LRL File No.: 190227

November 7, 2019

EXECUTIVE SUMMARY

Alexander Fleck House Inc. retained LRL Associates Ltd. (LRL) to complete a Phase II Environmental Site Assessment (ESA) on 593 Laurier Avenue West in Ottawa, Ontario (herein referred to as the Site). The Phase II ESA was carried out to determine the potential impacts to the Site identified in the previously prepared Phase I ESA by LRL, dated July 15, 2019. The Phase II ESA was conducted in general accordance with Ontario Regulation (O. Reg.) 153/04, as amended, in support of a City of Ottawa site plan approval application.

The site under investigation is the residential property located at 593 Laurier Avenue West in Ottawa, Ontario. The Site is irregularly shaped with an approximate area of 1,230 m² (0.3 acres). It is developed with a three-storey residence constructed circa 1908. The residence has a footprint of approximately 335 m². The building is serviced with municipal water and sanitary services and is heated with natural gas. The general surrounding area including the Site has a significant slope north-northwest towards the Ottawa River with elevations dropping from 80 m at the Site to 50 m at the river.

The Phase I ESA (July 2019) identified the following environmental concerns:

- The former heating oil tank located in the basement;
- The trap door in the garage over a gravel basement, purpose unknown;
- The former foundry identified east of the Site; and
- The unspecified spill on Bronson Avenue, east of the Site.

It was recommended that a Phase II ESA be conducted to determine the potential impacts from the above noted environmental concerns identified.

The purpose of a Phase II ESA is to determine if recognized potential environmental concerns have negatively impacted the quality of soil and groundwater of the subject site. Such an assessment provides information regarding the nature and extent of potential contamination to assist in making informed business decisions about the property.

Areas of potential environmental concern identified that require investigation are:

Potential Environmental Concern	Location	Comments	Contaminants of Potential Concern	Media Potentially Impacted
Former Heating Oil Tank	On-site	Historically located in the basement	PHCs and VOCs	Soil and groundwater
Trap Door Over Gravel Basement	On-site	Beneath the south end of the garage, purpose unknown.	PHCs and VOCs	Soil and groundwater
Former foundry	Approximately 20 m east of the Site	Brass foundry listed at 422 Slater in 1920-1950 in city directories, and brass foundry noted in 1922 fire insurance plan at the same location.	PHCs, VOCs, Metals and PAH	Groundwater
Spill	Bronson Avenue	Exact location, type of material and amount not specified.	PHCs and VOCs	Groundwater

Soil and groundwater conditions were evaluated with respect to the contaminants of concern in the context of the current regulations and guidelines applicable to contaminated sites. The findings and conclusions presented in this report apply only to the recognized environmental conditions assessed.

Regulatory requirements for assessing environmental conditions of a site are established by Ontario Regulation 153/04 – *Records of Site Conditions, Part XV.1 of the Environmental Protection Act* (O. Reg. 153/04). Site condition standards are set out in MECP's '*Soil, Ground Water and Sediment Standards for Use Under Part IV.1 of the Environmental Protection Act, April 15, 2011*'. The applicable site condition standard used was Table 7 Site Condition Standards for Shallow Soils in a Non-Potable Ground Water Condition, residential property use and coarse-textured soils.

The investigation involved advancing two (2) boreholes across the Site at strategic locations based on potential areas of environmental concern. The two (2) boreholes were completed as monitoring wells to assess the Site's hydrogeological conditions and facilitate groundwater sampling. The advancement of boreholes was attempted in the basement beneath the former oil tank and in the gravel pit beneath the garage, however bedrock was encountered directly beneath the concrete slab and the gravel.

The subsurface soil conditions in the area investigated on the Site generally consist of topsoil over fill. Limestone with shaly partings was encountered from depths of 0.50 and 1.65 m below ground surface (bgs) to 7.75 and 9.30 m bgs where the boreholes were terminated.

Groundwater contours could not be established due to the lack of data points. However, based on the topography of the area and the presence of the Ottawa River 550 m north of the Site, the anticipated groundwater flow direction is towards the north.

