once calculated, the times to peak were set to 67% (i.e., 2/3) of the time of concentration ( $T_e$ ). Under pre-development conditions, a 90 minute time to peak was calculated (refer to Appendix 'D' for calculations). When modelling post-development conditions, the "CALIB STANDHYD" command was used to calculate the time to peak associated with the proposed site surfaces and grades (refer to Appendix 'E' for SWMHYMO outputs).

# 6.3 Simulation of Pre- and Post-Development (Uncontrolled) Conditions

The hydrological analysis was carried over the entire HIP under both the pre- and post-development conditions. As stated in Section 6.1, two post-development conditions were investigated, namely, Phase 1 and Phase 2. Phase 1 evaluates servicing for the current Study area, while Phase 2 includes the current Study area along with servicing of an additional 11.2 ha of land to the north east, shown on drawings as "Future Development Block."

Peak flow rates were computed with SWMHYMO using the procedure and parameters described in Subsection 6.2. Table 4 presents the simulated peak runoff rates under a 3 hour Chicago design storm event for both the pre- and post- (uncontrolled) development conditions for the HIP (refer to Appendix 'E' for SWMHYMO data input and output files), along with those under a 4 hour - 25 mm storm.

Datum Davied	Peak Flow Rates (L/s)					
Return Period or Storm Depth	Pre-Development	Phase 1 Pre-Development Post-Development (Uncontrolled)				
25 mm	252	1,941	2,231			
2	467	3,077	3,548			
5	826	4,812	5,554			
10	1,097	6,135	7,029			
25	1,468	7,772	9,013			
50	1,767	9,240	10,588			
100	2,093	10,662	12,132			

## Table 4 - SWMHYMO Simulation Results

Simulation results presented in the above table show that uncontrolled post-development peak flows substantially exceed those obtained under pre-development conditions. Based on the design criterion for water quantity (refer to Subsections 1.3 and 2.2 for details), post-development peak flows should be maintained to their pre-development levels for storm events ranging from a 1:5 year to a 1:100 year recurrence. In addition, the 2-year post-development peak flow should be controlled to 50% of the 2-year pre-development peak flow to satisfy the erosion criterion. Water quantity control measures were, therefore, found to be necessary for the development of this site. Details and stormwater servicing approaches proposed to fulfil the design criteria listed in Subsections 1.3 and 2.2 are presented in the following Subsections.

# 6.4 Simulation of Phase 1 Post-Development (Controlled) Conditions

Development of the subject lands (i.e., 70 ha, as illustrated on Figure 3) will increase the imperviousness of the subject area. To achieve the surface water objectives listed in Subsections 1.3 and 2.2, it is proposed that an end-of-pipe facility be constructed that would provide storage volume for retention of runoff.

The stormwater management criteria for the development of the HIP consist of maintaining erosion potential and peak flow rates at the pre-development levels. Storm servicing of the Subdivision was, therefore, developed such that all of these requirements were fulfilled, along with the achievement of a "normal" protection level. It

is proposed to implement the following stormwater management servicing approach for the development of the HIP:

#### End-of-Pipe SWMF (Block 3)

Based on the proposed grading, the end-of-pipe facility was found to generate a volume of 37,240 m<sup>3</sup> (3.25 m depth). A low flow ditch sized for 2 year storm events was also included in the bottom of the end-of-pipe facility to convey flows to the outlet structure. The configuration of the outlet structure would be as follows:

- 1 x 150 mm diameter orifice within a 200 mm diameter Polyvinyl Chloride (PVC) pipe at elevation 82.90 m, which serves as outlet to the facility;
- 2 x 600 mm diameter Corrugated Steel Pipe culvert at elevation 84.80 m, which also serves as outlet to the facility;
- One (1) emergency overflow spillway (6.0 m wide) at elevation 86.15 m, which serves as outlet to the facility during a storm event greater than 1:100 year.

The above configuration was used to develop a Stage-Storage-Discharge relationship that relates the storativity and outlet capabilities of the proposed facility at various geodetic elevations (refer to Appendix 'F' for copy of this Table). This data (storage-discharge table) was then used as input to the SWMHYMO's ROUTE RESERVOIR command.

A SWMHYMO file, representing the post-development controlled conditions of the HIP, was developed incorporating the storage volume and the outflow capability of the proposed end-of-pipe facility. The following table presents the simulated peak runoff rates for the three (3) hour Chicago design storm under the post-development controlled conditions (refer to Appendix 'G' for SWMHYMO data input and output files), along with those under the four (4) hour - 25 mm storm.

Return Period	Peak Flow Rates (L/s)			
or Storm Depth	Pre-Development	Phase 1 Post-Development (Controlled) <sup>(1)</sup>		
25 mm	252	127		
2 year	467	194 <sup>(2)</sup>		
5 year	826	359		
10 year	1,097	589		
25 year	1,468	939		
50 year	1,767	1,191		
100 year	2,093	1,531		

#### Table 5 - SWMHYMO Simulation Results (Post-Development - Phase 1 Controlled Conditions)

Note:

(1) Post-development flow is the sum of flows from the end-of-pipe facility and two uncontrolled Sub-Areas totalling 12.1 ha.

(2) 2 year post-development peak flow less than half the 2-year predevelopment peak flow (233 L/s).

Simulation results presented in Table 5 show that the Phase 1 post-development controlled peak flows will be maintained below pre-development levels for the HIP. Consequently, the water quantity objective defined in Subsections 1.3 and 2.2 will be met under Phase 1.

# 6.5 Simulation of Phase 2 Post-Development (Controlled) Conditions

Development of Phase 2, as depicted on Figure 4, includes the Future Development Block located in the northeast corner of the HIP. This additional land could be serviced by the previously proposed end-of-pipe, without any modifications to facility size or outlet structure. However, a second inlet would be required in the northeast corner of the facility, which could be designed during the detailed design stage of the Future Development Block.

A SWMHYMO file, representing the Phase 2 post-development controlled conditions of the HIP, was developed incorporating the storage volume and the outflow capability of the proposed end-of-pipe facility. The following table presents the simulated peak runoff rates for the three (3) hour Chicago design storm under the Phase 2 post-development controlled conditions (refer to Appendix 'H' for SWMHYMO data input and output files), along with those under the four (4) hour - 25 mm storm.

Deturn Devied	Peak Flow Rates (L/s)			
Return Period or Storm Depth	Pre-Development	Phase 2 Post-Development (Controlled) <sup>(1)</sup>		
25 mm	252	73		
2 year	467	156 <sup>(2)</sup>		
5 year	826	457		
10 year	1,097	729		
25 year	1,468	1,051		
50 year	1,767	1,348		
100 year	2,093	1,515		

# Table 6 - SWMHYMO Simulation Results (Post-Development - Phase 2 Controlled Conditions)

Note: (1) Post-development flow is the sum of flows from the end-of-pipe facility and one uncontrolled Sub-Area totalling 2.7 ha.

(2) 2-year post-development peak flow less than half the 2 year predevelopment peak flow (233 L/s).

Simulation results presented in Table 6 show that the Phase 2 post-development controlled peak flows will be maintained below pre-development levels for the HIP. Consequently, the water quantity objective defined in Subsections 1.3 and 2.2 will also be met under Phase 2.

# 6.6 Simulation of the July 1, 1979 Historical Storm Event and Flood Potential

# 6.6.1 Simulation of the July 1, 1979 Historical Storm Event

In addition to designing the major drainage system to convey the 1:100 year storm event, the performance of both the open ditch system and SWMF was also assessed under the July 1, 1979 historical storm event. This historical storm event is defined as a high volume / low intensity storm event (when compared to the 1:100 year event) which occurred mostly over a three hour period (refer to Table 5.6 in the Ottawa Sewer Design Guidelines). As shown in Table 5.6, the maximum intensity of 106.7 mm/hr only occurred for a 10 minute period (i.e, between the 85 to 95 minute time interval). The 1:100 year storm event intensities used to size the open ditch system were found to exceed the highest intensity of 106.7 mm/hr (refer to Appendix 'A' for 1:100 year Rational Method Sheet) with the exception of the most downstream ditch section (i.e., from Node 19 to Pond) where an intensity of 101.69 mm/hr was rather utilized. If an intensity of 106.7 mm/hr was used, the overall peak flow would increase from 12,814 L/s to 13,430 L/s substantially less than the free-flowing capacity of 52,735 L/s for the proposed ditch configuration. Consequently, the proposed open ditch system has the ability to convey flows generated by the July 1, 1979 storm event.

To supplement the above open ditch analysis, a hydrological analysis was also conducted to assess the performance of the SWMF under the July 1, 1979 storm event. A SWMHYMO file was, therefore, developed for the controlled Phase 2 post-development conditions of the HIP. Simulation results show that the Phase 2 post-development runoff during the July 1, 1979 storm event will be contained within the SWMF with all three of the outlet culverts flowing full in addition to approximately 210 mm of flow depth over the emergency overflow channel (refer to Appendix 'K' for SWMHYMO data input and output files). Therefore, the outlet of the SWMF has sufficient capacity to convey the July 1, 1979 historical storm event via the designated overland flow route without overtopping the banks.

# 6.6.2 Flood Potential

Draft approval Condition 12 of the draft subdivision conditions by the former Region of Ottawa-Carleton requires that "The owner shall complete a study indicating the extent of potential flooding on the property from Findlay Creek. The study including all models and assumptions shall be to the satisfaction of the South Nation River Conservation Authority." This condition was included as part of the original February 10, 1998 draft conditions (Gloucester File: S-RU-94-03).

Many changes have occurred on-site and adjacent to the site since Condition 12 was included in the draft approval for this site. Improvements to the roadside ditch were made along Rideau Road, immediately adjacent to the site. Surface runoff generated by the lands north of Rideau Road and conveyed to the small tributary located within the HIP site has now been re-directed toward the northeast corner of the site where the existing 3.8 m wide x 2.8 m high multi plate arch culvert crosses Rideau Road. A

municipal drainage report was prepared by Stantec Consulting in 2004 for this section of Findlay Creek which assessed the overall geomorphological conditions and provided recommendations for future maintenance. In addition, the SCSS conducted a flood hazard analysis. The 100 year flows from the Stantec model were plotted along the creeks modelled. Floodlines were shown in Figure 6.2.3 of the report. No floodlines were indicated for the section of Findlay Creek adjacent to the HIP site.

As indicated previously in the Section 4 of this Report, as much as 5.5 m of construction fill has been added to the site since 1994. The placed fill material on the site has eliminated the natural low lying areas and raised the site grade approximately 4.5 m above the top of creek bank. The current site grades will be maintained as a minimum for the development of the HIP subdivision. Therefore, we have no concerns about flooding on the property from Findlay Creek given the above changes to the site and improvements to the adjacent drainage network. Consequently, Condition 12 of the draft approval should be considered as being satisfied on the basis that this condition is out of date based on the current site conditions.

# 7.0 EROSION AND SEDIMENT CONTROL MEASURES DURING CONSTRUCTION

During construction of the roadway, the collection systems (i.e., ditches, culverts, sewers, etc.) and end-of-pipe facility, appropriate erosion and sediment control measures, as outlined in MNR's "Guidelines on Erosion and Sediment Control for Urban Construction Sites," will be implemented to trap sediment on site. To ensure proper implementation, the proposed measures have been incorporated onto Drawing ESC (Drawing entitled "Erosion and Sedimentation Control Plan"). The measures shown on this Drawing were developed based on topography and site constraints. As a minimum, the following measures will be implemented during construction:

- Supply and installation of straw bale flow check dams (as per OPSD 219.180) at the upstream end of each culvert. Proposed locations of straw bale barriers are indicated on Drawing ESC.
- Supply and installation of topsoil and hydroseed along the entire open ditch system once grading has been completed for a section. Mulching will be carried out immediately after hydroseeding. This will allow for immediate bank stabilization of the system and will prevent sediment ladden from occurring from exposed ditch surfaces.

-20-

- Supply and installation of light duty silt fences (as per OPSD 219.110) at the toe of slope surrounding the proposed stormwater management pond (refer to Drawing ESC for details). It is recommended that silt fences also be used to enclose borrow and stockpile areas resulting from topsoil stripping activities or any excavating activities; locations to be determined in the field during grading operations.
- If dewatering and pumping operations become necessary, filtration is proposed using sediment dewatering bags prior to discharge off-site.

All control measures will be carried out in accordance with the following documents:

- "Guidelines on Erosion and Sediment Control for Urban Construction Sites" published by Ontario Ministries of Natural Resources, Environment, Municipal Affairs and Housing, and Transportation and Communication, Association of Construction Authorities of Ontario, and Urban Development Institute, Ontario, May 1987.
- ii) "Erosion and Sediment Control" Training Manual by Ministry of Environment, Spring 1998.
- iii) Applicable Regulations and Guidelines of the Ministry of Natural Resources. As a minimum, during the construction of the conveyance systems, the following Stormwater Management Practices will be used:

Any stockpiled material will be kept on flat areas during construction, well away from any natural flow paths. In the event that the stockpile is placed in other areas where potential washoff to the conveyance system is expected, silt fences will be installed to enclose the materials and prevent any washoff to the conveyance system.