No olfactory or visual (i.e. staining or free phase) evidence of petroleum hydrocarbon impacts were observed in any of the soil samples collected. Observations were confirmed through CSV concentrations measured. CSV concentrations ranged between non-detect (<0.1 ppm) and 0.2 ppm.

In the monitoring wells, headspace VOC levels were 1.2 and 0.6 ppm in MW19-1 and MW19-2, respectively. No olfactory or visual (i.e. sheen or free phase) evidence of petroleum hydrocarbon impacts were observed.

Select soil and groundwater samples were submitted for analysis to establish if the potential environmental concerns have negatively impacted the soil and groundwater conditions. The rationale for selection of soil and groundwater samples submitted for analysis was based on the results of the sample field screening (CSVs), visual/olfactory observations and/or proximity to the water table. The potential contaminants of concern were Petroleum Hydrocarbon Compounds (PHCs), Volatile Organic Compounds (VOCs), Polycyclic Aromatic Hydrocarbons (PAHs) and metals including mercury and hexavalent chromium.

In the soil, VOC parameters analysed were not detected in the samples submitted for analysis. PHC F3 and F4 were detected in BH19-1 and BH19-2; however, levels are below the applicable Table 7 standards. Select metals parameters exceeded the applicable standards in BH19-1 and BH19-2. In the sample submitted from BH19-1, Lead (172 µg/g) and Mercury (0.3 µg/g) exceeded the applicable standards of 120 µg/g and 0.27 µg/g, respectively. The exceedances in BH19-2 are summarized as follows:

- Barium (397 µg/g), above the standard of 390 µg/g;
- Cadmium (1.7 µg/g), above the standard of 1.2 µg/g;
- Lead (842 µg/g), above the standard of 120 µg/g;

- Mercury (2.1 µg/g) above the standard of 0.27 µg/g; and
- Zinc (1020 µg/g) above the standard of 340 µg/g.

In the groundwater, VOC and PHC parameters were not detected with the exception of chloroform. It was measured in MW19-1 and MW19-2 with levels of 17.5 µg/L and 13.0 µg/L, respectively, above the applicable standard of 2 µg/L. It is anticipated that the chloroform detected is due to the use of chlorinated municipal water used during coring. Select metal and PAH parameters were detected, however levels are below the applicable standards.

Due to a limited amount of water submitted from MW19-1, the detection limit for PHC F2 was raised to 196 µg/L which is above the standard of 150 µg/L. It can therefore not be determined whether the sample meets the applicable standards for PHC F2.

Based on our observations during drilling activities complemented with sample screening and laboratory analysis, evidence of contamination was encountered in the fill material between approximately 0.5 m and 1.5 m in depth in the eastern portion of the Site. The horizontal extent of the soil contamination has not been delineated. Chloroform was detected above the applicable standard in the groundwater, however it is anticipated to be caused by the use of chlorinated municipal water during coring.

It is recommended that the horizontal extent of the soil contamination be delineated and remediated. It is recommended that groundwater be resampled from MW19-1 for PHC F2 to determine the level since the detection limit was above the applicable standard. The contamination encountered onsite presents a low risk to the building occupants.

It is recommended that if groundwater monitoring wells are not required for future monitoring purposes, they should be decommissioned in accordance with O. Reg. 903.

1 INTRODUCTION

Alexander Fleck House Inc. retained LRL Associates Ltd. (LRL) to complete a Phase II Environmental Site Assessment (ESA) on 593 Laurier Avenue West in Ottawa, Ontario (herein referred to as the Site). The Phase II ESA was carried out to determine the potential impacts to the Site from the former foundry east of the Site, former spill on Bronson Avenue, former heating oil tank in the basement and the trap door over gravel basement in the garage. These areas were identified as areas of potential environmental concerns in the previously prepared Phase I ESA by LRL, July 15, 2019. The Phase II ESA was conducted in general accordance with Ontario Regulation (O. Reg.) 153/04, as amended, in support of a City of Ottawa site plan approval application.

1.1 Site Description

1.1.1 Subject Property

The site under investigation is the residential property located at 593 Laurier Avenue West in Ottawa, Ontario. The Site's location is presented in **Figure 1**. The Site is irregularly shaped with an approximate area of 1,230 m² (0.3 acres). It is developed with a three-storey residence constructed circa 1908. The residence has a footprint of approximately 335 m². The building is serviced with municipal water and sanitary services and is heated with natural gas. The general surrounding area including the Site has a significant slope north-northwest towards the Ottawa River with elevations dropping from 80 m at the Site to 50 m at the river.

For the purpose of this report, Laurier Avenue West will be inferred as being orientated in an east-west direction.

1.1.2 Surrounding Land Use

Surrounding land use is as follows:

Directions	Current Land Use	Current Occupant
North	Residential	Multi-tenant residential
South	Residential	Multi-tenant residential
East	Bronson Avenue followed parkland	Community garden
West	Residential	Multi-tenant residential

1.1.3 Site Services

Potable water and sanitary services are municipal.

1.2 Current and Proposed Future Uses

Current property use is residential and it is understood that the proposed use would remain as residential.

1.3 Applicable Site Condition Standards

Regulatory requirements for assessing environmental conditions of a site are established by Ontario Regulation 153/04 – *Records of Site Conditions, Part XV.1 of the Environmental Protection Act* (O. Reg. 153/04). Site condition standards are set out in Ministry of Environment, Conservation and Parks (MECP) 'Soil, Ground Water and Sediment Standards for Use Under

Part IV.1 of the Environmental Protection Act, April 15, 2011. The applicable site condition standard used was Table 7 Generic Site Condition Standards for Shallow Soils in a Non-Potable Groundwater Condition.

- The Site and adjacent properties are serviced with municipal potable water;
- The subsurface conditions encountered consisted of fill therefore the coarse-textured standard was applied; and
- The Site and neighbouring properties are zoned as residential; and
- The Site is considered environmentally sensitive as there was less than 2 m of overburden overlying the bedrock.

2 BACKGROUND INFORMATION

2.1 Physical Settings

A review of the Ontario Base Map indicates that the general surrounding area including the Site has a significant slope north-northwest towards the Ottawa River with elevations dropping from 80 m at the Site to 50 m to the river.

Surficial geology consists of till with a local relief less than 5 m. Bedrock is part of the Ottawa Formation, consisting of limestone with some shaly partings and some sandstone.

2.2 Previous Investigation

A Phase I Environmental Site Assessment was completed at the Site in June 2019 by LRL to identify any potential areas of environmental concern associated with the Site.

Report:	Phase I Environmental Site Assessment, 593 Laurier Avenue West, Ottawa, Ontario
Date:	July 15, 2019
Author:	LRL Associates Ltd.
Prepared for:	Alexander Fleck House Inc.
Description of data, analysis and findings relevant to the Phase I ESA:	
Alexander Fleck House Inc. retained LRL Associates Ltd. (LRL) to complete a Phase I Environmental Site Assessment (ESA) on 593 Laurier Avenue West, Ontario. The assessment was conducted in the context of obtaining a City of Ottawa Site plan approval for proposed development.	
The Site is irregularly shaped with an approximate area of 1,230 m ² (0.3 acres). It is developed with a three-storey residence constructed circa 1908. The residence has a footprint of approximately 335 m ² . The building is serviced with municipal water and sanitary services and is heated with natural gas.	
A review of records obtained through Ecology Eris revealed the following:	
<ul style="list-style-type: none">• Six (6) fire insurance plans dated between 1878 and 1963 were retrieved. Two (2) foundries were located within 250 m of the Site. The foundries were located 20 m east and 230 m north of the Site. The foundry located 20 m east of the Site presents a moderate to high risk for potential environmental concern.• The City Directories revealed that adjacent properties are generally residential with	

some commercial. 422 Slater Street, approximately 20 m east of the Site, was listed as 422-26 Ottawa Carleton & Aircraft Ltd. Brass Foundry from 1920 through 1946, and 422-26 Casing of Ottawa Plant 2 Brass & Aluminum Foundry in 1950. The operations are considered a potentially contaminating activity with moderate to high risk for potential environmental concern.

- In January 1988, an unknown amount of suspected petroleum-based material was spilt to Bronson Road. The exact location or the amount were not specified. It presents a low to high risk for environmental concern.

During the interview it was revealed that a former heating oil tank was located in the basement. The site visit revealed a gravel pit beneath a trap door in the garage. Its purpose was unknown. The tank and gravel pit present moderate to high risks for environmental concern.