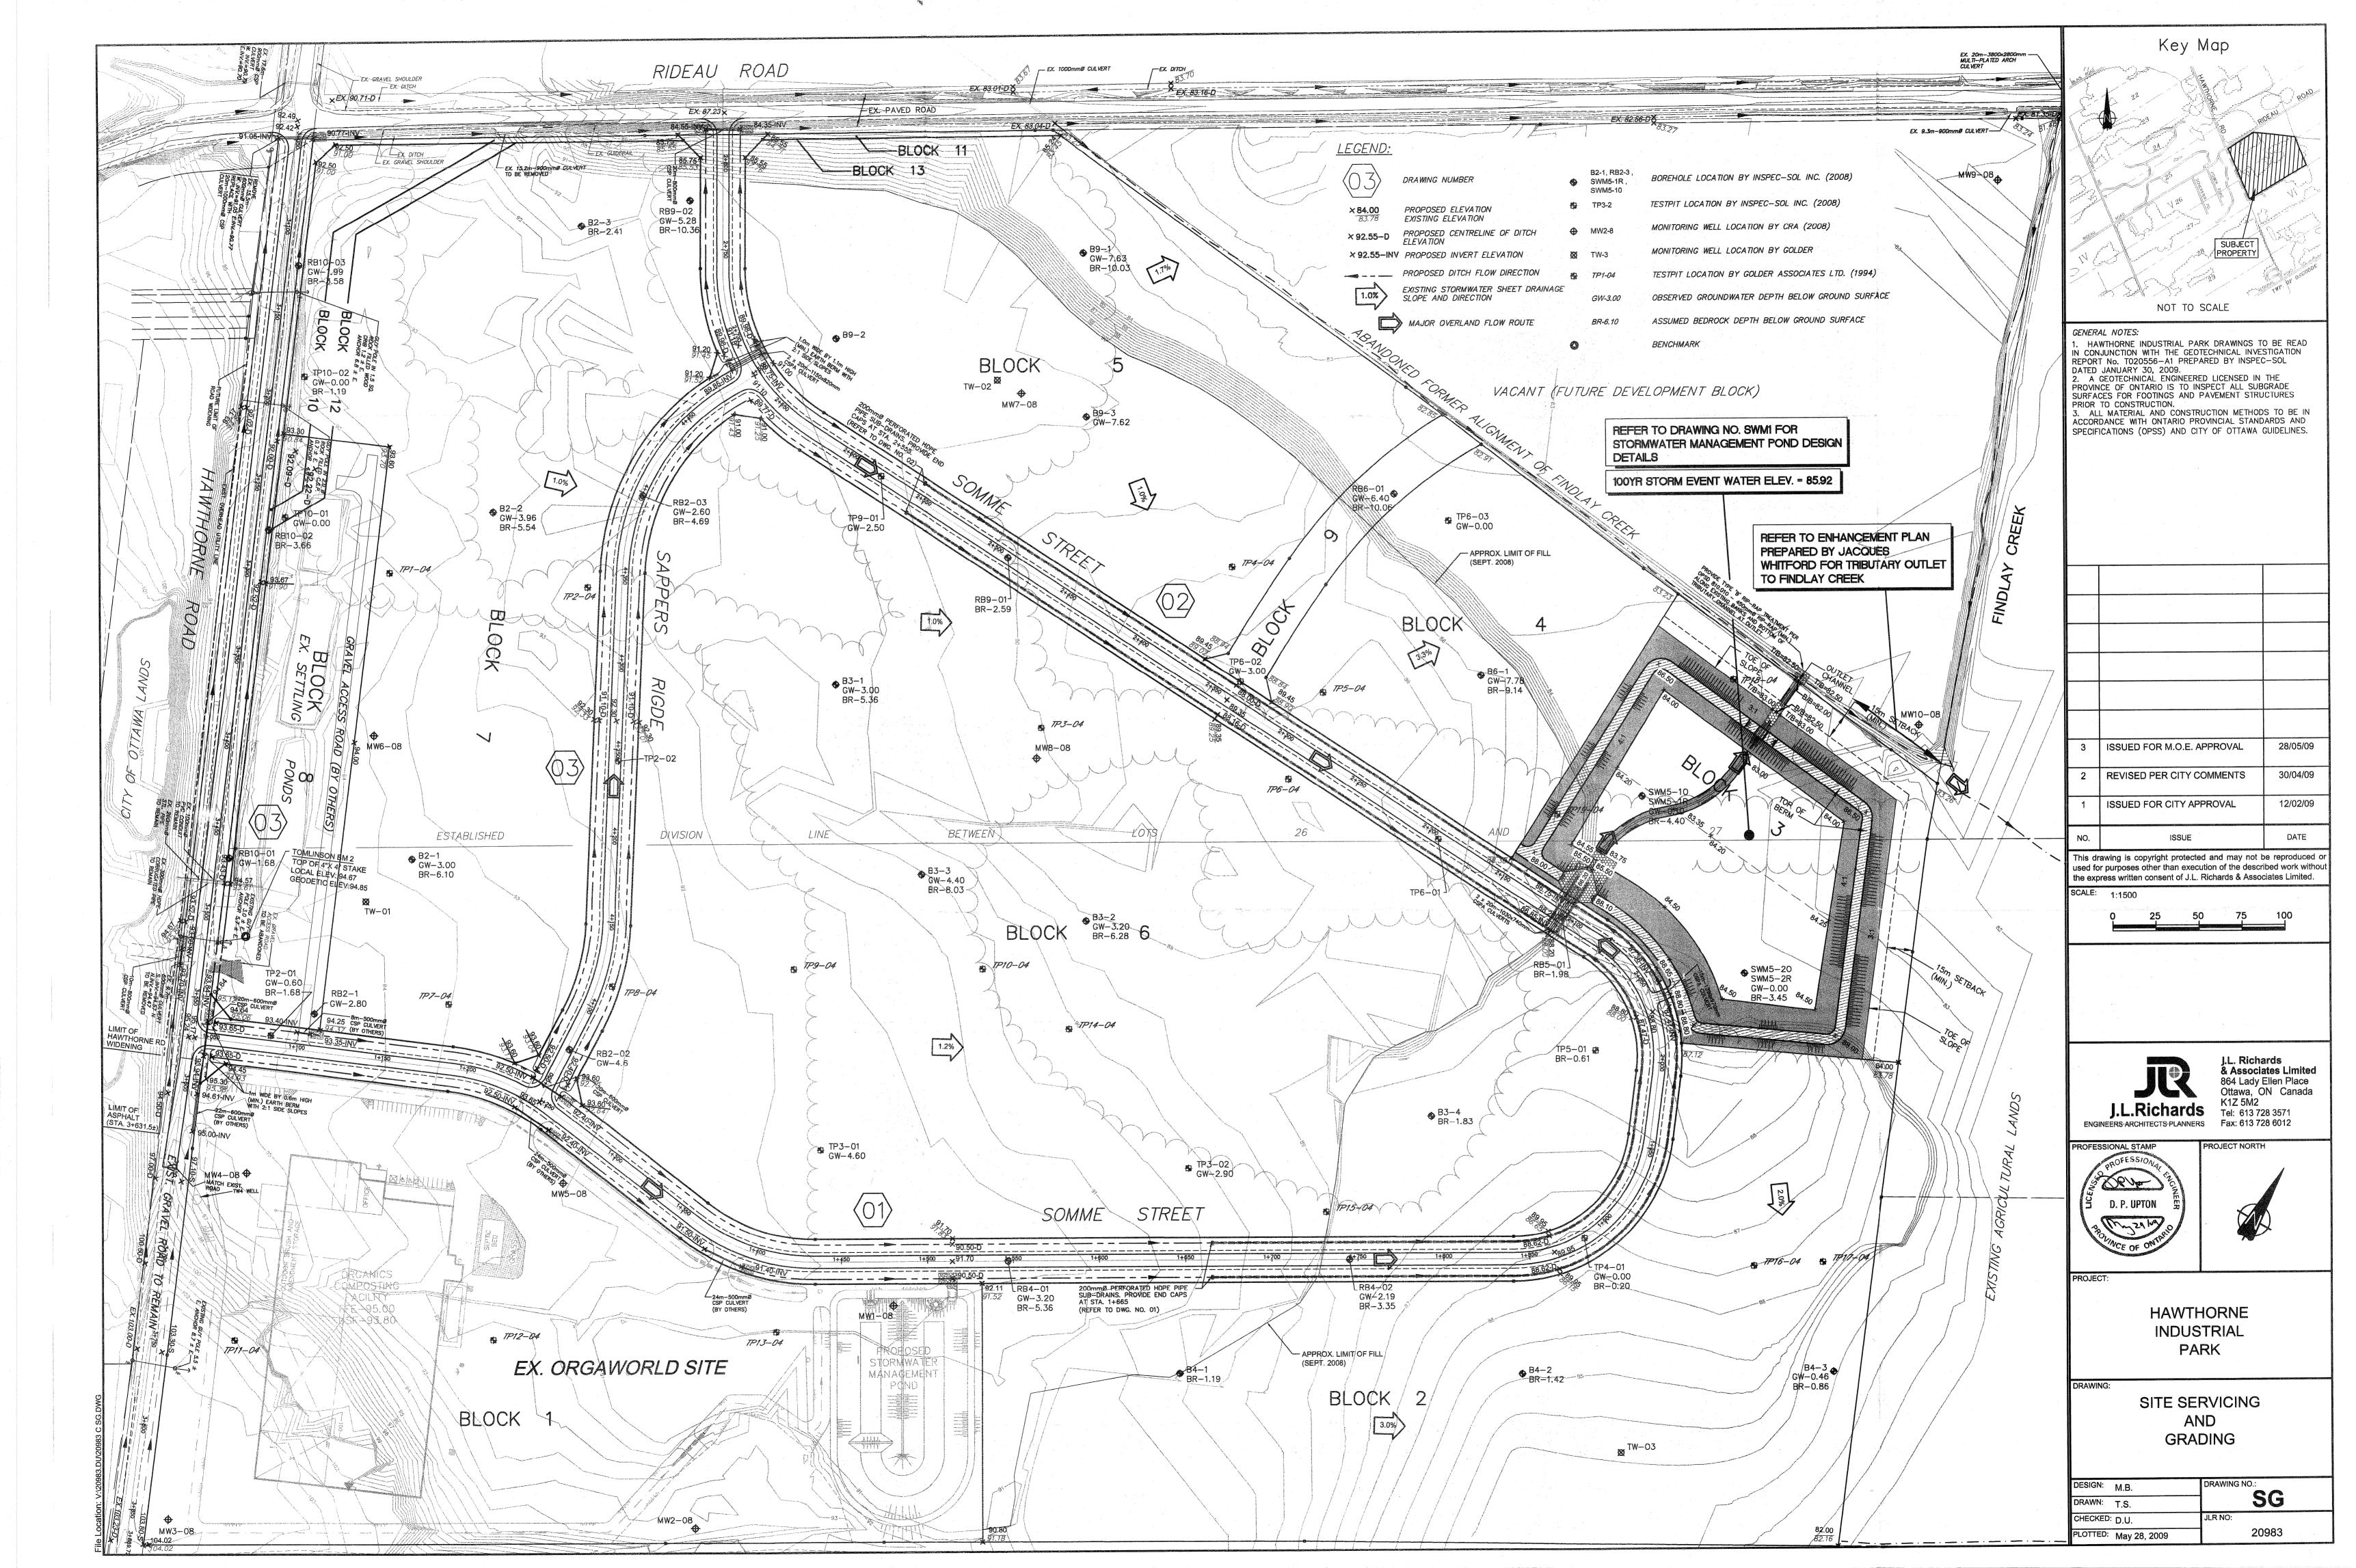

# 8.0 SUMMARY AND CONCLUSION

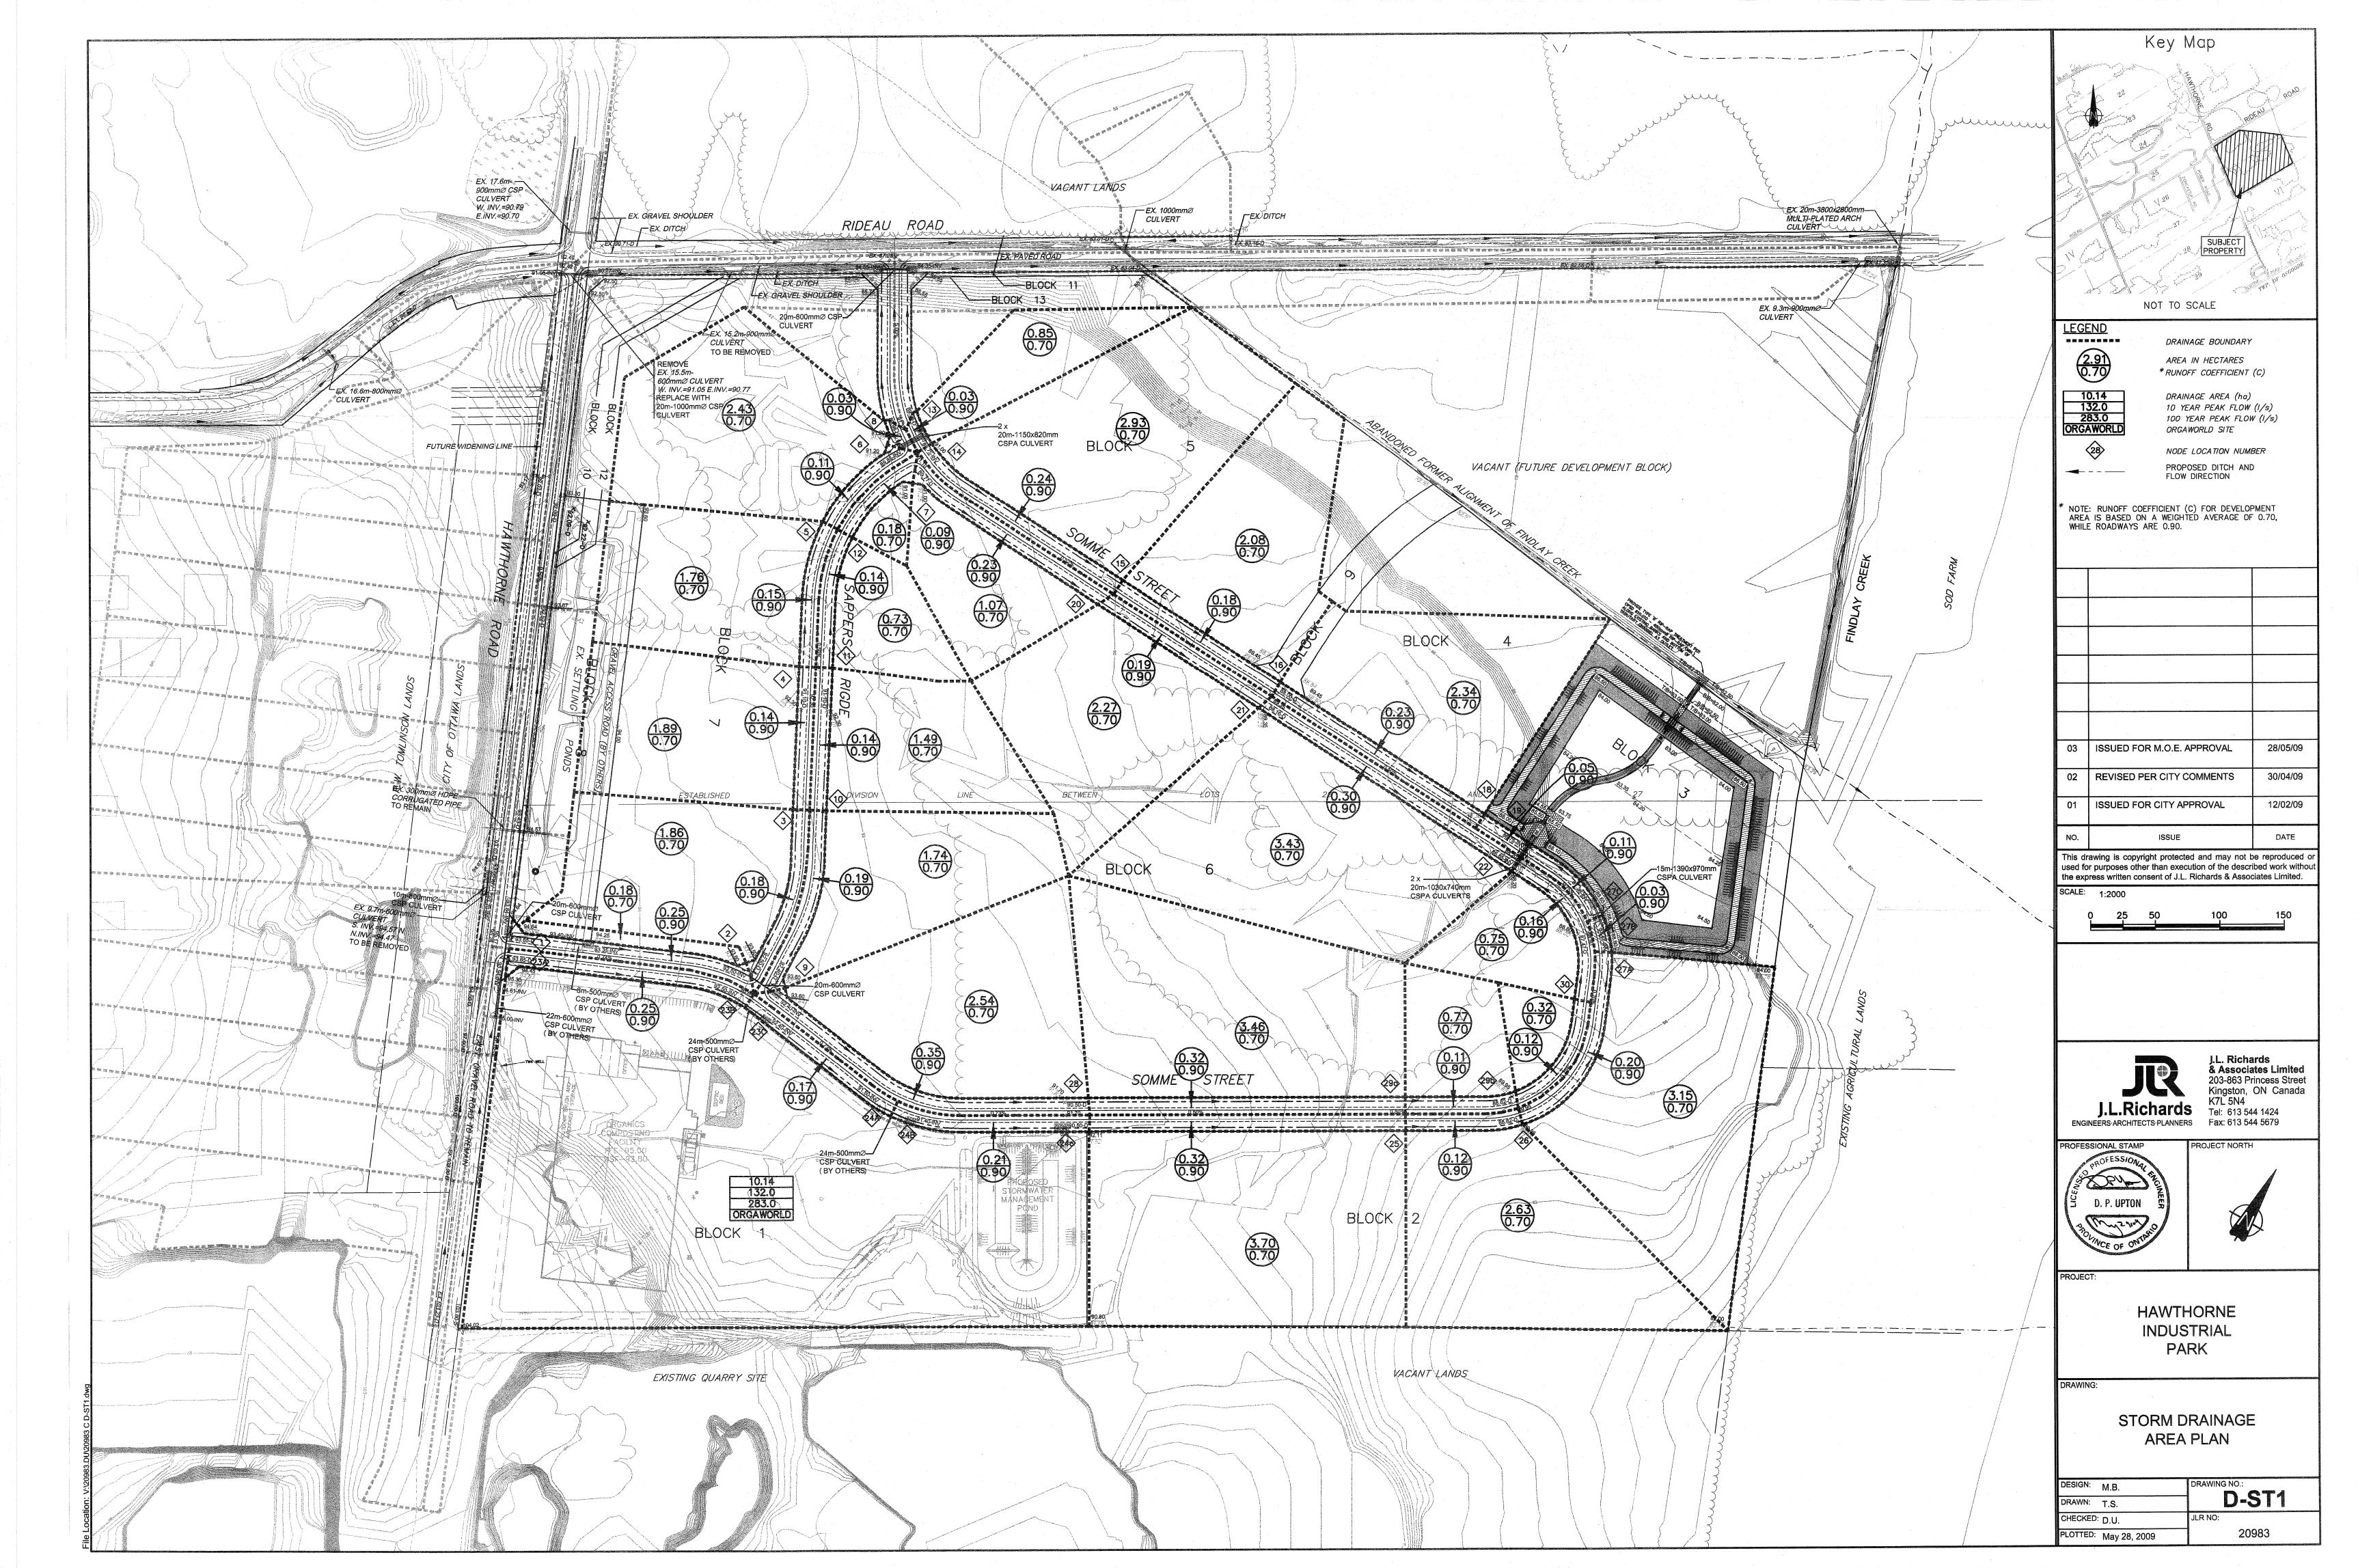

- 1. This Stormwater Management Report has been prepared to present a complete approach in achieving the stormwater criteria developed as part of the approved document entitled "Shields Creek Subwatershed Study."
- Stormwater servicing for the proposed HIP has been designed using the dual drainage concept. Storm servicing will be carried out with the use of an open ditch/culvert system. The open ditch system has been designed to convey the 1:00 year peak flow rates. Similarly, the culverts have been sized to convey the 1:10 year flow without any overtopping.
- 3. To fulfil the design criteria associated with water quality (as per the SCSS), it is proposed to provide both on-site oil/grit separators and infiltration storage volume within the roadside open ditch system. As per the requirements set out in Table 3.2 of the MOE SWMPDM, a total infiltration volume of 62.5 m<sup>3</sup> is required under Phase 2 to achieve a "normal" level of protection (i.e., TSS removal of 70%).
- 4. Water balance and infiltration requirements were not implemented due to existing site conditions and proposed industrial use development.
- 5. The 2-year post-development peak flow will be controlled to 50% of the 2-year pre-development peak flow. Therefore, meeting the SCSS recommendations associated with erosion potential.
- 6. Simulation results presented in Tables 5 and 6 show that proposed infrastructure will maintain peak flows below pre-development levels for both Phase 1 and Phase 2 of the HIP. Consequently, this design criterion (peak flow control) will be fulfilled.
- 7. A detailed Erosion and Sedimentation Control Plan has been prepared to reduce the impact of construction activities on Findlay Creek.

## MINISTRY OF THE ENVIRONMENT CERTIFICATE OF APPROVAL EXISTING SETTLING PONDS

Ministry Ministère of the de Environment l'Environnement

CERTIFICATE OF APPROVAL INDUSTRIAL SEWAGE WORKS NUMBER 6924-5YWQ3U

R. W. Tomlinson Limited 5597 Power Road, R.R. No. 6 Gloucester, Ontario K1G 3N4

Site Location: Tomlinson Property, east side of Hawthorne Road Lot 26 & 27, Concession VI Ottawa City

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of sewage works for the collection, transmission, treatment and disposal of excess wash plant wash water, consisting of the following:

410 millimeter pipeline extending from the wash plant, located on the Rideau Road Quarry #1 site, to the settling ponds;

three (3) settling ponds, in series, Cell #1 having an effective volume of 3,275 cubic metres (and an operating freeboard of 0.6 metres), Cell #2 having an effective volume of 2,347 cubic metres (and an operating freeboard of 0.6 metres) and Cell #3 having an effective volume of 1,154 cubic metres (and an operating freeboard of 0.6 metres), including temporary floating pumping station in Cell #1, floating recycle pumping station in Cell #2, baffle in Cell #2 and mixing manhole between Cell #2 and Cell #3 (if required), with an overflow discharge from Cell #3 to the roadside ditch along Hawthorne Road;

all other controls, electrical equipment, instrumentation, piping, pumps, valves and appurtenances essential for the proper operation of the aforementioned sewage works;

all in accordance with the following submitted supporting documents:

1. <u>Application for Approval of Industrial Sewage Works</u> submitted by Ronald Tomlinson of R. W. Tomlinson Limited dated March 8, 2004;

 Report on Application for Industrial Sewage Works Approval under Section 53 of the Ontario Water Resources Act, R.W. Tomlinson Limited, Aggregate Wash Water Management Associated with Rideau Road Quarry No. 1, Geographic City of Gloucester, City of Ottawa, Ontario prepared by Golder Associates, dated March 2004; and 3. Letter and attachments dated May 11, 2004 from Nural Kuyucak and K. Marentette of Golder Associates to Randy Chin of the Ministry of the Environment.

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"Certificate" means this entire certificate of approval document, issued in accordance with Section 53 of the *Ontario Water Resources Act*, and includes any schedules;

"Director" means any Ministry employee appointed by the Minister pursuant to section 5 of the Ontario Water Resources Act;

"District Manager" means the District Manager of the Ottawa District Office of the Ministry;

"Ministry" means the Ontario Ministry of the Environment;

"Owner" means R. W. Tomlinson Limited and includes its successors and assignees; and

"works" means the sewage works described in the Owner's application, this certificate and in the supporting documentation referred to herein, to the extent approved by this certificate.

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

#### TERMS AND CONDITIONS

### 1. <u>GENERAL CONDITION</u>

(1) Except as otherwise provided by these Conditions, the Owner shall design, build, install, operate and maintain the works in accordance with the description given in this Certificate, the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this Certificate.

(2) Where there is a conflict between a provision of any submitted document referred to in this Certificate and the Conditions of this Certificate, the Conditions in this Certificate shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

#### 2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within 30 days of the change occurring:

(a) change of Owner or operating authority, or both;

(b) change of address of Owner or operating authority or address of new owner or operating

authority;

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the *Partnerships Registration Act*; and

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the most current "Initial Notice or Notice of Change" (Form 1, 2 or 3 of O. Reg. 189, R.R.O. 1980, as amended from time to time), filed under the *Corporations Informations Act* shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the works, the Owner shall notify in writing the succeeding owner of the existence of this certificate, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this condition will refer to this certificate's number.

## **OPERATIONS MANUAL**

(1) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the works;

(b) inspection programs, including frequency of inspection, for the works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the works;

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager; and

(e) complaint procedures for receiving and responding to public complaints.

(2) The Owner shall maintain the operations manual up to date through revisions undertaken from time to time and retain a copy at the location of the sewage works. Upon request, the Owner shall make the manual available for inspection and copying by Ministry personnel.

## CLOSED LOOP OPERATION

4.

(1) The Owner shall ensure that the works are normally operated as a closed loop system with treated water being recycled back to the wash plant.

(2) In the event that excess accumulation of water occurs and a discharge is necessary, the Owner shall undertake the monitoring outlined in Condition 6 and shall adhere to the effluent limits in Condition 5.

### **EFFLUENT LIMITS**

5.

(1) The Owner shall design, construct and operate the works such that the concentration of Total Suspended Solids does not exceed 25 milligrams per litre in the effluent from the works.

(2) For the purposes of determining compliance with and enforcing subsection (1), non-compliance with respect to the Total Suspended Solids concentration limit is deemed to have occurred when any single sample (along with a follow-up confirmation sample collected within 7 days of the receipt of the original sample result that indicated that an exceedance had occurred) analyzed for Total Suspended Solids is greater than the corresponding maximum concentration set out in subsection (1).

## EFFLUENT MONITORING AND RECORDING

The Owner shall, upon commencement of operation of the sewage works, carry out the following monitoring program:

(1) All samples and measurements taken for the purposes of this certificate are to be taken at a time and in a location characteristic of the quality and quantity of the effluent stream over the time period being monitored.

(2) Samples shall be collected of the discharge from Cell #3 to the Hawthorne Road ditch and analyzed, at the sampling frequencies and using the sample type specified for each parameter listed:

	Table 1 - Effluent Monitoring							
Brequency	Frequency Once each Month During Periods of Effluent Discharge							
Sample Lype	Grab	· ·						