Based on the above findings it was concluded that there are potential environmental concerns associated with the current and historical use of the Site and adjacent properties. It was recommended that a Phase II Environmental Site Assessment be completed to determine any potential soil or groundwater impacts to the Site.

3 SCOPE OF THE INVESTIGATION

3.1 Overview of Site Investigation

Purpose of this Phase II ESA is to determine if recognized potential environmental concerns associated with current and past Site activities as well as other identified areas of concern associated with neighbouring properties have negatively impacted soil and groundwater quality of the subject site. Such an assessment provides information regarding the nature and extent of potential contamination to assist in making informed business decisions about the property.

The potential environmental concerns identified that require investigation are:

Potential Environmental Concern	Location	Comments	Contaminants of Potential Concern	Media Potentially Impacted
Former Heating Oil Tank	On-site	Historically located in the basement	PHCs and VOCs	Soil and groundwater
Trap Door Over Gravel Basement	On-site	Beneath the south end of the garage, purpose unknown.	PHCs and VOCs	Soil and groundwater
Former foundry	Approximately 20 m east of the Site	Brass foundry listed at 422 Slater in 1920-1950 in city directories, and brass foundry noted in 1922 fire insurance plan at the same location.	PHCs, VOCs, Metals and PAH	Groundwater
Spill	Bronson Avenue	Exact location, type of material and amount not specified.	PHCs and VOCs	Groundwater

Findings and conclusions presented in this report apply only to these recognized environmental conditions assessed.

3.2 Media Investigated

The Phase II ESA will establish the Site's subsurface geology and hydrogeological conditions. Soil and groundwater conditions will be evaluated with respect to the contaminants of concern in context of the current regulations and guidelines applicable to contaminated sites.

3.3 Scope and Methodology

Primary objective of this Phase II ESA was to evaluate current conditions of the Site in context of the applicable legislative and regulatory requirements. LRL's scope of work was as follows:

- Review all available information provided concerning the Site. Conduct a Site visit to determine existing conditions;
- Drill four (4) boreholes at strategic locations based on potential areas of environmental concern, to allow for soil sampling;
- Complete two (2) of the boreholes as monitoring wells to assess hydrogeological conditions and facilitate groundwater sampling;
- Submit representative soil (if applicable) and groundwater samples to an accredited laboratory for analysis of suspected parameters of concern; and
- Interpret results in relation to current provincial guidelines to determine subsurface soil and groundwater quality.

This report will present results of Site activities carried out between October 15 and 17, 2019.

4 INVESTIGATION METHOD

4.1 Field Preparation

Locations of all buried and overhead services were obtained by LRL prior to initiation of any subsurface investigation.

4.2 Drilling

An intrusive investigation was carried out on October 15, 2019. Two (2) boreholes were advanced across the Site, both of which were completed as monitoring wells (MW):

Borehole/ Monitoring Well	Location	Rational
BH19-1 and BH19-2	East portion of the Site	To establish the potential groundwater impacts from the former foundry identified to the east of the Site and former spill on Bronson avenue east of the Site.

The advancement of boreholes was attempted in the basement beneath the former oil tank and in the gravel pit beneath the garage, however bedrock was encountered directly beneath the concrete slab and the gravel. Boreholes could not be advanced close to the property line in the southeast portion of the Site or in the northeast portion of the Site due to the presence of utilities and the reported presence of a bunker, respectively. Borehole and monitoring well locations are presented in **Figure 2**.

4.2.1 Borehole Drilling

Boreholes were advanced using an LC55 track-mounted drill rig equipped with 203 mm diameter hollow stem augers and 96 mm HQ coring barrels. The drilling contractor was George Downing Estate Drilling Ltd. (Hawkesbury, Ontario) and worked under LRL field staff supervision. Overburden was encountered to depths between 0.5 and 1.5 m below ground surface (bgs), within which soil samples were collected continuously using a split spoon sampler of 0.6 m in length. Between each spoon, the sampling equipment was thoroughly cleaned. Upon refusal over bedrock, the boreholes were continued using HQ coring barrels to depths of 7.75 and 9.30 m bgs where the boreholes were terminated.

Locations of the boreholes are presented in **Figure 2**. Details of the borehole drilling are provided in the borehole logs in **Appendix A**.

4.3 Soil Sampling and Field Screening

Representative soil samples from each soil stratum encountered or split sampler were collected and transferred immediately into sealed laboratory supplied glass jars and polyethylene freezer bags. Samples were examined for soil type, colour, staining/discoloration and odours. Samples were logged, labelled and stored onsite in a cooler chilled with ice to prevent evaporation of potential combustible soil vapours (CSV). Soil samples stored in bags were screened for CSV presence using a Mini Rae 2000 Photoionization Detector (PID).

4.4 Monitoring Well Installation

The two (2) boreholes were completed as monitoring wells: BH19-1, BH19-2 (herein referred to as BH/MW19-1, BH/MW19-2). Monitoring wells were constructed within the 203/96 mm diameter boreholes with a 51 mm slotted PVC piezometer placed to bisect the groundwater table. Top of the screen was extended to the ground surface using a solid riser pipe. Annular space around the slotted portion of the piezometer was backfilled with pre-washed and graded silica sand up to 300 mm above the top of the screen. Bentonite was placed above the sand pack to surface. Monitoring wells were finished at the surface with a flush-mount aluminum protective cover.

Details of monitoring wells are provided in borehole logs in **Appendix A**.

4.5 Elevation Surveying

Ground surface elevations and tops of all monitoring well risers were surveyed and referenced to a temporary benchmark. Subsequent measurements of water elevations were made in reference to top of well risers. This benchmark was established as the northeast upper rim of the fire hydrant south of Laurier Avenue West. It was given an arbitrary elevation of 100.00 m.

4.6 Groundwater Monitoring and Sampling

Headspace vapour measurements for volatile organic compounds (VOC) were measured in each monitoring well immediately after removing the cap, prior to purging and sampling. VOC concentrations were measured by placing the combustible soil vapour nozzle at least 15 cm below the top of the casing and recording the peak VOC reading.

Newly installed wells were instrumented with dedicated LDPE tubing to facilitate well development, purging and sampling requirements. Prior to sampling, water levels were measured using an electronic water level meter and reduced to static elevations based on monitoring well survey data. Each well was purged (three well volumes) using dedicated LDPE

tubing and foot valve. Purge water was observed for colour, sheens or odour. Using a dedicated bailer or LDPE tubing, groundwater was transferred into laboratory supplied water bottles. Samples were logged, labelled and stored on site in a cooler chilled with ice.

4.7 Analytical Testing

Representative soil and groundwater samples collected during the investigation were submitted for laboratory analysis. Samples were submitted to Paracel Laboratories Ltd., Ottawa, ON for the following contaminants of concern: Volatile Organic Compounds (VOC), Petroleum Hydrocarbon Compound (PHC) fractions F1 (C6 – C10), F2 (>C11 – C16), F3 (>C16 – C34), and F4 (>C34), Polycyclic Aromatic Hydrocarbons (PAH) and/or metals including mercury and hexavalent chromium.

Potential Environmental Concern	Soil		Groundwater	
	Sample No.	Analysis	Sample No.	Analysis
Former oil tank in the basement and trap door in the garage over the gravel basement.			BH/MW19-1 BH/MW19-2	PHC, VOC, PAH, Metals
Former foundry and spill east of the Site.	BH19-1-1 BH19-2-4	PHC, VOC, Metals	BH/MW19-1 BH/MW19-2	PHC, VOC, PAH, Metals

Laboratory Certificates of Analysis are included in **Appendix B**. All remaining samples not analyzed will be kept in storage for a period of one (1) month following submission of this report at which time they shall be disposed of unless a written or verbal notice is received, stating otherwise.

4.8 QA/QC Protocols

Quality assurance/quality control (QA/QC) protocols were followed during the borehole drilling and sampling to ensure that representative samples were obtained. The protocols were generally performed in accordance with the following;

- MECP's *"Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario"*, revised February 1997.
- MECP's *"Guide for Completing Phase Two Environmental Site Assessments under Ontario Regulation 153/04"*, June 2011.