Parameters	Total Suspen	ded Solids		•				

(3) The methods and protocols for sampling, analysis, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions; and

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (17th edition) as amended from time to time by more recently published editions.

(4) The Owner shall measure, record and calculate the flowrate from Cell #3 to the Hawthorne Road ditch daily (during periods of discharge), within an accuracy of plus or minus 15 per cent of the actual flowrate.

(5) The Owner shall retain for a minimum of three (3) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this certificate.

### 7. <u>REPORTING</u>

1.

2.

3.

4.

5.

6.

(1) The Owner shall report to the District Manager or designate, of any exceedence of any parameter specified in Conditions 5 orally, as soon as reasonably possible, and in writing within seven (7) days of the exceedence.

## The reasons for the imposition of these terms and conditions are as follows:

Condition 1 is imposed to ensure that the works are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Certificate and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.

Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved works and to ensure that subsequent owners of the works are made aware of the certificate and continue to operate the works in compliance with it.

Condition 3 is included to ensure that a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the Ministry. Such a manual is an integral part of the operation of the works. Its compilation and use should assist the owner in staff training, in proper plant operation and in identifying and planning for contingencies during possible abnormal conditions. The manual will also act as a benchmark for Ministry staff when reviewing the owner's operation of the work.

Condition 4 is included to ensure that the works are operated as designed.

Condition 5 is imposed to ensure that the effluent discharged from the works meets the Ministry's effluent quality requirements thus minimizing environmental impact on the receiver.

Conditions 6 and 7 are included to require the owner to demonstrate on a continual basis that the quality of the effluent from the approved works is consistent with the effluent limits specified in the certificate and that the approved works does not cause any impairment to the receiving watercourse.

In accordance with Section 100 of the <u>Ontario Water Resources Act</u>, R.S.O. 1990, Chapter 0.40, as amended, you may by written notice served upon me and the Environmental Review Tribunal and in accordance with Section 47 of the <u>Environmental Bill of Rights</u>, S.O. 1993, Chapter 28, the Environmental Commissioner, within 15 days after receipt of this Notice, require a hearing by the Tribunal. The Environmental Commissioner will place notice of your appeal on the Environmental Registry. Section 101 of the <u>Ontario</u> <u>Water Resources Act</u>, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
 The grounds on which you intend to rely at the hearing in relation to <u>each</u> portion appealed.

### The Notice should also include:

The name of the appellant;

4.

- The address of the appellant;
- The Certificate of Approval number;
   The date of the Certificate of Approval;
  - The date of the Certificate of Apploy
- 7. The name of the Director;
  - The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

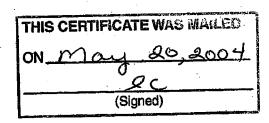

The Secretary* Environmental Review Tribunal 2300 Yonge St., 12th Floor P.O. Box 2382 Toronto, Ontario M4P 1E4	AND	The Environmental Commissioner 1075 Bay Street, 6th Floor Suite 605 Toronto, Ontario M5S 2B1	AND	The Director Section 53, <i>Ontario Water Resources Act</i> Ministry of the Environment 2 St. Clair Avenue West, Floor 12A Toronto, Ontario M4V 1L5
-------------------------------------------------------------------------------------------------------------------------------	-----	----------------------------------------------------------------------------------------------------------	-----	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

\* Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 314-4600, Fax: (416) 314-4506 or www.ert.gov.on.ca

This instrument is subject to Section 38 of the <u>Environmental Bill of Rights</u>, that allows residents of Ontario to seek leave to appeal the decision on this instrument. Residents of Ontario may seek leave to appeal within 15 days from the date this decision is placed on the Environmental Registry. By accessing the Environmental Registry at www.ene.gov.on.ca, you can determine when the leave to appeal period ends.

The above noted sewage works are approved under Section 53 of the Ontario Water Resources Act.

DATED AT TORONTO this 19th day of May, 2004

## APPENDIX'J'

## ASSESSMENT OF CULVERT CROSSING DURING AN EXTREME STORM EVENT

#### ENTRANCE TO POND ACCESS ROAD - OPEN DITCH/CULVERT CONFIGURATION

Typical open ditch/culvert configuration: 1390x970mm CSPA culvert, invert approx. 1.43 m below elevation at property line. Proposed Terrace Elevation is approx. 0.13 m above road centreline.

FLOW ABOVE CULVERT THRU A1:		FLOW ABOVE CULVERT THRU A2:			
Since 0 is equal to appro	k. 180 degrees				
Use the Rectangular Weir Equation to Estimate the Flow Thru A1:		Using the Rectangular Weir Equation to Estimate the Flow Thru A2:			
Q=CxLx	H ^ 1.5	$Q = C \times L \times H^{1.5}$			
C = 1.84		C = 1.84			
L' = L1 - (0.	1 x n x h) , where n= no. of end contractions	L' = L3 - (0.1 x n x h)	, where n= no. of end contractions		
use h = 88.	77 - 88.7 ≐ 0.07 m	use h = 88.9 - 88.77	= 0.13 m		
h =	0.07 m	h =	0.13 m		
		L3 = (L1 + L2) / 2 = 1	Om (Avg. Length)		
L' =	6.99 m	L'=`´´	9.97 m		
Q <sub>A1</sub> =	0.24 m3/s	Q <sub>A2</sub> =	0.86 m3/s		

1:100 year Peak Flow Rate of 3.0 m<sup>3</sup>/s (From Storm Design Sheet : 100 Year Flow 27B-27C)

Flow through the 1390 x 970 mm CSPA Culvert under inlet Control Conditions = 1.9 m<sup>3</sup>/s (From Culvert Sizing Nomograph 27B-27C) Total flow above culvert =  $Q_{A1} + Q_{A2} = 0.24$  m<sup>3</sup>/s + 0.86 m<sup>3</sup>/s = 1.10 m<sup>3</sup>/s Therefore, Total Flow =  $1.9 \text{ m}^3/\text{s} + 1.1 \text{ m}^3/\text{s}$ =  $3.0 \text{ m}^3/\text{s}$ =1:100 year Peak Flow Rate

J. L. Richards & Associates Limited

# Appendix A-2 MOE Certificate of Approval Hawthorne Industrial Park

Ministry of the Environment Ministère de l'Environnement

# CERTIFICATE OF APPROVAL MUNICIPAL AND PRIVATE SEWAGE WORKS NUMBER 4660-7UNPRJ Issue Date: November 9, 2009

Tomlinson Development Corporation 5597 Power Rd Ottawa, Ontario K1G 3N4

Site Location: Hawthorne Industrial Park (HIP) - Phase 1 Lot 26 and 27, Concession 6 (R.F.) City of Ottawa, Ontario

# You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of sewage works for the collection, transmission, treatment and disposal of stormwater runoff from a catchment area of approximately 70 hectares, servicing the Hawthorne Industrial Park, located immediately southeast of the Hawthorne Road/Rideau Road intersection in the City of Ottawa, to provide partial water quality protection (Normal Protection Level) and to attenuate post-development peak flows to pre-development levels, discharging to Findlay Creek, which is a tributary to the North Castor River, for all storm events up to and including the 100 year return storm, consisting of the following stormwater works:

# Stormwater Management System

# Outlet No. 1, HIP to a dry pond facility (Service area of 69.81 ha):

- A dry pond facility to provide quantity control by attenuating post development peak flows to pre-development levels for all storm events up to and including the 100 year return storm, having a design minimum liquid retention volume of approximately 37,240 m<sup>3</sup> at elevation 86.15 m (0.23 m above 100-year surface pond elevation), with side slopes of 4:1, and servicing approximately 69.81 hectares, which includes Orgaworld Canada Ltd's stormwater treated effluent (10.14 ha). The SWM pond is designed to provide a controlled maximum discharge flow rate of 1,531 L/s for the 100-year storm event, discharging to Findlay Creek; and equipped with:
  - An outlet structure consisting of a 150 mm diameter orifice within a 200 mm diameter polyvinyl chloride (PVC) pipe at an invert elevation of 82.90 m, which serves as outlet to the facility;
  - Two (2) 600 mm diameter corrugated steel pipe (CSP) culvert placed at an invert elevation of 84.80 m, which also serves as an outlet to the facility; and
  - An emergency spillway of 0.35 m deep with a 6.0 m wide base to convey surface flow toward the

receiving channel during extreme storm events.

Storm Events (catchment for Outlet #1 – 70 ha)	2-year	5-year	25-year	100-year
Existing flows, pre-development (m <sup>3</sup> /s.)	0.467	0.826	1.468	2.093
Post-development flows (m <sup>3</sup> /s)	3.077	4.812	7.772	10.662
Post-development attenuated flows (m <sup>3</sup> /s)	0.194	0.359	0.939	1.531

• The simulated modelling estimate and drainage pattern draining to Outlet No.1 is as follows:

- A new roadside ditch system draining to the dry pond facility, equipped with CSP culverts and approximately 1,755 m of 200 mm diameter HDPE perforated pipe sub-drains and clear stone bedding wrapped in geotextile located at the base of the ditches to meet a Normal water quality Protection Level (70% Total Suspended Solids removal) for the contributing catchment area of 1.58 ha which includes the paved portion of the industrial park road network located within the subdivision right-of-way as per the SWM Report (J.L.Richards, 2009).
- The requirement for quality protection for the remaining 68.23 ha is provided by the individual industrial lots within HIP as per the following Certificates of Approval (this list will be amended as future CofAs for other lots within HIP are developed, as per Condition 7 of this Certificate):
  - CofA # 9465-7NVRWT, issued on September 16, 2009, providing Normal water quality Protection Level for 10.14 ha.

# Outlet No.2, to Findlay Creek (Service area of 39.16 ha):

• A new roadside ditch system draining to Findlay Creek via an existing roadside ditch located adjacent to Rideau Road, servicing a catchment area along the Hawthorne Road extension and includes the Tomlinson Quarry, as per the SWM Report (J.L.Richards, 2009). This service area is not part of the HIP site.

All including erosion/sedimentation control measures during construction and all other controls and appurtenances essential for the proper operation of the aforementioned *Works*;

all in accordance with the following supporting documents:

- 1. <u>Application for Approval of Industrial Sewage Works</u> submitted by Domenic Idone, P.Eng., Planning Engineer of Tomlinson Development Corporation, dated March 12, 2009, and received on June 8, 2009;
- 2. Stormwater Management Report Hawthorne Industrial Park, dated February 2009 (revised May 2009), and prepared by J.L Richards & Associates Limited.
- 3. Geotechnical Study Subdivision Plan Hawthorne Industrial Park, Lots 26 and 27, Concession 6, Southeast of Hawthorne and Rideau Roads, Ottawa, dated May 4, 2009, and prepared by

Inspec-Sol Inc.

- 4. Certificate of Approval 6924-5YWQ3U, issued on May 19, 2004, for R.W. Tomlinson Limited for a lagoon system to treat sewage from the Tomlinson Quarry.
- 5. s.53 OWRA Certificate of Approval, Orgaworld Canada Ltd. (9465-7NVRWT, issued on September 16, 2009).
- 6. Revised Fish Habitat Ehnacement Strategy Hawthorne Industrial Park Stormwater Management Pond, prepared by Stantec (Jacques Whitford Stantec Limited), dated May 13, 2009.
- 7. Clearance Letter from the South Nation Conservation dated May 26, 2009, issued to the City of Ottawa for the Tomlinson / Hawthorne Industrial Park Subdivision.
- 8. Emails from Derrick P. Upton, P.Eng., of J.L. Richards & Associates Limited to Edgardo Tovilla, P.Eng., of the MOE, dated August 7 & 11, 2009, with additional information requested.
- 9. Letter from Derrick P. Upton, P.Eng., of J.L. Richards & Associates Limited to Edgardo Tovilla, P.Eng., of the MOE, dated August 31, 2009, with additional information requested.
- 10. Email from Tim Chadder of J.L. Richards & Associates Limited to Edgardo Tovilla, P.Eng., of the MOE, dated October 9, 2009, with final comments to the CofA.

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"*Certificate* " means this entire certificate of approval document, issued in accordance with Section 53 of the <u>Ontario Water Resources Act</u>, and includes any schedules;

"*Director* " means any *Ministry* employee appointed by the Minister pursuant to section 5 of the <u>Ontario</u> Water Resources Act;

"District Manager " means the District Manager of the Ottawa District Office of the Ministry ;

"Ministry " means the Ontario Ministry of the Environment;

"Owner " means Tomlinson Development Corporation and includes its successors and assignees; and

"*Works* " means the sewage works described in the *Owner* 's application, this *Certificate* and in the supporting documentation referred to herein, to the extent approved by this *Certificate*.

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

# **TERMS AND CONDITIONS**

# 1. <u>GENERAL PROVISIONS</u>

(1) Except as otherwise provided by these Conditions, the *Owner* shall design, build, install, operate and maintain the *Works* in accordance with the description given in this *Certificate*, the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this *Certificate*.

(2) Where there is a conflict between a provision of any submitted document referred to in this *Certificate* and the Conditions of this *Certificate*, the Conditions in this *Certificate* shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(3) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

# 2. EXPIRY OF APPROVAL

The approval issued by this *Certificate* will cease to apply to those parts of the *Works* which have not been constructed within five (5) years of the date of this *Certificate*.

# 3. CHANGE OF OWNER

The *Owner* shall notify the *District Manager* and the *Director*, in writing, of any of the following changes within thirty (30) days of the change occurring:

- (a) change of Owner;
- (b) change of address of the Owner;

(c) change of partners where the *Owner* is or at any time becomes a partnership, and a copy of the most recent declaration filed under the <u>Business Names Act</u>, R.S.O. 1990, c.B17 shall be included in the notification to the *District Manager*; and

(d) change of name of the corporation where the *Owner* is or at any time becomes a corporation, and a copy of the most current information filed under the <u>Corporations Information Act</u>, R.S.O. 1990, c. C39 shall be included in the notification to the *District Manager*.

# 4. <u>OPERATION AND MAINTENANCE</u>.

(1) The *Owner* shall ensure that the design minimum liquid retention volume(s) is maintained at all times.

(2) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the

Works to prevent the excessive build-up of sediments and/or vegetation.

(3) The *Owner* shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the Owner's office for inspection by the *Ministry*. The logbook shall include the following:

(a) the name of the *Works*;

(b) the date and results of each inspection, maintenance, monitoring reports and cleaning, including an estimate of the quantity of any materials removed; and

(c) the date of each spill within the catchment area, including follow-up actions / remedial measures undertaken.

(4) The *Owner* shall operate the *Works* with an objective of achieving Normal water quality Protection Level (70% long-term Total Suspended Solids removal) for the portion of the land being treated with the proposed Works.

# 5. MONITORING AND RECORDING

The *Owner* shall, upon commencement of operation of the *Works*, carry out the following monitoring program:

(1) All samples and measurements taken for the purposes of this *Certificate* are to be taken at a time and in a location characteristic of the quality and quantity of the effluent stream over the time period being monitored.

(2) For the purposes of this condition, Semi-annually means once twice per year;

(3) Samples shall be collected at the following sampling points, at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

	Table 1 - Surface Water Monitoring
Sample location: a	at the inlet of the dry pond facility
Frequency	Semi-annually; at least once being for the snowmelt freshets and another being 72 hours after the fall of precipitation of more than 25 mm.
Sample Type	Grab
Parameters	<i>CBOD5</i> , Total Suspended Solids, Total Phosphorus, <i>E. Coli</i> , pH, Temperature, Acute Lethality.

(4) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from

time to time by more recently published editions;

(b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(c) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition), as amended from time to time by more recently published editions;

(d) the Environment Canada publications "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Rainbow Trout" (July 1990) and "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to <u>Daphnia magna</u>" (July 1990), as amended from time to time by more recently published editions; and,

(6) The measurement frequencies and the overall monitoring program specified in subsection (3) are minimum requirements which may, after three (3) years of monitoring in accordance with this Condition or after a minimum 75% build-up of the site, whichever occurs first, be modified by the *District Manager* in writing from time to time.

(7) The *Owner* shall retain for a minimum of three (3) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this *Certificate*.

(8) The *Owner* shall enter into an agreement with the owner of the composting facility located within HIP, located at Part of Lot 27, Concession 6, 5123 Hawthorne Road, for the long-term acess to private wells for its operation, maintenance and testing to ensure that the provisions of a groundwater monitoring program can be administered. A copy of such Agreement shall be provided to the *District Manager* prior to the commencement of operation of the *Works*.

# 6. <u>RECORD KEEPING</u>

The *Owner* shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the operation and maintenance and activities required by this *Certificate*.

# 7. SPECIAL CONDITION

(1) The *Owner* shall ensure through the Site Plan Approval process that individual lots developed within the industrial park will obtain a approval, in accordance with section 53 of the OWRA, before discharging into the roadside ditches and ultimately to the dry pond facility.

(2) The *Owner* shall not approve any additional flow from storm sewers, catchbasin leads, and storm service drains to the individual industrial plots to connect with the dry pond <u>unless this Certificate of Approval is amended</u> with adequate quality treatment proposed via provision of additional sewage treatment works, best management practices and hydraulic capacity servicing them has been designed and reviewed by the Ministry concluding that the additional quality of stormwater will not overload the

downstream collection system, pond and/or alter the stormwater quality of effluent discharged to the receiver of this *Certificate*.

# The reasons for the imposition of these terms and conditions are as follows:

- 1. Condition 1 is imposed to ensure that the *Works* are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the *Certificate* and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.
- 2. Condition 2 is included to ensure that the *Works* are constructed in a timely manner so that standards applicable at the time of Approval of the *Works* are still applicable at the time of construction, to ensure the ongoing protection of the environment
- 3. Condition 3 is included to ensure that the *Ministry* records are kept accurate and current with respect to approved works and to ensure that subsequent owners of the works are made aware of the certificate and continue to operate the works in compliance with it.
- 4. Condition 4 is included to require that the *Works* be properly operated and maintained such that the environment is protected.
- 5. Conditions 5 and 7 are included to enable the *Owner* to evaluate and demonstrate the performance of the *Works*, on a continual basis, so that the *Works* are properly operated and maintained at a level which is consistent with the design objectives specified in the *Certificate* and that the *Works* does not cause any impairment to the receiving watercourse.
- 6. Condition 6 is included to require that all records are retained for a sufficient time period to adequately evaluate the long-term operation and maintenance of the *Works*.

In accordance with Section 100 of the <u>Ontario Water Resources Act</u>, R.S.O. 1990, Chapter 0.40, as amended, you may by written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the <u>Ontario Water Resources Act</u> , R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

- 1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
- 2. The grounds on which you intend to rely at the hearing in relation to <u>eachportion</u> appealed.

# The Notice should also include:

- 3. The name of the appellant;
- 4. The address of the appellant;
- 5. The Certificate of Approval number;
- 6. The date of the Certificate of Approval;
- 7. The name of the Director;
- 8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

 The Secretary\*
 The Director

 Environmental Review Tribunal
 Section 53, Ontario Water Resources Act

 655 Bay Street, 15th Floor
 Ministry of the Environment

 Toronto, Ontario
 AND

 M5G 1E5
 Toronto, Ontario

CIMA+ PROJECT NUMBER: CLIENT: PROJECT STATUS: Fastfrate Warehouse Development Industrial/Commercial Development A001083 Fastfrate Detailed Design

# STORM POST-DEVELOPMENT FLOW (UNCONTROLLED) Proposed Stormwater Management

#### DESCRIPTION

This calculation reflects the proposed stormwater management for the subject site areas discharging to the HIP SWMF. This calculation serves to determine the uncontrolled release rate as proposed.

### APPLICABLE DESIGN GUIDELINES:

1. City of Ottawa Sewer Design Guidelines, 2012

# PRE-DEVELOPMENT FLOW DETERMINATION: DESIGN CRITERIA:

Design Storm (year):	10	
IDF Regression Constants: (a) (b) (c)	1174.184 6.014 0.816	
IDF Curve Equation (mm/hr):	I = a / (Time	e in min + b)°
Rational Formula (L/s):	Q = 2.78C*I*A	where: Q = Flow (L/s) C = Runoff Coefficient I = Rainfall Intensity (mm/hr) A = Area

#### ALLOWABLE RELEASE RATE - SUMMARY:

Catchment ID	Area (A) <sub>ha</sub>	Runoff Coefficient (C)	Time of Concentration (tc) <sup>min</sup>	Intensity (I) <sup>mm/hr</sup>	Release Rate	Release Flow Per Unit Area (Q/ha) L/s/ha
A1	0.80	0.71	22.85	75.52	118.86	148.96
A2	1.31	0.81	22.85	75.52	222.69	169.68
A3	0.86	0.90	22.85	75.52	163.06	188.81
A4	0.14	0.69	22.85	75.52	20.61	144.60
A5	0.11	0.85	22.85	75.52	18.99	177.94
A6	0.39	0.20	22.85	75.52	16.39	41.96
A7	0.04	0.20	22.85	75.52	1.79	41.96
Total	3.66				562.373	153.81

#### NOTES:

1. Time of concentration taken from SWM report (JL Richards, 2009). It is assumed that the resulting time of concentration is identical to JL Richards SWM report.

2. IDF Parameters per City of Ottawa Sewer Design Guidelines, 2012 (Macdonald-Cartier International Airport)

Prepared by: Guillaume LeBlond, M.A.Sc., El7 PEO No.: 100530467 Date: May 27, 2022

Legend:						
NC	= Non-controlled areas (no storage available)		Design Criteria:			
Capacity Area	= Area of water accumulated in sub-area at Max. Elev.	1) Maximum Allowable Total Release Rate = 248.03 L/s/ha				
Catchbasin Elev.	v Elevation of catchbasin inlet (top of grate).					
Max. Elev.	w. = Maximum elevation of water that may be accumulated within sub-area. 3) Rainfall event of 100 years					
Y <sub>max</sub>	= Maximum depth of water that may be accumulated within the sub-area.		4) Pre-development flow (5 year) = L/s (or L/s/ha	<del>)</del>		
V <sub>max</sub>	= Maximum volume of water (capacity) that may be accumulated within the sub-area.					
V <sub>rain</sub>	= Volume of water generated by rainfall.					
Difference	= Difference between V <sub>max</sub> and V <sub>rain</sub> (remaining capacity of sub-area)					
V <sub>acc</sub>	= Total volume of water accumulated within the sub-area in the event of a specific rainfall.					
Y <sub>rain</sub>	= Depth of water generated by rainfall.	Prepared by:	Guillaume LeBlond, M.A.Sc., EIT	Date: May 30, 2022		
Elev <sub>rain</sub>	= Elevation of water generated by rainfall.	PEO No.:	100530467			
A <sub>rain</sub>	= Area of water generated by rainfall.					
Q <sub>ave</sub>	= Average flow (for drawndown time calculation).	Verified by:	Christian Lavoie-Lebel, P.Eng.	Date: <u>May 30, 2022</u>		
Drawdown Time	= Time required for the total volume of water accumulated within sub-area to evacuate (following rainfall event).	PEO No.:	100067842

# Appendix B-9 SOMME STREET DITCH ELEVATION (100-YEAR)

### FASTFRATE

### A001083 (360)

### CHANNEL CHECK AT DITCH ON SOMME STREET (100-YEAR)

Bed Length (I)	m	0.000				
Side Slopes (H:V)	H/V	3.0000	1.0000			
Slope (S)	m/m	0.0050	%	0.50		
Roughness Coefficient	n	0.0300				
Flow (Q)	m³/s	3.857	l/s	3,857		
Velocity (V)	m/s	1.395	cm/s	140		
Hydraulic Radius (R <sub>h</sub> )	m	0.455				
Wetted Area	m <sup>2</sup>	2.765		•		
Wetted Perimeter	m	6.072		h V		
Height of water (h)	m	0.960		4	, 1	•

**Notes:** The ditch on Somme street at which our site is connecting will have a headwater height of 0.96m during the 100-year storm event. The bottom of the ditch at that location is 89.110 which means the hydraulic grade line within the ditch will be at 90.07.