Field protocols that were employed include:

- All field-screening devices, such as a combustible gas detector, were calibrated prior to use, to ensure accuracy and reliability of readings;
- Thorough decontamination of all drilling and sampling equipment. Dedicated sampling equipment was used when possible;
- Soil and groundwater samples collected were placed in laboratory supplied glass sample jars;
- Thorough documentation of all field activities and sample handling practices including field notes, chain of custody forms, memos to files, etc.; and
- Samples were submitted to a laboratory which is certified by the Canadian Association for Laboratory Accreditation (CALA).

Due to the small number of soil and groundwater samples collected for investigation, field duplicates were not incorporated into the work program. Other QA/QC procedures conducted by LRL are outlined in the methodologies detailed above.

5 REVIEW & EVALUATION

5.1 Geology

Subsurface soil conditions in the area investigated on the Site generally consist of topsoil to 0.20 m bgs followed by fill to depths between 0.50 and 1.65 m bgs where refusal was encountered upon bedrock. Limestone with shaly partings was encountered to depths between 7.75 and 9.30 m bgs where the boreholes were terminated.

Detailed borehole logs of all borings are presented in **Appendix A**.

5.2 Groundwater Elevations & Flow Direction

Static groundwater elevations measured at each monitoring well are summarized in **Table 1**. Groundwater depth measurements in MW19-1 and MW19-2 were 5.04 and 3.21 m bgs, which correspond to elevations of 95.31 and 96.56 m, respectively. Groundwater contours could not be established due to the lack of data points. However, based on the topography of the area and the presence of the Ottawa River 550 m north of the Site, the anticipated groundwater flow direction is towards the north.

5.3 Soil: Field Screening

No olfactory or visual (i.e. staining or free phase) evidence of petroleum hydrocarbon impacts were observed in any of the soil samples collected.

Observations were confirmed through CSV concentrations measured. CSV concentrations of soil samples collected ranged between non-detect (<0.1 ppm) and 0.2 ppm. CSV measurements are summarized in the borehole logs in **Appendix A**.

5.4 Soil Texture

Native subsurface soil was not encountered. Fill was encountered above the bedrock which is considered coarse-grained.

5.5 Soil Quality

Results of soil analysis and respective MECP standards are presented in **Table 2** and **Table 3**. At least one soil sample from each borehole was submitted for chemical analysis. The Laboratory Certificate of Analysis is included in **Appendix B**.

VOC parameters analysed were not detected in soil samples submitted for analysis. PHC F3 and F4 were detected in BH19-1 and BH19-2; however, levels are below the applicable Table 7 standards.

Select metals parameters exceeded the applicable standards in BH19-1 and BH19-2. In the sample submitted from BH19-1, Lead (172 µg/g) and Mercury (0.3 µg/g) exceeded the applicable standards of 120 µg/g and 0.27 µg/g, respectively. The exceedances in BH19-2 are summarized as follows:

- Barium (397 µg/g), above the standard of 390 µg/g;
- Cadmium (1.7 µg/g), above the standard of 1.2 µg/g;

- Lead (842 µg/g), above the standard of 120 µg/g;
- Mercury (2.1 µg/g) above the standard of 0.27 µg/g; and
- Zinc (1020 µg/g) above the standard of 340 µg/g.

5.6 Groundwater Quality

Headspace VOC levels were 1.2 and 0.6 ppm in MW19-1 and MW19-2, respectively.

Groundwater analysis results and respective MECP standards are summarized in **Table 4** and **Table 5**. VOC and PHC parameters were not detected in the wells with the exception of chloroform. It was measured in MW19-1 and MW19-2 with levels of 17.5 µg/L and 13.0 µg/L, respectively, above the applicable standard of 2 µg/L. It is anticipated that the chloroform detected is due to the use of chlorinated municipal water during coring. Select metal and PAH parameters were detected, however levels are below the applicable standards.

Due to a limited amount of water submitted from MW19-1, the detection limit for PHC F2 was raised to 196 µg/L which is above the standard of 150 µg/L. It can therefore not be determined whether the sample meets the applicable standards for PHC F2.