# Appendix B-12 STORM SERVICE CONNECTION SIZING

PROJECT NAME: CIMA+ PROJECT NUMBER: CLIENT: PROJECT STATUS: Warehouse Development A001083 Fastfrate (Ottawa) Holdings Inc. Issued for Site Plan Approval

#### HYDRAULIC CALCULATIONS FOR STORM SEWERS

APPLICABLE DESIGN GUIDELINES:

1. City of Ottawa Sewer Design Guidelines, 2012

2. City of Ottawa Technical Bulletins up to and including ISTB-2018-01

### **DESIGN BASIS:**

Manning Coefficient :	0.013
Maximum permitted velocity :	3.00 m/s
Minimum permitted velocity :	0.80 m/s

Section	Dia.	Length	Slope	Invert	Invert	Capacity	Velocity	Flow	Velocity	% Full
				upstream	downstream	(full)	(full)		(actual)	
	mm	m	%	m	m	m³/s	m/s	m³/s	m/s	
Building Service Connection> STM #1	600	22.4	1.00%	89.750	89.525	0.614	2.17	0.213	1.96	35%
STM #1> STM #2	600	27.9	0.50%	89.515	89.375	0.435	1.54	0.283	1.64	65%
STM #2> Outlet (Wet Pond)	600	9.0	0.50%	89.345	89.300	0.435	1.54	0.283	1.64	65%

### <u>Remarks</u>

The data in green has been calculated or modified by the designer

The data in blue has been calculated using formulas inserted by the designer

### Notes :

1. Storm Sewer Peak Flow Determined per Roof Restricted flow of 213 L/s; and uncontrolled flow from Catchements A4 of 35.792 L/s and from Catchment A5 of 34.458 L/s.

## Hydraulic Analysis Report

## **Project Data**

Project Title: A001183 - Fastfrate Swales

Designer:

Project Date: Wednesday, June 6, 2022

Project Units: SI Units (Metric)

Notes:

## Channel Analysis: Channel West\_100y

Notes:

## Input Parameters

Channel Type: Trapezoidal

Side Slope 1 (Z1): 4.5000 m/m

Side Slope 2 (Z2): 3.0000 m/m

Channel Width 1.00 m

Longitudinal Slope: 0.0010 m/m

Manning's n: 0.0300

Flow 0.2310 cms

## **Result Parameters**

Depth 0.3050 m

Area of Flow 0.6539 m<sup>2</sup>

Wetted Perimeter 3.3707 m

Hydraulic Radius 0.1940 m

Average Velocity 0.3533 m/s

Top Width 3.2877 m

Froude Number: 0.2528

Critical Depth 0.1455 m Critical Velocity 1.0273 m/s Critical Slope: 0.0190 m/m Critical Top Width 2.09 m Calculated Max Shear Stress 2.9899 N/m^2 Calculated Avg Shear Stress 1.9017 N/m^2

## Channel Analysis: Channel West\_10y

Notes:

## **Input Parameters**

Channel Type: Trapezoidal Side Slope 1 (Z1): 4.5000 m/m Side Slope 2 (Z2): 3.0000 m/m Channel Width 1.00 m Longitudinal Slope: 0.0010 m/m Manning's n: 0.0300 Flow 0.1140 cms **Result Parameters** Depth 0.2158 m Area of Flow 0.3903 m<sup>2</sup> Wetted Perimeter 2.6769 m Hydraulic Radius 0.1458 m Average Velocity 0.2921 m/s Top Width 2.6182 m Froude Number: 0.2415 Critical Depth 0.0967 m Critical Velocity 0.8656 m/s

Critical Slope: 0.0212 m/m Critical Top Width 1.72 m Calculated Max Shear Stress 2.1149 N/m<sup>2</sup> Calculated Avg Shear Stress 1.4293 N/m<sup>2</sup>

## Channel Analysis: Channel East\_100y

Notes:

## **Input Parameters** Channel Type: Trapezoidal Side Slope 1 (Z1): 3.0000 m/m Side Slope 2 (Z2): 3.0000 m/m Channel Width 1.00 m Longitudinal Slope: 0.0010 m/m Manning's n: 0.0300 Flow 0.4453 cms **Result Parameters** Depth 0.4381 m Area of Flow 1.0139 m<sup>2</sup> Wetted Perimeter 3.7708 m Hydraulic Radius 0.2689 m Average Velocity 0.4392 m/s Top Width 3.6286 m Froude Number: 0.2652 Critical Depth 0.2177 m Critical Velocity 1.2374 m/s Critical Slope: 0.0171 m/m

Critical Top Width 2.31 m

Calculated Max Shear Stress 4.2944 N/m<sup>2</sup>

Calculated Avg Shear Stress 2.6357 N/m<sup>2</sup>

## **Channel Analysis: Channel East\_10y**

Notes:

### **Input Parameters**

Channel Type: Trapezoidal Side Slope 1 (Z1): 3.0000 m/m Side Slope 2 (Z2): 3.0000 m/m Channel Width 1.00 m Longitudinal Slope: 0.0010 m/m Manning's n: 0.0300 Flow 0.2226 cms **Result Parameters** Depth 0.3138 m Area of Flow 0.6092 m<sup>2</sup> Wetted Perimeter 2.9846 m Hydraulic Radius 0.2041 m Average Velocity 0.3654 m/s Top Width 2.8827 m Froude Number: 0.2537 Critical Depth 0.1470 m Critical Velocity 1.0509 m/s Critical Slope: 0.0189 m/m Critical Top Width 1.88 m Calculated Max Shear Stress 3.0758 N/m<sup>2</sup> Calculated Avg Shear Stress 2.0007 N/m<sup>2</sup>

Cost of new Steel Beam Guiderail:	
Length of Need:	

#### **COST FOR NEW SBGR:**

800.00	\$
000.00	φ

La = E (1 - A/B) where: La = Approach Length of Barrier for Approaching Traffic

- A = Distance from Edge of Travel Way to Face of Barrier.
- B = Distance from Edge of Travel Way to Back of Obstacle or
  - Area of Concern. B should not exceed Desirable Clear Zone according to Table 2-2
- G = Gating length of terminal
- E = Runout Length according to Table 2-15

#### \*Outside span to outside span of proposed culvert

#### La' = E(1 - A'/B') where: La, Lh and G according to above example

- La' = Approach Length of Barrier for Opposing Traffic
- A'= Distance from Centreline to Face of Barrier
- B' = Distance from Centreline to Back of Obstacle or Area of Concern. B' should not exceed Desirable Clear Zone according to Table 2-2
- E = Runout Length according to Table 2-15

(Rounded to nearest \$100)

## Subject: **CBRE – Fastfrate Warehouse – Required Fire Flow Proposal Ottawa, Ontario** O/Ref.: 2206-09A

Dear Sir,

To determine the water demand for fire protection based on the Fire Underwriters Survey, a document has been prepared by the Opta Information Intelligence Corp (formerly Insurance Advisory Organization). Part 2 of the document, contains a guide ("Guide for Determination of Required Fire Flows for Public Fire Protection in Canada), from here on referred to as the "Guide".

The subsection entitled "Risk Quantification with Required Fire Flows" states the following:

"The Guide to calculate required fire flows is made available to municipal officials, consulting engineers and other interested stakeholders as an aid in estimating water supply requirements for public fire protection. This document is a <u>guide and requires specialized knowledge and experience</u> in public fire protection engineering for its effective application."

The guide provides the following formula for estimating the fire flow required for a given area:

RFF=220 CA<sup>0.5</sup>

where RFF = Required Fire Flow C = coefficient related to the type of construction A is the total floor area of the building in m<sup>2</sup>

This formula only takes into consideration the building construction and the building area. The use of this formula provides a reasonable estimation for a building that does not have an adequate sprinkler system or that has a control mode density-area sprinkler system. The firefighting is based on a fire involving a majority of the building and the main objective is to limit the fire from spreading to other buildings and if possible extinguish the fire.

The modern-day sprinkler systems are designed to limit the fire to a relatively small area (by using Quick response sprinklers) and some are actually designed to extinguish the fire by using "Early Suppression Fast Response" sprinkler technology, as is the case in our situation. Since the proposed sprinkler design is based on the specific combustible loading of the building's occupancy content, the actual storage configuration, the actual height of the building and the clearances of the sprinklers with respect to the combustibles, it would be almost impossible to create a simple equation to estimate the fire flow. As a number of sprinkler systems for speculative buildings are not designed for the actual combustible contents nor do they necessarily use ESFR sprinkler technology, the Guide uses a very conservative credit for sprinklered buildings.

The following examples will demonstrate the typical exceptions where the Guide would provide unreasonable flows (at times under-estimated and at times over-estimated) and where fire protection knowledge is required to determine the reasonable fire flows.

## Example 1

We have a 1000  $\text{m}^2$  building of non-combustible construction. The building is used for storage of Class 1B flammable liquids in relieving-type metal drums 25 ft high on racks. The building is fully sprinklered. There is no required exposure protection.

In this example, the estimated fire flow would be:

220 x 0.8 x 10000.5 = 5,565 L/min

If we increase the flow by 25% for rapid burning fire, we get 6,957 L/min.

Assuming that we have a fully supervised sprinkler system, we can reduce the flow up to 50% yielding thus a RFF of 3,478 L/min or 920 usgpm.

The sprinkler system design for such an occupancy would require a density of 0.60 gpm/sq ft over an area of 3000 sq ft (flow of 1,800 gpm) plus in-rack sprinklers flowing 18 sprinklers at 30 gpm (flow of 540 gpm) and 500 gpm for hose streams yielding a total demand flow of 2840 usgpm or 10,750 L/min.

As we can see in this example, the real fire flow required to control the fire is approximately 3 times the flow calculated as per the Guide.

## Example 2

We have a 150,000  $m^2$  building of non-combustible construction. The building is used for storage of car parts. The building is fully sprinklered. There is no required exposure protection.

In this case the required flow is:

220 x 0.8 x 150,0000.5 = 68,164 L/min

We did not increase the flow for medium hazard.

Assuming that we have a fully supervised sprinkler system, we can reduce the flow up to 50% and we obtain 34,082 L/min or 9,005 usgpm.

Giving a 50% credit for sprinklers is not reasonable. The sprinkler system is typically designed to control the fire within an area of 140 m<sup>2</sup>. If the fire is not extinguished or controlled within the sprinkler design area, the fire will probably spread to the entire building and the credit for 50% would not work as the fire would behave as if the sprinkler system would not be present.

To protect this warehouse, there is almost no municipal water system that can provide these flows based on the Guide's estimation equation. These large warehouses are installed in industrial parks and the typical fire flows required to extinguish the fire are in the range of 5,000 L/min to 10,000 L/min (1320 usgpm – 2640 usgpm).

In this case, the calculations based on the guide require over 4 times more the water flow that is actually required to extinguish the fire.

These examples show why the experience in fire protection engineering is required to correctly determine the actual fire flows required to extinguish a fire.

## **Fastfrate Fire Flow Calculations**

As the sprinkler system at Fastfrate warehouse will be designed to extinguish the fire within a very limited area by using ESFR sprinkler technology, the use of the Guide's empirical formula to estimate the fire flow yields unrealistic results since it does not give sufficient credit for using ESFR sprinklers.

The Fastfrate warehouse's sprinkler design criteria is based on site specific conditions that go far beyond the parameters of the Guide and include features such as building height, height of storage, type of combustibles, type of sprinkler system, etc. Calculations to determine the required fire flow are based on a single fire incident at a time. This is also the case for the Guide.

The design of the sprinkler protection for the warehouse high piled storage section is based on using K16.8 ESFR sprinklers with a very large orifice size at a minimum end head pressure of 52 psi. In most cases, only 4 such sprinklers are expected to flow in a fire scenario. NFPA requires an additional safety margin whereby the design criteria is based on 12 sprinklers flowing at a minimum end head pressure of 52 psi. Although the sprinkler flow would only be expected to be in the range of 500 gpm (1893 L/min), the actual required NFPA design criteria is based on a sprinkler flow rate of 1500 usgpm (5677 L/min). In addition, it is expected that the fire department will require to use

fire hoses to fully extinguish the fire. NFPA requires 250 gpm (946 L/min) to be reserved for outside hoses when using an ESFR sprinkler design approach. The calculated total water flow is 1750 usgpm (6,624 L/min).

Calculations based on the FUS Guide yield a required fire flow of 10,000 L/min (2642 usgpm) (see attached calculations). We recommend to apply an additional reduction due to the ESFR sprinkler system which is actually designed to extinguish the fire. With this additional reduction the required fire flow would be 1982 usgpm (7500 L/min).

We have also compared the recommended flow with the required sprinkler flow based on the NFPA requirements. The NFPA water flow, including hose streams for the fire department, is 1750 usgpm (6624 L/min) as discussed above. For sprinkler designs that are based on a control mode density-area approach (ie. conventional sprinklers), the required hose stream allowance would be 500 usgpm (1892 L/min). By considering 500 usgpm (1892 L/min) for outside hose streams rather than the 250 usgpm required for an ESFR design approach, the resulting total fire flow would be approximately 2000 usgpm (7570 L/min). This is consistent with our assessment above.

## **Fire Duration**

With ESFR sprinklers, the required fire duration is expected to be 60 minutes. We recommend adding a 50% safety factor yielding thus a duration of 90 minutes. The overall volume of water required would therefore be 1982 GPM x 90 MINUTES = 178,380 US GALLONS or 675 cu. m.

## **Discussion on High One Storey Buildings**

Although FUS has special considerations for tall one storey buildings, for which the guide recommends to treat as a 3 storey building and to consider the potential of fire spreading to all three floors, our alternative objective based design already takes into consideration the higher combustible loading within an uncompartmentalized building as described below.

The water demand calculations in this report have been based on an uncompartmentalized building that contains a relatively high combustible loading in a single fire area for the full height of the building (37.5 ft). When comparing this scenario to a building that is vertically compartmentalized (ie multi-storey building), the fire demand and fire hazard for the latter are significantly decreased. To demonstrate this point, we will compare the NFPA 13 sprinkler demand requirement for a 3-storey building of the same total height versus the sprinkler demand requirement for the subject building.

If the building were deemed to be equivalent to a 3-storey building with a height of 12.5 ft per floor, the sprinkler demand as per NFPA 13 would be 600 us gpm based on the same commodity classification that the subject building will contain. The subject building has a proposed sprinkler demand of 1482 gpm (based on an ESFR sprinkler design). In the case of a 3 storey building, the vertically compartmentalized areas would significantly reduce the fire severity as demonstrated by

Fastfrate, Ottawa, Ontario

the much lower sprinkler demand. Furthermore, a 3-storey building of this size would be required to have fire separations between floors (as per OBC) which would limit fire spread.

Consequently, the alternative solution (using an ESFR suppression-based design) presented in this report would still be valid and provide an equivalent level of protection to the FUS recommended practice.

The attached Fire Flow Calculation Sheet represents the probable flows based on experience and fire protection engineering knowledge.

If you require any additional information, please do not hesitate to contact us.

Sincerely Yours,

Civelec Consultants Inc.

faul Hoby

#### EXTERNAL EMAIL

Hi Julien,

Thanks for confirming with the Conservation Authority; this question has come up for every property in the subdivision. The current standard is 80% TSS removal.

The pre-constitution for the site plan focussed on the adjacent watercourse and encroachment into the 30m setback. Our review will look to confirm that the stormwater management design implements the recommendations of an environmental impact statement that addresses this issue. We have not received a study so I cannot provide any additional information.

Feel free to contact me if there are any other questions about the site plan application. Regards,

James

**External email** - if you don't know or can't confirm the identity of the sender, please exercise caution and do not open links or attachments.

Hi Laura,

My name is Julien and I am working with Fastfrate to help design their new facility at the intersection of Rideau road and Somme Street. Refer to attached email for previous correspondence about the subject site.

The reason we are contacting you is to get confirmation on the water quality requirements. The attached SWM report 2009 for the Hawthorne Industrial site (see attached) states that individual site will need to fulfil the normal level of protection (TSS 70% removal). Can you confirm if this requirement is still valid? Refer to section 5 p. 14 of 30.

Please advise us on the water quality requirement and let us know if you have any questions.

Regards,

#### EXTERNAL EMAIL

Hi Guillaume,

The architectural drawings we have on hand do not show any roof drain positions. However, <u>if we are to assume a horizontal roof with no adjacent walls</u>, the **tota**l release rate will be **173.45L/s.** 

- 1) With a 6in capacity Rain Water Leader, a total of 13 Roof drains will be required (each having a release rate of 14L/s)
- 2) With an 8in capacity Rain Water Leader, a total of 6 Roof drains will be required (each having a release rate of 30L/s)

Let me know if you have further questions.

Thank you

Hi Uzo,

Just to clarify what I need from my last email: I need the number of roof drains as well as the flowrate per drain . Hope this clears up any confusion.

Thanks,

Good morning Uzo,

I work with Julien Sauvé and Christian Lavoie-Lebel on the Fastfrate project and we are currently finalizing the stormwater management design for the site. Could you please provide us with the release rates of the building roof drains? We are looking for both the 10 year and 100 year rainfall.

Thank you,

Subject: RE: A001083 Fastfrate: Culvert Safety analysis

A001083

Hi Arthur,

I am responsible for the culvert safety analysis calculations on the CIMA+ team.

I was wondering if you could provide the following information:

- + The AADT (or projected AADT) of Somme Street at the site entrance: To the best of my knowledge, our TIA estimated a build-out year for this development to be 2022. Exhibit 6-1 estimated the 2-way traffic on Somme in front of the development to be about 40 vph at the entrance in 2022. Translating this to AADT would imply 400 vpd 2-way AADT, once again in 2022. However, the culvert safety review should really examine buildout of the entire sub-division along Somme to determine the required flows. This was not done for our TIA as you can see that several exemptions (See Section 3.0) were granted given the size and the estimated traffic generation of the individual development.
- Confirm that a traffic growth rate of 3% is reasonable, as mentioned in the traffic study for the area. This we leave to you. The 3% figure was agreed to with the City of Ottawa in preparation of the TIA and was adopted. There is no rationale that the figure was based upon other than agreement with City staff.

I would also like to confirm whether the 3% traffic growth is linear or compounded. Unlike population growth, I have yet to ever see anyone apply compound growth to motor-vehicle travel, especially for long term horizons. I suggest using lowing formula.

$$\begin{split} TV_{future} &= TV_{existing} \left[ 1 + \left( n \times \frac{\%}{100} \right) \right] \\ TV &= traffic \ volume \\ n &= number \ of \ years \end{split}$$

If you'd like to discuss, feel free to give me a call when you get a chance (343-204-5387).

Thanks,

JAYMESON ADAMS, P.Eng. Engineer / Infrastructure Ingénieur / Infrastructures

Hi Doug / Pierre,

We are in the process of completing the Culvert Safety Analysis as per requirement from the City of Ottawa comments. In order to perform this task, we need to have the AADT (Average Annual Daily Traffic) value. The traffic study done by Castleglenn Consultants Inc does not provide this value. Could you reach out to them to obtain this value? Since the current site does not have any traffic at the current moment, they will most likely need to assume a certain value for future traffic.

Would it also be possible to confirm with the traffic team that a traffic growth rate of 3% is accurate at this location, and whether the 3% would be linear or compounded growth rate?

Regards,,

Subject: RE: A001083 Fastfrate: Culvert Security

A001083

Good morning Julien,

After reviewing the Traffic Study, there is no mention of an AADT (Average Annual Daily Traffic) to use or assume for Somme Street. I will require this number to do the culvert safety analysis as required per City comments.

Could you please check if there is an AADT available for Somme at the Fastfrate location?

Also, could you please confirm with the Traffic group that a traffic growth rate of 3% is accurate at this location, and whether the 3% would be linear or compounded growth rate?

Thanks,

JAYMESON ADAMS, P.Eng. Engineer / Infrastructure Ingénieur / Infrastructures

## Appendix F-2 DEVELOPMENT SERVICING STUDY CHECKLIST

	Servicing Study Guidelines for Development Applications	
4. Develop	ment Servicing Study Checklist	
4.1 Genera	l Content	
<b>Required Co</b>	ntent	Reference Location
	Executive Summary (for larger reports only).	N/A
1	Date and revision number of the report.	Cover Sheet
1	Location map and plan showing municipal address, boundary, and layout of proposed development.	Report Figures, Appendix
~	Plan showing the site and location of all existing services.	Project Drawings - Under separate cover
1	Development statistics, land use, density, adherence to zoning and official plan, and reference to applicable subwatershed and watershed plans that provide context to which individual developments must adhere.	Section 1.1
1	Summary of Pre-consultation Meetings with City and other approval agencies.	Section 1.4, Appendix L
<b>v</b>	Reference and confirm conformance to higher level studies and reports (Master Servicing Studies, Environmental Assessments, Community Design Plans), or in the case where it is not in conformance, the proponent must provide justification and develop a defendable design criteria.	Section 1.3 & 4.3.2
<u>√</u>	Statement of objectives and servicing criteria.	Section 1 , 2.2.1, 3.2 & 4.2
1	Identification of existing and proposed infrastructure available in the immediate area.	Section 1.2 & Appendix B
	Identification of Environmentally Significant Areas, watercourses and Municipal Drains potentially impacted by the proposed development (Reference can be made to the Natural Heritage Studies, if available).	Section 1.1
	Concept level master grading plan to confirm existing and proposed grades in the development. This is required to confirm the feasibility of proposed stormwater management and drainage, soil removal and fill constraints, and potential impacts to neighbouring properties. This is also required to confirm that the proposed grading will not impede existing major system flow paths.	Project Drawings - Under separate cover
	Identification of potential impacts of proposed piped services on private services (such as wells and septic fields on adjacent lands) and mitigation required to address potential impacts.	Geotechnical, Hydrogeological, and septic assessment - Under separate cover
	Proposed phasing of the development, if applicable.	N/A
	Reference to geotechnical studies and recommendations concerning servicing.	Section 7. References
	<ul> <li>All preliminary and formal site plan submissions should have the following information: <ul> <li>Metric scale;</li> <li>North Arrow (including construction North);</li> <li>Key Plan;</li> <li>Name and contact information of applicant and property owner;</li> <li>Property limits including bearings and dimensions;</li> <li>Existing and proposed structures and parking areas;</li> <li>Easements, road widening and rights-of-way;</li> <li>Adjacent street names.</li> </ul></li></ul>	Project Drawings - Under separate cover
4.2 Develo	pment Servicing Report: Water	
<b>Required Co</b>		<b>Reference Location</b>
	Confirm consistency with Master Servicing Study, if available	N/A
	Availability of public infrastructure to service proposed development	Section 1.2 & 3.1
	Identification of system constraints	
	Identify boundary conditions	Geotechnical, Hydrogeological, and septic assessment - Under separate cover
✓	Confirmation of adequate domestic supply and pressure	Section 3.2 & 3.3
<b>V</b>	Confirmation of adequate fire flow protection and confirmation that fire flow is calculated as per the Fire Underwriter's Survey. Output should show available fire flow at locations throughout the development.	Section 3.2.2
	Provide a check of high pressures. If pressure is found to be high, an assessment is required to confirm the application of pressure reducing valves.	N/A
	Definition of phasing constraints. Hydraulic modeling is required to confirm servicing for all defined phases of the project including the ultimate design	N/A
~	Address reliability requirements such as appropriate location of shut-off valves	Project Drawings - Under separate cover

	Servicing Study Guidelines for Development Applications	N1 / A
	Check on the necessity of a pressure zone boundary modification.	N/A
<ul> <li>✓</li> </ul>	Reference to water supply analysis to show that major infrastructure is capable of delivering sufficient water for the proposed land use. This includes data that shows that the expected demands under average day, peak hour and fire flow conditions provide water within the required pressure range	Section 3.3 & Geotechnica Hydrogeological, and septi assessment - Under separate cover
	Description of the proposed water distribution network, including locations of proposed connections to the existing system, provisions for necessary looping, and appurtenances (valves, pressure reducing valves, valve chambers, and fire hydrants) including special metering provisions.	N/A
	Description of off-site required feedermains, booster pumping stations, and other water infrastructure that will be ultimately required to service proposed development, including financing, interim facilities, and timing of implementation.	N/A
$\checkmark$	Confirmation that water demands are calculated based on the City of Ottawa Design Guidelines.	Section 3.2, Appendix D
	Provision of a model schematic showing the boundary conditions locations, streets, parcels, and building locations for reference.	N/A
4.3 Develo	opment Servicing Report: Wastewater	
Required C	ontent	<b>Reference Location</b>
~	Summary of proposed design criteria (Note: Wet-weather flow criteria should not deviate from the City of Ottawa Sewer Design Guidelines. Monitored flow data from relatively new infrastructure cannot be used to justify capacity requirements for proposed infrastructure).	Section 2.2
	Confirm consistency with Master Servicing Study and/or justifications for deviations.	N/A
	Consideration of local conditions that may contribute to extraneous flows that are higher than the recommended flows in the guidelines. This includes groundwater and soil conditions, and age and condition of sewers.	N/A
$\checkmark$	Description of existing sanitary sewer available for discharge of wastewater from proposed development	N/A
✓	Verify available capacity in downstream sanitary sewer and/or identification of upgrades necessary to service the proposed development. (Reference can be made to previously completed Master Servicing Study if applicable)	N/A
7	Calculations related to dry-weather and wet-weather flow rates from the development in standard MOE sanitary sewer design table (Appendix 'C') format.	Section 2.2 & Appendix F
$\checkmark$	Description of proposed sewer network including sewers, pumping stations, and forcemains.	Section 2.2
	Discussion of previously identified environmental constraints and impact on servicing (environmental constraints are related to limitations imposed on the development in order to preserve the physical condition of watercourses, vegetation, soil cover, as well as protecting against water quantity and quality).	N/A
	Pumping stations: impacts of proposed development on existing pumping stations or requirements for new pumping station to service development.	N/A
	Forcemain capacity in terms of operational redundancy, surge pressure and maximum flow velocity.	N/A
	Identification and implementation of the emergency overflow from sanitary pumping stations in relation to the hydraulic grade line to protect against basement flooding.	N/A
	Special considerations such as contamination, corrosive environment etc.	N/A
4.4 Devel	opment Servicing Report: Stormwater Checklist	
Required C	ontent	<b>Reference Location</b>
$\checkmark$	Description of drainage outlets and downstream constraints including legality of outlets (i.e. municipal drain, right-of-way, watercourse, or private property)	Section 4.1
$\checkmark$	Analysis of available capacity in existing public infrastructure.	Section 4.1, 4.3
✓	A drawing showing the subject lands, its surroundings, the receiving watercourse, existing drainage patterns, and proposed drainage pattern.	Appendix A, B
	Water quantity control objective (e.g. controlling post-development peak flows to pre-development level for storm events ranging from the 2 or 5 year event (dependent on the receiving sewer design) to 100 year return period); if other objectives are being applied, a rationale must be included with reference to hydrologic analyses of the potentially affected subwatersheds, taking into account long-term cumulative effects.	Section 4.2
~	Water Quality control objective (basic, normal or enhanced level of protection based on the sensitivities of the receiving watercourse) and storage requirements.	Section 4.2
~	Description of the stormwater management concept with facility locations and descriptions with references and supporting information.	Section 4.3, 4.4 & Appendi C
	Set-back from private sewage disposal systems.	Project Drawings - Under separate cover

	Watercourse and hazard lands setbacks.	Project Drawings - Unde
		separate cover
$\checkmark$	Record of pre-consultation with the Ontario Ministry of Environment and the Conservation Authority that has jurisdiction on the affected watershed.	Section 1.4 & Appendix
	Confirm consistency with sub-watershed and Master Servicing Study, if applicable study exists.	Section 4
~	Storage requirements (complete with calculations) and conveyance capacity for minor events (1:5 year return period) and major events (1:100 year return period).	Section 4.3 & Project Drawings - Under separa cover
	Identification of watercourses within the proposed development and how watercourses will be protected, or, if necessary, altered by the proposed development with applicable approvals.	Section 4
~	Calculate pre and post development peak flow rates including a description of existing site conditions and proposed impervious areas and drainage catchments in comparison to existing conditions.	Section 4.1 & 4.3
	Any proposed diversion of drainage catchment areas from one outlet to another.	Section 4.2, Appendix E
	Proposed minor and major systems including locations and sizes of stormwater trunk sewers, and stormwater management facilities.	Project Drawings - Unde separate cover
	If quantity control is not proposed, demonstration that downstream system has adequate capacity for the post-development flows up to and including the 100 year return period storm event.	N/A
	Identification of potential impacts to receiving watercourses	Section 1.3.4
	Identification of municipal drains and related approval requirements.	N/A
	Descriptions of how the conveyance and storage capacity will be achieved for the development.	Section 4.3 and 4.4
	100 year flood levels and major flow routing to protect proposed development from flooding for establishing	Project Drawings - Und
	minimum building elevations (MBE) and overall grading.	separate cover
	Inclusion of hydraulic analysis including hydraulic grade line elevations.	Appendix C
	Description of approach to erosion and sediment control during construction for the protection of receiving watercourse or drainage corridors.	Section 5
	Identification of floodplains – proponent to obtain relevant floodplain information from the appropriate Conservation Authority. The proponent may be required to delineate floodplain elevations to the satisfaction of the Conservation Authority if such information is not available or if information does not match current conditions.	N/A
	Identification of fill constraints related to floodplain and geotechnical investigation.	N/A
5 Annro	val and Permit Requirements: Checklist	
equired C		Reference Location
	Conservation Authority as the designated approval agency for modification of floodplain, potential impact on fish habitat, proposed works in or adjacent to a watercourse, cut/fill permits and Approval under Lakes and Rivers Improvement Act. The Conservation Authority is not the approval authority for the Lakes and Rivers Improvement Act. Where there are Conservation Authority regulations in place, approval under the Lakes and Rivers Improvement Act is not required, except in cases of dams as defined in the Act.	N/A
	Application for Certificate of Approval (CofA) under the Ontario Water Resources Act.	N/A
	Changes to Municipal Drains.	N/A
	Other permits (National Capital Commission, Parks Canada, Public Works and Government Services Canada, Ministry of Transportation etc.)	N/A
.6 Concl	ision Checklist	
equired C		Reference Location
	Clearly stated conclusions and recommendations	Section 6
	Comments received from review agencies including the City of Ottawa and information on how the comments were addressed. Final sign-off from the responsible reviewing agency.	
	All draft and final reports shall be signed and stamped by a professional Engineer registered in Ontario	

## Appendix G-1 ARMTECH CORRUGATED STEEL PIPE

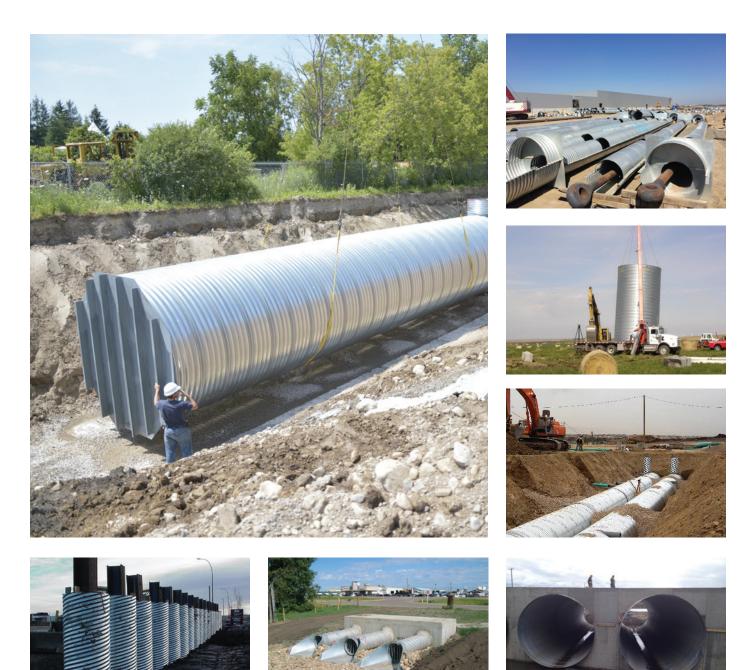

A division of **WGI** Westman Group Inc.