6 CONCLUSIONS AND RECOMMENDATIONS

Based on our Site visit, results of soil and groundwater sampling and laboratory analytical programs, LRL offers the following conclusions regarding environmental conditions of the subject Site:

- The site under investigation is the residential property located at 593 Laurier Avenue West in Ottawa, Ontario. The Site's location is presented in **Figure 1**. The Site is irregularly shaped with an approximate area of 1,230 m² (0.3 acres). It is developed with a three-storey residence constructed circa 1908. The residence has a footprint of approximately 335 m². The building is serviced with municipal water and sanitary services and is heated with natural gas. The general surrounding area including the Site has a significant slope north-northwest towards the Ottawa River with elevations dropping from 80 m at the Site to 50 m at the river.
- The Phase I ESA (July 2015) identified the following environmental concerns to be investigated:
 - The former heating oil tank located in the basement;
 - The trap door in the garage over a gravel basement, purpose unknown;
 - The former foundry identified east of the Site; and
 - The unspecified spill on Bronson Avenue, east of the Site.
- Regulatory requirements for assessing environmental conditions of a site are established by Ontario Regulation 153/04 – *Records of Site Conditions, Part XV.1 of the Environmental Protection Act* (O. Reg. 153/04). Site condition standards are set out in MECP's 'Soil, Ground Water and Sediment Standards for Use Under Part IV.1 of the Environmental Protection Act, April 15 2011'. The applicable site condition standard used was Table 7 Site Condition Standards for Shallow Soils in a Non-Potable Ground Water Condition, residential property use and coarse-textured soils;
- The investigation involved advancing two (2) boreholes across the Site at strategic locations based on potential areas of environmental concern. The two (2) boreholes were completed into monitoring wells to assess the Site's hydrogeological conditions

and facilitate groundwater sampling. The advancement of boreholes was attempted in the basement beneath the former oil tank and in the gravel pit beneath the garage, however bedrock was encountered directly beneath the concrete slab and the gravel;

- The subsurface soil conditions in the area investigated on the Site generally consist of topsoil over fill. Limestone with shaly partings was encountered from depths of 0.50 and 1.65 m bgs to 7.75 and 9.30 m bgs where the boreholes were terminated;
- Groundwater contours could not be established due to the lack of data points. However, based on the topography of the area and the presence of the Ottawa River 550 m north of the Site, the anticipated groundwater flow direction is towards the north;
- No olfactory or visual (i.e. staining or free phase) evidence of petroleum hydrocarbon impacts were observed in any of the soil samples collected. Observations were confirmed through CSV concentrations measured. CSV concentrations ranged between non-detect (<0.1 ppm) and 0.2 ppm;
- In the monitoring wells, headspace VOC levels were 1.2 and 0.6 ppm in MW19-1 and MW19-2, respectively. No olfactory or visual (i.e. sheen or free phase) evidence of petroleum hydrocarbon impacts were observed;
- Select soil and groundwater samples were submitted for analysis to establish if the potential environmental concerns have negatively impacted the soil and groundwater conditions. The rationale for selection of soil and groundwater samples submitted for analysis was based on the results of the sample field screening (CSVs), visual/olfactory observations and/or proximity to the water table. The potential contaminants of concern were PHCs, VOCs, PAHs and metals including mercury and hexavalent chromium;
- VOC parameters analysed were not detected in soil samples submitted for analysis. PHC F3 and F4 were detected in BH19-1 and BH19-2; however, levels are below the applicable Table 7 standards. Select metals parameters exceeded the applicable standards in BH19-1 and BH19-2. In the sample submitted from BH19-1, Lead (172 µg/g) and Mercury (0.3 µg/g) exceeded the applicable standards of 120 µg/g and 0.27 µg/g, respectively. The exceedances in BH19-2 are summarized as follows:
 - Barium (397 µg/g), above the standard of 390 µg/g;
 - Cadmium (1.7 µg/g), above the standard of 1.2 µg/g;
 - Lead (842 µg/g), above the standard of 120 µg/g;
 - Mercury (2.1 µg/g) above the standard of 0.27 µg/g; and
 - Zinc (1020 µg/g) above the standard of 340 µg/g.
- VOC and PHC parameters were not detected in the wells with the exception of chloroform. It was measured in MW19-1 and MW19-2 with levels of 17.5 µg/L and 13.0 µg/L, respectively, above the applicable standard of 2 µg/L. It is anticipated that the chloroform detected is due to the water used for coring. Select metal and PAH parameters were detected, however levels are below the applicable standards. Due to a limited amount of water submitted from MW19-1, the detection limit for PHC F2 was raised to 196 µg/L which is above the standard of 150 µg/L. It can therefore not be determined whether the sample meets the applicable standards for PHC F2.