# **CSP** Pipe

Superior structural strength in a durable and lightweight product.

**APPLICATIONS INCLUDE:** 

Culverts | Storm Sewers | Storm Water Detention Tanks | Utilidors | More!

From culverts to pole cribs, no other product works harder than **CSP**.

## CORRUGATED STEEL PIPE (CSP) AND RELATED PRODUCTS

Corrugated steel pipe has been successfully used in infrastructure across North America and around the world since the late 1890s. It is a trusted material that combines strength, light weight, flexibility and adaptability. The economy of CSP is second to none. No other material can beat its low up-front and total life cycle costs. Combine this with a service life of up to 100 years, and the choice is clear!

Armtec CSP is manufactured in Canada to the highest standard of quality and performance. With a variety of shapes, sizes, coating and material options, Armtec CSP products will meet the demands of your most challenging drainage projects.

#### **NESTABLE PIPE**

Versatile half-round segments of corrugated steel in flange or notch type configuration for ease of transportation.

#### STEELCOR

Galvanized CSP formed with helical corrugations and a continuous lock-seam combines flexibility with high compressive strength.

ARMTEC IS A MEMBER OF THE CORRUGATED STEEL PIPE INSTITUTE (CSPI)

#### **ULTRA-FLO**

Large diameter storm sewer pipe delivering superior hydraulic performance.

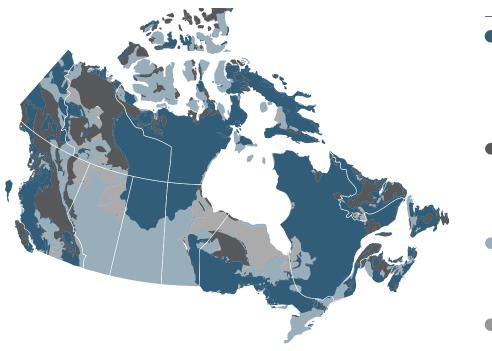

#### **CSP END SECTIONS**

Lightweight end sections for improved hydraulic performance and erosion control.

# **ARMTEC** CSP can tackle any condition Canada can throw at it.

### Steel Pipe Coatings to Match the Environment

# Surface Water Sensitivity to Atmospheric Pollutants

- Highly sensitive to acidification (i.e. low pH, elevated chloride and sulphate levels, low calcium carbonate levels [soft water]).
   Polymer laminated coating may be required.
- Moderately sensitive to acidification (i.e. moderate pH, medium to low calcium carbonate levels). Aluminized Type 2 coating may be required.
- Unlikely to be negatively influenced by atmospheric pollutants. Galvanized steel should be sufficient.

Unrated

**BACKED BY SCIENCE** – Armtec can provide industry technical bulletins (for pH, chlorides, hardness and resisitivity) to help you specify the right coating for your required service life.

#### OPTIMUM OPERATING RANGE OF VARIOUS PIPE COATINGS

pН

## CSP COATINGS AND DESIGN SERVICE LIFE

#### **GALVANIZED STEEL**

Galvanized steel is the standard finish for corrugated steel pipe. It performs well in low abrasion applications and in site conditions with a relatively neutral environment. Galvanized steel has a proven service life of 50 years minimum in non-aggressive (or ideal) site conditions. This is extended in hard water environments when the zinc coating reacts with the calcium carbonate (CaCO<sub>3</sub>) in the water to form an additional protective mineral scale.

#### ALUMINIZED STEEL TYPE 2

Aluminized Steel Type 2 pipe combines the corrosion resistant properties of aluminum with the strength and durability of CSP. It is fabricated from steel coils, and hot-dip coated with a uniform thickness on both sides. It tolerates soft water and slightly more acidic and saline conditions than galvanized steel. With a 75 year service life in its optimal operating range, it is an economical alternative to concrete pipe.

#### **POLYMER-LAMINATE**

Polymer-Laminate coating such as Trenchcoat can extend the service life of CSP to 100 years. The strong adhesion characteristics of the polyolefin laminate with the galvanized sheet makes it the most durable coating available today. This rugged laminate creates a protective barrier against corrosive and abrasive conditions, and maintains its service life across a broad pH spectrum.

100

YEARS

## Find out more about the durability of CSP at www.cspi.ca

## STEELCOR CORRUGATED STEEL PIPE

Since 1934, SteelCor pipe has proven its effectiveness and durability in countless installations under diverse conditions. Its helical corrugations and continuous lock-seam provide high compressive strength in a lightweight, thin-walled structure. SteelCor is available in a wide variety of sizes and various coating options. For ground water drainage, perforated SteelCor offers exceptional performance in low-lying areas, especially where high strength and hydraulic capacity are required.

#### **TYPICAL APPLICATIONS**

- Culverts
- Storm sewers
- Stormwater detention tanks
- Stream enclosures
- Underpasses
- Pipeline intakes
- Pipeline outfalls
- Storage relief tanks
- Caissons
- Cooling water lines
- Fish baffles

# AND STRENGTH

Helical corrugation combines strength and flexibility in a thin walled structure

#### HUGGER BAND

Hugger band couplers provide superior pull apart resistance, critical in soft soils

Variety of sizes, corrugation profiles and coating options

Lightweight and available in long lengths, minimizing installation time

## COST-EFFECTIVE

- Low installed cost
- Nestable pieces for economical shipping

**STEELCOR** IS AVAILABLE IN LONG LENGTHS, MINIMIZING INSTALLATION TIME

#### FLEXIBILITY AND HIGH COMPRESSIVE STRENGTH

CSP is categorized as a flexible pipe. The corrugated profile of the pipe wall provides a high degree of relative stiffness which, when combined with a properly-installed engineered backfill, provides for high circumferential strength in a thin-walled structure. The compacted fill acts together with the pipe wall to form a composite soil-steel structure.

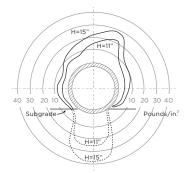

#### **RING COMPRESSION THEORY**

The compressive thrust in the pipe wall is equal to the radial pressure acting on the wall multiplied by the wall radius. In other words, pressure distribution around a flexible pipe is more uniform and load is more evenly distributed in the flexible pipe vs. the rigid pipe (i.e. concrete). Pipe wall thickness can be reduced and less bedding material is required for flexible CSP to achieve the same buried strength as a rigid pipe system.

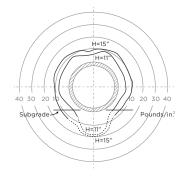

#### Table 1: Available Corrugation Profiles & Diameters of CSP Pipe

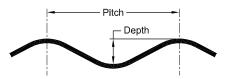

Corrugation	Pitch	Depth	Inside Diameter
(mm x mm)	(mm)	(mm)	(mm)
38 x 6.5	38	6.5	150, 200, 250
68 x 13	68	13	300 - 2,000
125 x 25	125	25	1,200 - 3,600

#### Load Distribution - Rigid Pipe

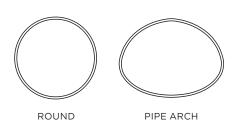

#### Load Distribution - Flexible Pipe

#### **SteelCor Shapes**

STEELCOR CSP IS AVAILABLE IN LARGE DIAMETERS UP TO 3,600MM

CSP PIPE ARCH

## **PIPE ARCHING** is available for projects where headroom is limited.

## COUPLERS

SteelCor pipe features universal annular corrugated ends, so a variety of couplings may be used for the pipe and pipe-arch. Annular corrugated couplers are standard for municipal and highway drainage. Hugger Band couplers are standard for storm sewer applications and Dimpled couplers are often used in forestry.

# Three types of couplers are available:

- Annular corrugated standard bolt and angle coupler
- Dimpled coupling band
- Hugger Band

#### STANDARD ANNULAR CORRUGATED COUPLER

The standard annular corrugated coupler, fitted with bolt and angle attachments, seats snugly onto the pipe-end corrugations, and is suitable for most general-purpose applications. It comes in one, two or three piece configurations depending on the pipe diameter.

DIMPLED COUPLING BAND

This coupler is used where helical and/or annular corrugated pipe ends are to be coupled. Dimpled couplers are available with steel angles or with wedge connectors as shown.

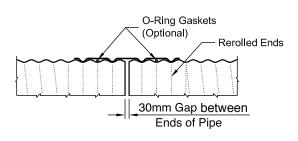

**HUGGER BAND** 

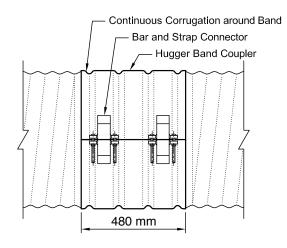

Armtec offers a highly effective Hugger Band joint. These 500mm wide bands are recommended for storm sewers and other installations where low leakage rates and resistance to longitudinal disjointing are prime requirements. When used with O-ring gaskets, the Hugger Band provides an extremely tight joint with low infiltration and exfiltration rates.

#### Hugger Band Couplers for CSP joints are comprised of the following components:

- Semi-corrugated coupler sheet to accommodate placing elastomeric O-rings at both re-corrugated pipe ends
- Bolted bar and strap connector at coupler sheet lap(s) to maximize joint pull-apart strength
- O-rings in combination with neoprene gasket at coupler sheet lap(s) to minimize joint leakage and/or joint infiltration

#### H-500 HUGGER BAND (DOUBLE BOLT, BAR AND STRAP)

## Fittings

Standard fittings such as tees, wyes and elbows are available. Special fittings such as saddle branches, manholes and catch-basins can be custom-fabricated to suit individual requirements.

CSP CAN BE FABRICATED TO SUIT A MULTITUDE OF CONFIGURATIONS

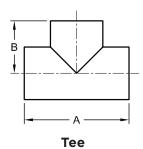

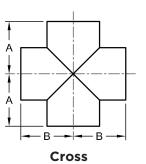

CUSTOM FITTINGS AVAILABLE

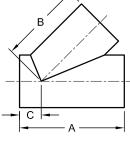

GALVANIZED CSP FIREWATER TANK SYSTEM

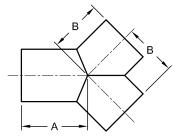

## **Typical Fittings**

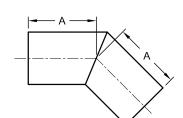

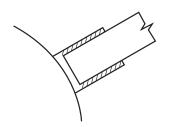

45° Lateral

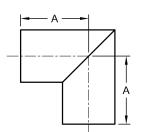

45° Wye

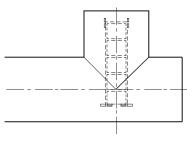

2 Piece Elbow 5° to 45°

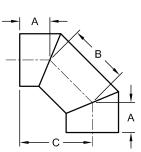

Saddle Branch

2 Piece Elbow 46° to 90°

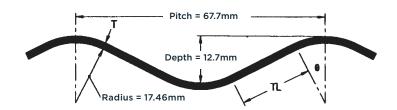

**Catch Basin with Manhole** 

3 Piece Elbow 46° to 90°

## STEELCOR PIPE AND PIPE-ARCH TECHNICAL SPECIFICATIONS

## PERFORATED STEELCOR PIPE FOR GROUND WATER CONTROL

Perforated SteelCor is widely accepted as a practical, durable and economical means of controlling unwanted ground water. It is an efficient solution and costs less than repeated surface repairs, virtually eliminating maintenance concerns. Perforated SteelCor pipe is available in plain galvanized and suitable for most applications, however it is strongly recommended that consideration be given to using either Aluminized Steel Type 2 or Polymer Coated in particularly aggressive environments.

#### **Pipe Size Selection**

For normal subdrainage, the infiltration of ground water is very slow. Therefore, approximately 150 metres of 150mm diameter pipe may be used as an interceptor before any increase in pipe diameter is required. Where extremely pervious material is being drained or where springs are encountered, larger sizes may be required.

#### **Pipe Outlets**

Perforated pipe's cantilever strength makes it ideal for use as a projecting pipe outlet.

Free outlets are important, and the failure of subdrains to properly function can often be attributed to plugged, damaged or improper outlets. Outlet pipes should be protected from damage by maintenance equipment. A suitable barrier such as a hinged rodent trap should be used to keep out wildlife whose nests could cause clogging.

#### **Spacing of Laterals**

Draining large, comparatively flat areas usually requires a parallel or herringbone system of drainage pipe. The spacing used on highways and railways is controlled by the location of the water-bearing strata.

#### **Recommended Backfill**

The trench should be excavated with approximately 100mm of clearance at the sides of the pipe so that pervious backfill can surround the pipe. For the filter backfill, concrete sand or other commonly available coarse sandgravel mixtures perform satisfactorily for perforated pipe in most soils.

#### Filter Sock and Geotextiles

Geotextile is widely used in perforated pipe applications, particularly where graded filter material is not available. More critical installations call for a high quality non-woven geotextile to separate the trenchfill from the native material. Armtec can also provide a low-cost knitted polyester sock to encase the pipe. This polyester sock is available custom sewn around the pipe.

#### **Placing of Perforations**

Armtec recommends that the pipe be placed with the perforations down. This hinders solids from entering the pipe and keeps the water table lower.

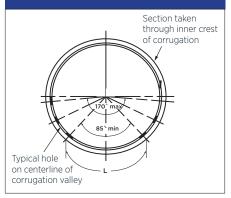

#### Table 10: Dimensions, Thicknesses and Spacing of Perforations\*

Nominal Internal Diameter	Corrugation Profile	Specified		Minimum Width Unperforated Segment	Distance Between Holes Along the Longitudinal Axis	Perforated Area
mm	mm	mm		mm	mm	cm²/m
150	38 x 6.5	1.6	4	125	38	74.61
200	38 x 6.5	1.6	4	160	38	74.61
250	38 x 6.5	1.6	4	195	38	74.61
300	68 x 13	1.6	6	235	136	31.27
400	68 x 13	1.6	6	310	136	31.27

#### NOTE:

#### INVERT PERFORATING DETAIL

#### NOTE :

\* RANDOM HOLE SPACING AROUND THE CIRCUMFERENCE IS AVAILABLE ON REQUEST

### STEELCOR CSP INSTALLATION

#### **Bedding and Backfilling**

Well graded, free draining backfill is recommended for good compaction. The designer may wish to refer to the gradation and backfill specifications of the appropriate provincial highway standard. Stumps, rocks, frozen lumps and other debris should be removed from the bedding site.

Round pipe can be installed on a flat sand cushion with rodding and tamping of the backfill around the haunches. Alternatively, the pipe can be installed on a pre-shaped granular base.

The pipe-arch bottom arc must be erected on a pre-shaped sand cushion. The support under the bottom arc should be relatively yielding but under the corner haunches the supporting ground must be highly stable. Special attention should be given to compacting the backfill around the corner arcs where the highest soil pressures develop.

Backfill should be spread in 150mm to 200mm lifts alternating from one side of the pipe to the other, and should extend above the pipe to a minimum height of 300mm or one sixth the span, whichever is greater.

Compaction using suitable mechanical equipment should be carried out to achieve the specified backfill density. Care must be taken to ensure that the pipe or pipe-arch is not damaged by heavy equipment traffic during construction.

STEELCOR'S LIGHTWEIGHT SECTIONS ALLOW INSTALLATION WITHOUT THE NEED FOR HEAVY EQUIPMENT

HELICAL CORRUGATIONS AND CONTINUOUS LOCK-SEAM PROVIDE STRENGTH IN A LIGHTWEIGHT STRUCTURE

## ULTRA FLO CORRUGATED STEEL PIPE

Ultra Flo is a durable storm sewer pipe with a unique external rib corrugation and smooth pipe interior that provides superior hydraulic performance at an economical price. It is available in round or pipe arch shapes for restricted headroom applications. Materials include Galvanized Steel, Aluminized Steel Type 2 and Polymer-Laminate.

Ultra Flo pipe is produced by a continuous spiral seam method. Stiffness is provided by 19mm x 19mm x 190mm continuous external box-shaped rib corrugations. Ultra Flo performs as a flexible compression ring under load, redistributing pressure radially into the surrounding high-density soil. The unit pressure at the pipe invert can be as little as one-third of the unit pressure under a concrete pipe in identical loading conditions.

#### **TYPICAL APPLICATIONS**

- Municipal storm sewers, in large diameter
- Highway median drainage
- Industrial storm sewers
- Large diameter culverts
- Slip-lines
- Stormwater detention tanks

ULTRA FLO'S EXTERIOR BOX RIBS AND SMOOTH INTERIOR COMBINES STRENGTH WITH SUPERIOR HYDRAULIC PERFORMANCE

## DURABLE

Available in a wide variety of coatings to suit environmental conditions

## EFFICIENT HYDRAULICS

Ultra Flo's low "n" factor is equivalent to or less than the standard 0.013 usually used in storm sewer design

### NESTABLE

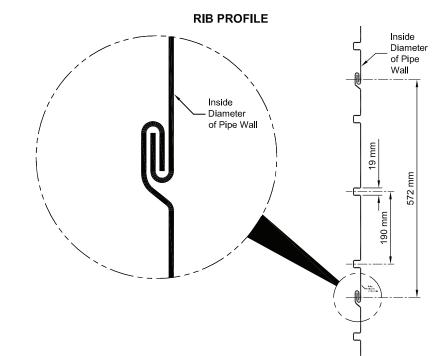

Efficient shipping for remote locations

## 

Lightweight and available in long lengths with minimal joints

## S ECONOMICAL

Lowest installed cost compared to large-diameter concrete storm sewers

## END TREATMENTS

### **CSP END SECTIONS**

Armtec supplies durable, lightweight end sections for improved hydraulic efficiency and erosion control. These sections help reduce scour at inlets, undermining at outlets, and provide an attractive and economical means of blending culvert ends with a sloping embankment.

The end sections clamp onto the culvert and are positioned with light equipment. In the case of the smaller available sections, no equipment is required to position the end sections. Earth is tamped around the sloping ends to complete the installation.

Standard end sections suit corrugated steel pipes up to 2,400mm diameter and pipe arches up to 2,130mm span x 1,400mm rise. They are available as twins, triplets and quads for multiple-pipe installations. Safety-slope end sections are also available with parallel cross bars and are built-in 4:1 or 6:1 slope.

CSP END SECTION WITH FUNCTIONAL GRATE

CSP END SECTION WITH OPTIONAL TOE PLATE EXTENSION

### ^ SLOPE RETENTION

Designed to support and retain slope grade and material

ECONOMICAL

Culvert repairs are reduced with the reduction of scour at the inlet and undermining at the outlet

ATTRACTIVE SOLUTION

End sections blend culvert ends with the slope embankment

#### HEADWALLS

Headwalls can be constructed of concrete, stone, rip rap stone or steel sheeting.

Pro-Eco-Lite headwalls are engineered from a composite reinforced polymer concrete. They combine the lightweight characteristics of plastic with the strength of concrete. Flow control accessories such as pre-fabricated trash racks, security grids and handrails, bolt-on scour aprons, pre-fabricated weir boards and frames, and pre-installed flap gates and slide gates can be added to enhance performance without affecting appearance.

For large SteelCor pipe, headwalls constructed of Armtec sheeting combined with wing walls constructed from Armtec Bin-Wall provide an economic solution.

### **CUT-OFFS**

Armtec steel sheeting can be used as cut-offs under the SteelCor pipe inlet and outlet. Depth of cut-off is usually 1m to 1.5m below the invert. Steel sheeting can often be used as a partial headwall with clay or other materials used to further seal the embankment.

PRO ECO-LITE HEADWALL

SHEETING HEADWALL

#### **TYPICAL CROSS SECTION**

## **NESTABLE PIPE**

Nestable corrugated steel pipe is available as flange-type and notch-type. Flange-type nestable CSP consists of half-round 610mm long sections with side flanges that can be easily bolted together to form a circular corrugated steel pipe. Notch-type nestable CSP consists of matching half-round segments of corrugated steel, assembled using stitch type or hook and eye bolts to become lengths of full-round corrugated steel pipe. Nestable pipe is typically galvanized and therefore highly durable under normal conditions. Aluminized Steel Type 2 is also available for added durability.

Nestable pipe sections are shipped nested and bundled together to save space during shipping. This is ideal for remote locations and overseas projects where shipping of factory-made pipe would be uneconomical. Both flange-type and notch-type products are useful where a casing is to be installed around an existing utility without disrupting its operation.

#### **TYPICAL APPLICATIONS**

- Culverts
- Storm Sewers
- Drains
- Casings
- Utilidors

HOOK AND EYE BOLTS PROVIDE A SECURE SOIL-TIGHT CONNECTION

## ECONOMICAL

## DURABLE

Sections are nested and bundled together for economical shipping

Available in Aluminized Steel Type 2 for added protection and extended service life Suitable for a wide range of applications

VERSATILE

### FLANGE-TYPE NESTABLE PIPE

#### Assembly

Flanged Nestable Pipe is easily assembled and no special instructions are necessary. Simple tools such as spud or socket wrenches are all that are required.

Five corrugation long pieces are used on the top at both ends to introduce a circumferential seam stagger. The 50mm wide flanges have slotted holes spaced at 68mm centre to centre on both sides and are bolted together using galvanized 10mm diameter bolts and nuts. All circumferential laps should be assembled in the direction of fluid flow.

FLANGE-TYPE NESTABLE PIPE REQUIRES ONLY SIMPLE TOOLS FOR ASSEMBLY

### Assembly

There are three standard methods used in attaching the half-round pipe segments together. The method used is dictated by the pipe diameter. The stitch type method (using #1 or #2 type stitches) is used up to 800mm in pipe diameter and the hook and eye bolt method is used for pipe diameters 900mm and over.

When assembling Armtec Nestable Pipe, the bottom ten corrugation sections are placed into position with each succeeding section overlapping the previous one by one

NESTABLE PIPE IS IDEAL FOR MINING APPLICATIONS

corrugation. The top ten corrugation sections are staggered by using five corrugation sections at the ends.

All laps should be assembled in the direction of fluid flow. The half sections will be drawn together at the notched seams with a bending bar and the appropriate fastener inserted through the matching holes. There are two fasteners every 600mm on each side.

NESTED SECTIONS ARE BUNDLED FOR ECONOMICAL TRANSPORTATION

#### SPECIFICATIONS

Half round sections are manufactured from 68mm x 13mm corrugated steel:

- Corrugations and steel thickness per ASTM A 760A, CSA G401, AASHTO M 36
- Galvanized and Aluminized Type 2 per ASTM A 929A, AASHTO M 218-87
- Zinc coating mass will not be less than 610 g/m<sup>2</sup> per AASHTO M 218
- Milling sampling and marking per ASTM A924 A 924M
- Minimum aluminum coating thickness of 47µm
- Installation per ASTM A798
- Hardware is zinc plated

## Appendix G-3 BACKFLOW PREVENTER – CHECKMATE BROCHURE

## CheckMate®Inline Check Valve

United States Patent # 5,769,125

Red Valve Company, Inc.

## CheckMate<sup>®</sup>: Your Final Move to Eliminate Backflow!

## **Dependable Backflow Prevention**

The CheckMate® Inline Check Valve is the valve of choice for both municipal and industrial applications - including stormwater, wastewater, highway run-off, CSO, SSO and flood control. CheckMate® Valves prevent unwanted backflow that can cause surcharging and flooding.

CheckMate® Inline Check Valves have become the specified solution for residential and commercial areas where complete, dependable backflow prevention is necessary. The CheckMate® is not simply a molded part. Rather it is hand-fabricated, utilizing various natural and synthetic elastomers and fabric ply reinforcement to create a unibody construction. There are no mechanical parts or fasteners to catch debris, corrode, or fail, making the CheckMate® maintenance-free. With seven elastomers to select from, the CheckMate<sup>®</sup> can be custom engineered to resist chemicals, grease and oils typically found in stormwater, wastewater and industrial applications.

The CheckMate® Valve boasts extremely low headloss, allowing for near 100% flow capacity. Its inherent design makes it the most user-friendly inline check valve on the market today. From the upstream or downstream end of the pipe, simply insert the valve into position and clamp it into place. Typically no modification to the pipe or structure is required to install the CheckMate®. Because the CheckMate® is recessed inside of the pipe, additional permitting is not required. The result is savings in both installation time and operational cost.

The valve can successfully withstand severe winter freezes, typhoons, hurricanes and flooding. The CheckMate® also minimizes damage to wetlands, beaches and residential areas, eliminates hydraulic surges to wastewater treatment plants and saves municipalities millions of dollars in maintenance and treatment costs.

## Benefits and Features of CheckMate®:

- Extremely Low Headloss
- No Moving Mechanical Parts to Corrode, Catch Debris or Fail
- Heavy Duty Elastomer Unibody Construction
- Quick and Easy Installation
- Seals Around Debris

For an animated demonstration of the CheckMate<sup>®</sup> in operation, please visit: http://www.tideflex.com/checkmate.

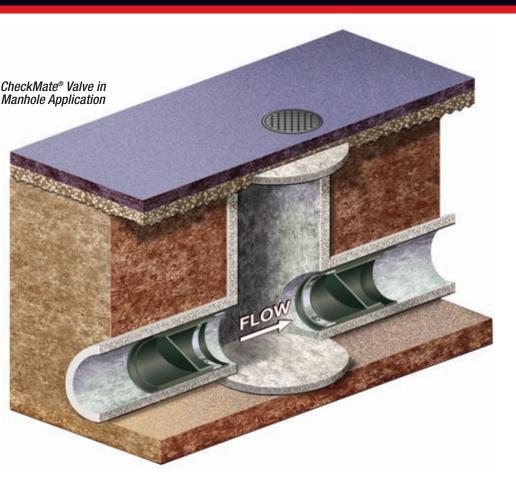

**FULLY OPEN** 

**FLOWING** 

## CHECKMATE® VALVE **Designed for Inline Service**

- Operates on Differential Pressure, Totally Passive
- Virtually No Maintenance
- Self-draining, 1" of Cracking Pressure
- Silent, Non-slamming
- Available in Sizes 3" (75 mm) to 78" (1950 mm)
- Extensive Independent Hydraulic Testing

**FULLY CLOSED** 

# CheckMate<sup>®</sup> Applications: Simply Versatile!

48" CheckMate<sup>®</sup> installed in a storm sewer drain to stop backflow from flooding a residential area.

#### **Residential and Municipal Sewers**

CheckMate<sup>®</sup> Inline Check Valves have become a frequently specified solution for residential and municipal areas where complete, dependable backflow prevention is necessary. The CheckMate<sup>®</sup> Valve's maintenance-free, passive operation provides years of trouble-free service.

### **CSO, SSO and Outfalls**

CheckMate<sup>®</sup> Valves are used for interceptor, manhole and outfall pipelines because they maximize pipeline storage and capacity while preventing water from backflowing into a sewage treatment plant. The CheckMate<sup>®</sup> Valve's innovative inline design allows it to be easily installed without modifications to structures.

## Stormwater, MS4, Highway Run-off and Site Drainage

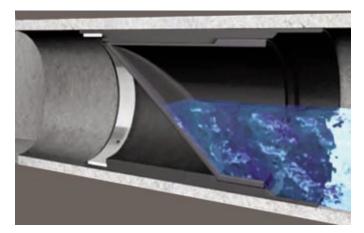

CheckMate<sup>®</sup> Inline Check Valves are the valve of choice for both municipalities and commercial property owners to prevent costly flood damage and to maximize system storage. The CheckMate's<sup>®</sup> low cracking pressure and headloss provide rapid drainage.

## Flow Equalization Basins, Pump Stations and Effluent Discharge

CheckMate<sup>®</sup> Valves provide backflow prevention in between basins and also protect pumps and capital equipment. The CheckMate's<sup>®</sup> low headloss characteristics maximize flow efficiency.

24" CheckMate® is easily installed in a municipal sewer.

The CheckMate's<sup>®</sup> rugged unibody construction prevents backflow.

48" CheckMate<sup>®</sup> installed at the Freedom Tower for stormwater drainage.

48" CheckMate<sup>®</sup> Valve replacing a faulty flapgate in a CSO application.

### **Odor Control**

CheckMate<sup>®</sup> Inline Check Valves prevent sewer systems' offending odors from escaping, while still allowing water to discharge when needed. The CheckMate<sup>®</sup> Valve is designed to eliminate the backflow of unwanted methane and hydrogen sulfide gases that typically result in complaints about odor from the general public.

### Levees, Marinas and Wetlands

In low lying areas where headloss is at a premium, CheckMate<sup>®</sup> Valves efficiently drain with the added benefit of providing absolute backflow prevention.

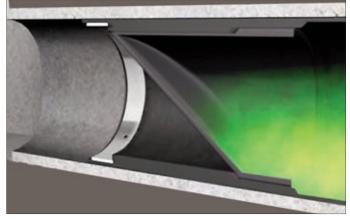

## **Independent Hydraulic Testing**

CheckMate<sup>®</sup> Inline Check Valves are independently tested to determine their hydraulic characteristics in both free and submerged discharge applications. Red Valve's published hydraulic data is validated through this independent testing.

## **CHECKMATE® VALVE** Designed for Inline Service

The CheckMate® is also easily installed by hand.

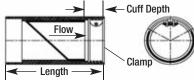

The CheckMate® provides odor control.

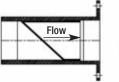

# CheckMate<sup>®</sup> Configurations and Custom Designs

**Downstream Clamp** 

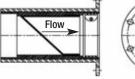

## **Downstream Flanged**

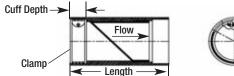

## **Downstream Flanged Thimble Insert**

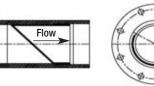

CheckMates® can be made for any pipe I.D. Built to fit in sizes from 3" to 78".

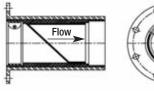

## **Upstream Clamp**

## **Upstream Flanged**

## **Upstream Flanged Thimble Insert**

Flange shape and bolt pattern can be customized. Flangeless thimble inserts are available.

Elliptical Pipe CheckMate®

## **Elliptical, Arch and Rectangular Pipes**

Elliptical, arch and rectangular pipes for drainage and flood prevention projects have become popular, particularly in high water table areas with shallow surface gradients. CheckMate® Inline Check Valves are the perfect solution for backflow prevention in elliptical, arch and rectangular pipes.

## **Rubber Flanged**

Rubber Flanged CheckMate® Valves can be manufactured with an integral rubber upstream or downstream flange. The flanged CheckMate® gets inserted into the host pipe then can be bolted to a mating flange or anchored to a concrete headwall. The flange can be circular with standard drilling; or circular, square or rectangular with custom flange drilling. The valve is supplied with retaining rings for mounting.

## **Thimble Inserts**

A CheckMate® Thimble Insert is a CheckMate® Valve that is factoryinstalled, clamped, and pinned into flanged or plain end pipe. The thimble insert assembly can either be inserted into the I.D. of the host pipe, or can be mounted to a mating flange or concrete headwall and extend beyond the pipe. Plain end thimble inserts are inserted into the host pipe and non-shrink grout is placed between the thimble insert 0.D. and host pipe I.D. to form the seal.

## CHECKMATE® VALVE **Designed for Inline Service**

Arch Pipe CheckMate®

Rectangular Pipe CheckMate®

Upstream Flanged CheckMate®

CheckMate® Thimble Insert

In addition to the Checkmate® Inline Check Valve, Tideflex® Technologies offers a complete line of check valves.

## **TF-1 CHECK VALVES**

The Tideflex® TF-1 Curved Bill Check Valve is designed with enhanced sealing to improve headloss. The improved TF-1 design allows the valve to handle long-term water weight while maintaining structural integrity. The spine is at a greater vertical angle, making it able to withstand the cantilever effect when water is flowing through the valve. The TF-1 is constructed of rubber, making it immune to rust, corrosion and weathering.

The flat-bottom Series 35-1 features an integral rubber flange, allowing them to be mounted to flanged outfall pipes or directly to headwalls where the pipe is flush. The flange size drilling conforms to ANSI B16.10, Class 150#, or can be constructed with DIN, 2632 and other

standards. The Series 35-1 Check Valve is furnished complete with steel or stainless steel backup rings for installation.

## **SERIES 39 CHECK VALVES**

The Tideflex® Series 39 Inline Check Valve features a fabric-reinforced elastomer check sleeve housed in a cast iron body with ANSI 125/150 flanges, allowing for easy installation into any piping system. The valve's operation is silent, nonslamming and maintenance free. Sliding, rotating, swinging

and plunging parts are completely eliminated. The body is equipped with flush ports and a clean-out port and can be epoxy coated.