Based on our observations during drilling activities complemented with sample screening and laboratory analysis, evidence of contamination was encountered in the fill material between

approximately 0.5 m and 1.5 m in depth in the eastern portion of the Site. The horizontal extent of the soil contamination has not been delineated. Chloroform was detected above the applicable standard in the groundwater, however it is anticipated to be caused by the use of chlorinated municipal water during coring.

It is recommended that the horizontal extent of the soil contamination be delineated and remediated. It is recommended that groundwater be resampled from MW19-1 for PHC F2 to determine the level since the detection limit was above the applicable standard. The contamination encountered onsite presents a low risk to the building occupants.

It is recommended that if groundwater monitoring wells are not required for future monitoring purposes, they should be decommissioned in accordance with O. Reg. 903.

7 LIMITATIONS AND USE OF REPORT

Results of this Phase II ESA should not be considered a warranty that the subject property is free from any and all contaminants from former and current practices, other than those noted in this report, nor that all compliance issues have been addressed.

Findings contained in this report are based on data and information collected during the Phase II ESA of the subject property conducted by LRL Associates Ltd. Conclusions and recommendations are based solely on Site conditions encountered during fieldwork completed between October 15 and 17, 2019. No assurance is made regarding changes in conditions subsequent to the time of this investigation. If additional information is discovered or obtained, LRL Associates Ltd. should be requested to re-evaluate conclusions presented in this report and to provide amendments as required.

In evaluating the subject property, LRL Associates Ltd. has relied in good faith on information provided by individuals as noted in this report. We assume that information provided is factual and accurate. We accept no responsibility for any deficiencies, misstatements or inaccuracies contained in this report as a result of omissions, misinterpretation or fraudulent acts of the persons contacted.

This report is intended for sole use of Alexander Fleck House Inc. and their authorized agents. LRL Associates Ltd. will not be responsible for any use of the information contained within this report by any third party.

In addition, LRL Associates Ltd. will not be responsible for the real or perceived decrease in property value, its saleability or ability to gain financing, through reporting of factual information.

Yours truly,
LRL Associates Ltd.

Geneviève Marcoux
Environmental Technician

Monitoring Well Diameter: 51 mm

NOTES

Gorundwater sample collected on October 17, 2019 and submitted for Petroleum Hydrocabons (PHC), Volatile Organic Compounds (VOC), Polycyclic Aromatic Hydrocarbons (PAH), and metals including mercury and hexavalent chromium.

HSA - Hollow Stem Auger
BGS - Below Ground Surface

Project No.: 190227

Client: Alexander Fleck House Inc.

Date: October 15, 2019

Borehole Log: BH/MW19-2

Project: Phase II Environmental Site Assessment

Location: 593 Laurier Avenue West

Field Personnel: GM

Driller: George Downing Estate Drilling

Drilling Equipment: CME LC55

Drilling Method: HSA/HQ Coring

Order Date: 18-Oct-2019
Project Description: 190227

Qualifier Notes:

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.

Qualifier Notes:

Sample Qualifiers :

- 1 : Elevated Reporting Limits due to limited sample volume.
- 2 : Limited sample volume available limiting accuracy of reported result.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

CCME PHC additional information:

- The method for the analysis of PHCs complies with the Reference Method for the CWS PHC and is validated for use in the laboratory. All prescribed quality criteria identified in the method has been met.
- F1 range corrected for BTEX.
- F2 to F3 ranges corrected for appropriate PAHs where available.
- The gravimetric heavy hydrocarbons (F4G) are not to be added to C6 to C50 hydrocarbons.
- In the case where F4 and F4G are both reported, the greater of the two results is to be used for comparison to CWS PHC criteria.
- When reported, data for F4G has been processed using a silica gel cleanup.
